Harmonized Commodity Description
and Coding System
Explanatory Notes

GENERAL RULES FOR THE INTERPRETATION OF THE HARMONIZED SYSTEM

Classification of goods in the nomenclature shall be governed by the following principles :

RULE 1

The titles of Sections, Chapters and sub-Chapters are provided for ease of reference only; for legal purposes, classification shall be determined according to the terms of the headings and any relative Section or Chapter Notes and, provided such headings or Notes do not otherwise require, according to the following provisions.

EXPLANATORY NOTE

- (I) The Nomenclature sets out in systematic form the goods handled in international trade. It groups these goods in Sections, Chapters and sub-Chapters which have been given titles indicating as concisely as possible the categories or types of goods they cover. In many cases, however, the variety and number of goods classified in a Section or Chapter are such that it is impossible to cover them all or to cite them specifically in the titles.
- (II) Rule 1 begins therefore by establishing that the titles are provided “for ease of reference only”. They accordingly have no legal bearing on classification.
- (III) The second part of this Rule provides that classification shall be determined :
 - (a) according to the terms of the headings and any relative Section or Chapter Notes, and
 - (b) where appropriate, **provided the headings or Notes do not otherwise require**, according to the provisions of Rules 2, 3, 4, and 5.
- (IV) Provision (III) (a) is self-evident, and many goods are classified in the Nomenclature without recourse to any further consideration of the Interpretative Rules (e.g., live horses (heading 01.01), pharmaceutical goods specified in Note 4 to Chapter 30 (heading 30.06)).
- (V) In provision (III) (b) :
 - (a) The expression “provided such headings or Notes do not otherwise require” is intended to make it quite clear that the terms of the headings and any relative Section or Chapter Notes are paramount, i.e., they are the first consideration in determining classification. For example, in Chapter 31, the Notes provide that certain headings relate **only** to particular goods. Consequently those headings cannot be extended to include goods which otherwise might fall there by reason of the operation of Rule 2 (b).
 - (b) The reference to Rule 2 in the expression “according to the provisions of Rules 2, 3, 4 and 5” means that :
 - (1) goods presented incomplete or unfinished (e.g., a bicycle without saddle and tyres), and
 - (2) goods presented unassembled or disassembled (e.g., a bicycle, unassembled or disassembled, all components being presented together) whose components could individually be classified in their own right (e.g., tyres, inner tubes) or as “parts” of those goods,

are to be classified as if they were those goods in a complete or finished state, **provided the terms of Rule 2 (a) are satisfied and the headings or Notes do not otherwise require**.

RULE 2

- (a) Any reference in a heading to an article shall be taken to include a reference to that article incomplete or unfinished, provided that, as presented, the incomplete or unfinished article has the essential character of the complete or finished article. It shall also be taken to include a reference to that article complete or finished (or failing to be classified as complete or finished by virtue of this rule), presented unassembled or disassembled.
- (b) Any reference in a heading to a material or substance shall be taken to include a reference to mixtures or combinations of that material or substance with other materials or substances. Any reference to goods of a given material or substance shall be taken to include a reference to goods consisting wholly or partly of such material or substance. The classification of goods consisting of more than one material or substance shall be according to the principles of Rule 3.

EXPLANATORY NOTE

RULE 2 (a) (Incomplete or unfinished articles)

- (I) The first part of Rule 2 (a) extends the scope of any heading which refers to a particular article to cover not only the complete article but also that article incomplete or unfinished, **provided** that, as presented, it has the essential character of the complete or finished article.
- (II) The provisions of this Rule also apply to **blanks** unless these are specified in a particular heading. The term "**blank**" means an article, not ready for direct use, having the approximate shape or outline of the finished article or part, and which can only be used, other than in exceptional cases, for completion into the finished article or part (e.g., bottle preforms of plastics being intermediate products having tubular shape, with one closed end and one open end threaded to secure a screw type closure, the portion below the threaded end being intended to be expanded to a desired size and shape).
Semi-manufactures not yet having the essential shape of the finished articles (such as is generally the case with bars, discs, tubes, etc.) are not regarded as "blanks".
- (III) In view of the scope of the headings of Sections I to VI, this part of the Rules does not normally apply to goods of these Sections.
- (IV) Several cases covered by the Rule are cited in the General Explanatory Notes to Sections or Chapters (e.g., Section XVI, and Chapters 61, 62, 86, 87 and 90).

RULE 2 (a) (Articles presented unassembled or disassembled)

- (V) The second part of Rule 2 (a) provides that complete or finished articles presented unassembled or disassembled are to be classified in the same heading as the assembled article. When goods are so presented, it is usually for reasons such as requirements or convenience of packing, handling or transport.
- (VI) This Rule also applies to incomplete or unfinished articles presented unassembled or disassembled provided that they are to be treated as complete or finished articles by virtue of the first part of this Rule.

- (VII) For the purposes of this Rule, “articles presented unassembled or disassembled” means articles the components of which are to be assembled either by means of fixing devices (screws, nuts, bolts, etc.) or by riveting or welding, for example, **provided** only assembly operations are involved.

No account is to be taken in that regard of the complexity of the assembly method. However, the components shall not be subjected to any further working operation for completion into the finished state.

Unassembled components of an article which are in excess of the number required for that article when complete are to be classified separately.

- (VIII) Cases covered by this Rule are cited in the General Explanatory Notes to Sections or Chapters (e.g., Section XVI, and Chapters 44, 86, 87 and 89).

- (IX) In view of the scope of the headings of Sections I to VI, this part of the Rule does not normally apply to goods of these Sections.

RULE 2 (b) **(Mixtures and combinations of materials or substances)**

- (X) Rule 2 (b) concerns mixtures and combinations of materials or substances, and goods consisting of two or more materials or substances. The headings to which it refers are headings in which there is a reference to a material or substance (e.g., heading 05.07 - ivory), and headings in which there is a reference to goods of a given material or substance (e.g., heading 45.03 - articles of natural cork). It will be noted that the Rule applies only if the headings or the Section or Chapter Notes do not otherwise require (e.g., heading 15.03 - lard oil, **not ... mixed**).

Mixtures being preparations described as such in a Section or Chapter Note or in a heading text are to be classified under the provisions of Rule 1.

- (XI) The effect of the Rule is to extend any heading referring to a material or substance to include mixtures or combinations of that material or substance with other materials or substances. The effect of the Rule is also to extend any heading referring to goods of a given material or substance to include goods consisting partly of that material or substance.

- (XII) It does not, however, widen the heading so as to cover goods which cannot be regarded, as required under Rule 1, as answering the description in the heading; this occurs where the addition of another material or substance deprives the goods of the character of goods of the kind mentioned in the heading.

- (XIII) As a consequence of this Rule, mixtures and combinations of materials or substances, and goods consisting of more than one material or substance, if *prima facie* classifiable under two or more headings, must therefore be classified according to the principles of Rule 3.

RULE 3

When by application of Rule 2 (b) or for any other reason, goods are *prima facie*, classifiable under two or more headings, classification shall be effected as follows:

- (a) The heading which provides the most specific description shall be preferred to headings providing a more general description. However, when two or more headings each refer to part only of the materials or substances contained in mixed or composite goods or to part only of the items in a set put up for retail sale, those headings are to be regarded as equally specific in relation to those goods, even if one of them gives a more complete or precise description of the goods.

- (b) Mixtures, composite goods consisting of different materials or made up of different components, and goods put up in sets for retail sale, which cannot be classified by reference to 3 (a), shall be classified as if they consisted of the material or component which gives them their essential character, insofar as this criterion is applicable
- (c) When goods cannot be classified by reference to 3 (a) or 3 (b), they shall be classified under the heading which occurs last in numerical order among those which equally merit consideration

EXPLANATORY NOTE

- (I) This Rule provides three methods of classifying goods which, *prima facie*, fall under two or more headings, either under the terms of Rule 2 (b) or for any other reason. These methods operate in the order in which they are set out in the Rule. Thus Rule 3 (b) operates only if Rule 3 (a) fails in classification, and if both Rules 3 (a) and (b) fail, Rule 3 (c) will apply. The order of priority is therefore (a) specific description; (b) essential character; (c) heading which occurs last in numerical order.
- (II) The Rule can only take effect **provided the terms of headings or Section or Chapter Notes do not otherwise require**. For instance, Note 4 (B) to Chapter 97 requires that goods covered both by the description in one of the headings 97.01 to 97.05 and by the description in heading 97.06 shall be classified in one of the former headings. Such goods are to be classified according to Note 4 (B) to Chapter 97 and not according to this Rule.

RULE 3 (a)

- (III) The first method of classification is provided in Rule 3 (a), under which the heading which provides the most specific description of the goods is to be preferred to a heading which provides a more general description.
- (IV) It is not practicable to lay down hard and fast rules by which to determine whether one heading more specifically describes the goods than another, but in general it may be said that :
 - (a) A description by name is more specific than a description by class (e.g., shavers and hair clippers, with self-contained electric motor, are classified in heading 85.10 and not in heading 84.67 as tools for working in the hand with self-contained electric motor or in heading 85.09 as electro-mechanical domestic appliances with self-contained electric motor).
 - (b) If the goods answer to a description which more clearly identifies them, that description is more specific than one where identification is less complete.

Examples of the latter category of goods are :

- (1) Tufted textile carpets, identifiable for use in motor cars, which are to be classified not as accessories of motor cars in heading 87.08 but in heading 57.03, where they are more specifically described as carpets.

- (2) Unframed safety glass consisting of toughened or laminated glass, shaped and identifiable for use in aeroplanes, which is to be classified not in heading 88.03 as parts of goods of heading 88.01 or 88.02 but in heading 70.07, where it is more specifically described as safety glass.
- (V) However, when two or more headings each refer to part only of the materials or substances contained in mixed or composite goods or to part only of the items in a set put up for retail sale, those headings are to be regarded as equally specific in relation to those goods, even if one of them gives a more complete or precise description than the others. In such cases, the classification of the goods shall be determined by Rule 3 (b) or 3 (c).

RULE 3 (b)

- (VI) This second method relates only to :
- (i) Mixtures.
 - (ii) Composite goods consisting of different materials.
 - (iii) Composite goods consisting of different components.
 - (iv) Goods put up in sets for retail sales.
- It applies only if Rule 3 (a) fails.
- (VII) In all these cases the goods are to be classified as if they consisted of the material or component **which gives them their essential character**, insofar as this criterion is applicable.
- (VIII) The factor which determines essential character will vary as between different kinds of goods. It may, for example, be determined by the nature of the material or component, its bulk, quantity, weight or value, or by the role of a constituent material in relation to the use of the goods.
- (IX) For the purposes of this Rule, composite goods made up of different components shall be taken to mean not only those in which the components are attached to each other to form a practically inseparable whole but also those with separable components, **provided** these components are adapted one to the other and are mutually complementary and that together they form a whole which would not normally be offered for sale in separate parts.
- Examples of the latter category of goods are :
- (1) Ashtrays consisting of a stand incorporating a removable ash bowl.
 - (2) Household spice racks consisting of a specially designed frame (usually of wood) and an appropriate number of empty spice jars of suitable shape and size.
- As a general rule, the components of these composite goods are put up in a common packing.
- (X) For the purposes of this Rule, the term “goods put up in sets for retail sale” shall be taken to mean goods which :
- (a) consist of at least two different articles which are, *prima facie*, classifiable in different headings. Therefore, for example, six fondue forks cannot be regarded as a set within the meaning of this Rule;

- (b) consist of products or articles put up together to meet a particular need or carry out a specific activity; and
- (c) are put up in a manner suitable for sale directly to end users without repacking (e.g., in boxes or cases or on boards).

“Retail sale” does not include sales of products which are intended to be re-sold after further manufacture, preparation, repacking or incorporation with or into other goods.

The term “goods put up in sets for retail sale” therefore only covers sets consisting of goods which are intended to be sold to the end user where the individual goods are intended to be used together. For example, different foodstuffs intended to be used together in the preparation of a ready-to-eat dish or meal, packaged together and intended for consumption by the purchaser would be a “set put up for retail sale”.

Examples of sets which can be classified by reference to Rule 3 (b) are :

- (1) (a) Sets consisting of a sandwich made of beef, with or without cheese, in a bun (heading 16.02), packaged with potato chips (French fries) (heading 20.04) :

Classification in heading 16.02.

- (b) Sets, the components of which are intended to be used together in the preparation of a spaghetti meal, consisting of a packet of uncooked spaghetti (heading 19.02), a sachet of grated cheese (heading 04.06) and a small tin of tomato sauce (heading 21.03), put up in a carton :

Classification in heading 19.02.

The Rule does not, however, cover selections of products put up together and consisting, for example, of :

- a can of shrimps (heading 16.05), a can of *pâté de foie* (heading 16.02), a can of cheese (heading 04.06), a can of sliced bacon (heading 16.02), and a can of cocktail sausages (heading 16.01); or
- a bottle of spirits of heading 22.08 and a bottle of wine of heading 22.04.

In the case of these two examples and similar selections of products, each item is to be classified separately in its own appropriate heading.

This also applies, for example, to soluble coffee in a glass jar (heading 21.01), a ceramic cup (heading 69.12) and a ceramic saucer (heading 69.12) put up together for retail sale in a paperboard box.

- (2) Hairdressing sets consisting of a pair of electric hair clippers (heading 85.10), a comb (heading 96.15), a pair of scissors (heading 82.13), a brush (heading 96.03) and a towel of textile material (heading 63.02), put up in a leather case (heading 42.02) :

Classification in heading 85.10.

- (3) Drawing kits comprising a ruler (heading 90.17), a disc calculator (heading 90.17), a drawing compass (heading 90.17), a pencil (heading 96.09) and a pencil-sharpener (heading 82.14), put up in a case of plastic sheeting (heading 42.02) :

Classification in heading 90.17.

For the sets mentioned above, the classification is made according to the component, or components taken together, which can be regarded as conferring on the set as a whole its essential character.

- (XI) This Rule does not apply to goods consisting of separately packed constituents put up together, whether or not in a common packing, in fixed proportions for the industrial manufacture of, for example, beverages.

RULE 3 (c)

- (XII) When goods cannot be classified by reference to Rule 3 (a) or 3 (b), they are to be classified in the heading which occurs last in numerical order among those which equally merit consideration in determining their classification.

RULE 4

Goods which cannot be classified in accordance with the above Rules shall be classified under the heading appropriate to the goods to which they are most akin.

EXPLANATORY NOTE

- (I) This Rule relates to goods which cannot be classified in accordance with Rules 1 to 3. It provides that such goods shall be classified under the heading appropriate to the goods to which they are most akin.
- (II) In classifying in accordance with Rule 4, it is necessary to compare the presented goods with similar goods in order to determine the goods to which the presented goods are most akin. The presented goods are classified in the same heading as the similar goods to which they are most akin.
- (III) Kinship can, of course, depend on many factors, such as description, character, purpose.

RULE 5

In addition to the foregoing provisions, the following Rules shall apply in respect of the goods referred to therein :

- (a) Camera cases, musical instrument cases, gun cases, drawing instrument cases, necklace cases and similar containers, specially shaped or fitted to contain a specific article or set of articles, suitable for long-term use and presented with the articles for which they are intended, shall be classified with such articles when of a kind normally sold therewith. This Rule does not, however, apply to containers which give the whole its essential character;
- (b) Subject to the provisions of Rule 5 (a) above, packing materials and packing containers presented with the goods therein shall be classified with the goods if they are of a kind normally used for packing such goods. However, this provision is not binding when such packing materials or packing containers are clearly suitable for repetitive use.

EXPLANATORY NOTE

RULE 5 (a) **(Cases, boxes and similar containers)**

- (I) This Rule shall be taken to cover only those containers which :
- (1) are specially shaped or fitted to contain a specific article or set of articles, i.e., they are designed specifically to accommodate the article for which they are intended. Some containers are shaped in the form of the article they contain;
 - (2) are suitable for long-term use, i.e., they are designed to have a durability comparable to that of the articles for which they are intended. These containers also serve to protect the article when not in use (during transport or storage, for example). These criteria enable them to be distinguished from simple packings;
 - (3) are presented with the articles for which they are intended, whether or not the articles are packed separately for convenience of transport. Presented separately the containers are classified in their appropriate headings;
 - (4) are of a kind normally sold with such articles; and
 - (5) do not give the whole its essential character.
- (II) Examples of containers, presented with the articles for which they are intended, which are to be classified by reference to this Rule are :
- (1) Jewellery boxes and cases (heading 71.13);
 - (2) Electric shaver cases (heading 85.10);
 - (3) Binocular cases, telescope cases (heading 90.05);
 - (4) Musical instrument cases, boxes and bags (e.g., heading 92.02);
 - (5) Gun cases (e.g., heading 93.03).
- (III) Examples of containers not covered by this Rule are containers such as a silver caddy containing tea, or an ornamental ceramic bowl containing sweets.

RULE 5 (b) **(Packing materials and packing containers)**

- (IV) This Rule governs the classification of packing materials and packing containers of a kind normally used for packing the goods to which they relate. However, this provision is not binding when such packing materials or packing containers are clearly suitable for repetitive use, for example, certain metal drums or containers of iron or steel for compressed or liquefied gas.
- (V) This Rule is subject to Rule 5 (a) and, therefore, the classification of cases, boxes and similar containers of the kind mentioned in Rule 5 (a) shall be determined by the application of that Rule.

RULE 6

For legal purposes, the classification of goods in the subheadings of a heading shall be determined according to the terms of those subheadings and any related Subheading Notes and, *mutatis mutandis*, to the above Rules, on the understanding that only subheadings at the same level are comparable. For the purposes of this Rule the relative Section and Chapter Notes also apply, unless the context otherwise requires.

EXPLANATORY NOTE

- (I) Rules 1 to 5 above govern, *mutatis mutandis*, classification at subheading levels within the same heading.
- (II) For the purposes of Rule 6, the following expressions have the meanings hereby assigned to them :
 - (a) “subheadings at the same level” : one-dash subheadings (level 1) or two-dash subheadings (level 2).

Thus, when considering the relative merits of two or more one-dash subheadings within a single heading in the context of Rule 3 (a), their specificity or kinship in relation to a given article is to be assessed solely on the basis of the texts of the competing one-dash subheadings. When the one-dash subheading that is most specific has been chosen and when that subheading is itself subdivided, then, and only then, shall the texts of the two-dash subheadings be taken into consideration for determining which two-dash subheading should be selected.

- (b) “unless the context otherwise requires” : except where Section or Chapter Notes are incompatible with subheading texts or Subheading Notes.

This occurs, for example, in Chapter 71 where the scope assigned to the term “platinum” in Chapter Note 4 (B) differs from that assigned to “platinum” in Subheading Note 2. For the purpose of interpreting subheadings 7110.11 and 7110.19, therefore, Subheading Note 2 applies and Chapter Note 4 (B) is to be disregarded.

- (III) The scope of a two-dash subheading shall not extend beyond that of the one-dash subheading to which the two-dash subheading belongs; and the scope of a one-dash subheading shall not extend beyond that of the heading to which the one-dash subheading belongs.

*
* * *

Section I

LIVE ANIMALS; ANIMAL PRODUCTS

Notes.

- 1.- Any reference in this Section to a particular genus or species of an animal, except where the context otherwise requires, includes a reference to the young of that genus or species.
- 2.- Except where the context otherwise requires, throughout the Nomenclature any reference to "dried" products also covers products which have been dehydrated, evaporated or freeze-dried.

Chapter 1

Live animals

Note.

1.- This Chapter covers all live animals except :

- (a) Fish and crustaceans, molluscs and other aquatic invertebrates, of heading 03.01, 03.06, 03.07 or 03.08;
- (b) Cultures of micro-organisms and other products of heading 30.02; and
- (c) Animals of heading 95.08.

GENERAL

This Chapter covers all living creatures (for food or other purposes) **except** :

- (1) Fish and crustaceans, molluscs and other aquatic invertebrates.
- (2) Cultures of micro-organisms and other products of **heading 30.02**.
- (3) Animals forming part of circuses, menageries or other similar travelling animal shows (**heading 95.08**).

Animals which die during transport are classified in **headings 02.01 to 02.05, 02.07 or 02.08** if they are edible animals fit for human consumption. In other cases, they are classified in **heading 05.11**.

01.01 - Live horses, asses, mules and hinnies (+).

- Horses :

0101.21 -- Pure-bred breeding animals

0101.29 -- Other

0101.30 - Asses

0101.90 - Other

This heading covers horses (mares, stallions, geldings, foals and ponies), asses, mules and hinnies, whether domestic or wild.

Mules are the hybrid offspring of the ass and the mare. The hinny is bred from the stallion and the ass.

Subheading Explanatory Note.

Subheading 0101.21

For the purposes of subheading 0101.21, the expression "pure-bred breeding animals" covers only those breeding animals which are regarded as "pure-bred" by the competent national authorities.

01.02 - Live bovine animals (+).

- Cattle :

0102.21 -- Pure-bred breeding animals

0102.29 -- Other

- Buffalo :

0102.31 -- Pure-bred breeding animals

0102.39 -- Other

0102.90 - Other

(1) Cattle :

This category covers bovine animals of the genus *Bos*, which is divided into four sub-genera : *Bos*, *Bibos*, *Novibos* and *Poephagus*. These include, *inter alia* :

- (A) The common ox (*Bos taurus*), the Zebu or humped ox (*Bos indicus*) and the Watussi ox.
- (B) The Asiatic oxen of the sub-genus *Bibos*, such as the gaur (*Bos gaurus*), the gayal (*Bos frontalis*) and the banteng (*Bos sondaicus* or *Bos javanicus*).
- (C) Animals of the sub-genus *Poephagus*, such as the Tibetan yak (*Bos grunniens*).

(2) Buffalo :

This category covers animals of the genera *Bubalus*, *Syncerus* and *Bison*. These include, *inter alia* :

- (A) Animals of the genus *Bubalus*, including the Indian or water buffalo (*Bubalus bubalis*), the Asiatic buffalo or arni (*Bubalus arni*) and the Celebesian anoa or pigmy buffalo (*Bubalus depressicornis* or *Anoa depressicornis*).
- (B) African buffaloes of the genus *Syncerus*, such as the dwarf buffalo (*Syncerus nanus*) and the large Caffrarian buffalo (*Syncerus caffer*).
- (C) Animals of the genus *Bison*, i.e., the American bison (*Bison bison*) or “buffalo” and the European bison (*Bison bonasus*).
- (D) The Beffalo (a cross between a bison and a domestic beef animal).

(3) Other, including the four-horned antelope (*Tetracerus quadricornis*) and the spiral-horned antelopes of the genera *Taurotragus* and *Tragelaphus*.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 0102.21 and 0102.31

For the purposes of subheadings 0102.21 and 0102.31, the expression “pure-bred breeding animals” covers only those breeding animals which are regarded as “pure-bred” by the competent national authorities.

01.03 - Live swine (+).

0103.10 - Pure-bred breeding animals

- Other :

0103.91 -- Weighing less than 50 kg

0103.92 -- Weighing 50 kg or more

This heading covers both domestic pigs and wild pigs (e.g., wild boars).

Subheading Explanatory Notes.

Subheading 0103.10

For the purposes of subheading 0103.10, the expression "pure-bred breeding animals" covers only those breeding animals which are regarded as "pure-bred" by the competent national authorities.

Subheadings 0103.91 and 0103.92

For the purposes of subheadings 0103.91 and 0103.92, the specified weight limits relate to the weight of each animal.

01.04 - Live sheep and goats.

0104.10 - Sheep

0104.20 - Goats

This heading covers domestic or wild sheep (rams, ewes, and lambs) and domestic or wild goats and kids.

01.05 - Live poultry, that is to say, fowls of the species *Gallus domesticus*, ducks, geese, turkeys and guinea fowls (+).

- Weighing not more than 185 g :

0105.11 -- Fowls of the species *Gallus domesticus*

0105.12 -- Turkeys

0105.13 -- Ducks

0105.14 -- Geese

0105.15 -- Guinea fowls

- Other :

0105.94 -- Fowls of the species *Gallus domesticus*

0105.99 -- Other

This heading covers only live domestic birds of the kinds specified in the heading. Fowls of the species *Gallus domesticus* include chickens and capons. Other live birds (e.g., partridges, pheasants, pigeons, wild ducks, wild geese) are **excluded (heading 01.06)**.

○
○ ○

Subheading Explanatory Note.

Subheadings 0105.11, 0105.12, 0105.13, 0105.14 and 0105.15

For the purposes of subheadings 0105.11, 0105.12, 0105.13, 0105.14 and 0105.15, the specified weight limit relates to the weight of each bird.

01.06 - Other live animals.

- Mammals :

0106.11 -- Primates

0106.12 -- Whales, dolphins and porpoises (mammals of the order Cetacea); manatees and dugongs (mammals of the order Sirenia); seals, sea lions and walruses (mammals of the suborder Pinnipedia)

0106.13 -- Camels and other camelids (*Camelidae*)

0106.14 -- Rabbits and hares

0106.19 -- Other

0106.20 - Reptiles (including snakes and turtles)

- Birds :

0106.31 -- Birds of prey

0106.32 -- Psittaciformes (including parrots, parakeets, macaws and cockatoos)

0106.33 -- Ostriches; emus (*Dromaius novaehollandiae*)

0106.39 -- Other

- Insects :

0106.41 -- Bees

0106.49 -- Other

0106.90 - Other

This heading includes, *inter alia*, the following domestic or wild animals :

(A) Mammals :

(1) Primates.

(2) Whales, dolphins and porpoises (mammals of the order Cetacea); manatees and dugongs (mammals of the order Sirenia) ; seals, sea lions and walruses (mammals of the suborder Pinnipedia).

(3) Other (e.g., reindeer, cats, dogs, lions, tigers, bears, elephants, camels (including dromedaries), zebras, rabbits, hares, deer, antelope (other than those of the sub-family *Bovinae*), chamois, foxes, minks and other animals for fur farms).

(B) Reptiles (including snakes and turtles).

(C) Birds :

- (1) Birds of prey.
- (2) Psittaciformes (including parrots, parakeets, macaws and cockatoos).
- (3) Other (e.g., partridges, pheasants, quail, woodcocks, snipe, pigeons, grouse, ortolan, wild ducks, wild geese, thrushes, blackbirds, larks, finches, tits, humming birds, peacocks, swans and other birds not specified in heading 01.05).

(D) Insects, e.g., bees (whether or not in travelling boxes or cages or hives).

(E) Other, e.g., frogs.

This heading **excludes** animals forming part of circuses, menageries or other similar travelling animal shows (**heading 95.08**).

Chapter 2

Meat and edible meat offal

Note.

1.- This Chapter does not cover :

- (a) Products of the kinds described in headings 02.01 to 02.08 or 02.10, unfit or unsuitable for human consumption;
- (b) Guts, bladders or stomachs of animals (heading 05.04) or animal blood (heading 05.11 or 30.02); or
- (c) Animal fat, other than products of heading 02.09 (Chapter 15).

GENERAL

This Chapter applies to meat in carcasses (i.e., the body of an animal with or without the head), half-carcasses (resulting from the lengthwise splitting of a carcass), quarters, pieces, etc., to meat offal, and to flours and meals of meat or meat offal, of all animals (**except** fish and crustaceans, molluses and other aquatic invertebrates - **Chapter 3**), suitable for human consumption.

Meat and meat offal unsuitable or unfit for human consumption are **excluded (heading 05.11)**. Flours, meals and pellets unfit for human consumption, obtained from meat or meat offal, are also **excluded (heading 23.01)**.

Offal generally can be grouped in four categories :

- (1) That which is mainly used for human consumption (e.g., heads and cuts thereof (including ears), feet, tails, hearts, tongues, thick skirts, thin skirts, cauls, throats, thymus glands).
- (2) That which is used solely in the preparation of pharmaceutical products (e.g., gall bags, adrenal glands, placenta).
- (3) That which can be used for human consumption or for the preparation of pharmaceutical products (e.g., livers, kidneys, lungs, brains, pancreas, spleens, spinal cords, ovaries, uteri, testes, udders, thyroid glands, pituitary glands).
- (4) That, such as skins, which can be used for human consumption or for other purposes (e.g., manufacture of leather).

The offal referred to in paragraph (1), fresh, chilled, frozen, salted, in brine, dried or smoked, remains classified in this Chapter **unless** it is unfit for human consumption, in which case it is to be classified in **heading 05.11**.

The offal referred to in paragraph (2) falls in **heading 05.10** when fresh, chilled, frozen or otherwise provisionally preserved and in **heading 30.01** when dried.

The offal referred to in paragraph (3) is classified as follows :

- (a) In **heading 05.10** when provisionally preserved for the preparation of pharmaceutical products (e.g., in glycerol, acetone, alcohol, formaldehyde, sodium borate).
- (b) In **heading 30.01** when dried.

- (c) In Chapter 2 when suitable for human consumption, but in **heading 05.11** if unfit for human consumption.

The offal referred to in paragraph (4) is classified in Chapter 2 when suitable for human consumption or generally in **heading 05.11** or **Chapter 41** if unfit for human consumption.

Guts, bladders and stomachs of animals (other than fish), whether or not edible, are classified in **heading 05.04**.

Animal fat presented separately is **excluded (Chapter 15)** (except in the case of pig fat, free of lean meat, and poultry fat, not rendered or otherwise extracted, which fall in heading 02.09 even if fit only for industrial use), but fat presented in the carcass or adhering to meat is treated as forming part of the meat.

Distinction between meat and meat offal of this Chapter and those of Chapter 16.

This Chapter covers meat and meat offal in the following states only, whether or not they have been previously scalded or similarly treated but not cooked :

- (1) Fresh (including meat and meat offal, packed with salt as a temporary preservative during transport).
- (2) Chilled, that is, reduced in temperature generally to around 0 °C, without being frozen.
- (3) Frozen, that is, cooled to below the product's freezing point until it is frozen throughout.
- (4) Salted, in brine, dried or smoked.

Meat and meat offal, slightly sprinkled with sugar or with an aqueous solution of sugar are also classified in this Chapter.

Meat and meat offal in the states referred to in Items (1) to (4) above remain classified in this Chapter whether or not they have undergone tenderising treatment with proteolytic enzymes (e.g., papain) or have been cut, chopped or minced (ground). In addition, mixtures or combinations of products of different headings of the Chapter (e.g., poultry meat of heading 02.07 covered with pig fat of heading 02.09) remain classified in this Chapter.

Meat and meat offal not falling in any heading of this Chapter are classified in **Chapter 16**, e.g. :

- (a) Sausages and similar products, whether or not cooked (**heading 16.01**).
- (b) Meat and meat offal cooked in any way (boiled, steamed, grilled, fried or roasted), or otherwise prepared or preserved by any process not provided for in this Chapter, including those merely covered with batter or bread crumbs, truffled or seasoned (e.g., with pepper and salt), as well as liver pastes and patés (**heading 16.02**).

This Chapter also includes meat and meat offal suitable for human consumption, whether or not cooked, in the form of flour or meal.

It should be noted that meat and meat offal of this Chapter remain classified here even if put up in airtight packings (e.g., dried meat in cans). In most cases, however, products put up in these packings have been prepared or preserved otherwise than as provided for in the headings of this Chapter and, accordingly, are classified in **Chapter 16**.

Similarly, meat and meat offal of this Chapter remain classified here (e.g., fresh or chilled meat of bovine animals) when subjected to packaging by means of a Modified Atmospheric Packaging (MAP) process. In a MAP process the atmosphere surrounding the product is altered or controlled (e.g., by removing or reducing the oxygen content and replacing it with or increasing the nitrogen or carbon dioxide content).

◦
◦ ◦

Subheading Explanatory Note.

With bone in

The expression “with bone in” means meat with all bones intact, as well as meat where some or part of the bones have been removed (e.g., shankless and semi-boneless hams). This expression does not cover products where the bones have been removed and thereafter reinserted so that they are no longer connected to the meat tissues.

02.01 - Meat of bovine animals, fresh or chilled.

0201.10 - Carcasses and half-carcasses

0201.20 - Other cuts with bone in

0201.30 - Boneless

This heading covers fresh or chilled meat of domestic or wild bovine animals of heading 01.02.

02.02 - Meat of bovine animals, frozen.

0202.10 - Carcasses and half-carcasses

0202.20 - Other cuts with bone in

0202.30 - Boneless

This heading covers frozen meat of domestic or wild bovine animals of heading 01.02.

02.03 - Meat of swine, fresh, chilled or frozen.

- Fresh or chilled :

0203.11 -- Carcasses and half-carcasses

0203.12 -- Hams, shoulders and cuts thereof, with bone in

0203.19 -- Other

- Frozen :

0203.21 -- Carcasses and half-carcasses

0203.22 -- Hams, shoulders and cuts thereof, with bone in

0203.29 -- Other

This heading covers fresh, chilled or frozen meat of pigs and other swine, whether domestic or wild (e.g., wild boars). The heading includes streaky pork and similar meats interlarded with a high proportion of fat, and fat with an adhering layer of meat.

02.04 - Meat of sheep or goats, fresh, chilled or frozen (+).

0204.10 - Carcasses and half-carcasses of lamb, fresh or chilled

- Other meat of sheep, fresh or chilled :

0204.21 -- Carcasses and half-carcasses

0204.22 -- Other cuts with bone in

0204.23 -- Boneless

0204.30 - Carcasses and half-carcasses of lamb, frozen

- Other meat of sheep, frozen :

0204.41 -- Carcasses and half-carcasses

0204.42 -- Other cuts with bone in

0204.43 -- Boneless

0204.50 - Meat of goats

This heading covers fresh, chilled or frozen meat of sheep (rams, ewes and lambs), goats or kids, whether domestic or wild.

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 0204.10 and 0204.30

For the purposes of subheadings 0204.10 and 0204.30, meat of lamb is meat derived from an animal of the ovine species not more than 12 months of age. The flesh is of fine grain and texture, pinkish-red in colour and of velvety appearance. The weight of carcasses does not exceed 26 kg.

02.05 - Meat of horses, asses, mules or hinnies, fresh, chilled or frozen.

This heading covers fresh, chilled or frozen meat of those animals which, when live, are classified in heading 01.01.

02.06 - Edible offal of bovine animals, swine, sheep, goats, horses, asses, mules or hinnies, fresh, chilled or frozen.

0206.10 - Of bovine animals, fresh or chilled

- Of bovine animals, frozen :

0206.21 -- Tongues

0206.22 -- Livers

0206.29 -- Other

0206.30 - Of swine, fresh or chilled

- Of swine, frozen :

0206.41 -- Livers

0206.49 -- Other

0206.80 - Other, fresh or chilled

0206.90 - Other, frozen

The edible offal of this heading includes the following : heads and cuts thereof (including ears), feet, tails, hearts, udders, livers, kidneys, sweetbreads (thymus glands and pancreas), brains, lungs, throats, thick skirts, thin skirts, spleens, tongues, caul, spinal cords, edible skin, reproductive organs (e.g., uteri, ovaries and testes), thyroid glands, pituitary glands. For the principles to be applied for the classification of offal, see the General Explanatory Note to this Chapter.

02.07 - Meat and edible offal, of the poultry of heading 01.05, fresh, chilled or frozen.

- Of fowls of the species *Gallus domesticus* :

0207.11 -- Not cut in pieces, fresh or chilled

0207.12 -- Not cut in pieces, frozen

0207.13 -- Cuts and offal, fresh or chilled

0207.14 -- Cuts and offal, frozen

- Of turkeys :

0207.24 -- Not cut in pieces, fresh or chilled

0207.25 -- Not cut in pieces, frozen

0207.26 -- Cuts and offal, fresh or chilled

0207.27 -- Cuts and offal, frozen

- Of ducks :

0207.41 -- Not cut in pieces, fresh or chilled

0207.42 -- Not cut in pieces, frozen

0207.43 -- Fatty livers, fresh or chilled

0207.44 -- Other, fresh or chilled

0207.45 -- Other, frozen

- Of geese :

0207.51 -- Not cut in pieces, fresh or chilled

0207.52 -- Not cut in pieces, frozen

0207.53 -- Fatty livers, fresh or chilled

0207.54 -- Other, fresh or chilled

0207.55 -- Other, frozen

0207.60 - Of guinea fowls

This heading covers only fresh, chilled or frozen meat and edible offal of domestic poultry which, when live, are classified in heading 01.05.

The poultry offal of greatest importance in international trade is chicken, goose or duck livers. These include "fatty livers" of geese or ducks which may be distinguished from other livers by the fact that they are much larger and heavier, firmer and richer in fat; their colour varies from whitish beige to light chestnut, while the other livers are in general of a dark or light reddish colour.

02.08 - Other meat and edible meat offal, fresh, chilled or frozen.

0208.10 - Of rabbits or hares

0208.30 - Of primates

0208.40 - Of whales, dolphins and porpoises (mammals of the order Cetacea); of manatees and dugongs (mammals of the order Sirenia); of seals, sea lions and walruses (mammals of the suborder Pinnipedia)

0208.50 - Of reptiles (including snakes and turtles)

0208.60 - Of camels and other camelids (*Camelidae*)

0208.90 - Other

This heading covers meat and meat offal of the animals classified in heading 01.06, provided that they are suitable for human consumption (e.g., rabbit, hare, frog, reindeer, beaver, whale, turtle).

02.09 - Pig fat, free of lean meat, and poultry fat, not rendered or otherwise extracted, fresh, chilled, frozen, salted, in brine, dried or smoked.

0209.10 - Of pigs

0209.90 - Other

The pig fat of this heading is restricted to fat free of lean meat; such fat falls in the heading even if suitable only for industrial use. Meat in forms commonly eaten as such is **excluded (heading 02.03 or 02.10 as the case may be, for example, streaky pork and similar meats interlarded with a high proportion of fat, and fat with an adhering layer of meat).**

This heading includes, in particular, the fat found mainly round the pig's viscera and which, when rendered, or otherwise extracted, is classified in **heading 15.01**.

Fat of domestic or wild poultry (e.g., of geese), not rendered or otherwise extracted, also falls in the heading; when rendered or otherwise extracted it is **excluded (heading 15.01)**.

Fat from marine mammals is **excluded (Chapter 15)**.

02.10 - Meat and edible meat offal, salted, in brine, dried or smoked; edible flours and meals of meat or meat offal.

- Meat of swine :

0210.11 -- Hams, shoulders and cuts thereof, with bone in

0210.12 -- Bellies (streaky) and cuts thereof

0210.19 -- Other

0210.20 - Meat of bovine animals

- Other, including edible flours and meals of meat or meat offal :

0210.91 -- Of primates

0210.92 -- Of whales, dolphins and porpoises (mammals of the order Cetacea); of manatees and dugongs (mammals of the order Sirenia); of seals, sea lions and walruses (mammals of the suborder Pinnipedia)

0210.93 -- Of reptiles (including snakes and turtles)

0210.99 -- Other

This heading applies to all kinds of meat and edible meat offal which have been prepared as described in the heading, **other than** pig fat, free of lean meat, and poultry fat, not rendered or otherwise extracted (**heading 02.09**). The heading includes streaky pork and similar meats interlarded with a high proportion of fat, and fat with an adhering layer of meat, provided they have been prepared as described in the heading.

Salted, dried (including dehydrated or freeze-dried) or smoked meat (e.g., bacon, ham, shoulder) remains classified in this heading if it has been enclosed in guts, stomachs, bladders, skins or similar casings (natural or artificial), **provided** that it has not been previously chopped or minced and combined with other ingredients (**heading 16.01**).

Edible flours and meals of meat or meat offal also fall in this heading; flours and meals of meat or meat offal unfit for human consumption (e.g., for feeding animals) are **excluded** (**heading 23.01**).

The provisions of Explanatory Note to heading 02.06 apply, *mutatis mutandis*, to edible meat offal of this heading.

Chapter 3

Fish and crustaceans, molluscs and other aquatic invertebrates

Notes.

- 1.- This Chapter does not cover :
 - (a) Mammals of heading 01.06;
 - (b) Meat of mammals of heading 01.06 (heading 02.08 or 02.10);
 - (c) Fish (including livers, roes and milt thereof) or crustaceans, molluscs or other aquatic invertebrates, dead and unfit or unsuitable for human consumption by reason of either their species or their condition (Chapter 5); flours, meals or pellets of fish or of crustaceans, molluscs or other aquatic invertebrates, unfit for human consumption (heading 23.01); or
 - (d) Caviar or caviar substitutes prepared from fish eggs (heading 16.04).
- 2.- In this Chapter the term " pellets " means products which have been agglomerated either directly by compression or by the addition of a small quantity of binder.

GENERAL

This Chapter covers all fish and crustaceans, molluscs and other aquatic invertebrates, whether live or dead, presented for direct consumption, or for industrial purposes (canning, etc.), for spawning, for aquaria, etc., with the **exception** of dead fish (including livers and roes thereof), crustaceans, molluscs and other aquatic invertebrates which are unfit or unsuitable for human consumption by reason of either their species or their condition (**Chapter 5**).

The term " chilled " means that the temperature of a product has been reduced, generally to around 0 °C, without the product being frozen. The expression " frozen " means that the product has been cooled to below the product's freezing point until it is frozen throughout.

This Chapter also covers edible fish roes and milt, not prepared or preserved, or prepared or preserved only by processes provided for in this Chapter. Otherwise prepared or preserved edible roes and milt, or those suitable for immediate consumption as caviar or caviar substitutes are classified in **heading 16.04**.

Distinction between goods of this Chapter and those of Chapter 16.

This Chapter is limited to fish (including livers and roes thereof) and crustaceans, molluscs and other aquatic invertebrates in the states described in the headings. Subject to this proviso, they remain classified in the Chapter whether or not they have been cut, chopped, minced, ground, etc. In addition, mixtures or combinations of products of different headings of the Chapter (e.g., fish of **headings 03.02 to 03.04** combined with crustaceans of **heading 03.06**) remain classified in this Chapter.

On the other hand, fish and crustaceans, molluscs and other aquatic invertebrates are classified in **Chapter 16** if they have been cooked or otherwise prepared or preserved by processes not provided for in this Chapter (e.g., fish fillets merely covered with batter or bread crumbs, cooked fish); it should, however, be noted that smoked fish and smoked crustaceans, molluscs and other aquatic invertebrates, which may have undergone cooking during or before the smoking process, and crustaceans in their shells simply steamed or boiled in water, remain classified in **headings 03.05, 03.06, 03.07 and 03.08**, respectively, and that flours, meals and pellets obtained from cooked fish and cooked crustaceans, molluscs or other aquatic invertebrates remain classified in **headings 03.05, 03.06, 03.07 and 03.08**, respectively.

It should also be noted that fish and crustaceans, molluscs and other aquatic invertebrates of this Chapter remain classified here even if put up in airtight containers (e.g., smoked salmon in cans). In most cases, however, products put up in these packings have been prepared or preserved otherwise than as provided for in the headings of this Chapter, and accordingly fall to be classified in **Chapter 16**.

Similarly, fish and crustaceans, molluscs and other aquatic invertebrates of this Chapter remain classified here (e.g., fresh or chilled fish) when subjected to packaging by means of a Modified Atmospheric Packaging (MAP) process. In a MAP process the atmosphere surrounding the product is altered or controlled (e.g., by removing or reducing the oxygen content and replacing it with or increasing the nitrogen or carbon dioxide content).

In addition to the exclusions referred to above, the Chapter also **excludes** :

- (a) Mammals of **heading 01.06**.
- (b) Meat of mammals of heading 01.06 (**heading 02.08 or 02.10**).
- (c) Fish waste and inedible roes (e.g., salted cod roes used as fishing bait) (**heading 05.11**).
- (d) Flours, meals and pellets of fish or of crustaceans, molluscs or other aquatic invertebrates, unfit for human consumption (**heading 23.01**).
 -
 - ◦

Subheading Explanatory Note.

Subheadings 0305.10, 0306.19, 0306.29, 0307.91, 0307.99 and 0308.90

Within headings 03.05, 03.06, 03.07 and 03.08, flours, meals and pellets, fit for human consumption, are to be classified in subheadings 0305.10, 0306.19, 0306.29, 0307.91, 0307.99 and 0308.90, as appropriate.

03.01 - Live fish (+).

- Ornamental fish

0301.11 -- Freshwater

0301.19 -- Other

- Other live fish :

0301.91 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)

0301.92 -- Eels (*Anguilla spp.*)

0301.93 -- Carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*)

0301.94 -- Atlantic and Pacific bluefin tunas (*Thunnus thynnus*, *Thunnus orientalis*)

0301.95 -- Southern bluefin tunas (*Thunnus maccoyii*)

0301.99 -- Other

This heading covers all live fish, whatever their intended use (e.g., ornamental fish).

The fish of this heading are normally transported in suitable containers (aquaria, fish tanks, etc.) in which they can be kept alive in conditions similar to those found in their natural environment.

Subheading Explanatory Note.

Subheadings 0301.11 and 0301.19

The expression "ornamental fish" means live fish which, because of their colours or shapes, are normally used for ornamental purposes, in particular, in aquaria.

03.02 - Fish, fresh or chilled, excluding fish fillets and other fish meat of heading 03.04.(+)

- Salmonidae, excluding edible fish offal of subheadings 0302.91 to 0302.99 :

0302.11 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)

0302.13 -- Pacific salmon (*Oncorhynchus nerka*, *Oncorhynchus gorbuscha*, *Oncorhynchus keta*, *Oncorhynchus tshawytscha*, *Oncorhynchus kisutch*, *Oncorhynchus masou* and *Oncorhynchus rhodurus*)

0302.14 -- Atlantic salmon (*Salmo salar*) and Danube salmon (*Hucho hucho*)

0302.19 -- Other

- Flat fish (*Pleuronectidae*, *Bothidae*, *Cynoglossidae*, *Soleidae*, *Scophthalmidae* and *Citharidae*), excluding edible fish offal of subheadings 0302.91 to 0302.99 :

0302.21 -- Halibut (*Reinhardtius hippoglossoides*, *Hippoglossus hippoglossus*, *Hippoglossus stenolepis*)

0302.22 -- Plaice (*Pleuronectes platessa*)

0302.23 -- Sole (*Solea spp.*)

0302.24 -- Turbots (*Psetta maxima*)

0302.29 -- Other

- Tunas (of the genus *Thunnus*), skipjack or stripe-bellied bonito (*Euthynnus (Katsuwonus) pelamis*), excluding edible fish offal of subheadings 0302.91 to 0302.99 :

0302.31 -- Albacore or longfinned tunas (*Thunnus alalunga*)

0302.32 -- Yellowfin tunas (*Thunnus albacares*)

0302.33 -- Skipjack or stripe-bellied bonito

0302.34 -- Bigeye tunas (*Thunnus obesus*)

0302.35 -- Atlantic and Pacific bluefin tunas (*Thunnus thynnus*, *Thunnus orientalis*)

0302.36 -- Southern bluefin tunas (*Thunnus maccoyii*)

0302.39 -- Other

- Herrings (*Clupea harengus*, *Clupea pallasii*), anchovies (*Engraulis spp.*), sardines (*Sardina pilchardus*, *Sardinops spp.*), sardinella (*Sardinella spp.*), brisling or sprats (*Sprattus sprattus*), mackerel (*Scomber scombrus*, *Scomber australasicus*, *Scomber japonicus*), Indian mackerels (*Rastrelliger spp.*), seerfishes (*Scomberomorus spp.*), jack and horse mackerel (*Trachurus spp.*), jacks, crevallles (*Caranx spp.*), cobia (*Rachycentron canadum*), silver pomfrets (*Pampus spp.*), Pacific saury (*Cololabis saira*), scads (*Decapterus spp.*), capelin (*Mallotus villosus*), swordfish (*Xiphias gladius*), Kawakawa (*Euthynnus affinis*), bonitos (*Sarda spp.*), marlins, sailfishes, spearfish (*Istiophoridae*), excluding edible fish offal of subheadings 0302.91 to 0302.99 :

- 0302.41 -- Herrings (*Clupea harengus*, *Clupea pallasii*)
0302.42 -- Anchovies (*Engraulis spp.*)
0302.43 -- Sardines (*Sardina pilchardus*, *Sardinops spp.*), sardinella (*Sardinella spp.*), brisling or sprats (*Sprattus sprattus*)
0302.44 -- Mackerel (*Scomber scombrus*, *Scomber australasicus*, *Scomber japonicus*)
0302.45 -- Jack and horse mackerel (*Trachurus spp.*)
0302.46 -- Cobia (*Rachycentron canadum*)
0302.47 -- Swordfish (*Xiphias gladius*)
0302.49 -- Other
- Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*, excluding edible fish offal of subheadings 0302.91 to 0302.99 :
0302.51 -- Cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)
0302.52 -- Haddock (*Melanogrammus aeglefinus*)
0302.53 -- Coalfish (*Pollachius virens*)
0302.54 -- Hake (*Merluccius spp.*, *Urophycis spp.*)
0302.55 -- Alaska Pollack (*Theragra chalcogramma*)
0302.56 -- Blue whiting (*Micromesistius poutassou*, *Micromesistius australis*)
0302.59 -- Other
- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*), excluding edible fish offal of subheadings 0302.91 to 0302.99 :
0302.71 -- Tilapias (*Oreochromis spp.*)
0302.72 -- Catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*)

0302.73 -- Carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*)

0302.74 -- Eels (*Anguilla spp.*)

0302.79 -- Other

- Other fish, excluding edible fish offal of subheadings 0302.91 to 0302.99 :

0302.81 -- Dogfish and other sharks

0302.82 -- Rays and skates (*Rajidae*)

0302.83 -- Toothfish (*Dissostichus spp.*)

0302.84 -- Seabass (*Dicentrarchus spp.*)

0302.85 -- Seabream (*Sparidae*)

0302.89 -- Other

0302.90 - Livers, roes, milt, fish fins, heads, tails, maws and other edible fish Offal :

0302.91 -- Livers, roes and milt

0302.92 -- Shark fins

0302.99 -- Other

This heading covers fish, fresh or chilled, whether whole, headless, gutted, or in cuts containing bones or cartilage. However, the heading **does not include** fish fillets and other fish meat of **heading 03.04**. The fish may be packed with salt or ice or sprinkled with salt water as a temporary preservative during transport.

Fish slightly sugared or packed with a few bay leaves remains in this heading.

Edible fish offal separated from the rest of the body of the fish (e.g., skins, tails, maws (swim bladders), heads and halves of heads (with or without the brains, cheeks, tongues, eyes, jaws, or lips), stomachs, fins, tongues), as well as livers, roes and milt, fresh or chilled, are also classified in this heading.

○
○ ○

Subheading Explanatory Note.

Subheading 0302.92

For the purposes of subheading 0302.92, the term "shark fins" covers dorsal, pectoral, ventral, anal fins and the lower lobe of the tail (caudal fin) of sharks. However, the upper parts of shark tails **are not** regarded as shark fins.

03.03 - Fish, frozen, excluding fish fillets and other fish meat of heading 03.04.(+)

- Salmonidae, excluding edible fish offal of subheadings 0303.91 to 0303.99 :

0303.11 -- Sockeye salmon (red salmon) (*Oncorhynchus nerka*)

0303.12 -- Other Pacific salmon (*Oncorhynchus gorbuscha*, *Oncorhynchus keta*, *Oncorhynchus tshawytscha*, *Oncorhynchus kisutch*, *Oncorhynchus masou* and *Oncorhynchus rhodurus*)

0303.13 -- Atlantic salmon (*Salmo salar*) and Danube salmon (*Hucho hucho*)

0303.14 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)

0303.19 -- Other

- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*), excluding edible fish offal of subheadings 0303.91 to 0303.99 :

0303.23 -- Tilapias (*Oreochromis spp.*)

0303.24 -- Catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*)

0303.25 -- Carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*)

0303.26 -- Eels (*Anguilla spp.*)

0303.29 -- Other

- Flat fish (*Pleuronectidae*, *Bothidae*, *Cynoglossidae*, *Soleidae*, *Scophthalmidae* and *Citharidae*), excluding edible fish offal of subheadings 0303.91 to 0303.99 :

0303.31 -- Halibut (*Reinhardtius hippoglossoides*, *Hippoglossus hippoglossus*, *Hippoglossus stenolepis*)

0303.32 -- Plaice (*Pleuronectes platessa*)

0303.33 -- Sole (*Solea spp.*)

0303.34 -- Turbots (*Psetta maxima*)

0303.39 -- Other

- Tunas (of the genus *Thunnus*), skipjack or stripe-bellied bonito (*Euthynnus (Katsuwonus) pelamis*), excluding edible fish offal of subheadings 0303.91 to 0303.99 :

- 0303.41 -- Albacore or longfinned tunas (*Thunnus alalunga*)
- 0303.42 -- Yellowfin tunas (*Thunnus albacares*)
- 0303.43 -- Skipjack or stripe-bellied bonito
- 0303.44 -- Bigeye tunas (*Thunnus obesus*)
- 0303.45 -- Atlantic and Pacific bluefin tunas (*Thunnus thynnus*, *Thunnus orientalis*)
- 0303.46 -- Southern bluefin tunas (*Thunnus maccoyii*)
- 0303.49 -- Other
 - Herrings (*Clupea harengus*, *Clupea pallasii*), anchovies (*Engraulis spp.*), sardines (*Sardina pilchardus*, *Sardinops spp.*), sardinella (*Sardinella spp.*), brisling or sprats (*Sprattus sprattus*), mackerel (*Scomber scombrus*, *Scomber australasicus*, *Scomber japonicus*), Indian mackerels (*Rastrelliger spp.*), seerfishes (*Scomberomorus spp.*), jack and horse mackerel (*Trachurus spp.*), jacks, crevallies (*Caranx spp.*), cobia (*Rachycentron canadum*), silver pomfrets (*Pampus spp.*), Pacific saury (*Cololabis saira*), scads (*Decapterus spp.*), capelin (*Mallotus villosus*), swordfish (*Xiphias gladius*), Kawakawa (*Euthynnus affinis*), bonitos (*Sarda spp.*), marlins, sailfishes, spearfish (*Istiophoridae*), excluding edible fish offal of subheadings 0303.91 to 0303.99 :
- 0303.51 -- Herrings (*Clupea harengus*, *Clupea pallasii*)
- 0303.53 -- Sardines (*Sardina pilchardus*, *Sardinops spp.*), sardinella (*Sardinella spp.*), brisling or sprats (*Sprattus sprattus*)
- 0303.54 -- Mackerel (*Scomber scombrus*, *Scomber australasicus*, *Scomber japonicus*)
- 0303.55 -- Jack and horse mackerel (*Trachurus spp.*)
- 0303.56 -- Cobia (*Rachycentron canadum*)
- 0303.57 -- Swordfish (*Xiphias gladius*)
- 0303.59 -- Other
 - Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*, excluding edible fish offal of subheadings 0303.91 to 0303.99 :
- 0303.63 -- Cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)
- 0303.64 -- Haddock (*Melanogrammus aeglefinus*)
- 0303.65 -- Coalfish (*Pollachius virens*)
- 0303.66 -- Hake (*Merluccius spp.*, *Urophycis spp.*)
- 0303.67 -- Alaska Pollack (*Theragra chalcogramma*)

- 0303.68 - - Blue whiting (*Micromesistius poutassou*, *Micromesistius australis*)
- 0303.69 - - Other
- Other fish, excluding edible fish offal of subheadings 0303.91 to 0303.99 :
- 0303.81 - - Dogfish and other sharks
- 0303.82 - - Rays and skates (*Rajidae*)
- 0303.83 - - Toothfish (*Dissostichus spp.*)
- 0303.84 - - Seabass (*Dicentrarchus spp.*)
- 0303.89 - - Other
- 0303.90 - Livers, roes, milt, fish fins, heads, tails, maws and other edible fish offal :
- 0303.91 - - Livers, roes and milt
- 0303.92 - - Shark fins
- 0303.99 - - Other

The provisions of the Explanatory Note to heading 03.02 apply, *mutatis mutandis*, to the products of this heading.

Subheading Explanatory Note

Subheading 0303.92

The provisions of the Subheading Explanatory Note to subheading 0302.92 apply, *mutatis mutandis*, to the products of this subheading.

03.04 - Fish fillets and other fish meat (whether or not minced), fresh, chilled or frozen.

- Fresh or chilled fillets of tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*) :

0304.31 -- Tilapias (*Oreochromis spp.*)

0304.32 -- Catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*)

0304.33 -- Nile Perch (*Lates niloticus*)

0304.39 -- Other

- Fresh or chilled fillets of other fish :

0304.41 -- Pacific salmon (*Oncorhynchus nerka*, *Oncorhynchus gorbuscha*, *Oncorhynchus keta*, *Oncorhynchus tshawytscha*, *Oncorhynchus kisutch*, *Oncorhynchus masou* and *Oncorhynchus rhodurus*), Atlantic salmon (*Salmo salar*) and Danube salmon (*Hucho hucho*)

0304.42 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)

0304.43 -- Flat fish (*Pleuronectidae*, *Bothidae*, *Cynoglossidae*, *Soleidae*, *Scophthalmidae* and *Citharidae*)

0304.44 -- Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*

0304.45 -- Swordfish (*Xiphias gladius*)

0304.46 -- Toothfish (*Dissostichus spp.*)

0304.47 -- Dogfish and other sharks

0304.48 -- Rays and skates (*Rajidae*)

0304.49 -- Other

- Other, fresh or chilled :

0304.51 -- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

0304.52 -- Salmonidae

- 0304.53 -- Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*
- 0304.54 -- Swordfish (*Xiphias gladius*)
- 0304.55 -- Toothfish (*Dissostichus spp.*)
- 0304.56 -- Dogfish and other sharks
- 0304.57 -- Rays and skates (*Rajidae*)
- 0304.59 -- Other
 - Frozen fillets of tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*) :
- 0304.61 -- Tilapias (*Oreochromis spp.*)
- 0304.62 -- Catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*)
- 0304.63 -- Nile Perch (*Lates niloticus*)
- 0304.69 -- Other
 - Frozen fillets of fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae* :
- 0304.71 -- Cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)
- 0304.72 -- Haddock (*Melanogrammus aeglefinus*)
- 0304.73 -- Coalfish (*Pollachius virens*)
- 0304.74 -- Hake (*Merluccius spp.*, *Urophycis spp.*)
- 0304.75 -- Alaska Pollack (*Theragra chalcogramma*)
- 0304.79 -- Other
 - Frozen fillets of other fish :
- 0304.81 -- Pacific salmon (*Oncorhynchus nerka*, *Oncorhynchus gorbuscha*, *Oncorhynchus keta*, *Oncorhynchus tshawytscha*, *Oncorhynchus kisutch*, *Oncorhynchus masou* and *Oncorhynchus rhodurus*), Atlantic salmon (*Salmo salar*) and Danube salmon (*Hucho hucho*)
- 0304.82 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)
- 0304.83 -- Flat fish (*Pleuronectidae*, *Bothidae*, *Cynoglossidae*, *Soleidae*, *Scophthalmidae* and *Citharidae*)

- 0304.84 - - Swordfish (*Xiphias gladius*)
- 0304.85 - - Toothfish (*Dissostichus spp.*)
- 0304.86 - - Herrings (*Clupea harengus*, *Clupea pallasii*)
- 0304.87 - - Tunas (of the genus *Thunnus*), skipjack or stripe-bellied bonito (*Euthynnus (Katsuwonus) pelamis*)
- 0304.88 - - Dogfish, other sharks, rays and skates (*Rajidae*)
- 0304.89 - - Other
- Other, frozen :
- 0304.91 - - Swordfish (*Xiphias gladius*)
- 0304.92 - - Toothfish (*Dissostichus spp.*)
- 0304.93 - - Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

- 0304.95 - - Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*, other than Alaska Pollack (*Theragra chalcogramma*)
- 0304.96 - - Dogfish and other sharks
- 0304.97 - - Rays and skates (*Rajidae*)
- 0304.99 - - Other

This heading covers :

(1) **Fish fillets.**

For the purposes of this heading the term **fish fillets** means the strips of meat cut parallel to the backbone of the fish and constituting the right or left side of a fish insofar as the head, guts, fins (dorsal, anal, caudal, ventral, pectoral) and bones (spinal column or main backbone, ventral or costal bones, branchial bone or stapes, etc.) have been removed and the two sides are not joined together, for example by the back or belly.

The classification of these products is not affected by the possible presence of the skin, sometimes left attached to the fillet to hold it together or to facilitate subsequent slicing. Classification is similarly unaffected by the presence of pin bones or other minor bones which may not have been completely removed.

Fillets cut in pieces are also classified as fillets in this heading.

Cooked fillets, and fillets merely covered with batter or bread crumbs, whether or not frozen, are classified in **heading 16.04**.

- (2) **Other fish meat** (whether or not minced), i.e., fish meat from which the bones have been removed. As in the case of fish fillets, classification of fish meat is unaffected by the presence of minor bones which may not have been completely removed.

*
* *

This heading covers fish fillets and other fish meat (whether or not minced) in the following states only :

- (i) Fresh or chilled, whether or not packed with salt or ice or sprinkled with salt water as a temporary preservative during transport.
- (ii) Frozen, often presented in the form of frozen blocks.

Fish fillets and other fish meat (whether or not minced) slightly sugared or packed with a few bay leaves remain in this heading.

03.05 - Fish, dried, salted or in brine; smoked fish, whether or not cooked before or during the smoking process; flours, meals and pellets of fish, fit for human consumption (+).

0305.10 - Flours, meals and pellets of fish, fit for human consumption

0305.20 - Livers, roes and milt of fish, dried, smoked, salted or in brine

- Fish fillets, dried, salted or in brine, but not smoked :

0305.31 -- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

0305.32 -- Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and *Muraenolepididae*

0305.39 -- Other

- Smoked fish, including fillets, other than edible fish offal :

0305.41 -- Pacific salmon (*Oncorhynchus nerka*, *Oncorhynchus gorbuscha*, *Oncorhynchus keta*, *Oncorhynchus tshawytscha*, *Oncorhynchus kisutch*, *Oncorhynchus masou* and *Oncorhynchus rhodurus*), Atlantic salmon (*Salmo salar*) and Danube salmon (*Hucho hucho*)

0305.42 -- Herrings (*Clupea harengus*, *Clupea pallasii*)

0305.43 -- Trout (*Salmo trutta*, *Oncorhynchus mykiss*, *Oncorhynchus clarki*, *Oncorhynchus aguabonita*, *Oncorhynchus gilae*, *Oncorhynchus apache* and *Oncorhynchus chrysogaster*)

0305.44 -- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

0305.49 -- Other

- Dried fish, other than edible fish offal, whether or not salted but not smoked :

0305.51 -- Cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)

0305.52 -- Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

0305.53 -- Fish of the families *Bregmacerotidae*, *Euclichthyidae*, *Gadidae*, *Macrouridae*, *Melanonidae*, *Merlucciidae*, *Moridae* and

Muraenolepididae, other than cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)

0305.54 - - Herrings (*Clupea harengus*, *Clupea pallasii*), anchovies (*Engraulis spp.*), sardines (*Sardina pilchardus*, *Sardinops spp.*), sardinella (*Sardinella spp.*), brisling or sprats (*Sprattus sprattus*), mackerel (*Scomber scombrus*, *Scomber australasicus*, *Scomber japonicus*), Indian mackerels (*Rastrelliger spp.*), seerfishes (*Scomberomorus spp.*), jack and horse mackerel (*Trachurus spp.*), jacks, crevallies (*Caranx spp.*), cobia (*Rachycentron canadum*), silver pomfrets (*Pampus spp.*), Pacific saury (*Cololabis saira*), scads (*Decapterus spp.*), capelin (*Mallotus villosus*), swordfish (*Xiphias gladius*), Kawakawa (*Euthynnus affinis*), bonitos (*Sarda spp.*), marlins, sailfishes, spearfish (*Istiophoridae*)

0305.59 - - Other

- Fish, salted but not dried or smoked and fish in brine, other than edible fish offal :

0305.61 - - Herrings (*Clupea harengus*, *Clupea pallasii*)

0305.62 - - Cod (*Gadus morhua*, *Gadus ogac*, *Gadus macrocephalus*)

0305.63 - - Anchovies (*Engraulis spp.*)

0305.64 - - Tilapias (*Oreochromis spp.*), catfish (*Pangasius spp.*, *Silurus spp.*, *Clarias spp.*, *Ictalurus spp.*), carp (*Cyprinus spp.*, *Carassius spp.*, *Ctenopharyngodon idellus*, *Hypophthalmichthys spp.*, *Cirrhinus spp.*, *Mylopharyngodon piceus*, *Catla catla*, *Labeo spp.*, *Osteochilus hasselti*, *Leptobarbus hoeveni*, *Megalobrama spp.*), eels (*Anguilla spp.*), Nile perch (*Lates niloticus*) and snakeheads (*Channa spp.*)

0305.69 - - Other

- Fish fins, heads, tails, maws and other edible fish offal :

0305.71 - - Shark fins

0305.72 - - Fish heads, tails and maws

0305.79 - - Other

This heading covers fish (whole, headless, in pieces, in fillets or minced) and edible fish offal which are :

- (1) dried;
- (2) salted or in brine; or
- (3) smoked.

The salt used in the preparation of fish, salted or in brine, may contain added sodium nitrite or sodium nitrate. Small quantities of sugar may be used in the preparation of salted fish without affecting the classification of the fish in this heading.

Fish having undergone two or more of these processes remains classified here, as do fish flour and fish meal (whether or not defatted (for example, defatted by a solvent-extract method) or subjected to heat treatment) and pellets of fish, fit for human consumption.

Smoked fish is sometimes submitted, either before smoking or during smoking (hot smoking), to a heat treatment which partly or wholly cooks the meat; this does not affect its classification in this heading **provided** that it has not undergone any other processing which deprives it of the character of smoked fish.

The principal varieties of fish prepared in the manner covered by this heading are sardines, anchovies, pilchards, sprats, tunas, mackerel, salmon, herring, cod, haddock and halibut.

Edible fish offal separated from the rest of the body of the fish (e.g., skins, tails, maws (air bladders), heads and halves of heads (with or without the brains, cheeks, tongues, eyes, jaws or lips), stomachs, fins, tongues), as well as livers, roes and milt, dried, salted, in brine or smoked, are also classified in this heading.

The heading **does not cover**:

- (a) Inedible fish offal (e.g., of a kind used in industrial applications) and fish waste (**heading 05.11**).
- (b) Cooked fish (subject to the above provisions regarding smoked fish) and fish prepared in any other way, for example preserved in oil or vinegar or in a marinade, and caviar and caviar substitutes (**heading 16.04**).
- (c) Fish soups (**heading 21.04**).
- (d) Flours, meals and pellets of fish, unfit for human consumption (**heading 23.01**).

Subheading Explanatory Note.

Subheading 0305.71

The provisions of the Subheading Explanatory Note to subheading 0302.92 apply, *mutatis mutandis*, to the products of this subheading.

This subheading includes, *inter alia*, unskinned sharks' fins, simply dried, and parts of sharks' fins which have been immersed in hot water, skinned or shredded before drying.

03.06 - Crustaceans, whether in shell or not, live, fresh, chilled, frozen, dried, salted or in brine; smoked crustaceans, whether in shell or not, whether or not cooked before or during the smoking process; crustaceans, in shell, cooked by steaming or by boiling in water, whether or not chilled, frozen, dried, salted or in brine; flours, meals and pellets of crustaceans, fit for human consumption.

- Frozen :

0306.11 -- Rock lobster and other sea crawfish (*Palinurus spp.*, *Panulirus spp.*, *Jasus spp.*)

0306.12 -- Lobsters (*Homarus spp.*)

0306.14 -- Crabs

0306.15 -- Norway lobsters (*Nephrops norvegicus*)

0306.16 -- Cold-water shrimps and prawns (*Pandalus spp.*, *Crangon crangon*)

0306.17 -- Other shrimps and prawns

0306.19 -- Other, including flours, meals and pellets of crustaceans, fit for human consumption

- Live, fresh or chilled :

0306.31 -- Rock lobster and other sea crawfish (*Palinurus spp.*, *Panulirus spp.*, *Jasus spp.*)

0306.32 -- Lobsters (*Homarus spp.*)

0306.33 -- Crabs

0306.34 -- Norway lobsters (*Nephrops norvegicus*)

0306.35 -- Cold-water shrimps and prawns (*Pandalus spp.*, *Crangon crangon*)

0306.36 -- Other shrimps and prawns

0306.39 -- Other, including flours, meals and pellets of crustaceans, fit for human consumption

- Other :

0306.91 -- Rock lobster and other sea crawfish (*Palinurus spp.*, *Panulirus spp.*, *Jasus spp.*)

0306.92 -- Lobsters (*Homarus spp.*)

0306.93 -- Crabs

0306.94 -- Norway lobsters (*Nephrops norvegicus*)

0306.95 -- Shrimps and prawns

0306.99 -- Other, including flours, meals and pellets of crustaceans, fit for human consumption

This heading covers :

- (1) Crustaceans, whether in shell or not, live, fresh, chilled, frozen, dried, salted or in brine.
- (2) Smoked crustaceans, whether in shell or not, whether or not cooked before or during the smoking process.
- (3) Crustaceans, in their shells, cooked by steaming or by boiling in water (whether or not small quantities of provisional chemical preserving agents have been added); they may also be chilled, frozen, dried, salted or in brine.

The main kinds of crustaceans are lobsters, sea crawfish, crayfish, crabs, shrimps and prawns.

The heading also covers parts of crustaceans (e.g., " tails " of lobsters or crayfish, crabs' claws), **provided** those not in shell have been subjected to no other processes than those specified in (1) above.

The heading also includes flours, meals and pellets of crustaceans fit or suitable for human consumption.

The heading **does not cover** :

- (a) Sea-urchins and other aquatic invertebrates of **heading 03.08**.
- (b) Crustaceans (including parts thereof) prepared or preserved by processes not provided for in this heading (e.g., shelled crustaceans boiled in water) (**heading 16.05**).

03.07 - Molluscs, whether in shell or not, live, fresh, chilled, frozen, dried, salted or in brine; smoked molluscs, whether in shell or not, whether or not cooked before or during the smoking process; flours, meals and pellets of molluscs, fit for human consumption.

- Oysters :

0307.11 -- Live, fresh or chilled

0307.12 -- Frozen

0307.19 -- Other

- Scallops, including queen scallops, of the genera *Pecten*, *Chlamys* or *Placopecten* :

0307.21 -- Live, fresh or chilled

0307.22 -- Frozen

0307.29 -- Other

- Mussels (*Mytilus spp.*, *Perna spp.*) :

0307.31 -- Live, fresh or chilled

0307.32 -- Frozen

0307.39 -- Other

- Cuttle fish and squid :

0307.42 -- Live, fresh or chilled

0307.43 -- Frozen

0307.49 -- Other

- Octopus (*Octopus spp.*) :

0307.51 -- Live, fresh or chilled

0307.52 -- Frozen

0307.59 -- Other

0307.60 - Snails, other than sea snails

- Clams, cockles and ark shells (families *Arcidae*, *Arcticidae*, *Cardiidae*, *Donacidae*, *Hiatellidae*, *Mactridae*, *Mesodesmatidae*, *Myidae*, *Semelidae*, *Solecurtidae*, *Solenidae*, *Tridacnidae* and *Veneridae*) :

0307.71 -- Live, fresh or chilled

0307.72 -- Frozen

0307.79 -- Other

- Abalone (*Hallotis spp.*) and stromboid conchs (*Strombus spp.*) :

0307.81 -- Live, fresh or chilled abalone (*Hallotis spp.*)

0307.82 -- Live, fresh or chilled stromboid conchs (*Strombus spp.*)

0307.83 -- Frozen abalone (*Hallotis spp.*)

0307.84 -- Frozen stromboid conchs (*Strombus spp.*)

0307.87 -- Other abalone (*Hallotis spp.*)

0307.88 -- Other stromboid conchs (*Strombus spp.*)

- Other, including flours, meals and pellets, fit for human consumption :

0307.91 -- Live, fresh or chilled

0307.92 -- Frozen

0307.99 -- Other

This heading covers :

- (1) Molluscs, whether in shell or not, live, fresh, chilled, frozen, dried, salted or in brine.
- (2) Smoked molluscs, whether in shell or not, whether or not cooked before or during the smoking process.

The main kinds of molluscs are oysters, scallops, mussels, cuttle fish, squid, octopus, snails, clams, cockles, ark shells, abalone and stromboid conchs.

This heading also covers parts of molluscs, **provided** they have been subjected to no other processes than those specified in (1) or (2) above.

The heading also includes oyster spat (small oysters intended for cultivation) and flours, meals and pellets of molluscs, fit or suitable for human consumption.

The heading **does not cover** molluscs prepared or preserved by processes not provided for in this heading (e.g., molluscs boiled in water or preserved in vinegar) (**heading 16.05**).

03.08 - Aquatic invertebrates other than crustaceans and molluscs, live, fresh, chilled, frozen, dried, salted or in brine; smoked aquatic invertebrates other than crustaceans and molluscs, whether or not cooked before or during the smoking process; flours, meals and pellets of aquatic invertebrates other than crustaceans and molluscs, fit for human consumption.

- Sea cucumbers (*Stichopus japonicus*, *Holothuroidea*) :

0308.11 -- Live, fresh or chilled

0308.12 -- Frozen

0308.19 -- Other

- Sea urchins (*Strongylocentrotus spp.*, *Paracentrotus lividus*, *Loxechinus albus*, *Echinus esculentus*) :

0308.21 -- Live, fresh or chilled

0308.22 -- Frozen

0308.29 -- Other

0308.30 -- Jellyfish (*Rhopilema spp.*)

0308.90 - Other

This heading covers :

- (1) Aquatic invertebrates other than crustaceans and molluscs, live, fresh, chilled, frozen, dried, salted or in brine.
- (2) Smoked aquatic invertebrates other than crustaceans and molluscs, whether or not cooked before or during the smoking process.

The principal varieties of aquatic invertebrates are sea-urchins, sea cucumbers (beches-de-mer) and jellyfish.

This heading also covers parts of aquatic invertebrates (e.g., gonads of sea-urchins), **provided** they have been subjected to no other processes than those specified in (1) or (2) above.

The heading also includes flours, meals and pellets of aquatic invertebrates, fit or suitable for human consumption.

The heading **does not cover** aquatic invertebrates prepared or preserved by processes not provided for in this heading (e.g., aquatic invertebrates boiled in water or preserved in vinegar) (**heading 16.05**).

Chapter 4

Dairy produce; birds' eggs; natural honey; edible products of animal origin, not elsewhere specified or included

Notes.

- 1.- The expression "milk" means full cream milk or partially or completely skimmed milk.
- 2.- For the purposes of heading 04.05 :
 - (a) The term "butter" means natural butter, whey butter or recombined butter (fresh, salted or rancid, including canned butter) derived exclusively from milk, with a milkfat content of 80 % or more but not more than 95 % by weight, a maximum milk solids-not-fat content of 2 % by weight and a maximum water content of 16 % by weight. Butter does not contain added emulsifiers, but may contain sodium chloride, food colours, neutralising salts and cultures of harmless lactic-acid-producing bacteria.
 - (b) The expression "dairy spreads" means a spreadable emulsion of the water-in-oil type, containing milkfat as the only fat in the product, with a milkfat content of 39 % or more but less than 80 % by weight.
- 3.- Products obtained by the concentration of whey and with the addition of milk or milkfat are to be classified as cheese in heading 04.06 provided that they have the three following characteristics :
 - (a) a milkfat content, by weight of the dry matter, of 5 % or more;
 - (b) a dry matter content, by weight, of at least 70 % but not exceeding 85 %; and
 - (c) they are moulded or capable of being moulded.
- 4.- This Chapter does not cover :
 - (a) Products obtained from whey, containing by weight more than 95 % lactose, expressed as anhydrous lactose, calculated on the dry matter (heading 17.02);
 - (b) Products obtained from milk by replacing one or more of its natural constituents (for example, butyric fats) by another substance (for example, oleic fats) (heading 19.01 or 21.06); or
 - (c) Albumins (including concentrates of two or more whey proteins, containing by weight more than 80 % whey proteins, calculated on the dry matter) (heading 35.02) or globulins (heading 35.04).

○
○ ○

Subheading Notes.

- 1.- For the purposes of subheading 0404.10, the expression "modified whey" means products consisting of whey constituents, that is, whey from which all or part of the lactose, proteins or minerals have been removed, whey to which natural whey constituents have been added, and products obtained by mixing natural whey constituents.
- 2.- For the purposes of subheading 0405.10 the term "butter" does not include dehydrated butter or ghee (subheading 0405.90).

GENERAL

This Chapter covers :

(I) **Dairy products :**

- (A) **Milk**, i.e., full cream milk and partially or completely skimmed milk.
- (B) **Cream**.
- (C) **Buttermilk, curdled milk and cream, yogurt, kefir and other fermented or acidified milk and cream**.
- (D) **Whey**.
- (E) **Products consisting of natural milk constituents, not elsewhere specified or included**.
- (F) **Butter and other fats and oils derived from milk; dairy spreads**.
- (G) **Cheese and curd**.

The products mentioned at Items (A) to (E) above may contain, in addition to natural milk constituents (e.g., milk enriched in vitamins or mineral salts), small quantities of stabilising agents which serve to maintain the natural consistency of the product during transport in liquid state (disodium phosphate, trisodium citrate and calcium chloride, for instance) as well as very small quantities of anti-oxidants or of vitamins not normally found in the product. Certain of these products may also contain small quantities of chemicals (e.g., sodium bicarbonate) necessary for their processing; products in the form of powder or granules may contain anticaking agents (for example, phospholipids, amorphous silicon dioxide).

On the other hand, the Chapter **excludes** products obtained from whey, containing by weight more than 95 % lactose, expressed as anhydrous lactose, calculated on the dry matter (**heading 17.02**). For the purposes of calculating the percentage weight of lactose in a product the expression "dry matter" should be taken to exclude both free water and water of crystallisation.

For the purposes of Note 4 (b) to this Chapter the expression "butyric fats" means milk fats and the expression "oleic fats" means fats other than milk fats, in particular vegetable fats (e.g., olive oil).

The Chapter also **excludes**, *inter alia*, the following :

- (a) Food preparations based on dairy products (in particular, **heading 19.01**).
- (b) Products obtained from milk by replacing one or more of the natural constituents (e.g., butyric fats) by another substance (e.g., oleic fats) (**heading 19.01 or 21.06**).
- (c) Ice cream and other edible ice (**heading 21.05**).
- (d) Medicaments of **Chapter 30**.
- (e) Casein (**heading 35.01**), milk albumin (**heading 35.02**) and hardened casein (**heading 39.13**).

(II) **Birds' eggs and egg yolks**.

(III) **Natural honey**.

(IV) **Edible products of animal origin, not elsewhere specified or included**.

04.01 - Milk and cream, not concentrated nor containing added sugar or other sweetening matter.

0401.10 - Of a fat content, by weight, not exceeding 1 %

0401.20 - Of a fat content, by weight, exceeding 1 % but not exceeding 6 %

0401.40 - Of a fat content, by weight, exceeding 6 % but not exceeding 10 %

0401.50 - Of a fat content, by weight, exceeding 10 %

This heading covers milk (as defined in Note 1 to this Chapter) and cream, whether or not pasteurised, sterilised or otherwise preserved, homogenised or peptonised; but it **excludes** milk and cream which have been concentrated or which contain added sugar or other sweetening matter (**heading 04.02**) and curdled, fermented or acidified milk and cream (**heading 04.03**).

The products of this heading may be frozen and may contain the additives referred to in the General Explanatory Note to this Chapter. The heading also covers reconstituted milk and cream having the same qualitative and quantitative composition as the natural products.

04.02 - Milk and cream, concentrated or containing added sugar or other sweetening matter (+).

0402.10 - In powder, granules or other solid forms, of a fat content, by weight, not exceeding 1.5 %

- In powder, granules or other solid forms, of a fat content, by weight, exceeding 1.5 % :

0402.21 -- Not containing added sugar or other sweetening matter

0402.29 -- Other

- Other :

0402.91 -- Not containing added sugar or other sweetening matter

0402.99 -- Other

This heading covers milk (as defined in Note 1 to this Chapter) and cream, concentrated (for example, evaporated) or containing added sugar or other sweetening matter, whether liquid, paste or solid (in blocks, powder or granules) and whether or not preserved or reconstituted.

Milk powder may contain small quantities of starch (not exceeding 5 % by weight), added, in particular, to maintain the reconstituted milk in its normal physical state.

The heading **does not cover** :

- (a) Curdled, fermented or acidified milk or cream (**heading 04.03**).
- (b) Beverages consisting of milk flavoured with cocoa or other substances (**heading 22.02**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 0402.10, 0402.21 and 0402.29

These subheadings **do not cover** concentrated milk or cream in the form of paste (**subheadings 0402.91 and 0402.99**).

04.03 - Buttermilk, curdled milk and cream, yogurt, kefir and other fermented or acidified milk and cream, whether or not concentrated or containing added sugar or other sweetening matter or flavoured or containing added fruit, nuts or cocoa.

0403.10 - Yogurt

0403.90 - Other

This heading covers buttermilk, and all fermented or acidified milk and cream and includes curdled milk and cream, yogurt and kefir. The products of this heading may be in liquid, paste or solid (including frozen) form and may be concentrated (e.g., evaporated or in blocks, powder or granules) or preserved.

Fermented milk of this heading may consist of milk powder of heading 04.02 containing small quantities of added lactic ferments, with a view to its use in prepared meat products or as an additive for animal feed.

Acidified milk of this heading may consist of milk powder of heading 04.02 containing small quantities of added acid (including lemon juice) in crystal form in order to produce curdled milk on reconstitution with water.

Apart from the additives mentioned in the General Explanatory Note to this Chapter, the products of this heading may also contain added sugar or other sweetening matter, flavourings, fruit (including pulp and jams), nuts or cocoa.

04.04 - Whey, whether or not concentrated or containing added sugar or other sweetening matter; products consisting of natural milk constituents, whether or not containing added sugar or other sweetening matter, not elsewhere specified or included.

0404.10 - Whey and modified whey, whether or not concentrated or containing added sugar or other sweetening matter

0404.90 - Other

This heading covers whey (i.e., the natural constituents of milk which remain after the fat and casein have been removed) and modified whey (see Subheading Note 1 to this Chapter). These products may be in liquid, paste or solid (including frozen) form, and may be concentrated (e.g., in powder) or preserved.

The heading also covers fresh or preserved products consisting of milk constituents, which do not have the same composition as the natural product, provided they are not more specifically covered elsewhere. Thus the heading includes products which lack one or more natural milk constituents, milk to which natural milk constituents have been added (to obtain, for example, a protein-rich product).

Apart from natural milk constituents and the additives mentioned in the General Explanatory Note to this Chapter, the products of this heading may also contain added sugar or other sweetening matter.

The powdered products of this heading, particularly whey, may contain small quantities of added lactic ferments, with a view to their use in prepared meat products or as additives for animal feed.

The heading **does not cover** :

- (a) Skimmed milk or reconstituted milk having the same qualitative and quantitative composition as natural milk (**heading 04.01** or **04.02**).
- (b) Whey cheese (**heading 04.06**).
- (c) Products obtained from whey, containing by weight more than 95 % lactose, expressed as anhydrous lactose, calculated on the dry matter (**heading 17.02**).
- (d) Food preparations based on natural milk constituents but containing other substances not allowed in the products of this Chapter (in particular, **heading 19.01**).
- (e) Albumins (including concentrates of two or more whey proteins, containing by weight more than 80 % whey proteins, calculated on the dry matter) (**heading 35.02**) or globulins (**heading 35.04**).

04.05 - Butter and other fats and oils derived from milk; dairy spreads.

0405.10 - Butter

0405.20 - Dairy spreads

0405.90 - Other

This heading covers :

(A) Butter.

This group covers natural butter, whey butter and recombined butter (fresh, salted or rancid, including canned butter). Butter must be derived exclusively from milk and must have a milkfat content of 80 % or more but not more than 95 % by weight, a maximum milk solids-not-fat content of 2 % by weight and a maximum water content of 16 % by weight. Butter contains no added emulsifiers, but may contain sodium chloride, food colours, neutralising salts and cultures of harmless lactic-acid-producing bacteria. (See Note 2 (a) to this Chapter).

Butter obtained from goat's or sheep's milk is also covered by this group.

(B) Dairy spreads.

This group covers dairy spreads, i.e., spreadable emulsions of the water-in-oil type, containing milkfat as the only fat in the product, and having a milkfat content of 39 % or more but less than 80 % by weight (see Note 2 (b) to this Chapter). Dairy spreads may contain optional ingredients such as cultures of harmless lactic-acid-producing bacteria, vitamins, sodium chloride, sugars, gelatine, starches; food colours; flavours; emulsifiers; thickening agents and preservatives.

(C) Other fats and oils derived from milk.

This group covers fats and oils derived from milk (e.g., milkfat, butterfat and butteroil). Butteroil is the product obtained by extracting the water and non-fat content from butter or cream.

This group further includes dehydrated butter and ghee (a kind of butter made most commonly from the milk of buffaloes or cows), as well as products consisting of a mixture of butter and small quantities of herbs, spices, flavourings, garlic, etc. (provided they retain the character of the products falling in this heading).

The heading **does not cover** fat spreads containing fats other than milkfats or containing less than 39 % by weight of milkfat (generally **heading 15.17** or **21.06**).

04.06 - Cheese and curd (+).

- 0406.10 - Fresh (unripened or uncured) cheese, including whey cheese, and curd
- 0406.20 - Grated or powdered cheese, of all kinds
- 0406.30 - Processed cheese, not grated or powdered
- 0406.40 - Blue-veined cheese and other cheese containing veins produced by *Penicillium roqueforti*
- 0406.90 - Other cheese

This heading covers all kinds of cheese, viz. :

- (1) Fresh cheese (including cheese made from whey or buttermilk) and curd. Fresh cheese is an unripened or uncured cheese which is ready for consumption shortly after manufacture (e.g., Ricotta, Broccio, cottage cheese, cream cheese, Mozzarella).
- (2) Grated or powdered cheese.
- (3) Processed cheese, also known as process cheese. It is manufactured by comminuting, mixing, melting and emulsifying, with the aid of heat and emulsifying or acidifying agents (including melting salts), one or more varieties of cheese and one or more of the following : cream or other dairy products, salt, spices, flavouring, colouring and water.
- (4) Blue-veined cheese and other cheese containing veins produced by *Penicillium roqueforti*.
- (5) Soft cheese (e.g., Camembert, Brie).
- (6) Medium-hard cheese and hard cheese (e.g., Cheddar, Gouda, Gruyère, Parmesan).

Whey cheeses are obtained by concentrating whey and adding milk or milk fat. They are classified in this heading only if they have the three following characteristics :

- (a) a milkfat content, by weight of the dry matter, of 5 % or more;
- (b) a dry matter content, by weight, of at least 70 % but not exceeding 85 %;
- (c) they are moulded or capable of being moulded.

The presence of meat, fish, crustaceans, herbs, spices, vegetables, fruit, nuts, vitamins, skimmed milk powder, etc., does not affect classification **provided** that the goods retain the character of cheese.

Cheeses which have been coated with batter or bread crumbs remain classified in this heading whether or not they have been pre-cooked, provided that the goods retain the character of cheese.

Subheading Explanatory Note.

Subheading 0406.40

This subheading covers cheese containing visible veins in the body of the cheese that may be blue, green, greenish-blue or whitish-grey in colour, such as Bleu d'Auvergne, Bleu de Causses, Bleu de Quercy, Blue Cheshire, Blue Dorset, Blue Wensleydale, Cabrales, Danish Blue (Danablu), Gorgonzola, Mycella, Roquefort, Saingorlon and Stilton, as well as cheeses with proprietary or trade names, provided they meet the above criterion.

04.07 - Birds' eggs, in shell, fresh, preserved or cooked.

- Fertilised eggs for incubation :

0407.11 -- Of fowls of the species *Gallus domesticus*

0407.19 -- Other

- Other fresh eggs :

0407.21 -- Of fowls of the species *Gallus domesticus*

0407.29 -- Other

0407.90 - Other

This heading covers fertilised eggs for incubation and other fresh (including chilled) eggs of all birds. It also covers preserved or cooked eggs, in shell.

04.08 - Birds' eggs, not in shell, and egg yolks, fresh, dried, cooked by steaming or by boiling in water, moulded, frozen or otherwise preserved, whether or not containing added sugar or other sweetening matter.

- Egg yolks :

0408.11 -- Dried

0408.19 -- Other

- Other :

0408.91 -- Dried

0408.99 -- Other

This heading covers whole eggs, not in the shell, and egg yolks of all birds. The products of this heading may be fresh, dried, cooked by steaming or by boiling in water, moulded (e.g., cylindrical "long eggs"), frozen or otherwise preserved. All these fall in the heading whether or not containing added sugar or other sweetening matter and whether for use as food or for industrial purposes (e.g., in tanning).

The heading **does not cover** :

- (a) Oil of egg yolk (**heading 15.06**).
- (b) Egg preparations containing seasoning, spices or other additives (**heading 21.06**).
- (c) Lecithin (**heading 29.23**).
- (d) Separate egg white (egg albumin) (**heading 35.02**).

04.09 - Natural honey.

This heading covers honey produced by bees (*Apis mellifera*) or by other insects, centrifuged, or in the comb or containing comb chunks, provided that neither sugar nor any other substance has been added. Such honey may be designated by floral source, origin or colour.

The heading **excludes** artificial honey and mixtures of natural and artificial honey (**heading 17.02**).

04.10 - Edible products of animal origin, not elsewhere specified or included.

This heading covers products of animal origin suitable for human consumption, not specified or included elsewhere in the Nomenclature.

It includes :

- (1) **Turtles' eggs.** These are eggs laid by river or marine turtles; they may be fresh, dried or otherwise preserved.
Turtle-egg oil is **excluded (heading 15.06).**
- (2) **Salanganes' nests** ("birds' nests"). These consist of a substance secreted by the bird which solidifies rapidly on exposure to air.

The nests may be presented untreated, or they may have been cleaned to remove feathers, down, dust and other impurities in order to render them suitable for consumption. They are generally in the form of whitish strips or threads.

Salanganes' nests have a high protein content and are used almost exclusively to make soups or other food preparations.

The heading **excludes** animal blood, edible or not, liquid or dried (**heading 05.11 or 30.02**).

Chapter 5

Products of animal origin, not elsewhere specified or included

Notes.

- 1.- This Chapter does not cover :
 - (a) Edible products (other than guts, bladders and stomachs of animals, whole and pieces thereof, and animal blood, liquid or dried);
 - (b) Hides or skins (including furskins) other than goods of heading 05.05 and parings and similar waste of raw hides or skins of heading 05.11 (Chapter 41 or 43);
 - (c) Animal textile materials, other than horsehair and horsehair waste (Section XI); or
 - (d) Prepared knots or tufts for broom or brush making (heading 96.03).
- 2.- For the purposes of heading 05.01, the sorting of hair by length (provided the root ends and tip ends respectively are not arranged together) shall be deemed not to constitute working.
- 3.- Throughout the Nomenclature, elephant, hippopotamus, walrus, narwhal and wild boar tusks, rhinoceros horns and the teeth of all animals are regarded as "ivory".
- 4.- Throughout the Nomenclature, the expression "horsehair" means hair of the manes or tails of equine or bovine animals. Heading 05.11 covers, inter alia, horsehair and horsehair waste, whether or not put up as a layer with or without supporting material.

GENERAL

This Chapter covers a variety of materials of animal origin, unworked or having undergone a simple process of preparation, which are not normally used as food (**except** certain blood, guts, bladders and stomachs of animals) and which are not dealt with in other Chapters of the Nomenclature.

The following are **excluded** from this Chapter :

- (a) Animal fats (**Chapter 2 or 15**).
- (b) Uncooked edible skins of animals (**Chapter 2**) or of fish (**Chapter 3**). (When cooked, such skins are classified in **Chapter 16**.)
- (c) Edible fish fins, heads, tails, maws and other edible fish offal (**Chapter 3**).
- (d) Organo-therapeutic glands or other organs, dried, whether or not powdered (**Chapter 30**).
- (e) Fertilisers of animal origin (**Chapter 31**).
- (f) Raw hides and skins (**except** birdskins and parts of birdskins, with their feathers or down, unworked, cleaned, disinfected or treated for preservation, but not otherwise worked) (**Chapter 41**).
- (g) Furskins (**Chapter 43**).
- (h) Silk and wool and other textile raw materials of animal origin (**except** horsehair and horsehair waste (**Section XI**)).
- (ij) Natural or cultured pearls (**Chapter 71**).

05.01 - Human hair, unworked, whether or not washed or scoured; waste of human hair.

This heading covers human hair, unworked, whether or not washed or scoured, including hair laid parallel but not arranged so that the root ends and tip ends are respectively together, and waste human hair.

Human hair (other than waste) which has been processed beyond simple washing or scouring, e.g., thinned, dyed, bleached, curled or prepared for the manufacture of postiches, wigs, etc., and also human hair which has been arranged so that the root ends and tip ends are respectively together, is **excluded (heading 67.03, see corresponding Explanatory Note)**. This exclusion does not apply to waste human hair, which is always classified in this heading, even if it results from, for example, bleached or dyed hair.

The heading also **excludes** :

- (a) Straining cloth made from human hair (**heading 59.11**).
- (b) Hair-nets made of human hair (**heading 65.05**).
- (c) Other articles made of human hair (**heading 67.04**).

05.02 - Pigs', hogs' or boars' bristles and hair; badger hair and other brush making hair; waste of such bristles or hair.

0502.10 - Pigs', hogs' or boars' bristles and hair and waste thereof

0502.90 - Other

These goods may be in bulk, in loose bundles, or in tied bunches in which the bristles or hairs are laid parallel and the root ends more or less levelled. They may be raw or they may have been cleaned, bleached, dyed or sterilised.

Other brush making hair includes that of the skunk, squirrel and marten.

The heading **excludes**, however, bristles or hairs when in the form of prepared knots or tufts (i.e., made up into unmounted bundles ready for incorporation without division in brooms or brushes or requiring only certain minor processes to be ready for such incorporation); these fall in **heading 96.03** (see Note 3 to Chapter 96).

[05.03]

05.04 - Guts, bladders and stomachs of animals (other than fish), whole and pieces thereof, fresh, chilled, frozen, salted, in brine, dried or smoked.

This heading covers guts, bladders and stomachs of animals (**other than** those of fish, which fall in **heading 05.11**), whether whole or in pieces, and whether or not edible, fresh, chilled, frozen, salted, in brine, dried or smoked. If otherwise prepared or preserved such products are **excluded** (generally **Chapter 16**).

This heading includes :

- (1) Rennet bags (calf, kid, etc.), whether or not cut or dried; these are used for the extraction of rennet.
- (2) Tripe and paunches. (When cooked, they are classified in **Chapter 16**.)
- (3) Unworked goldbeater's skin, which is the outer envelope of the caecum of the ox or sheep.

The heading also covers guts and goldbeater's skin (of the ox, in particular) which have been split or cut lengthwise into strips, whether or not the inner coats have been removed by scraping.

Guts are mainly used as sausage casings. They are also used for the manufacture of sterile surgical catgut (**heading 30.06**), tennis racket strings (**heading 42.06**) or musical instrument strings (**heading 92.09**).

The heading also **excludes** "artificial guts" made by extrusion of a paste of hide or skin fibres, subsequently hardened with a solution of formaldehyde and phenols (**heading 39.17**) and "artificial" guts made by glueing together split natural guts (**heading 42.06**).

05.05 - Skins and other parts of birds, with their feathers or down, feathers and parts of feathers (whether or not with trimmed edges) and down, not further worked than cleaned, disinfected or treated for preservation; powder and waste of feathers or parts of feathers (+).

0505.10 - Feathers of a kind used for stuffing; down

0505.90 - Other

This heading covers :

- (1) Skins and other parts of birds (e.g., heads, wings) with their feathers or down, and
(2) Feathers and parts of feathers (whether or not with trimmed edges), and down,
provided they are either unworked, or merely cleaned, disinfected or treated for preservation, but not otherwise worked or mounted.

The heading also covers powder, meal and waste of feathers or parts of feathers.

The goods of this heading are of a kind intended for use as bed feathers, for ornamental purposes (usually after further preparation) or for other purposes. For classification purposes, no distinction is made between the different kinds of feathers.

The parts of feathers of this heading include feathers split along their length, barbs cut from the scape or attached to a thin shaving of the scape (whether or not with trimmed edges), quills and scapes.

Feathers and down packed for retail sale in cloth bags and clearly of a kind not constituting cushions or pillows are classified in this heading. Feathers simply strung together for convenience of transport also remain classified in this heading.

The heading **excludes** skins and other parts of birds, feathers and parts of feathers which have undergone working other than that permitted in this heading (e.g., bleaching, dyeing, curling or waving), or which have been mounted, and articles of feathers, etc.; these are generally classified in **heading 67.01** (see the Explanatory Note thereto). Worked quills, and articles made from quills, however, are classified according to their character (e.g. : angling floats - **heading 95.07**, toothpicks **heading 96.01**).

Three small black circles are arranged in a triangular pattern: one at the top center and two at the bottom corners.

Subheading Explanatory Note.

Subheading 0505.10

"Feathers of a kind used for stuffing" means feathers of poultry (in particular goose or duck), of pigeon, of partridge or the like, other than large wing or tail feathers and large feathers rejected on grading. "Down" is the finest and softest part of the plumage of goose or duck in particular and differs from feathers in not having rigid scapes. Such feathers and down are mainly used for stuffing articles of bedding or other articles such as cushions and insulating clothing (for example, anoraks).

05.06 - Bones and horn-cores, unworked, defatted, simply prepared (but not cut to shape), treated with acid or degelatinised; powder and waste of these products.

0506.10 - Ossein and bones treated with acid

0506.90 - Other

The products of this heading are used mainly as carving materials, for the manufacture of glue and gelatin or as fertilisers.

The heading covers :

- (1) **Bones and horn-cores** (inner bones of horns), unworked or defatted (bones from which the fat has been removed by various processes).
- (2) **Bones, simply prepared (but not cut to shape)**, i.e., not having undergone processes extending beyond simple sawing for the removal of superfluous parts, cutting (crosswise or lengthwise), sometimes followed by rough planing or bleaching. The heading therefore **excludes** rectangular (including square) plates and sheets and other shapes, whether or not polished or otherwise worked, and products obtained by moulding powdered bone; all these goods fall in **heading 96.01** or in other more specific headings.
- (3) **Bones treated with acid**, i.e., bones, the calcareous part of which has been dissolved by means of hydrochloric acid, and which, without having lost their original form, retain only their cellular tissue and cartilaginous parts (ossein) which can be easily transformed into gelatin.
- (4) **Degelatinised bones** from which the gelatin has been removed by steaming and which are usually in the form of powder (steam bone flour).
- (5) **Powder and waste of bones** (including crushed bones), e.g., that produced by working the bone.

05.07 - Ivory, tortoise-shell, whalebone and whalebone hair, horns, antlers, hooves, nails, claws and beaks, unworked or simply prepared but not cut to shape; powder and waste of these products.

0507.10 - Ivory; ivory powder and waste

0507.90 - Other

This heading covers the products described below, unworked or simply prepared but not cut to shape, i.e., not having undergone processes extending beyond rasping, scraping, cleaning, removal of superfluous parts, trimming, splitting, cutting other than to shape, rough planing, straightening or flattening :

(A) Ivory.

Throughout the Nomenclature, the term "ivory" is regarded as covering the bony substance which constitutes :

- (1) The tusks of the elephant, hippopotamus, walrus, narwhal or wild boar.
- (2) The horns of the rhinoceros.
- (3) The teeth of any land or marine animal.

(B) Tortoise-shell.

The tortoise-shell of commerce is normally turtle shell (generally obtained from the species known as Kemp's Turtles, Loggerheads and Hawksbill Turtles), and references to tortoise-shell include turtle shell.

Tortoise-shell is a horny material in the form of plates (scales), of varying size and thickness, protecting the horny frame-work which encloses the body of the animal.

In this heading "tortoise-shell" means :

- (1) **Shells**, whole or in part.
- (2) **Scales** from these shells, almost always detached at the fishing ground, and consisting of plates of uneven thickness, with a curved surface. These scales are described as **dorsal** or **ventral** according to the part of the body from which they are obtained; the part which covers the stomach and breast is known as the **plastron**.

(C) Whalebone and whalebone hair.

In its natural state, **whalebone** (of whales or other marine mammals) takes the form of curved, horny blades with a greyish skin adhering to the surface and with a kind of fringe of the same material as the whalebone (**whalebone hair**) on the inner edge.

(D) Horns, antlers, hooves, nails, claws and beaks.

The **horns** of this group may be presented with or without their cores and their frontal bones. **Antlers** are branched horns of deer, elk, etc.

The heading also covers powder and waste (including parings) of these products.

The heading **excludes** products which have been cut to rectangular (including square) shapes or into rods, tubes or other semi-finished forms and products obtained by moulding (**heading 96.01** or other more specific headings).

05.08 - Coral and similar materials, unworked or simply prepared but not otherwise worked; shells of molluscs, crustaceans or echinoderms and cuttle-bone, unworked or simply prepared but not cut to shape, powder and waste thereof.

Coral is the calcareous skeleton of a marine polyp and is generally used for articles of jewellery.

The most important shell for industrial purposes is that used as mother of pearl.

The heading covers :

- (1) **Coral, unworked**, or from which only the outer crust has been removed.
- (2) **Coral, simply prepared** but not otherwise worked, i.e., coral not having undergone processes extending beyond simple cutting.
- (3) **Shells, unworked or simply prepared** but not cut to shape, i.e., shells not having undergone processes extending beyond cleaning or simple cutting.

The heading includes cuttle-fish bone, crushed or powdered shells used as animal foodstuffs, and waste of shells.

The heading **excludes** rods, rectangular (including square) plates and other shapes, whether or not polished or otherwise worked; these fall in **heading 96.01** or in other more specific headings.

[05.09]

05.10 - Ambergis, castoreum, civet and musk; cantharides; bile, whether or not dried; glands and other animal products used in the preparation of pharmaceutical products, fresh, chilled, frozen or otherwise provisionally preserved.

Ambergis is a substance secreted by the sperm-whale and is found in the form of rounded masses made up of concentric layers and weighing up to a hundred kilograms. It has a waxy consistency and gives a sweet odour when rubbed. It varies from ash grey to black in colour and its density is less than that of water. Ambergis should not be confused with yellow amber (succinate) which is a mineral resin and falls in **heading 25.30**.

Castoreum is a resinous substance, brown, reddish or yellowish, with a bitter flavour and a pungent smell. It is secreted by beavers and is usually presented in the pouches (generally joined at their ends) in which it is formed. These pouches are often pleated and range in length from 5 to 10 cm.

Civet is produced by the civet cat and is a golden brown or brown resinous substance of pasty and oily consistency, with a very strong odour which closely resembles natural musk.

Musk, secreted by a kind of deer, is normally enclosed in pouches (flat and hairless on one side and convex and covered with whitish hair on the other) in which it is formed. The secretion is dark brown and has a strong smell. The musk in question should not be confused with artificial musk (musk xylene, musk ambrette, etc.) included in **Chapter 29**.

Cantharides are beetles used primarily for their vesicant or counter-irritant properties. They are usually presented in dried or powdered form.

The heading also includes :

- (1) **Animal glands and other animal organs** used in the preparation of organo-therapeutic products and unfit, by reason of their nature or of the manner in which they are put up, for human consumption (pancreas, testes, ovaries, gall bags, thyroid glands, pituitary glands, etc.), fresh, chilled or frozen, or otherwise provisionally preserved for the purposes of transport or storage (e.g., in glycerol, acetone or alcohol). When dried or in the form of extract, these products are **excluded (heading 30.01)**. (See however Note 1 (a) to this Chapter as regards edible products.)
- (2) **Bile**, whether or not dried. (Bile extract is **excluded - heading 30.01**).

The heading also **excludes** snake or bee venom put up in dried flakes in sealed ampoules (**heading 30.01**).

05.11 - Animal products not elsewhere specified or included; dead animals of Chapter 1 or 3, unfit for human consumption.

0511.10 - Bovine semen

- Other :

0511.91 -- Products of fish or crustaceans, molluscs or other aquatic invertebrates; dead animals of Chapter 3

0511.99 -- Other

This heading includes :

- (1) **Animal semen.**
- (2) **Animal embryos**, which are shipped frozen with the intended purpose of transplanting them into a recipient mother.
- (3) **Animal blood**, liquid or dried, edible or not.

The heading **excludes** animal blood prepared for therapeutic, prophylactic or diagnostic uses (**heading 30.02**).

- (4) **Cochineal and similar insects.** The cochineal is an insect which lives on certain cactus plants. There are three kinds of cochineal on the market - black, grey or silver, and reddish. The cochineal furnishes a red dye (cochineal extract) (**heading 32.03**) which is used in the preparation of carmine lake (**heading 32.05**).

Amongst the insects similar to the cochineal the most important is the animal kermes, which lives on a variety of dwarf oak tree. Kermes is used for the preparation of vivid and lasting red dyes which are classified in **heading 32.03**.

Animal kermes should not be confused with "kermes mineral" (**heading 38.24**).

Cochineal and kermes are presented dried and may be whole or powdered.

- (5) **Inedible fish eggs, roes and milt.**

These comprise :

- (i) Fertile eggs for hatching, recognisable by the presence of black spots which are the embryonic eyes.
- (ii) Salted roes (e.g., of cod or mackerel) used as fishing bait. These can be distinguished from caviar substitutes (**heading 16.04**) by their strong disagreeable odour and because they are usually packed in bulk.

The heading **excludes** edible roes and milt (**Chapter 3**).

- (6) **Waste of fish or crustaceans, molluscs or other aquatic invertebrates.**

This category covers, *inter alia* :

- (i) Scales of whitebait or of similar fish, fresh or preserved (but not in solution); these are used for the preparation of pearl essence for the coating of imitation pearls.

- (ii) Fish bladders, raw, dried or salted, used in the manufacture of isinglass and fish glues.
- (iii) Fish guts and waste of skins used for glue manufacture, etc.
- (iv) Fish waste.

The heading also **excludes** :

- (a) Edible fish livers, fish fins, heads, tails, maws and other edible fish offal (**Chapter 3**).
 - (b) Shells of molluscs, crustaceans or echinoderms of **heading 05.08**.
 - (c) Inedible fish livers used in the preparation of pharmaceutical products (**heading 05.10**).
- (7) **Silkworm eggs.** These have the appearance of small seeds, pale yellow turning gradually to ash grey or earthy yellow. They are usually presented in boxes (or cellular combs) or in cloth sachets.
- (8) **Ant eggs.**
- (9) **Sinews and tendons** used, like the waste cited in Items (10) and (11) below, mainly as raw materials for the manufacture of glue.
- (10) **Parings and similar waste, of raw hides or skins.**
- (11) **Waste of raw furskins**, clearly not capable of use by furriers.
- (12) **Dead animals** of Chapter 1 or 3 and their meat or meat offals unfit for human consumption **other than** products of **heading 02.09** or of one of the preceding headings of this Chapter.
- (13) **Horsehair and horsehair waste**, whether or not put up as a layer with or without supporting material. This category covers hair of the manes or tails of equine or bovine animals. It includes not only unworked horsehair but also horsehair which has been washed, scoured, bleached, dyed, curled or otherwise prepared. The goods may be in bulk, in bunches or may be put up in skeins, etc.

This heading also covers a layer of horsehair on a support of textile fabric, paper, etc., or put up between sheets of textile fabric, paper, etc., by stapling or simple sewing.

The heading **excludes** horsehair which has undergone a spinning process and horsehair knotted end to end (**Chapter 51**).

- (14) **Natural sponges of animal origin.** They comprise both raw sponges (including those merely washed) and sponges which have been prepared (e.g., by removal of calcareous matter or by bleaching). This category also covers waste sponge.

Loofah, also known as vegetable sponge, is classified in **heading 14.04**.

The heading further **excludes** :

- (a) Shellac, seed lac, stick lac and other lacs (**heading 13.01**).
 - (b) Animal fats of **Chapter 15**.
 - (c) Collections and collectors' pieces of zoological interest, consisting of stuffed or otherwise preserved animals, butterflies and other insects, eggs, etc. (**heading 97.05**).
-

Section II

VEGETABLE PRODUCTS

Note.

- 1.- In this Section the term "pellets" means products which have been agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight.

Chapter 6

Live trees and other plants; bulbs, roots and the like; cut flowers and ornamental foliage

Notes.

- 1.- Subject to the second part of heading 06.01, this Chapter covers only live trees and goods (including seedling vegetables) of a kind commonly supplied by nursery gardeners or florists for planting or for ornamental use; nevertheless it does not include potatoes, onions, shallots, garlic or other products of Chapter 7.
- 2.- Any reference in heading 06.03 or 06.04 to goods of any kind shall be construed as including a reference to bouquets, floral baskets, wreaths and similar articles made wholly or partly of goods of that kind, account not being taken of accessories of other materials. However, these headings do not include collages or similar decorative plaques of heading 97.01.

GENERAL

This Chapter covers all living plants, of a kind supplied by nursery gardeners (including horticulturists) or florists, which are in a condition suitable for planting or ornamental purposes and also chicory plants and roots, **other than** roots of **heading 12.12**, even if they are not commonly supplied by nursery gardeners or florists. These range from trees, shrubs and bushes to seedling vegetables including, *inter alia*, plants for medicinal purposes. The Chapter **does not include** seeds and fruit, or certain tubers and bulbs (potatoes, onions, shallots and garlic) for which it is not possible to make a distinction between the kinds used as food and those for planting.

The Chapter also covers :

- (1) Cut flowers and flower buds, foliage, branches and other parts of plants, fresh, dried, dyed, bleached, impregnated or otherwise prepared for ornamental purposes.
- (2) Bouquets, wreaths, floral baskets and similar florists' wares.

06.01 - Bulbs, tubers, tuberous roots, corms, crowns and rhizomes, dormant, in growth or in flower; chicory plants and roots other than roots of heading 12.12.

0601.10 - Bulbs, tubers, tuberous roots, corms, crowns and rhizomes, dormant

0601.20 - Bulbs, tubers, tuberous roots, corms, crowns and rhizomes, in growth or in flower; chicory plants and roots

This heading includes bulbs, etc., whether or not presented in pots, boxes, etc., of, *inter alia*, plants of the following kinds :

Amaryllis, anemone (bulbous species), begonia, canna, chionodoxa, convallaria (lily of the valley), crocus, cyclamen, dahlia, eremurus, freesia, fritillaria, galanthus (snow-drop), gladiolus, gloxinia, hyacinthus, iris, lily, montbretia, narcissus, ornithogalum, oxalis, polianthes (tuberose), ranunculus, richardia, tigridia and tulipa.

The heading also includes bulbs, etc., of plants not used for ornamental purposes (e.g., rhubarb crowns) and asparagus crowns.

The heading **excludes**, however, certain bulbs, tubers, tuberous roots, corms, crowns and rhizomes (e.g., onions, shallots, garlic, potatoes, Jerusalem artichokes) of **Chapter 7**, and ginger rhizomes (**heading 09.10**).

Chicory plants and roots are also covered by this heading. However, unroasted chicory roots, of the variety *Cichorium intybus sativum*, are **excluded** (**heading 12.12**).

06.02 - Other live plants (including their roots), cuttings and slips; mushroom spawn (+).

- 0602.10 - Unrooted cuttings and slips
- 0602.20 - Trees, shrubs and bushes, grafted or not, of kinds which bear edible fruit or nuts
- 0602.30 - Rhododendrons and azaleas, grafted or not
- 0602.40 - Roses, grafted or not
- 0602.90 - Other

This heading includes :

- (1) Trees, shrubs and bushes of all kinds (forest, fruit, ornamental, etc.), including stocks for grafting.
- (2) Plants and seedlings of all kinds for planting, **except** those of **heading 06.01**.
- (3) Live roots of plants.
- (4) Unrooted cuttings; slips (grafts or scions); runners and shoots.
- (5) Mushroom spawn consisting of mushroom plant threads (mycelium) whether or not mixed with soil or vegetable matter.

The trees, shrubs, bushes and other plants covered by this heading may be presented with their roots bare or balled, or planted in pots, tubs, boxes or the like.

The heading **excludes** tuberous roots (e.g., dahlias, **heading 06.01**) and chicory roots of **heading 06.01** or **12.12**.

○
○ ○

Subheading Explanatory Notes.

Subheading 0602.20

For the purposes of subheading 0602.20, the term "trees, shrubs and bushes" includes canes and vines having woody stems (e.g., grape, boysenberry, dewberry, kiwifruit) and rooted cuttings thereof.

This subheading **does not cover** wild roses (**subheading 0602.40**).

Subheadings 0602.20, 0602.30, 0602.40 and 0602.90

Live roots are to be classified along with plants in their appropriate subheadings.

06.03 - Cut flowers and flower buds of a kind suitable for bouquets or for ornamental purposes, fresh, dried, dyed, bleached, impregnated or otherwise prepared.

- Fresh

0603.11 -- Roses

0603.12 -- Carnations

0603.13 -- Orchids

0603.14 -- Chrysanthemums

0603.15 -- Lilies (*Lilium spp.*)

0603.19 -- Other

0603.90 - Other

The heading covers not only cut flowers and buds as such, but also bouquets, wreaths, floral baskets and similar articles (e.g., posies and buttonholes) incorporating flowers or flower buds. Provided that such bouquets, etc., have the essential character of florists' wares, they remain in the heading even if they contain accessories of other materials (ribbons, paper trimmings, etc.).

Cut branches of trees, shrubs or bushes, if bearing flowers or flower buds (e.g., magnolia and certain types of roses), are treated as cut flowers or flower buds of this heading.

The heading **excludes** flowers, petals and buds of a kind used primarily in perfumery, in pharmacy, or for insecticidal, fungicidal or similar purposes, provided that, in the condition in which they are presented, they are not suitable for bouquets or for ornamental use (**heading 12.11**). The heading also **excludes** collages and similar decorative plaques of **heading 97.01**.

06.04 - Foliage, branches and other parts of plants, without flowers or flower buds, and grasses, mosses and lichens, being goods of a kind suitable for bouquets or for ornamental purposes, fresh, dried, dyed, bleached, impregnated or otherwise prepared.

0604.20 -- Fresh

0604.90 -- Other

This heading covers not only foliage, branches, etc., as such, but also bouquets, wreaths, floral baskets and similar articles incorporating foliage or parts of trees, shrubs, bushes or other plants, or incorporating grasses, mosses or lichens. Provided that such bouquets, etc., have the essential character of florists' wares, they remain in the heading even if they contain accessories of other materials (ribbons, wire frames, etc.).

Goods of this heading may bear decorative fruits, but if they incorporate flowers or flower buds they are **excluded (heading 06.03)**.

The heading covers natural Christmas trees, provided that they are clearly unfit for replanting (e.g., root sawn off, root killed by immersion in boiling water).

The heading also **excludes** plants and parts of plants (including grasses, mosses and lichens) of a kind used primarily in perfumery, in pharmacy or for insecticidal, fungicidal or similar purposes (**heading 12.11**) or for plaiting (**heading 14.01**), provided that, in the condition in which they are presented, they are not suitable for bouquets or for ornamental purposes. The heading also **excludes** collages and similar decorative plaques of **heading 97.01**.

Chapter 7

Edible vegetables and certain roots and tubers

Notes.

- 1.- This Chapter does not cover forage products of heading 12.14.
- 2.- In headings 07.09, 07.10, 07.11 and 07.12 the word “ vegetables ” includes edible mushrooms, truffles, olives, capers, marrows, pumpkins, aubergines, sweet corn (*Zea mays var. saccharata*), fruits of the genus *Capsicum* or of the genus *Pimenta*, fennel, parsley, chervil, tarragon, cress and sweet marjoram (*Majorana hortensis* or *Origanum majorana*).
- 3.- Heading 07.12 covers all dried vegetables of the kinds falling in headings 07.01 to 07.11, other than :
 - (a) dried leguminous vegetables, shelled (heading 07.13);
 - (b) sweet corn in the forms specified in headings 11.02 to 11.04;
 - (c) flour, meal, powder, flakes, granules and pellets of potatoes (heading 11.05);
 - (d) flour, meal and powder of the dried leguminous vegetables of heading 07.13 (heading 11.06).
- 4.- However, dried or crushed or ground fruits of the genus *Capsicum* or of the genus *Pimenta* are excluded from this Chapter (heading 09.04).

GENERAL

This Chapter covers vegetables, including the products listed in Note 2 to the Chapter, whether fresh, chilled, frozen (uncooked or cooked by steaming or boiling in water), provisionally preserved or dried (including dehydrated, evaporated or freeze-dried). It should be noted that some of these products when dried and powdered are sometimes used as flavouring materials but nevertheless remain classified in heading 07.12.

The term “ chilled ” means that the temperature of a product has been reduced, generally to around 0 °C, without the product being frozen. However, some products, such as potatoes, may be considered to be chilled when their temperature has been reduced to and maintained at + 10 °C.

The expression “ frozen ” means that the product has been cooled to below the product’s freezing point until it is frozen throughout.

Unless the context otherwise requires, vegetables of this Chapter may be whole, sliced, chopped, shredded, pulped, grated, peeled or shelled.

The Chapter also includes certain tubers and roots with a high starch or inulin content, fresh, chilled, frozen or dried, whether or not sliced or in the form of pellets.

Vegetables not presented in a state covered by any heading of this Chapter are classified in **Chapter 11** or **Section IV**. For example, flour, meal and powder of dried leguminous vegetables and flour, meal, powder, flakes, granules and pellets of potatoes are classified in **Chapter 11**, and vegetables prepared or preserved by any process not provided for in this Chapter fall in **Chapter 20**.

However, it should be noted that homogenisation, by itself, does not qualify a product of this Chapter for classification as a preparation of Chapter 20.

It should also be noted that vegetables of this Chapter remain classified here even if put up in airtight containers (e.g., onion flour in cans). In most cases, however, products put up in these packings have been prepared or preserved otherwise than as provided for in the headings of this Chapter, and are therefore **excluded (Chapter 20)**.

Similarly, products of this Chapter remain classified here (e.g., fresh or chilled vegetables) when subjected to packaging by means of a Modified Atmospheric Packaging (MAP) process. In a MAP process the atmosphere surrounding the product is altered or controlled (e.g., by removing or reducing the oxygen content and replacing it with or increasing the nitrogen or carbon dioxide content).

Fresh or dried vegetables fall in this Chapter whether intended for use as food, for sowing or for planting (e.g., potatoes, onions, shallots, garlic, leguminous vegetables). However, the Chapter **does not cover** seedling vegetables in a condition for replanting (**heading 06.02**).

In addition to the exclusions mentioned above and in the Chapter Notes, this Chapter **does not include** :

- (a) Chicory plants or chicory roots (**heading 06.01** or **12.12**).
- (b) Certain vegetable products used as raw materials in the food industries e.g., cereals (**Chapter 10**) and sugar beet and sugar cane (**heading 12.12**).
- (c) Flour, meal and powder of roots or tubers of heading 07.14 (**heading 11.06**).
- (d) Certain plants and parts of plants, although sometimes used for culinary purposes, e.g., basil, borage, hyssop, all species of mint, rosemary, rue, sage and dried roots of burdock (*Arctium lappa*) (**heading 12.11**).
- (e) Edible seaweeds and other algae (**heading 12.12**).
- (f) Swedes, mangolds, fodder roots, hay, lucerne (alfalfa), clover, sainfoin, forage kale, lupines, vetches and similar forage products (**heading 12.14**).
- (g) Beet or carrot tops (**heading 23.08**).

07.01 - Potatoes, fresh or chilled (+).

0701.10 - Seed

0701.90 - Other

This heading covers fresh or chilled potatoes of all kinds (**other than** sweet potatoes of **heading 07.14**). The heading includes, *inter alia*, seed potatoes intended for sowing and new potatoes.

Subheading Explanatory Note.

Subheading 0701.10

For the purposes of subheading 0701.10, the expression “seed” covers only potatoes which are regarded by the competent national authorities as intended for sowing.

07.02 - Tomatoes, fresh or chilled.

This heading covers fresh or chilled tomatoes of all kinds.

07.03 - Onions, shallots, garlic, leeks and other alliaceous vegetables, fresh or chilled.

0703.10 - Onions and shallots

0703.20 - Garlic

0703.90 - Leeks and other alliaceous vegetables

This heading covers the following fresh or chilled alliaceous vegetables :

- (1) Onions (including onion sets and Spring onions) and shallots.
- (2) Garlic.
- (3) Leeks, chives and other alliaceous vegetables.

07.04 - Cabbages, cauliflowers, kohlrabi, kale and similar edible brassicas, fresh or chilled.

0704.10 - Cauliflowers and headed broccoli

0704.20 - Brussels sprouts

0704.90 - Other

The fresh or chilled products of this heading include the following :

- (1) Cauliflowers and headed broccoli (*Brassica oleracea L. convar. botrytis (L.) Alef var. botrytis L.*).
- (2) Brussels sprouts.
- (3) Other headed brassicas, (e.g., white cabbage, Savoy cabbage, red cabbage, Chinese cabbage), collards, kale and other leafy brassicas, sprouting broccoli (*Brassica oleracea L. convar. botrytis (L.) Alef var. italica Plenck*) and other sprouting brassicas, and kohlrabi.

Other brassicas in the form of roots are, however, **excluded** (e.g., turnips of **heading 07.06**, swedes (rutabagas) of **heading 12.14**).

07.05 - Lettuce (*Lactuca sativa*) and chicory (*Cichorium spp.*), fresh or chilled.

- Lettuce :

0705.11 -- Cabbage lettuce (head lettuce)

0705.19 -- Other

- Chicory :

0705.21 -- Witloof chicory (*Cichorium intybus var. foliosum*)

0705.29 -- Other

This heading covers fresh or chilled lettuce (*Lactuca sativa*) of which the principal type is cabbage or head lettuce. In addition the heading covers fresh or chilled chicory (*Cichorium spp.*), including endive, which includes the following principal varieties :

- (1) Witloof (blanched) chicory (*Cichorium intybus var. foliosum*).
- (2) Escarole chicory (*Cichorium endivia var. latifolia*).
- (3) Curly chicory also known as endive (*Cichorium endivia var. crispa*).

The heading **excludes** chicory plants and chicory roots (**heading 06.01 or 12.12**).

07.06 - Carrots, turnips, salad beetroot, salsify, celeriac, radishes and similar edible roots, fresh or chilled.

0706.10 - Carrots and turnips

0706.90 - Other

The fresh or chilled roots of this heading include carrots, turnips, salad beetroot (salad beets), salsify, celeriac (turnip-rooted or German celery), radishes, scorzonera, horseradish, Chinese artichokes (*Stachys affinis*), burdock (*Arctium lappa*) and parsnips (*Pastinaca sativa*). These products remain in this heading whether or not their tops have been removed.

The heading **excludes** :

- (a) Celery of **heading 07.09**.
- (b) Provisionally preserved roots of burdock (**heading 07.11**).
- (c) Forage products of **heading 12.14**

07.07 - Cucumbers and gherkins, fresh or chilled.

This heading covers only fresh or chilled cucumbers and gherkins.

07.08 - Leguminous vegetables, shelled or unshelled, fresh or chilled.

0708.10 - Peas (*Pisum sativum*)

0708.20 - Beans (*Vigna spp.*, *Phaseolus spp.*)

0708.90 - Other leguminous vegetables

The leguminous vegetables of this heading include :

- (1) Peas (*Pisum sativum*), including green peas and fodder peas.
- (2) Beans (*Phaseolus spp.*, *Vigna spp.*), which include Lima or butter beans, mung beans, beans in edible pods (variously known as kidney beans, French beans, runner beans, string beans, wax beans or snap beans) and cowpeas (including black eye).
- (3) Broad beans (*Vicia faba var. major*), horse beans (*Vicia faba var. equina* or *var. minor*) and hyacinth beans (*Dolichos lablab L.*).
- (4) Chickpeas (garbanzos).
- (5) Lentils.
- (6) Guar seeds.

The heading **excludes** :

- (a) Soya beans (**heading 12.01**).
- (b) Locust beans (**heading 12.12**).

07.09 - Other vegetables, fresh or chilled.

0709.20 - Asparagus

0709.30 - Aubergines (egg-plants)

0709.40 - Celery other than celeriac

- Mushrooms and truffles :

0709.51 -- Mushrooms of the genus *Agaricus*

0709.59 -- Other

0709.60 - Fruits of the genus *Capsicum* or of the genus *Pimenta*

0709.70 - Spinach, New Zealand spinach and orache spinach (garden spinach)

- Other

0709.91 -- Globe artichokes

0709.92 -- Olives

0709.93 -- Pumpkins, squash and gourds (*Cucurbita spp.*)

0709.99 -- Other

The vegetables of this heading include :

- (1) Asparagus.
- (2) Aubergines (egg-plants).
- (3) Celery (**other than** celeriac of **heading 07.06**).
- (4) Mushrooms (including mushrooms of the genus *Agaricus*, such as the common white mushroom, *A. bisporus*) and truffles.
- (5) Fruits of the genus *Capsicum* or of the genus *Pimenta*, commonly referred to as “peppers”. Fruits of the genus *Capsicum* range from the sweet or bell peppers (*Capsicum annuum* var. *annuum*), which are the mildest and largest of the genus *Capsicum* and which, either in their green or their ripened state, are most commonly eaten as a vegetable in salads, to the more pungent varieties of *Capsicum frutescens* and *Capsicum annuum*, which include chillies, Cayenne pepper, paprikas, etc., used most often to flavour foods. Fruits of the genus *Pimenta* include Jamaica pepper (also known as clove pepper, English pepper and allspice). The heading **does not cover** these products when dried, crushed or ground (**heading 09.04**).
- (6) Spinach, including New Zealand and orache (garden) spinach.
- (7) Globe artichokes.
- (8) Sweet corn (*Zea mays* var. *saccharata*), whether or not on the cob.
- (9) Pumpkins, marrows, squash and gourds (*Cucurbita spp.*).
- (10) Olives.
- (11) Rhubarb, edible cardoons, fennel, capers and sorrel.
- (12) Chard (white beet) and okra (gumbo).

- (13) Parsley, chervil, tarragon, cress (e.g., watercress), savory (*Satureia hortensis*), coriander, dill, sweet marjoram (*Majorana hortensis* or *Origanum majorana*). Wild marjoram (*Origanum vulgare*) is **excluded (heading 12.11)**.
- (14) Bamboo shoots and soya bean sprouts.

The heading also **excludes** the edible tuber of the species *Eleocharis dulcis* or *Eleocharis tuberosa*, commonly known as the Chinese water chestnut (**heading 07.14**).

07.10 - Vegetables (uncooked or cooked by steaming or boiling in water), frozen.

0710.10 - Potatoes

- Leguminous vegetables, shelled or unshelled :

0710.21 -- Peas (*Pisum sativum*)

0710.22 -- Beans (*Vigna spp.*, *Phaseolus spp.*)

0710.29 -- Other

0710.30 - Spinach, New Zealand spinach and orache spinach (garden spinach)

0710.40 - Sweet corn

0710.80 - Other vegetables

0710.90 - Mixtures of vegetables

This heading covers frozen vegetables which, when fresh or chilled, are classified in headings 07.01 to 07.09.

The expression "frozen" is defined in the General Explanatory Note to this Chapter.

The frozen vegetables of this heading are generally obtained at the industrial level by quick-freezing processes. Such processes are used in order that the temperature range of maximum crystallisation is passed quickly. This avoids the rupture of the cellular structure and the vegetables therefore substantially retain their fresh appearance on thawing.

Vegetables to which salt or sugar has been added before freezing remain classified in this heading, as do vegetables which have been cooked by steaming or boiling in water before freezing. However, the heading **excludes** vegetables cooked by other processes (Chapter 20) or prepared with other ingredients, such as prepared meals (Section IV).

The principal kinds of vegetables preserved by freezing are potatoes, peas, beans, spinach, sweet corn, asparagus, carrots and beetroot.

This heading also includes mixtures of frozen vegetables.

07.11 - Vegetables provisionally preserved (for example, by sulphur dioxide gas, in brine, in sulphur water or in other preservative solutions), but unsuitable in that state for immediate consumption.

0711.20 - Olives

0711.40 - Cucumbers and gherkins

- Mushrooms and truffles :

0711.51 -- Mushrooms of the genus *Agaricus*

0711.59 -- Other

0711.90 - Other vegetables; mixtures of vegetables

This heading applies to vegetables which have been treated solely to ensure their provisional preservation during transport or storage prior to use (e.g., by sulphur dioxide gas, in brine, in sulphur water or in other preservative solutions), **provided** they remain unsuitable for immediate consumption in that state.

Vegetables covered by this heading are generally packed in casks or barrels, and are mainly used as raw materials for manufacturing purposes; the principal varieties are onions, olives, capers, cucumbers, gherkins, mushrooms, truffles and tomatoes.

However the heading **excludes** goods which, in addition to having been provisionally preserved in brine, have also been specially treated (e.g., by soda solution, by lactic fermentation); these fall in **Chapter 20** (for example, olives, sauerkraut, gherkins and green beans).

07.12 - Dried vegetables, whole, cut, sliced, broken or in powder, but not further prepared.

0712.20 - Onions

- Mushrooms, wood ears (*Auricularia spp.*), jelly fungi (*Tremella spp.*) and truffles :

0712.31 -- Mushrooms of the genus *Agaricus*

0712.32 -- Wood ears (*Auricularia spp.*)

0712.33 -- Jelly fungi (*Tremella spp.*)

0712.39 -- Other

0712.90 - Other vegetables; mixtures of vegetables

This heading covers vegetables of headings 07.01 to 07.11 which have been dried (including dehydrated, evaporated or freeze-dried) i.e., with their natural water content removed by various processes. The principal kinds of vegetables treated in this way are potatoes, onions, mushrooms, wood ears (*Auricularia spp.*), jelly fungi (*Tremella spp.*), truffles, carrots, cabbage and spinach. They are usually prepared in strips or slices, either of one variety or mixed (*julienne*).

The heading also covers dried vegetables, broken or powdered, such as asparagus, cauliflower, parsley, chervil, onion, garlic, celery, generally used either as flavouring materials or in the preparation of soups.

The heading **excludes**, *inter alia* :

- (a) Dried leguminous vegetables, shelled (**heading 07.13**).
- (b) Dried, crushed or ground fruits of the genus *Capsicum* or of the genus *Pimenta* (**heading 09.04**), potato flour, meal, powder, flakes, granules and pellets (**heading 11.05**), flour, meal and powder of the dried leguminous vegetables of heading 07.13 (**heading 11.06**).
- (c) Mixed condiments and mixed seasonings (**heading 21.03**).
- (d) Soup preparations based on dried vegetables (**heading 21.04**).

07.13 - Dried leguminous vegetables, shelled, whether or not skinned or split (+).

0713.10 - Peas (*Pisum sativum*)

0713.20 - Chickpeas (garbanzos)

- Beans (*Vigna spp.*, *Phaseolus spp.*) :

0713.31 -- Beans of the species *Vigna mungo* (L.) Hepper or *Vigna radiata* (L.) Wilczek

0713.32 -- Small red (Adzuki) beans (*Phaseolus* or *Vigna angularis*)

0713.33 -- Kidney beans, including white pea beans (*Phaseolus vulgaris*)

0713.34 -- Bambara beans (*Vigna subterranea* or *Voandzeia subterranea*)

0713.35 -- Cow peas (*Vigna unguiculata*)

0713.39 -- Other

0713.40 - Lentils

0713.50 -Broad beans (*Vicia faba* var. *major*) and horse beans (*Vicia faba* var. *equina*, *Vicia faba* var. *minor*)

0713.60 - Pigeon peas (*Cajanus cajan*)

0713.90 - Other

This heading covers leguminous vegetables of heading 07.08 which have been dried and shelled, of a kind used for human or animal consumption (e.g., peas, chickpeas, Adzuki and other beans, lentils, broad beans, horse beans, guar seeds), even if intended for sowing (whether or not rendered inedible by chemical treatment) or for other purposes. They may have undergone moderate heat treatment designed mainly to ensure better preservation by inactivating the enzymes (the peroxidases in particular) and eliminating part of the moisture; however, such treatment should not affect the internal character of the cotyledon.

The dried leguminous vegetables of this heading may be skinned or split.

This heading **excludes** :

- (a) Flour, meal and powder of dried shelled leguminous vegetables (**heading 11.06**).
- (b) Soya beans (**heading 12.01**).
- (c) Seeds of vetches (other than broad beans and horse beans), tares and lupines (**heading 12.09**).
- (d) Locust beans (**heading 12.12**).

Subheading Explanatory Note.

Subheading 0713.31

This subheading covers only beans of the species *Vigna mungo* (L.) Hepper, also known as urd or black gram, and beans of the species *Vigna radiata* (L.) Wilczek, also known as mung or green gram. Both species are widely used for bean sprout production.

07.14 - Manioc, arrowroot, salep, Jerusalem artichokes, sweet potatoes and similar roots and tubers with high starch or inulin content, fresh, chilled, frozen or dried, whether or not sliced or in the form of pellets; sago pith.

0714.10 - Manioc (cassava)

0714.20 - Sweet potatoes

0714.30 - Yams (*Dioscorea spp.*)

0714.40 - Taro (*Colocasia spp.*)

0714.50 - Yautia (*Xanthosoma spp.*)

0714.90 - Other

This heading covers tubers and roots with high starch or inulin content and which are therefore used for manufacturing food or industrial products; it also covers sago pith. In some cases, the tubers and roots are also used directly for human or animal consumption.

The heading covers these products, fresh, chilled, frozen or dried, whether or not sliced or in the form of pellets made either from pieces (e.g., chips) of the roots or tubers of this heading or from their flours, meals or powders of heading 11.06. The pellets are produced either directly by compression or by the addition of a binder (molasses, concentrated sulphite lyes, etc.); the proportion of added binder may not exceed 3 % by weight. Manioc pellets may be disintegrated, but remain classified here provided that they are identifiable as such. The disintegrated manioc pellets can be identified by observing their physical characteristics, e.g., non-homogeneous particles with broken pieces of manioc pellets, brownish colour with black spots, pieces of fibre visible to the naked eye and a small quantity of sand or silica left in.

In addition to the tubers and roots specifically mentioned in the heading text (manioc (*Manihot esculenta*), sweet potatoes (*Ipomoea batatas*), etc.), the heading includes the edible tuber of the species *Eleocharis dulcis* or *Eleocharis tuberosa*, commonly known as the Chinese water chestnut.

Products of this heading which are otherwise prepared fall in other Chapters, e.g., flour, meal and powder (**heading 11.06**), starches (**heading 11.08**) and tapioca (**heading 19.03**).

The heading also **excludes** live dahlia tubers (**heading 06.01**), and potatoes, fresh or dried (**heading 07.01** or **07.12**, respectively).

Chapter 8

Edible fruit and nuts; peel of citrus fruit or melons

Notes.

- 1.- This Chapter does not cover inedible nuts or fruits.
- 2.- Chilled fruits and nuts are to be classified in the same headings as the corresponding fresh fruits and nuts.
- 3.- Dried fruit or dried nuts of this Chapter may be partially rehydrated, or treated for the following purposes :
 - (a) For additional preservation or stabilisation (for example, by moderate heat treatment, sulphuring, the addition of sorbic acid or potassium sorbate),
 - (b) To improve or maintain their appearance (for example, by the addition of vegetable oil or small quantities of glucose syrup),

provided that they retain the character of dried fruit or dried nuts.

GENERAL

This Chapter covers fruit, nuts and peel of citrus fruit or melons (including watermelons), generally intended for human consumption (whether as presented or after processing). They may be fresh (including chilled), frozen (whether or not previously cooked by steaming or boiling in water or containing added sweetening matter) or dried (including dehydrated, evaporated or freeze-dried); **provided** they are unsuitable for immediate consumption in that state, they may be provisionally preserved (e.g., by sulphur dioxide gas, in brine, in sulphur water or in other preservative solutions).

The term “chilled” means that the temperature of a product has been reduced, generally to around 0 °C, without the product being frozen. However, some products, such as melons and certain citrus fruit, may be considered to be chilled when their temperature has been reduced to and maintained at +10 °C. The expression “frozen” means that the product has been cooled to below the product’s freezing point until it is frozen throughout.

Fruit and nuts of this Chapter may be whole, sliced, chopped, shredded, stoned, pulped, grated, peeled or shelled.

It should be noted that homogenisation, by itself, does not qualify a product of this Chapter for classification as a preparation of Chapter 20.

The addition of small quantities of sugar does not affect the classification of fruit in this Chapter. The Chapter also includes dried fruit (e.g., dates and prunes), the exterior of which may be covered with a deposit of dried **natural** sugar thus giving the fruit an appearance somewhat similar to that of the crystallised fruit of heading 20.06.

However, this Chapter **does not cover** fruit preserved by osmotic dehydration. The expression “osmotic dehydration” refers to a process whereby pieces of fruit are subjected to prolonged soaking in a concentrated sugar syrup so that much of the water and the natural sugar of the fruit is replaced by sugar from the syrup. The fruit may subsequently be air-dried to further reduce the moisture content. Such fruit is classified in **Chapter 20 (heading 20.08)**.

This Chapter also **excludes** a number of vegetable products more specifically covered in other Chapters even though botanically some of them are fruits, e.g. :

- (a) Olives, tomatoes, cucumbers, gherkins, marrows, pumpkins, aubergines (egg-plant), fruits of the genus *Capsicum* or of the genus *Pimenta* (**Chapter 7**).
- (b) Coffee, vanilla, juniper berries and other products of **Chapter 9**.
- (c) Ground-nuts and other oleaginous fruit, fruit used primarily in pharmacy or in perfumery, locust beans, kernels of apricots or of similar fruit (**Chapter 12**).
- (d) Cocoa beans (**heading 18.01**).

The Chapter further **excludes** :

- (i) Fruit flour, meal and powder (**heading 11.06**).
- (ii) Edible fruit and nuts and peel of melons or citrus fruit, prepared or preserved otherwise than as described above (**Chapter 20**).
- (iii) Roasted fruit and nuts (e.g., chestnuts, almonds and figs), whether or not ground, generally used as coffee substitutes (**heading 21.01**).

It should be noted that fruit and nuts of this Chapter remain classified here even if put up in airtight packings (e.g., dried prunes, dried nuts in cans). In most cases, however, products put up in these packings have been prepared or preserved otherwise than as provided for in the headings of this Chapter, and are therefore **excluded** (**Chapter 20**).

Products of this Chapter remain classified here (e.g., fresh strawberries) when subjected to packaging by means of a Modified Atmospheric Packaging (MAP) process. In a MAP process the atmosphere surrounding the product is altered or controlled (e.g., by removing or reducing the oxygen content and replacing it with or increasing the nitrogen or carbon dioxide content).

08.01 - Coconuts, Brazil nuts and cashew nuts, fresh or dried, whether or not shelled or peeled (+).

- Coconuts :

0801.11 -- Desiccated

0801.12 -- In the inner shell (endocarp)

0801.19 -- Other

- Brazil nuts :

0801.21 -- In shell

0801.22 -- Shelled

- Cashew nuts :

0801.31 -- In shell

0801.32 -- Shelled

The heading includes desiccated coconut, that is dried and shredded flesh of coconut, but it **excludes** copra, the dried flesh of coconut used for the expression of coconut oil and unsuitable for human consumption (**heading 12.03**).

◦◦◦

Subheading Explanatory Note.

Subheading 0801.12

This subheading covers only coconuts whose outer fibrous husk (mesocarp) has been partially or completely removed.

08.02 - Other nuts, fresh or dried, whether or not shelled or peeled.

- Almonds :

0802.11 -- In shell

0802.12 -- Shelled

- Hazelnuts or filberts (*Corylus spp.*) :

0802.21 -- In shell

0802.22 -- Shelled

- Walnuts :

0802.31 -- In shell

0802.32 -- Shelled

- Chestnuts (*Castanea spp.*) :

0802.41 -- In shell

0802.42 -- Shelled

- Pistachios :

0802.51 -- In shell

0802.52 -- Shelled

- Macadamia nuts :

0802.61 -- In shell

0802.62 -- Shelled

0802.70 - Kola nuts (*Cola spp.*)

0802.80 - Areca nuts

0802.90 - Other

The principal nuts of this heading are almonds (sweet or bitter), hazelnuts or filberts, walnuts, chestnuts (*Castanea spp.*), pistachios, macadamia nuts, pecans and pignolia nuts (seeds of the *Pinus pinea*).

This heading also covers areca (betel) nuts used chiefly as a masticatory, cola (kola) nuts used both as a masticatory and as a base in the manufacture of beverages, and an edible, nutlike, spiny-angled fruit of the species *Trapa natans*, sometimes referred to as a water chestnut.

The heading **does not include** :

- (a) The edible tuber of the species *Eleocharis dulcis* or *Eleocharis tuberosa*, commonly known as the Chinese water chestnut (**heading 07.14**).
- (b) Empty walnut or almond hulls (**heading 14.04**).
- (c) Ground-nuts (**heading 12.02**), roasted ground-nuts or peanut butter (**heading 20.08**).
- (d) Horse chestnuts (*Aesculus hippocastanum*) (**heading 23.08**).

08.03 - Bananas, including plantains, fresh or dried.

0803.10 - Plantains

0803.90 - Other

This heading covers all edible fruit of the species of the genus *Musa*.

Plantains are starchy bananas that are less sweet than other bananas. The starch contained in plantains differs from that contained in other bananas in that it does not become sweet during ripening. Plantains are primarily consumed after being fried, roasted, steamed, boiled or otherwise cooked.

08.04 - Dates, figs, pineapples, avocados, guavas, mangoes and mangosteens, fresh or dried.

0804.10 - Dates

0804.20 - Figs

0804.30 - Pineapples

0804.40 - Avocados

0804.50 - Guavas, mangoes and mangosteens

For the purposes of this heading the term "figs" applies only to fruits of the species *Ficus carica*, whether or not to be used for distillation; the heading therefore **does not cover** cactus figs (prickly pears) which fall in **heading 08.10**.

08.05 - Citrus fruit, fresh or dried.(+)

0805.10 - Oranges

0805.20 - Mandarins (including tangerines and satsumas); clementines, wilkins and similar citrus hybrids :

0805.21 - - Mandarins (including tangerines and satsumas)

0805.22 - - Clementines

0805.29 - - Other

0805.40 - Grapefruit, including pomelos

0805.50 - Lemons (*Citrus limon*, *Citrus limonum*) and limes (*Citrus aurantifolia*, *Citrus latifolia*)

0805.90 - Other

The expression " citrus fruit " applies *inter alia* to :

- (1) Oranges, sweet or bitter (Seville oranges).
- (2) Mandarins (including tangerines and satsumas). Mandarins can be grouped in the following main classes or groups :
 - Satsuma (*Citrus unshiu* Marcovitch), which consists of many varieties.
 - King (*Citrus nobilis* Loureiro), which contains a few varieties.
 - Mediterranean (*Citrus deliciosa* Tenore), also known as Willowleaf.
 - Common (*Citrus reticulata* Blanco), which is represented by numerous varieties.
 - Small-fruited mandarins, which consist of many species.
- (3) Clementines, wilkins and similar citrus hybrids.
- (4) Grapefruit (including pomelos).
- (5) Lemons (*Citrus limon*, *Citrus limonum*) and limes (*Citrus aurantifolia*, *Citrus latifolia*).
- (6) Citrons, kumquats and bergamots, etc.

The heading also includes small green oranges and small green lemons of a kind used for preserving.

The heading **excludes** :

- (a) Citrus fruit peel (**heading 08.14**).
- (b) " Orange peas " or " orangettes " which are immature inedible oranges having fallen soon after the tree has blossomed, gathered dry with a view, in particular, to extraction of their essential oil (petit-grain) (**heading 12.11**).

◦
◦◦

Subheading Explanatory Notes.

Subheading 0805.21

This subheading covers mandarins (including tangerines and satsumas). Mandarins (*Citrus reticulata Blanco*) under the “Common” group may be distinguished from ordinary oranges by their smaller, flattened shape, by easier peeling, by a more distinct division of their segments and by their sweeter and more perfumed taste. Mandarins have an open core (much more so than any of the oranges) and seeds with greenish cotyledons (minor exceptions).

Tangerines are round in shape and slightly smaller than an orange. Their peel is bright orange or red in colour. Tangerines peel easily, and their taste is less acid than that of other citrus fruit.

Satsumas (*Citrus unshiu Marcovitch*) are an early variety of mandarin. The fruit is large, yellow-orange in colour, juicy, non-acid and without pips.

Mandarin hybrids (including tangerine and satsuma hybrids) are classified in subheading 0805.29.

Subheading 0805.22

This subheading covers clementines.

Clementines (*Citrus reticulata ‘Clementina’*) may be distinguished from mandarins by the colour of their peel, which is orange to reddish-orange. The peel is smooth and glossy, but slightly pebbled. Furthermore, they are never flattened in shape as are mandarins, but are well rounded and smaller in size. Like mandarins, clementines can be peeled and divided into sections with ease. The taste is sweet, sub acid and aromatic, and is rather more orange-like.

Subheading 0805.29

This subheading covers Wilkins and similar citrus hybrids.

Wilkins are hybrids with parents belonging to two different mandarin groups (Willowleaf and King). They are small to medium-sized and slightly flattened in shape. Their peel is orange in colour at maturity, and is glossy and slightly pebbled. It is medium-thin, somewhat brittle, somewhat adherent but readily peelable. Their flesh is deep orange in colour, and they have more pips. Wilkins are very juicy and have a rich, aromatic and distinctive flavour.

The other main hybrids are tangelos (hybrid of the mandarin with the grapefruit or the pomelo), tangors (hybrid of the tangerine with the sweet orange), calamondins, lyos and rangpurs.

08.06 - Grapes, fresh or dried.

0806.10 - Fresh

0806.20 - Dried

The heading covers fresh grapes whether for dessert purposes or for wine-production (including those rough-packed in barrels), and whether grown outdoors or under glass (hot-house).

The heading also covers dried grapes, the principal kinds being those known as "currants", "sultanas", "Izmir", "Thompson" or the so-called "seedless" raisins (all of which are substantially without pips) and the large raisins with seeds, such as "Muscatel", "Malaga", "Denia", "Damascus", "Lexir" or "Gordo" raisins.

08.07 - Melons (including watermelons) and papaws (papayas), fresh.

- Melons (including watermelons) :

0807.11 -- Watermelons

0807.19 -- Other

0807.20 - Papaws (papayas)

This heading covers fresh melons of the species *Citrullus vulgaris* or *Cucumis melo*, including, *inter alia*, watermelons, citron (preserving) melons, muskmelons, cantaloupes, casaba and honeydew melons. The heading also covers the melon-like fruit of the species *Carica papaya*, known as papaws or papaya. However, the heading **excludes** fruit of the species *Asimina triloba* known in English as pawpaws (**heading 08.10**).

08.08 - Apples, pears and quinces, fresh.

0808.10 - Apples

0808.30 - Pears

0808.40 - Quinces

Apples and pears are classified in this heading whether they are suitable for dessert, for making beverages (e.g., cider or perry) or for industrial purposes (e.g., preparation of apple paste, jam or jelly, extraction of pectin).

Quinces are mainly used for making jam or jelly.

08.09 - Apricots, cherries, peaches (including nectarines), plums and sloes, fresh.

0809.10 - Apricots

- Cherries :

0809.21 -- Sour cherries (*Prunus cerasus*)

0809.29 -- Other

0809.30 - Peaches, including nectarines

0809.40 - Plums and sloes

This heading covers apricots, all varieties of cherries (whiteheart cherries, morello cherries, etc.), peaches (including nectarines), plums of all kinds (greengages, mirabelles, damsons, etc.), and sloes.

08.10 - Other fruit, fresh.

- 0810.10 - Strawberries
- 0810.20 - Raspberries, blackberries, mulberries and loganberries
- 0810.30 - Black, white or red currants and gooseberries
- 0810.40 - Cranberries, bilberries and other fruits of the genus *Vaccinium*
- 0810.50 - Kiwifruit
- 0810.60 - Durians
- 0810.70 - Persimmons
- 0810.90 - Other

This heading covers all edible fruits not falling in any preceding heading of this Chapter nor included in other Chapters of the Nomenclature (see the exclusions in the General Explanatory Note to this Chapter).

It therefore includes :

- (1) Strawberries.
- (2) Raspberries, blackberries, mulberries and loganberries.
- (3) Black, white or red currants and gooseberries.
- (4) Cranberries, bilberries, blueberries, myrtle berries and other fruits of the genus *Vaccinium*.
- (5) Kiwifruit (*Actinidia chinensis* Planch. or *Actinidia deliciosa*).
- (6) Durians (*Durio zibethinus*).
- (7) Persimmons (kakis).
- (8) Boysenberries, rowan berries, elderberries, sapodilla (naseberries), pomegranates, cactus figs (prickly pears), rose hips, jujubes, medlars, longans, litchi, soursops, sweetsops and fruit of the species *Asimina triloba* also known as pawpaws.

The heading **excludes** juniper berries (**heading 09.09**).

08.11 - Fruit and nuts, uncooked or cooked by steaming or boiling in water, frozen, whether or not containing added sugar or other sweetening matter.

0811.10 - Strawberries

0811.20 - Raspberries, blackberries, mulberries, loganberries, black, white or red currants and gooseberries

0811.90 - Other

This heading applies to frozen fruit and nuts which, when fresh or chilled, are classified in the preceding headings of this Chapter. (As regards the meanings of the expressions "chilled" and "frozen", see the General Explanatory Note to this Chapter.)

Fruit and nuts which have been cooked by steaming or boiling in water before freezing remain classified in this heading. Frozen fruit and nuts cooked by other methods before freezing are **excluded (Chapter 20)**.

Frozen fruit and nuts to which sugar or other sweetening matter has been added are also covered by this heading, the sugar having the effect of inhibiting oxidation and thus preventing the change of colour which would otherwise occur, generally on thawing out. The products of this heading may also contain added salt.

08.12 - Fruit and nuts, provisionally preserved (for example, by sulphur dioxide gas, in brine, in sulphur water or in other preservative solutions), but unsuitable in that state for immediate consumption.

0812.10 - Cherries

0812.90 - Other

Provided they remain unsuitable for immediate consumption in that state, this heading applies to fruit and nuts (whether or not blanched or scalded) which have been treated solely to ensure their provisional preservation during transport or storage prior to use (e.g., by sulphur dioxide gas, in brine, in sulphur water or in other preservative solutions).

Such products are used mainly in the food industry (manufacture of jam, preparation of candied fruits, etc.). The products most commonly presented in this state are cherries, strawberries, oranges, citrons, apricots and greengages. They are usually packed in casks, trays or open-lath type containers.

08.13 - Fruit, dried, other than that of headings 08.01 to 08.06; mixtures of nuts or dried fruits of this Chapter.

0813.10 - Apricots

0813.20 - Prunes

0813.30 - Apples

0813.40 - Other fruit

0813.50 - Mixtures of nuts or dried fruits of this Chapter

(A) Dried fruit.

This heading includes dried fruits which when fresh are classified in headings 08.07 to 08.10. They are prepared either by direct drying in the sun or by industrial processes (e.g., tunnel-drying).

The fruits most commonly processed in this way are apricots, prunes, apples, peaches and pears. Dried apples and pears are used for the manufacture of cider or perry as well as for culinary purposes. With the exception of prunes, the fruits are usually halved or sliced, and stoned, cored or seeded. They may also be presented (particularly in the case of apricots and prunes) in the form of slices or blocks of pulp, dried or evaporated.

The heading covers tamarind pods. It also includes tamarind pulp, without sugar or other substances added and not otherwise processed, with or without seeds, strings or pieces of the endocarp.

(B) Mixtures of nuts or dried fruits.

The heading also covers all mixtures of nuts or dried fruits of this Chapter (including mixtures of nuts or dried fruits falling in the same heading). It therefore includes mixtures of fresh or dried nuts, mixtures of dried fruits (excluding nuts) and mixtures of fresh or dried nuts and dried fruits. These mixtures are often presented in boxes, cellulose packets, etc.

Certain dried fruits or mixtures of dried fruits of this heading may be put up (e.g., in sachets) for making herbal infusions or herbal "teas". These products remain classified here.

However, the heading **excludes** such products consisting of a mixture of one or more of the dried fruits of this heading with plants or parts of plants of other Chapters or with other substances such as one or more plant extracts (generally **heading 21.06**).

08.14 - Peel of citrus fruit or melons (including watermelons), fresh, frozen, dried or provisionally preserved in brine, in sulphur water or in other preservative solutions.

The citrus fruit peels most commonly used for edible purposes are orange (including bitter or Seville orange), lemon and citron. These peels are mainly used for making candied peel or for extracting the essential oils.

The heading **excludes** powdered peel (**heading 11.06**) and candied fruit peel (**heading 20.06**).

Chapter 9

Coffee, tea, maté and spices

Notes.

- 1.- Mixtures of the products of headings 09.04 to 09.10 are to be classified as follows :
 - (a) Mixtures of two or more of the products of the same heading are to be classified in that heading;
 - (b) Mixtures of two or more of the products of different headings are to be classified in heading 09.10.

The addition of other substances to the products of headings 09.04 to 09.10 (or to the mixtures referred to in paragraph (a) or (b) above) shall not affect their classification provided the resulting mixtures retain the essential character of the goods of those headings. Otherwise such mixtures are not classified in this Chapter; those constituting mixed condiments or mixed seasonings are classified in heading 21.03.
- 2.- This Chapter does not cover Cubeb pepper (*Piper cubeba*) or other products of heading 12.11.

GENERAL

This Chapter covers :

- (1) Coffee, tea and maté.
- (2) Spices, i.e., a group of vegetable products (including seeds, etc.), rich in essential oils and aromatic principles, and which, because of their characteristic taste, are mainly used as condiments.

These products may be whole or in crushed or powdered form.

As regards the classification of mixtures of products of headings 09.04 to 09.10, see Note 1 to this Chapter. Under the provisions of this Note, the addition of other substances to the products of headings 09.04 to 09.10 (or to the mixtures referred to in paragraph (a) or (b) of the Note) shall not affect their classification **provided** the resulting mixtures retain the essential character of the goods falling in those headings.

This applies, in particular, to spices and mixed spices containing added :

- (a) **Diluents** ("spreader" bases) added to facilitate measuring out of the spices and their distribution in the food preparation (cereal flour, ground rusk, dextrose, etc.).
- (b) Food **colourings** (e.g., xanthophyll).
- (c) Products added to intensify or enhance the flavour of the spices (**synergetics**), such as sodium glutamate.
- (d) Substances such as **salt** or **chemical antioxidants** added, usually in small quantity, to preserve the products and prolong their flavouring powers.

Spices (including mixed spices) containing added substances of other Chapters, but themselves having flavouring or seasoning properties, remain in this Chapter **provided** the added quantity does not affect the essential character of the mixture as a spice.

This Chapter also includes mixtures consisting of plants, parts of plants, seeds or fruit (whole, cut, crushed, ground or powdered) of species falling in different Chapters (e.g., Chapters 7, 9, 11, 12), of a kind used either directly for flavouring beverages or for preparing extracts for the manufacture of beverages,

- (i) if the essential character is given by one or more species of any single one of the headings 09.04 to 09.10 (headings 09.04 to 09.10 as the case may be);
- (ii) if the essential character is given by a mixture of species of two or more of the headings 09.04 to 09.10 (heading 09.10).

This Chapter however **excludes** such mixtures if the essential character is not given by the species mentioned in (i) or by the mixtures referred to in (ii) above (**heading 21.06**).

This Chapter further **excludes** :

- (a) Vegetables (e.g., parsley, chervil, tarragon, cress, sweet marjoram, coriander and dill) of **Chapter 7**.
- (b) Mustard seed (**heading 12.07**); mustard flour, whether unprepared or prepared (**heading 21.03**).
- (c) Hop cones (**heading 12.10**).
- (d) Certain fruits, seeds and parts of plants which, although they can be used as spices, are more often employed in perfumery or in medicine (**heading 12.11**) (e.g., cassia pods, rosemary, wild marjoram, basil, borage, hyssop, all species of mint, rue and sage).
- (e) Mixed condiments and mixed seasonings (**heading 21.03**).

09.01 - Coffee, whether or not roasted or decaffeinated; coffee husks and skins; coffee substitutes containing coffee in any proportion.

- Coffee, not roasted :

0901.11 -- Not decaffeinated

0901.12 -- Decaffeinated

- Coffee, roasted :

0901.21 -- Not decaffeinated

0901.22 -- Decaffeinated

0901.90 - Other

This heading includes :

- (1) Raw coffee in all forms, i.e. : in berries, as gathered from the shrub; in beans or seeds complete with their yellowish skins; in beans or seeds stripped of their skins.
- (2) Coffee from which the caffeine has been extracted by soaking the raw beans in various solvents.
- (3) Roasted coffee (with or without caffeine content) whether or not ground.
- (4) Husks and skins of coffee.
- (5) Coffee substitutes containing coffee in any proportion.

The heading **excludes** :

- (a) Coffee wax (**heading 15.21**).
- (b) Extracts, essences and concentrates of coffee (sometimes known as instant coffee) and preparations with a basis of those extracts, essences or concentrates; roasted coffee substitutes not containing coffee (**heading 21.01**).
- (c) Caffeine, the alkaloid in coffee (**heading 29.39**).

09.02 - Tea, whether or not flavoured.

0902.10 - Green tea (not fermented) in immediate packings of a content not exceeding 3 kg

0902.20 - Other green tea (not fermented)

0902.30 - Black tea (fermented) and partly fermented tea, in immediate packings of a content not exceeding 3 kg

0902.40 - Other black tea (fermented) and other partly fermented tea

The heading covers the different varieties of tea derived from the plants of the botanical genus *Thea (Camellia)*.

The preparation of green tea consists essentially of heating the fresh leaves, rolling them and drying them. In the case of black tea, the leaves are rolled and fermented before being fired or dried.

The heading also includes partly fermented tea (e.g., Oolong tea).

The heading includes tea flowers, buds and residues, as well as powdered tea (leaves, flowers or buds) agglomerated in balls or tablets, as well as tea presented compressed into various shapes and sizes.

Tea which has been flavoured by a steaming process (during fermentation, for example) or by the addition of essential oils (e.g., lemon or bergamot oil), artificial flavourings (which may be in crystalline or powder form) or parts of various other aromatic plants or fruits (such as jasmine flowers, dried orange peel or cloves) is also classified in this heading.

The heading also includes decaffeinated tea, but it **excludes** caffeine as such (**heading 29.39**).

The heading further **excludes** products **not** derived from the plants of the botanical genus *Thea* but sometimes called "teas", e.g.:

- (a) Maté (Paraguay tea) (**heading 09.03**).
- (b) Products for making herbal infusions or herbal "teas". These are classified, for example, in **heading 08.13, 09.09, 12.11 or 21.06**.
- (c) Ginseng "tea" (a mixture of ginseng extract with lactose or glucose) (**heading 21.06**).

09.03 - Maté.

Maté consists of the dried leaves of certain shrubs of the holly family which grow in South America. It is sometimes known as "Paraguay tea" or "Jesuits' tea". Maté is used for the preparation by infusion of a drink containing only a little caffeine.

09.04 - Pepper of the genus *Piper*; dried or crushed or ground fruits of the genus *Capsicum* or of the genus *Pimenta*.

- Pepper :

0904.11 -- Neither crushed nor ground

0904.12 -- Crushed or ground

- Fruits of the genus *Capsicum* or of the genus *Pimenta* :

0904.21 -- Dried, neither crushed nor ground

0904.22 -- Crushed or ground

(1) Pepper of the genus *Piper*.

This term includes the seeds or fruits of all pepper plants of the genus *Piper*, **except** Cubeb pepper (*Piper cubeba*) (**heading 12.11**). The main commercial variety is pepper of the species *Piper nigrum*, which takes the form of black or white pepper. Black pepper-corns are obtained from the unripe fruits by sun-drying or smoking, sometimes after treatment with boiling water. White pepper is prepared from the nearly ripe fruit from which the pulp and outer coating of the seed have been removed by soaking or slight fermentation. White pepper is also often prepared from black pepper-corns by grinding off the outer parts. White pepper, which is in fact yellowish grey, is not so pungent as black.

Long pepper (*Piper longum*) is another variety of pepper.

The heading also covers pepper dust and sweepings.

Certain products incorrectly known as peppers are in fact pimentos, e.g., Indian, Turkish, Spanish, Cayenne and Jamaica peppers.

(2) Dried or crushed or ground fruits of the genus *Capsicum* or of the genus *Pimenta*.

Fruits of the genus *Capsicum* generally belong to the species *Capsicum frutescens* or *Capsicum annuum* and include two main groups, the chillies and the paprikas. There are many varieties (Cayenne pepper, Sierra Leone and Zanzibar pepper, Spanish and Hungarian paprika, etc.).

Fruits of the genus *Pimenta* include Jamaica pepper (also known as clove pepper, English pepper and allspice).

These fruits share the common characteristic of a bitter, strong, burning and long-lasting flavour; however there are other varieties of the genus *Capsicum* which do not have a pungent odour (e.g., *Capsicum annuum* var. *grossum*).

The heading **does not include** uncrushed or unground fresh fruits of the genus *Capsicum* or of the genus *Pimenta* (**heading 07.09**).

09.05 - Vanilla.

0905.10 - Neither crushed nor ground

0905.20 - Crushed or ground

This is the fruit (or bean) of a climbing plant of the orchid family. It is blackish in colour and very aromatic. There are two kinds of vanilla, long and short, as well as a very low-grade variety known as vanillon (obtained from the species *Vanilla pompona*), soft, almost viscous and always open.

The heading **does not include** :

- (a) Vanilla oleoresin (sometimes erroneously known as “vanilla resinoid” or “vanilla extract”) (**heading 13.02**).
- (b) Vanilla sugar (**heading 17.01** or **17.02**).
- (c) Vanillin (the odoriferous principle of vanilla) (**heading 29.12**).

09.06 - Cinnamon and cinnamon-tree flowers (+).

- Neither crushed nor ground :

0906.11 - - Cinnamon (*Cinnamomum zeylanicum* Blume)

0906.19 -- Other

0906.20 - Crushed or ground

Cinnamon is the inner bark of young branches of certain trees of the *Lauraceae* family. Sri Lankan (Ceylon) type, Seychelles type and Madagascan type cinnamon (*Cinnamomum zeylanicum* Blume), also called fine cinnamon, is generally presented in bundles of pale-coloured strips of bark rolled together. Chinese type (*Cinnamomum cassia* (Nees) ex Blume), Indonesian type (*Cinnamomum burmanii* (C.G.Nees)) and Vietnamese type (*Cinnamomum loureirii* Nees) cinnamon, also known as cassia or common cinnamon, is formed of thicker layers of bark, streaked with brown; it is generally presented in rolls of a single layer. Other varieties of cinnamon include *Cinnamomum obtusifolium*, *Cinnamomum tamala* and *Cinnamomum sintek*.

This heading also covers cinnamon waste, known as "chips", used chiefly for the preparation of cinnamon essence.

Cinnamon-tree flowers are the dried and sieved flowers of the cinnamon tree. They are club-shaped and of a length not normally exceeding 1 cm. After grinding, they are mixed with cinnamon.

The heading also includes cinnamon fruit.

Three small black circles are arranged in a triangular pattern: one at the top center and two at the bottom corners.

Subheading Explanatory Note.

Subheading 0906.11

The scope of this subheading is limited to cinnamon which is the inner bark of young branches of the tree or shrub *Cinnamomum zeylanicum* Blume, commonly known as Sri Lankan (Ceylon) type, Seychelles type and Madagascan type cinnamon.

General commercial grades are quills, quillings, featherings and chips.

09.07 - Cloves (whole fruit, cloves and stems).

0907.10 - Neither crushed nor ground

0907.20 - Crushed or ground

This heading includes :

- (1) Whole fruit of the clove tree (these have the characteristic taste and smell of cloves although less pronounced).
- (2) Cloves (the flowers of the clove tree picked before maturity and dried in the sun).
- (3) The fine, greyish, strongly scented stems of the clove flowers.

The heading **excludes** clove bark and leaves (**heading 12.11**).

09.08 - Nutmeg, mace and cardamoms.

- Nutmeg :

0908.11 -- Neither crushed nor ground

0908.12 -- Crushed or ground

- Mace :

0908.21 -- Neither crushed nor ground

0908.22 -- Crushed or ground

- Cardamoms :

0908.31 -- Neither crushed nor ground

0908.32 -- Crushed or ground

This heading covers :

- (a) **Nutmegs**, round or long, whether or not shelled.
- (b) **Mace**, which is the membranous envelope of the nutmeg, between the outer shell and the kernel. This substance, which is cut into strips, has the same properties as nutmeg, but even more marked. It is bright red when fresh, but turns yellow with age, and becomes brittle and translucent like horn. Some mace is flaxen-coloured or even white.
- (c) **Cardamoms** :
 - (1) **Grape cardamoms**, so-called because this variety grows in the form of closely packed clusters which are sometimes presented whole, but are more usually presented as single nuts about the size of a grape-pip. The nuts are whitish, rounded with three projecting sides, light and membranous; they are divided internally into three sections containing many very aromatic seeds with a bitter, pungent flavour.
 - (2) **Small or medium cardamoms**, similar to grape cardamoms in structure and properties, but more triangular and elongated.
 - (3) **Large cardamoms**, which are triangular, from 27 to 40 mm long, and have a brownish shell.
 - (4) **Malaguetta pepper** or “**grains of paradise**” (*Aframomum melegueta*) are almost invariably presented shelled, in small, elongated, angular seeds which, though rough surfaced, gleam as if they had been varnished. They are odourless but have a bitter, burning flavour similar to that of pepper.

09.09 - Seeds of anise, badian, fennel, coriander, cumin or caraway; juniper berries.

- Seeds of coriander :

0909.21 -- Neither crushed nor ground

0909.22 -- Crushed or ground

- Seeds of cumin :

0909.31 -- Neither crushed nor ground

0909.32 -- Crushed or ground

- Seeds of anise, badian, caraway or fennel; juniper berries :

0909.61 -- Neither crushed nor ground

0909.62 -- Crushed or ground

These fruits or seeds are used for consumption as spices, for industrial purposes (e.g., in distilleries) and for medicinal purposes. They remain in this heading even when, in the case of anise seeds in particular, they are put up (e.g., in sachets) for making herbal infusions or herbal "teas".

The **seeds of anise** referred to here are the green anise, an egg-shaped seed, striped lengthwise, greyish-green, with a very characteristic odour and aromatic flavour. **Badian** is star anise.

Coriander, cumin and caraway seeds are the aromatic seeds of certain plants of the umbelliferous family, used chiefly in the preparation of liqueurs.

Fennel seeds, obtained from the culinary herb, may be dark grey giving off a strong and agreeable odour, or pale green with a very individual sweet scent.

Juniper berries are a very dark brown faintly tinted with purplish-blue, and are covered with a resinous dust. They contain a reddish aromatic pulp, with a bitter and slightly sweetened taste, enclosing three small and very hard pips. These berries are used to flavour various alcoholic beverages (e.g., gin), sauerkraut and sundry food preparations, and for the extraction of the essential oil.

09.10 - Ginger, saffron, turmeric (curcuma), thyme, bay leaves, curry and other spices.

- Ginger :

0910.11 -- Neither crushed nor ground

0910.12 -- Crushed or ground

0910.20 - Saffron

0910.30 - Turmeric (curcuma)

- Other spices :

0910.91 -- Mixtures referred to in Note 1 (b) to this Chapter

0910.99 -- Other

The heading includes :

- (a) **Ginger** (including fresh ginger, provisionally preserved in brine, unsuitable in that state for immediate consumption); ginger preserved in syrup is **excluded (heading 20.08)**.
- (b) **Saffron**, which consists of the dried stigmas and styles of the flowers of the saffron crocus (*Crocus sativus*). It may also be presented as an orange-red powder with a strong, penetrating and agreeable odour. It contains a colouring element of little stability. It is used as a seasoning and also in confectionery and medicine.
- (c) **Turmeric or curcuma** (*Curcuma longa*), sometimes incorrectly called " Indian saffron " because of its vivid yellow colour; the curcuma rhizome is marketed either whole or, more often, in powder form.
- (d) **Thyme** (including wild thyme) and **bay leaves**, whether or not dried.
- (e) **Curry powder**, consisting of a mixture in variable proportions of turmeric (curcuma), of various other spices (e.g., coriander, black pepper, cumin, ginger, cloves) and of other flavouring substances (e.g., garlic powder) which, although not falling in this Chapter, are often used as spices.
- (f) **Dill seed** (*Anethum graveolens*), and **fenugreek seed** (*Trigonella foenum graecum*).
- (g) **Mixtures** of the products of headings 09.04 to 09.10 when the separate ingredients of the mixture fall in different headings, e.g., mixtures of pepper (heading 09.04) with products of heading 09.08.

Chapter 10

Cereals

Notes.

- 1.- (A) The products specified in the headings of this Chapter are to be classified in those headings only if grains are present, whether or not in the ear or on the stalk.
- (B) The Chapter does not cover grains which have been hulled or otherwise worked. However, rice, husked, milled, polished, glazed, parboiled or broken remains classified in heading 10.06.
- 2.- Heading 10.05 does not cover sweet corn (Chapter 7).

○
○ ○

Subheading Note.

- 1.- The term "durum wheat" means wheat of the *Triticum durum* species and the hybrids derived from the inter-specific crossing of *Triticum durum* which have the same number (28) of chromosomes as that species.

GENERAL

This Chapter covers cereal grains only, whether or not presented in sheaves or in the ear. Grain obtained from cereals cut before maturity and still complete with husks is classified with ordinary grain. Fresh cereals (**other than** sweet corn of **Chapter 7**), whether or not suitable for use as vegetables, remain classified in this Chapter.

Rice remains classified in heading 10.06 even if it has been husked, milled, glazed, polished, parboiled, or broken, provided it has not been otherwise worked. Other grains are, however, **excluded** from the Chapter if they have been hulled or otherwise worked, for example, as described in heading 11.04 (see the corresponding Explanatory Note).

10.01 - Wheat and meslin (+).

- Durum wheat :

1001.11 - - Seed

1001.19 - - Other

- Other :

1001.91 - - Seed

1001.99 - - Other

Wheat can be divided into two main classes :

- (1) **Common wheat**, soft, semi-hard or hard, usually having a floury fracture;
- (2) **Durum wheat** (see Subheading Note 1 to this Chapter). Durum wheat is generally of a colour ranging from amber yellow to brown; it usually shows a translucent, hornlike, vitreous fracture.

Spelt, a type of wheat with a small brown grain which retains its husk even after threshing, is also classified in this heading.

Meslin is a mixture of wheat and rye, generally in proportions of two to one.

Subheading Explanatory Note.

Subheadings 1001.11 and 1001.91

For the purposes of subheadings 1001.11 and 1001.91, the term "seed" covers only wheat or meslin regarded by the competent national authorities as being for sowing.

10.02 - Rye (+).

1002.10 - Seed

1002.90 - Other

Rye has a rather elongated grain, greenish-grey or light grey in colour. Its flour is grey.

Rye bearing the fungoid growth known as ergot is **excluded (heading 12.11)**.

**Subheading Explanatory Note.****Subheading 1002.10**

For the purposes of subheading 1002.10, the term "seed" covers only rye regarded by the competent national authorities as being for sowing.

10.03 - Barley (+).

1003.10 - Seed

1003.90 - Other

Barley has a fleshier grain than that of wheat. It is mainly used as livestock feed, for the manufacture of malt and, when polished or pearled, for the preparation of soups or cooked foods.

Bracteiferous varieties of barley differ from most other cereals in that their husks (or hulls) become fused to the grain kernel in the course of growth and therefore cannot be separated by simple threshing or winnowing. Barley grain of this kind, which is straw-yellow in colour and pointed at the ends, falls in the heading only if presented complete with husk (or hull). When this husk or hull has been removed bracteiferous barley grains are **excluded (heading 11.04)**; this removal requires a milling process which sometimes also removes part of the pericarp.

The variety of barley which in its natural state has no husk or hull, remains in this heading provided it has not undergone any process other than threshing or winnowing.

The heading **does not include** :

- (a) Sprouted barley (malt), nor roasted malt (see Explanatory Note to **heading 11.07**).
- (b) Roasted barley (coffee substitutes) (**heading 21.01**).
- (c) Malt sprouts separated from the malted grain during the kilning process and other brewing wastes (dregs of cereals, hops, etc.) (**heading 23.03**).

◦
◦ ◦

Subheading Explanatory Note.**Subheading 1003.10**

For the purposes of subheading 1003.10, the term “seed” covers only barley regarded by the competent national authorities as being for sowing.

10.04 - Oats (+).

1004.10 - Seed

1004.90 - Other

There are two main kinds of oats : grey (or black) oats and white (or yellow) oats.

This heading covers grains with their husks as well as those which in their natural state have no husk or hull, provided they have not undergone any process other than threshing or winnowing.

The heading also covers oats from which the glume tips may have been removed during normal processing or handling (threshing, transportation, reloading, etc.).

**Subheading Explanatory Note.****Subheading 1004.10**

For the purposes of subheading 1004.10, the term "seed" covers only oats regarded by the competent national authorities as being for sowing.

10.05 - Maize (corn) (+).

1005.10 - Seed

1005.90 - Other

There are several kinds of maize (corn), with grains of different colours (golden yellow, white, sometimes reddish-brown or mottled), and of different shapes (round, dog-tooth shaped, flattened, etc.).

The heading **does not include** sweet corn (**Chapter 7**).

**Subheading Explanatory Note.****Subheading 1005.10**

For the purposes of subheading 1005.10, the term "seed" covers only maize (corn) regarded by the competent national authorities as being for sowing.

10.06 - Rice.

- 1006.10 - Rice in the husk (paddy or rough)
- 1006.20 - Husked (brown) rice
- 1006.30 - Semi-milled or wholly milled rice, whether or not polished or glazed
- 1006.40 - Broken rice

This heading covers :

- (1) **Rice in the husk (paddy or rough rice)**, that is to say, rice grain still tightly enveloped by the husk.
- (2) **Husked (brown) rice (cargo rice)** which, although the husk has been removed by mechanical hullers, is still enclosed in the pericarp. Husked rice almost always still contains a small quantity of paddy.
- (3) **Semi-milled rice**, that is to say, whole rice grains from which the pericarp has been partly removed.
- (4) **Wholly milled rice (bleached rice)**, whole rice grains from which the pericarp has been removed by passage through special tapering cylinders.

Wholly milled rice may be polished and subsequently glazed to improve its appearance. The polishing process (which is designed to embellish the mat surface of the plain milled rice) is carried out in brush machines or "polishing cones". "Glazing" consists of coating the grains with a mixture of glucose and talcum in special glazing drums.

The heading also includes "Camolino" rice, which consists of milled rice coated with a thin film of oil.

- (5) **Broken rice**, i.e., rice broken during processing.

The heading also includes the following :

- (a) **Enriched rice**, consisting of a mixture of ordinary milled rice grains and a very small proportion (in the order of 1 %) of rice grains coated or impregnated with vitamin substances.
- (b) **Parboiled rice**, which, while still in the husk and before being subjected to other processes (e.g., husking, milling, polishing), has been soaked in hot water or steamed and then dried. At certain stages of the parboiling process, the rice may have been treated under pressure or exposed to a complete or partial vacuum.

The grain structure of parboiled rice is only modified to a minor extent by the process it has undergone. Such rice, after milling, polishing, etc., takes from 20 to 35 minutes to cook fully.

The varieties of rice which have been submitted to treatments considerably modifying the grain structure are **excluded** from this heading. Pre-cooked rice consisting of worked rice grains cooked either fully or partially and then dehydrated falls in **heading 19.04**. Partially pre-cooked rice takes 5 to 12 minutes to prepare for consumption, whereas fully pre-cooked rice needs only to be soaked in water and brought to the boil before consumption. "Puffed" rice obtained by a swelling process and ready for consumption is also classified in **heading 19.04**.

10.07 - Grain sorghum (+).

1007.10 - Seed

1007.90 - Other

This heading covers only those varieties of sorghum which are known as grain sorghums and whose grains may be used as cereals for human consumption. The heading includes sorghums such as *caffrorum* (kafir), *cernuum* (white durra), *durra* (brown durra) and *nervosum* (kaoliang).

The heading **does not include** forage sorghums (which are used for making hay or silage) such as *halepensis* (halepense), grass sorghums (which are used for grazing) such as *sudanensis* (sudanense) or sweet sorghums (which are used primarily for the manufacture of syrup or molasses) such as *saccharatum*. When presented as seeds for sowing, these products are classified in **heading 12.09**. Otherwise, forage sorghums and grass sorghums fall to be classified in **heading 12.14** and sweet sorghums in **heading 12.12**. The heading also **excludes** broomcorn (*Sorghum vulgare var. technicum*), which is classified in **heading 14.04**.

○
○ ○

Subheading Explanatory Note.**Subheading 1007.10**

For the purposes of subheading 1007.10, the term “seed” covers only grain sorghum regarded by the competent national authorities as being for sowing.

10.08 - Buckwheat, millet and canary seeds; other cereals (+).

1008.10 - Buckwheat

- Millet :

1008.21 -- Seed

1008.29 -- Other

1008.30 - Canary seeds

1008.40 - Fonio (*Digitaria spp.*)

1008.50 - Quinoa (*Chenopodium quinoa*)

1008.60 - Triticale

1008.90 - Other cereals

(A) BUCKWHEAT, MILLET AND CANARY SEED

This group covers :

- (1) **Buckwheat.** This cereal, also known as black wheat, belongs to the *Polygonaceae* family, quite different from the *Gramineae* family which includes most other cereals.
- (2) **Millet**, a round grain, pale-yellow in colour. It includes the following species : *Setaria spp.*, *Pennisetum spp.*, *Echinochloa spp.*, *Eleusine spp.* (including *Eleusine coracana* (Coracan)), *Panicum spp.*, *Digitaria sanguinalis* and *Eragrostis tef*.
- (3) **Canary seed**, a shining straw coloured seed, elongated and pointed at both ends.

(B) OTHER CEREALS

This group includes certain hybrid grains, e.g., triticale, a cross between wheat and rye.

Subheading Explanatory Note.

Subheading 1008.21

For the purposes of subheading 1008.21, the term "seed" covers only millet regarded by the competent national authorities as being for sowing.

Chapter 11

Products of the milling industry; malt; starches; inulin; wheat gluten

Notes.

1.- This Chapter does not cover :

- (a) Roasted malt put up as coffee substitutes (heading 09.01 or 21.01);
- (b) Prepared flours, groats, meals or starches of heading 19.01;
- (c) Corn flakes or other products of heading 19.04;
- (d) Vegetables, prepared or preserved, of heading 20.01, 20.04 or 20.05;
- (e) Pharmaceutical products (Chapter 30); or
- (f) Starches having the character of perfumery, cosmetic or toilet preparations (Chapter 33).

2.- (A) Products from the milling of the cereals listed in the table below fall in this Chapter if they have, by weight on the dry product :

- (a) a starch content (determined by the modified Ewers polarimetric method) exceeding that indicated in Column (2); and
- (b) an ash content (after deduction of any added minerals) not exceeding that indicated in Column (3).

Otherwise, they fall in heading 23.02. However, germ of cereals, whole, rolled, flaked or ground is always classified in heading 11.04.

(B) Products falling in this Chapter under the above provisions shall be classified in heading 11.01 or 11.02 if the percentage passing through a woven metal wire cloth sieve with the aperture indicated in Column (4) or (5) is not less, by weight, than that shown against the cereal concerned.

Otherwise, they fall in heading 11.03 or 11.04.

Cereal (1)	Starch Content (2)	Ash Content (3)	Rate of passage through a sieve with an aperture of	
			315 micrometres (microns) (4)	500 micrometers (microns) (5)
Wheat and rye	45 %	2.5 %	80 %	-
Barley	45 %	3 %	80 %	-
Oats	45 %	5 %	80 %	-
Maize (corn) and grain sorghum	45 %	2 %	-	90 %
Rice.....	45 %	1.6 %	80 %	-
Buckwheat	45 %	4 %	80 %	-

- 3.- For the purposes of heading 11.03, the terms " groats " and " meal " mean products obtained by the fragmentation of cereal grains, of which :
- (a) in the case of maize (corn) products, at least 95 % by weight passes through a woven metal wire cloth sieve with an aperture of 2 mm;
 - (b) in the case of other cereal products, at least 95 % by weight passes through a woven metal wire cloth sieve with an aperture of 1.25 mm.

GENERAL

This Chapter includes :

- (1) Products from the milling of the cereals of Chapter 10 and of sweet corn of Chapter 7, **other than** milling residues of **heading 23.02**. In this context, the products from the milling of wheat, rye, barley, oats, maize (corn) (including whole cobs ground with or without their husks), grain sorghum, rice and buckwheat falling in this Chapter are to be distinguished from the residues of heading 23.02 in accordance with the criteria as to starch and ash content laid down in Chapter Note 2 (A).

Within the Chapter, as regards the cereals mentioned by name above, the flours of heading 11.01 or 11.02 are to be distinguished from the products of heading 11.03 or 11.04 in accordance with the criterion as to passage through a sieve laid down in Chapter Note 2 (B). At the same time, all cereal groats and meal of heading 11.03 must fulfil the relevant criterion as to passage through a sieve laid down in Chapter Note 3.

- (2) Products also obtained from the cereals of Chapter 10 by submitting them to the processes provided for in the various headings of the Chapter, such as malting or the extraction of starch or wheat gluten.
- (3) Products obtained by submitting raw materials of other Chapters (dried leguminous vegetables, potatoes, fruit, etc.) to processes similar to those indicated in paragraph (1) or (2) above.

This Chapter **excludes**, *inter alia* :

- (a) Roasted malt put up as coffee substitutes (**heading 09.01 or 21.01**).
- (b) Cereal husks (**heading 12.13**).
- (c) Prepared flours, groats, meals or starches of **heading 19.01**.
- (d) Tapioca (**heading 19.03**).
- (e) Puffed rice, corn flakes and the like, obtained by swelling or roasting, and bulgur wheat in the form of worked grains (**heading 19.04**).
- (f) Vegetables, prepared or preserved, of **headings 20.01, 20.04 and 20.05**.
- (g) Residues derived from the sifting, milling or other working of cereals or of leguminous plants (**heading 23.02**).
- (h) Pharmaceutical products (**Chapter 30**).
- (ij) Products of **Chapter 33** (see Notes 3 and 4 to Chapter 33).

11.01 - Wheat or meslin flour.

This heading covers wheat or meslin flour (i.e., the pulverised products obtained by milling the cereals of heading 10.01) which fulfil the requirements as to starch content and ash content set out in paragraph (A) of Chapter Note 2 (see General Explanatory Note) and comply with the criterion of passage through a standard sieve as required by paragraph (B) of that Note.

Flours of this heading may be improved by the addition of very small quantities of mineral phosphates, anti-oxidants, emulsifiers, vitamins or prepared baking powders (self-raising flour). Wheat flour may be further enriched by an addition of gluten, generally not exceeding 10 %.

The heading also covers "swelling" (pregelatinised) flours which have been heat treated to pregelatinise the starch. They are used for making preparations of heading 19.01, bakery improvers or animal feeds or in certain industries such as the textile or paper industries or in metallurgy (for the preparation of foundry core binders).

Flours which have been further processed or had other substances added with a view to their use as food preparations are **excluded** (generally **heading 19.01**).

The heading also **excludes** flours mixed with cocoa (**heading 18.06** if they contain 40 % or more by weight of cocoa calculated on a totally defatted basis, or **heading 19.01** if less).

11.02 - Cereal flours other than of wheat or meslin.

1102.20 - Maize (corn) flour

1102.90 - Other

This heading covers flours (i.e., the pulverised products obtained by milling the cereals of Chapter 10) **other than** flours of wheat or meslin.

Products of the milling of rye, barley, oats, maize (corn) (including whole cobs ground with or without their husks) grain sorghum, rice or buckwheat are classified in this heading as flours if they fulfil the requirements as to starch content and ash content set out in paragraph (A) of Chapter Note 2 (see General Explanatory Note) and comply with the criterion of passage through a standard sieve as required by paragraph (B) of that Note.

Flours of this heading may be improved by the addition of very small quantities of mineral phosphates, anti-oxidants, emulsifiers, vitamins or prepared baking powders (self-raising flour).

The heading also covers "swelling" (pregelatinised) flours which have been heat treated to pregelatinise the starch. They are used for making preparations of heading 19.01, bakery improvers or animal feeds or in certain industries such as the textile or paper industries or in metallurgy (for the preparation of foundry core binders).

Flours which have been further processed or had other substances added with a view to their use as food preparations are **excluded** (generally **heading 19.01**).

The heading also **excludes** flours mixed with cocoa (**heading 18.06** if they contain 40 % or more by weight of cocoa calculated on a totally defatted basis, or **heading 19.01** if less).

11.03 - Cereal groats, meal and pellets.

- Groats and meal :

1103.11 -- Of wheat

1103.13 -- Of maize (corn)

1103.19 -- Of other cereals

1103.20 - Pellets

The cereal groats and meal of this heading are products, obtained by the fragmentation of cereal grains (including whole maize (corn) cobs ground with or without their husks), which, where appropriate, fulfil the requirements as to starch and ash content laid down in Chapter Note 2 (A) and which in all cases comply with the relevant criterion as to passage through a sieve laid down in Chapter Note 3.

As regards the distinction to be made between the flours of heading 11.01 or 11.02, the groats and meal of this heading and the products of heading 11.04, see the General Explanatory Note to the Chapter (Item (1), second paragraph).

Cereal groats are small fragments or floury kernels obtained by the rough grinding of grains.

Meal is a more granular product than flour and is obtained either from the first sifting after the initial milling operation, or by re-grinding and re-sifting the groats resulting from that initial milling.

Durum wheat meal, or semolina, is the principal raw material in the manufacture of macaroni, spaghetti or the like. Semolina is also used directly as a foodstuff (e.g., in making semolina puddings).

This heading also includes meal (e.g., of maize (corn)) pregelatinised by heat treatment, used, for instance, as an additive in brewing.

Pellets are products from the milling of cereals of this Chapter which have been agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight (see Note 1 to Section II). The heading **does not cover** pelletised residues derived from the milling of cereals (**Chapter 23**).

11.04 - Cereal grains otherwise worked (for example, hulled, rolled, flaked, pearled, sliced or kibbled), except rice of heading 10.06; germ of cereals, whole, rolled, flaked or ground.

- Rolled or flaked grains :

1104.12 -- Of oats

1104.19 -- Of other cereals

- Other worked grains (for example, hulled, pearled, sliced or kibbled) :

1104.22 -- Of oats

1104.23 -- Of maize (corn)

1104.29 -- Of other cereals

1104.30 - Germ of cereals, whole, rolled, flaked or ground

This heading covers all unprepared milling products of cereals, **except** flours (**headings 11.01 and 11.02**), groats, meal and pellets (**heading 11.03**), and residues (**heading 23.02**). As regards the distinction to be made between the products of this heading and the **exceptions** referred to, see Item (1) of the General Explanatory Note to the Chapter.

This heading covers :

(1) **Rolled or flaked grain** (e.g., barley or oats), obtained by crushing or rolling the whole grain (whether or not dehulled) or kibbled grain or the products described in Items (2) and (3) below and in Items (2) to (5) of the Explanatory Note to heading 10.06. In this process, the grain is usually steam-heated or rolled between heated rollers. Breakfast foods of the "corn flakes" type are cooked preparations ready for consumption and therefore fall, like similar cooked cereals, in **heading 19.04**.

(2) **Oats, buckwheat and millet** from which the husk but not the pericarp has been removed.

However, the heading **does not cover** oats which in their natural state have no husk or hull, provided they have not undergone any process other than threshing or winnowing (**heading 10.04**).

(3) **Grain which has been hulled or otherwise worked** to remove wholly or partly the pericarp (the skin beneath the husk). The floury kernel may then be visible. Grains of the bracteiferous varieties of barley are also classified in this heading if their husks (or hulls) have been removed. (The husks can be removed only by grinding since they adhere too firmly to the grain kernel to be separated by mere threshing or winnowing - see the Explanatory Note to heading 10.03).

(4) **Pearled grains** (principally barley), i.e., grain from which practically the whole pericarp has been removed; these are more rounded at the ends.

(5) **Kibbled grain**, i.e., grain (whether or not dehulled) cut or broken into fragments and differing from groats in that the fragments are coarser and more irregular.

11.05 - Flour, meal, powder, flakes, granules and pellets of potatoes.

1105.10 - Flour, meal and powder

1105.20 - Flakes, granules and pellets

This heading applies to dried potatoes presented as flour, meal, powder, flakes, granules or pellets. The flour, powder, flakes and granules of the heading may be obtained by steam-cooking and mashing fresh potatoes and subsequent drying of the resulting mash either to a flour, powder or granules or to thin sheets which are cut into small flakes. The pellets of the heading are usually obtained by agglomeration of flour, meal, powder or pieces of potato.

Products of this heading may be improved by the addition of very small amounts of anti-oxidants, emulsifiers or vitamins.

However, the heading **excludes** products to which other substances have been added so that they take on the characteristics of potato preparations.

The heading also **excludes** :

- (a) Potatoes which have been simply dried, dehydrated or evaporated, without further processing (**heading 07.12**).
- (b) Potato starch (**heading 11.08**).
- (c) Tapioca substitutes prepared from potato starch (**heading 19.03**).

11.06 - Flour, meal and powder of the dried leguminous vegetables of heading 07.13, of sago or of roots or tubers of heading 07.14 or of the products of Chapter 8.

1106.10 - Of the dried leguminous vegetables of heading 07.13

1106.20 - Of sago or of roots or tubers of heading 07.14

1106.30 - Of the products of Chapter 8

(A) Flour, meal and powder of the dried leguminous vegetables of heading 07.13.

This heading includes the flour, meal and powder made from peas, beans or lentils; they are mainly used for prepared soups or purées.

The heading **does not cover** :

- (a) Non-defatted soya flour (**heading 12.08**).
- (b) Locust bean flour (**heading 12.12**).
- (c) Soups and broths (whether in liquid, solid or powder form), with a basis of vegetable flours or meals (**heading 21.04**).

(B) Flour, meal and powder of sago or of roots or tubers of heading 07.14.

These products are obtained by the simple grinding or grating of the pith of the sago palm or of the dried roots of the manioc, etc. Some of these products are often subjected to heat treatment in the course of manufacture to eliminate toxic substances; this treatment may entail pregelatinisation of the starch.

The heading **does not cover** starches obtained from these sources (it should be noted that the starch obtained from sago is sometimes called "sago flour"). These starches fall in **heading 11.08** and can be distinguished from the flours of this heading, because flours, unlike starches, do not crackle when rubbed between the fingers. Pelletised flour, meal and powder of sago or of roots or tubers of heading 07.14 are also **excluded** (**heading 07.14**).

(C) Flour, meal and powder of the products of Chapter 8.

The principal fruits or nuts of Chapter 8 which are made into flours, meals or powders are chestnuts, almonds, dates, bananas, coconuts and tamarinds.

The heading also includes flour, meal and powder of peel of fruits.

However, the heading **does not cover** tamarind powder in packings for retail sale for prophylactic or therapeutic purposes (**heading 30.04**).

Products of this heading may be improved by the addition of very small amounts of anti-oxidants or emulsifiers.

The heading also **excludes** :

- (a) Sago pith (**heading 07.14**).
- (b) Prepared foodstuffs known as tapioca (**heading 19.03**).

11.07 - Malt, whether or not roasted.

1107.10 - Not roasted

1107.20 - Roasted

Malt is germinated grain (most frequently barley), which is usually subsequently dried in hot-air kilns (malt-kilns).

It has faint wrinkles running from end to end and is brownish-yellow outside and white inside. It leaves tracing marks like chalk and, unlike non-malted grain, it usually floats on water and is also friable. Malt has a characteristic odour of cooked grain and a faintly sweetened flavour.

This heading covers whole malt, ground malt and malt flour. It also covers roasted malt (e.g., for colouring beers), but it **excludes** products which have undergone further processing, such as malt extract and food preparations of malt extract of **heading 19.01** and roasted malt put up as coffee substitutes (**heading 21.01**).

11.08 - Starches; inulin.

- Starches :

- 1108.11 -- Wheat starch
- 1108.12 -- Maize (corn) starch
- 1108.13 -- Potato starch
- 1108.14 -- Manioc (cassava) starch
- 1108.19 -- Other starches
- 1108.20 - Inulin

Starches, which chemically are carbohydrates, are contained in the cells of many vegetable products. The most important sources of starch are the cereal grains (e.g., maize (corn), wheat and rice), certain lichens, certain tubers and roots (potato, manioc, arrowroot, etc.) and the pith of the sago palm.

Starches are white odourless powders composed of fine grains which crackle when rubbed between the fingers. They generally give an intense dark blue colour with iodine (**except** amylopectin starches, where the colour is reddish brown). Viewed under the microscope in polarised light the grains display characteristic dark polarisation crosses. They are insoluble in cold water, but, if heated in water to above their gelatinisation temperature (about 60 °C for most starches), the grains break up and a starch paste is formed. Starches are commercially processed to give a wide range of products classified under other headings, e.g., modified starch, roasted soluble starch, dextrin, malto-dextrin, dextrose, glucose. They are also used as such in a wide variety of industries, especially the food, paper, paper converting and textile industries.

The heading also includes **inulin**; this is chemically similar to starch but gives a light yellowish-brown coloration with iodine instead of blue. It is extracted from Jerusalem artichokes, dahlia roots and chicory roots. When hydrolysed by long boiling in water it forms fructose (laevulose).

This heading **excludes**, *inter alia* :

- (a) Starch preparations of **heading 19.01**.
- (b) Tapioca and substitutes therefore prepared from starches (see the Explanatory Note to **heading 19.03**).
- (c) Starches put up as perfumery or toilet preparations (**Chapter 33**).
- (d) Dextrans and other modified starches of **heading 35.05**.
- (e) Glues based on starch (**heading 35.05** or **35.06**).
- (f) Prepared glazings or dressings made from starch (**heading 38.09**).
- (g) Isolated amylopectin and isolated amylose obtained by the fractionation of starch (**heading 39.13**).

11.09 - Wheat gluten, whether or not dried.

Gluten is extracted from wheat flour by simple aqueous separation from the other constituents (starch, etc.). It comes in the form of a whitish viscous liquid or paste ("moist" gluten) or a cream-coloured powder (dry gluten).

It consists essentially of a mixture of various proteins, the main ones being **gliadin** and **glutenin** (which account for 85 to 95 % of the total). The presence of these two proteins is characteristic of wheat gluten, which owes to them its elasticity and plasticity when mixed with water in suitable proportions.

Gluten is used mainly to enrich in proteins flours used in making certain types of bread or biscuits, of macaroni or similar products or of dietetic preparations. It is also used as a binder in certain meat preparations, for the manufacture of certain glues or of products such as gluten sulphate or gluten phosphate, hydrolysed vegetable proteins or sodium glutamate.

The heading **excludes**, *inter alia* :

- (a) Wheat flour enriched by the addition of gluten (**heading 11.01**).
 - (b) Proteins extracted from wheat gluten (generally **heading 35.04**).
 - (c) Wheat gluten prepared for use as a glue or as a glazing or dressing for the textile industry (**heading 35.06** or **38.09**).
-

Chapter 12

Oil seeds and oleaginous fruits; miscellaneous grains, seeds and fruit; industrial or medicinal plants; straw and fodder

Notes.

- 1.- Heading 12.07 applies, *inter alia*, to palm nuts and kernels, cotton seeds, castor oil seeds, sesamum seeds, mustard seeds, safflower seeds, poppy seeds and shea nuts (karite nuts). It does not apply to products of heading 08.01 or 08.02 or to olives (Chapter 7 or Chapter 20).
- 2.- Heading 12.08 applies not only to non-defatted flours and meals but also to flours and meals which have been partially defatted or defatted and wholly or partially refatted with their original oils. It does not, however, apply to residues of headings 23.04 to 23.06.
- 3.- For the purposes of heading 12.09, beet seeds, grass and other herbage seeds, seeds of ornamental flowers, vegetable seeds, seeds of forest trees, seeds of fruit trees, seeds of vetches (other than those of the species *Vicia faba*) or of lupines are to be regarded as "seeds of a kind used for sowing".

Heading 12.09 does not, however, apply to the following even if for sowing :

- (a) Leguminous vegetables or sweet corn (Chapter 7);
- (b) Spices or other products of Chapter 9;
- (c) Cereals (Chapter 10); or
- (d) Products of headings 12.01 to 12.07 or 12.11.

- 4.- Heading 12.11 applies, *inter alia*, to the following plants or parts thereof : basil, borage, ginseng, hyssop, liquorice, all species of mint, rosemary, rue, sage and wormwood.

Heading 12.11 does not, however, apply to :

- (a) Medicaments of Chapter 30;
- (b) Perfumery, cosmetic or toilet preparations of Chapter 33; or
- (c) Insecticides, fungicides, herbicides, disinfectants or similar products of heading 38.08.

- 5.- For the purposes of heading 12.12, the term "seaweeds and other algae" does not include :

- (a) Dead single-cell micro-organisms of heading 21.02;
- (b) Cultures of micro-organisms of heading 30.02; or
- (c) Fertilisers of heading 31.01 or 31.05.

○
○ ○

Subheading Note.

- 1.- For the purposes of subheading 1205.10, the expression "low erucic acid rape or colza seeds" means rape or colza seeds yielding a fixed oil which has an erucic acid content of less than 2 % by weight and yielding a solid component which contains less than 30 micromoles of glucosinolates per gram.

GENERAL

Headings 12.01 to 12.07 cover seeds and fruits of a kind used for the extraction (by pressure or by solvents) of edible or industrial oils and fats, whether they are presented for that purpose, for sowing or for other purposes. These headings **do not**, however, **include** products of **heading 08.01 or 08.02**, olives (**Chapter 7 or 20**) or certain seeds and fruits from which oil may be extracted but which are primarily used for other purposes, e.g., apricot, peach or plum kernels (**heading 12.12**) and cocoa beans (**heading 18.01**).

The seeds and fruits covered by the heading may be whole, broken, crushed, husked or shelled. They may also have undergone heat treatment designed mainly to ensure better preservation (e.g., by inactivating the lipolytic enzymes and eliminating part of the moisture), for the purpose of de-bittering, for inactivating antinutritional factors or to facilitate their use. However, such treatment is permitted **only if** it does not alter the character of the seeds and fruits as natural products and does not make them suitable for a specific use rather than for general use.

The headings **exclude** solid residues resulting from the extraction of vegetable oil from oil seeds or oleaginous fruits (including defatted flours and meals) (**heading 23.04, 23.05 or 23.06**).

12.01 - Soya beans, whether or not broken (+).

1201.10 - Seed

1201.90 - Other

Soya beans are very important source of vegetable oil. The soya beans of this heading may be heat-treated for the purpose of de-bittering (see General Explanatory Note).

However, the heading **excludes** roasted soya beans used as a coffee substitute (**heading 21.01**).

Subheading Explanatory Note.

Subheading 1201.10

For the purposes of subheading 1201.10, the term "seed" covers only soya beans regarded by the competent national authorities as being for sowing.

12.02 - Ground-nuts, not roasted or otherwise cooked, whether or not shelled or broken (+).

1202.30 - Seed

- Other :

1202.41 -- In shell

1202.42 -- Shelled, whether or not broken

This heading covers ground-nuts (also known as peanuts), whether or not shelled or broken, which are **not** roasted or otherwise cooked. The ground-nuts of this heading may be heat-treated to ensure better preservation (see the General Explanatory Note). Roasted or otherwise cooked ground-nuts fall in **Chapter 20**.

○
○ ○

Subheading Explanatory Note.

Subheading 1202.30

For the purposes of subheading 1202.30, the term "seed" covers only ground-nuts regarded by the competent national authorities as being for sowing.

12.03 - Copra.

Copra is the dried flesh of coconut used for the expression of coconut oil and unsuitable for human consumption.

This heading **does not include** desiccated coconut, i.e., the dried and shredded flesh of coconut suitable for human consumption (**heading 08.01**).

12.04 - Linseed, whether or not broken.

Linseed, i.e., the seed of the flax plant, is the source of one of the most important of the drying oils.

12.05 - Rape or colza seeds, whether or not broken.

1205.10 - Low erucic acid rape or colza seeds

1205.90 - Other

This heading includes rape or colza seeds (the seeds of several species of *Brassica*, particularly *B. napus* and *B. rapa* (or *B. campestris*)). The heading covers both the traditional rape or colza seeds and the low erucic acid rape or colza seeds. Low erucic acid rape or colza seeds, e.g., canola seeds or the European rape or colza seeds "double zero", yield a fixed oil which has a total erucic acid content of less than 2 % by weight and yield a solid component which contains less than 30 micromoles of glucosinolates per gram.

12.06 - Sunflower seeds, whether or not broken.

This heading covers the seeds of the common sunflower (*Helianthus annuus*).

12.07 - Other oil seeds and oleaginous fruits, whether or not broken (+).

1207.10 - Palm nuts and kernels

- Cotton seeds :

1207.21 -- Seed

1207.29 -- Other

1207.30 - Castor oil seeds

1207.40 - Sesamum seeds

1207.50 - Mustard seeds

1207.60 - Safflower (*Carthamus tinctorius*) seeds

1207.70 - Melon seeds

- Other :

1207.91 -- Poppy seeds

1207.99 -- Other

This heading covers seeds and fruits of a kind used for the extraction of edible or industrial oils and fats, **other than** those specified in **headings 12.01 to 12.06** (see also General Explanatory Note).

The heading covers, *inter alia* :

Babassu kernels	Mowra seeds
Beech nuts	Mustard seeds
Candlenuts	Niger seeds
Carapa nuts (e.g., touloucouna nuts)	Oiticica seeds
Castor oil seeds	Palm nuts and kernels
Chaulmoogra seeds	Perilla seeds
Cotton seeds	Physic (pulza) nuts
Croton seeds	Poppy seeds
Evening primrose seeds of the species <i>Oenothera biennis</i> and <i>Oenothera lamarckiana</i>	Safflower seeds
Grape pips	Sesamum seeds
Hemp seeds	Shea nuts (Karite nuts)
Illipe seeds	Stillingia seeds
Kapok seeds	Tea seeds
	Tung nuts (or oleococca seeds)

◦
◦ ◦

Subheading Explanatory Note.

Subheading 1207.21

For the purposes of subheading 1207.21, the term "seed" covers only cotton seeds regarded by the competent national authorities as being for sowing.

12.08 - Flours and meals of oil seeds or oleaginous fruits, other than those of mustard.

1208.10 - Of soya beans

1208.90 - Other

This heading covers non-defatted or partially defatted flours or meals obtained by grinding the oil seeds or oleaginous fruits covered by headings 12.01 to 12.07. It also includes flours and meals defatted and wholly or partially refatted with their original oils (see Note 2 to this Chapter).

The heading **excludes** :

- (a) Peanut butter (**heading 20.08**).
- (b) Mustard flour and meal, whether or not defatted, prepared or not (**heading 21.03**).
- (c) Defatted flours and meals (other than those of mustard) (**headings 23.04 to 23.06**).

12.09 - Seeds, fruit and spores, of a kind used for sowing.

1209.10 - Sugar beet seeds

- Seeds of forage plants :

1209.21 -- Lucerne (alfalfa) seeds

1209.22 -- Clover (*Trifolium spp.*) seeds

1209.23 -- Fescue seeds

1209.24 -- Kentucky blue grass (*Poa pratensis L.*) seeds

1209.25 -- Rye grass (*Lolium multiflorum Lam.*, *Lolium perenne L.*) seeds

1209.29 -- Other

1209.30 - Seeds of herbaceous plants cultivated principally for their flowers

- Other :

1209.91 -- Vegetable seeds

1209.99 -- Other

This heading covers all seeds, fruit and spores of a kind used for sowing. It includes such products even if they are no longer capable of germination. However, it **does not include** products such as those mentioned at the end of this Explanatory Note, which, although intended for sowing, are classified elsewhere in the Nomenclature because they are normally used other than for sowing.

The heading includes beet seeds, grass or other herbage seeds (lucerne, sainfoin, clover, fescue, rye grass, Kentucky blue grass, timothy grass, etc.), seeds of ornamental flowers, vegetable seeds, seeds of forest trees (including pine cones bearing seeds), seeds of fruit trees, seeds of vetches (**other than** those of the species *Vicia faba*, i.e., broad beans and horse beans), seeds of lupines, tamarind seeds, tobacco seeds, and seeds (**not themselves** used primarily in perfumery, in pharmacy or for insecticidal, fungicidal or similar purposes) of plants yielding the products of heading 12.11.

Products of this heading (especially grass seeds) may be dispersed with fine fertiliser particles on a paper backing and covered with a fine layer of wadding held in place by a reinforcing mesh of plastics.

The heading **excludes** :

- (a) Mushroom spawn (**heading 06.02**).
- (b) Leguminous vegetables and sweet corn (**Chapter 7**).
- (c) Fruit of **Chapter 8**.
- (d) Spices and other products of **Chapter 9**.
- (e) Cereal grains (**Chapter 10**).
- (f) Oil seeds and oleaginous fruits of **headings 12.01 to 12.07**.
- (g) Seeds and fruit which **are themselves** of a kind used primarily in perfumery, in pharmacy, or for insecticidal, fungicidal or similar purposes (**heading 12.11**).
- (h) Locust beans (**heading 12.12**).

12.10 - Hop cones, fresh or dried, whether or not ground, powdered or in the form of pellets; lupulin.

1210.10 - Hop cones, neither ground nor powdered nor in the form of pellets

1210.20 - Hop cones, ground, powdered or in the form of pellets; lupulin

Hop cones are the scaly cone-like catkins or flowers of the hop plant (*Humulus lupulus*). They are used mainly in the brewing industry to give flavour to the beer, but they are also used for medicinal purposes. The cones fall in this heading whether fresh or dried and whether or not ground or powdered or in the form of pellets (i.e., agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight).

Lupulin is a yellow resinous powder which covers the hop cones and contains the bitter, aromatic principle which gives hops their characteristic properties. It is used in brewing as a partial substitute for hops and in medicine. It may be separated from the hops mechanically after drying.

The heading **excludes** :

- (a) Extract of hops (**heading 13.02**).
- (b) Spent hops (**heading 23.03**).
- (c) The essential oil of hops (**heading 33.01**).

12.11 - Plants and parts of plants (including seeds and fruits), of a kind used primarily in perfumery, in pharmacy or for insecticidal, fungicidal or similar purposes, fresh, chilled, frozen or dried, whether or not cut, crushed or powdered.

1211.20 - Ginseng roots

1211.30 - Coca leaf

1211.40 - Poppy straw

1211.50 - Ephedra

1211.90 - Other

This heading covers vegetable products of a kind used primarily in perfumery, in pharmacy or medicine, or for insecticidal, fungicidal, parasiticidal or similar purposes. They may be in the form of whole plants, mosses or lichens, or of parts (such as wood, bark, roots, stems, leaves, flowers, petals, fruits and seeds (**other than** oleaginous fruits and oil seeds classified in **headings 12.01 to 12.07**)), or in the form of waste resulting, in the main, from mechanical treatment. They remain in the heading whether fresh, chilled, frozen or dried, whole, cut, crushed, ground or powdered or (where appropriate) grated or hulled. Products of this heading impregnated with alcohol remain classified here.

Plants and parts (including seeds and fruits) of trees, bushes, shrubs or other plants are classified here if of a kind used directly for the purposes specified above or if used for the production of extracts, alkaloids or essential oils suitable for those purposes. On the other hand, the heading **excludes** seeds and fruits of a kind used for the extraction of fixed oils; these fall in **headings 12.01 to 12.07** even if the oils are to be used for the purposes mentioned in this heading.

It should also be noted that vegetable products more specifically described in other headings of the Nomenclature are **excluded** from this heading, even if they are suitable for use in perfumery, pharmacy, etc., e.g.: citrus fruit peel (**heading 08.14**); vanilla, cloves, aniseed, badian and other products of **Chapter 9**; hop cones (**heading 12.10**); chicory roots of **heading 12.12**; natural gums, resins, gum-resins and oleoresins (**heading 13.01**).

Live chicory plants and roots and other live seedling plants, bulbs, rhizomes, etc., clearly intended for planting, and flowers, foliage, etc., for ornamental purposes, fall in **Chapter 6**.

It should be noted that woods of a kind used primarily in perfumery, in pharmacy or for insecticidal, fungicidal or similar purposes are classified in this heading only if in chips, in shavings or in crushed, ground or powdered form. In other forms, such wood is **excluded** (**Chapter 44**).

Certain plants or parts of plants (including seeds or fruits) of this heading may be put up (e.g., in sachets) for making herbal infusions or herbal "teas". Such products consisting of plants or parts of plants (including seeds or fruits) of a single species (e.g., peppermint "tea") remain classified in this heading.

However, the heading **excludes** such products consisting of plants or parts of plants (including seeds or fruits) of different species (whether or not incorporating plants or plant parts of other headings) or consisting of plants or parts of plants of a single or of different species mixed with other substances, such as one or more plant extracts (**heading 21.06**).

It should also be noted that the following products fall in **headings 30.03, 30.04, 33.03 to 33.07 or 38.08**, as the case may be :

- (a) Products of this heading, unmixed, but put up in measured doses or in forms or packings for retail sale, whether for therapeutic or prophylactic purposes, or put up for retail sale as perfumery products or as insecticidal, fungicidal or similar products.
- (b) Products which have been mixed for use for the purposes described in (a) above.

However, the classification of vegetable products in this heading, by virtue of their being used primarily in pharmacy, **does not necessarily imply** that they may be regarded as medicaments of heading 30.03 or 30.04 when they are mixed, or unmixed but put up in measured doses or in forms or packings for retail sale. While the term "medicaments" within the meaning of heading 30.03 or 30.04 refers only to products which have therapeutic or prophylactic uses, the broader term "pharmacy" has reference both to medicaments and to products having no therapeutic or prophylactic uses (e.g., tonic beverages, fortified foods, blood-grouping reagents).

The heading also **excludes** the following products of a kind used either directly for flavouring beverages or for preparing extracts for the manufacture of beverages :

- (a) mixtures consisting of different species of plants or parts of plants of this heading (**heading 21.06**);
- (b) mixtures of plants or parts of plants of this heading with vegetable products falling in other Chapters (e.g., Chapters 7, 9, 11) (**Chapter 9** or **heading 21.06**).

The following products are included in the heading :

- Aconite** (*Aconitum napellus*) : roots and leaves.
- Ambrette (musk)** (*Hibiscus abelmoschus*) : seeds.
- Angelica** (*Archangelica officinalis*) : roots and seeds.
- Angostura** (*Galipea officinalis*) : bark.
- Araroba** (*Andira araroba*) : powder.
- Arnica** (*Arnica montana*) : roots, stems, leaves and flowers.
- Basil** (*Ocimum basilicum*) : flowers and leaves.
- Bearberry** (*Uva ursi*) : leaves.
- Belladonna** (*Atropa belladonna*) : herbs, roots, berries, leaves and flowers.
- Boldo** (*Peumus boldus*) : leaves.
- Borage** (*Borago officinalis*) : stems and flowers.
- Bryony** (*Bryonia dioica*) : roots.
- Buchu** (*Barosma betulina*, *Barosma serratifolia* and *Barosma crenulata*) : leaves.
- Buckbean** (*Menyanthes trifoliata*) : leaves.
- Burdock** (*Arctium lappa*) : Seeds and dried roots.
- Calabar** (*Physostigma venenosum*) : beans.
- Calamus** (*Acorus calamus*) : roots.
- Calumba** (*Jateorhiza palmata*) : roots.
- Cannabis** (*Cannabis sativa*) : herbs.
- Cascara sagrada** (*Rhamnus purshiana*) : bark.
- Cascarilla** (*Croton eluteria*) : bark.
- Cassia** (*Cassia fistula*) : pods and unpurified pulp. (Purified cassia pulp (aqueous extract) is classified in **heading 13.02**.)
- Centauria** (*Erythraea centaurium*) : herbs.
- Cevadilla (Sabadilla)** (*Schoenocaulon officinale*) : seeds.
- Chamomile** (*Matricaria chamomilla*, *Anthemis nobilis*) : flowers.
- Chenopodium** : seeds.
- Cherry** : stalks.
- Cherry laurel** (*Prunus laurocerasus*) : berries.
- Cinchona** : bark.
- Clove** (*Caryophyllus aromaticus*) : bark and leaves.
- Coca** (*Erythroxylon coca* and *Erythroxylon truxillense*) : leaves.
- Coccus indicus (Indian berry)** (*Anamirta paniculata*) : fruit.
- Cocillana** (*Guarea rusbyi*) : bark.
- Colchicum** (*Colchicum autumnale*) : corms and seeds.
- Colocynth** (*Citrullus colocynthis*) : fruit.
- Comfrey** (*Symphytum officinale*) : roots.
- Condurango** (*Marsdenia condurango*) : bark.
- Couchgrass (Triticum)** (*Agropyrum repens*) : roots.

Cubé (barbasco or timbo) (*Lonchocarpus nicou*) : bark and roots.
Cubeb (*Cubeba officinalis* Miquel or *Piper cubeba*) : powder.
Damiana (*Turnera diffusa*) : leaves.
Dandelion (*Taraxacum officinale*) : roots.
Datura metel : leaves and seeds.
Derris (or **tuba**) (*Derris elliptica* and *Derris trifoliata*) : roots.
Digitalis (*Digitalis purpurea*) : leaves and seeds.
Elder (*Sambucus nigra*) : flowers and bark.
Ephedra (Mahuang) : stems and branches.
Ergot of rye.
Eucalyptus (*Eucalyptus globulus*) : leaves.
Frangula : bark.
Fumitory (*Fumaria officinalis*) : leaves and flowers.
Galangal (*Alpinia officinarum*) : rhizomes.
Gentian (*Gentiana lutea*) : roots.
Ginseng (*Panax quinquefolium* and *Panax ginseng*) : roots.
Golden seal (Hydrastis) (*Hydrastis canadensis*) : roots.
Guaiacum (*Guaiacum officinale* and *Guaiacum sanctum*) : wood.
Hamamelis (witch hazel) (*Hamamelis virginiana*) : bark and leaves.
Hellebore (*Veratrum album* and *Veratrum viride*) : roots.
Henbane (Hyoscyamus) (*Hyoscyamus niger*) : roots, seeds and leaves.
Horehound (*Marrubium vulgare*) : herbs and stems.
Hyssop (*Hyssopus officinalis*) : flowers and leaves.
Ipecacuanha (*Cephaelis ipecacuanha*) : roots.
Ipomoea (*Ipomoea orizabensis*) : roots.
Jaborandi (*Pilocarpus jaborandi* and *Pilocarpus microphyllus*) : leaves.
Jalap (*Ipomoea purga*) : roots.
Lavender (*Lavandula vera*) : flowers and herbs.
Leptandra (*Veronica virginica*) : roots.
Linaloe (*Bursera delpechiana*) : wood.
Linden (*Tilia europaea*) : flowers and leaves.
Liquorice (*Glycyrrhiza glabra*) : roots.
Lobelia (*Lobelia inflata*) : herbs and flowers.
Long pepper (*Piper longum*) : roots and underground stems.
Male fern (*Dryopteris filix-mas*) : root.
Mallow (*Malva silvestris* and *Malva rotundifolia*) : leaves and flowers.
Mandrake : roots or rhizomes.
Marjoram (see " Wild marjoram " below).
Marshmallow (*Althaea officinalis*) : flowers, leaves and roots.
Melissa (*Melissa officinalis*) : leaves, flowers and tops.
Mint (all species).
Mousse de chêne (oak moss) (*Evernia furfuracea*) (a lichen).
Mugwort (*Artemisia vulgaris*) : roots.
Nux vomica (*Strychnos nux-vomica*) : seeds.
Orange tree (*Citrus aurantium*) : leaves and flowers.
Orris (*Iris germanica*, *Iris pallida* and *Iris florentina*) : roots.
Pansy : flowers.
Patchouli (*Pogostemon patchouli*) : leaves.
Peppermint (see mint).
Pine : buds.
Plantago psyllium : herbs and seeds.
Podophyllum (*Podophyllum peltatum*) : roots or rhizomes.
Poppy (*Papaver somniferum*) : heads (unripe, dried).
Pulsatilla (*Anemone pulsatilla*) : herbs.
Pyrethrum (*Chrysanthemum cinerariaefolium*) : leaves, stems and flowers.
Pyrethrum (*Anacyclus pyrethrum*) : roots.

Quassia (*Quassia amara* and *Picraena excelsa*) : wood and bark.
Quince : seeds.
Rhatany (*Krameria triandra*) : roots.
Rhubarb (*Rheum officinale*) : roots.
Rose : flowers.
Rosemary (*Rosmarinus officinalis*) : herbs, flowers and leaves.
Rue (*Ruta graveolens*) : leaves.
Sage (*Salvia officinalis*) : leaves and flowers.
St. Ignatius beans (*Strychnos ignatii*).
Sandalwood : chips (white and yellow).
Sarsaparilla (*Smilax*) : roots.
Sassafras (*Sassafras officinalis*) : bark, roots and wood.
Scammony (*Convolvulus scamonnia*) : roots.
Senega (*Polygala senega*) : roots.
Senna (*Cassia acutifolia* and *Cassia angustifolia*) : pods and leaves.
Slippery elm (*Ulmus fulva*) : bark.
Solanum nigrum.
Squill (*Urginea maritima*, *Urginea scilla*) : bulbs.
Stramonium (*Datura stramonium*) : leaves and tops.
Strophanthus (*Strophanthus kombe*) : seeds.
Tansy (*Tanacetum vulgare*) : roots, leaves and seeds.
Tonka (tonquin) (*Dipterix odorata*) : beans.
Valerian (*Valeriana officinalis*) : roots.
Verbascum (mullein) (*Verbascum thapsus* and *Verbascum phlomoides*) : leaves and flowers.
Verbena : leaves and tops.
Veronica (*Veronica officinalis*) : leaves.
Viburnum (*Viburnum prunifolium*) : root bark.
Violets (*Viola odorata*) : roots and dried flowers.
Walnut : leaves.
Wild marjoram (*Origanum vulgare*); sweet marjoram (*Majorana hortensis* or *Origanum majorana*) is excluded (**Chapter 7**).
Woodruff (*Asperula odorata*) : herbs.
Wormseed (*Artemisia cina*) : flowers.
Wormwood (*Artemisia absinthium*) : leaves and flowers.
Yohimba (*Corynanthe johimbe*) : bark.

The botanical names in the list above (which is **not exhaustive**) are given to assist in the identification of the plants. Mention of the botanical name of a particular species does not necessarily indicate that other species of the same plant family are not classified in the heading.

Certain products of this heading, which are regarded as narcotic drugs under international instruments, are indicated in the list which appears at the end of Chapter 29.

12.12 - Locust beans, seaweeds and other algae, sugar beet and sugar cane, fresh, chilled, frozen or dried, whether or not ground; fruit stones and kernels and other vegetable products (including unroasted chicory roots of the variety *Cichorium intybus sativum*) of a kind used primarily for human consumption, not elsewhere specified or included.

- Seaweeds and other algae :

1212.21 -- Fit for human consumption

1212.29 -- Other

- Other :

1212.91 -- Sugar beet

1212.92 -- Locust beans (carob)

1212.93 -- Sugar cane

1212.94 -- Chicory roots

1212.99 -- Other

(A) Seaweeds and other algae.

This heading covers all seaweeds and other algae, whether or not edible. They may be fresh, chilled, frozen, dried or ground. Seaweeds and other algae are used for various purposes (e.g., pharmaceutical products, cosmetics, human consumption, animal feeding, fertilisers).

The heading also covers seaweed meal and meal of other algae, whether or not consisting of a mixture of many different varieties of seaweeds and other algae.

The heading **excludes** :

- (a) Agar-agar and carrageenan (**heading 13.02**).
- (b) Dead single-cell algae (**heading 21.02**).
- (c) Cultures of micro-organisms of **heading 30.02**.
- (d) Fertilisers of **heading 31.01** or **31.05**.

(B) Sugar beet and sugar cane.

This heading also covers sugar beet and sugar cane, in the forms specified in the heading. The heading **excludes** bagasse, the fibrous portion of the sugar cane remaining after the juice has been extracted (**heading 23.03**).

(C) Locust beans.

Locust (or carob) beans are the fruit of a small evergreen tree (*Ceratonia siliqua*) indigenous to the Mediterranean region. They consist of a brown pod which contains a large number of seeds and are used mainly as a material for distilling or as animal feeding stuff.

Locust beans contain a high proportion of sugar and are sometimes eaten as a sweetmeat.

13.01

This heading covers the endosperm, the germs, the whole seeds, and also powdered germs, whether or not mixed with powdered tegument.

The heading **excludes** locust bean endosperm flour which is classified in **heading 13.02** as a mucilage or thickener.

(D) **Fruit stones and kernels and other vegetable products (including unroasted chicory roots of the variety *Cichorium intybus sativum*) of a kind used primarily for human consumption, not elsewhere specified or included.**

This group includes fruit stones and kernels and other vegetable products of a kind mainly used, directly or indirectly, for human consumption, but not elsewhere specified or included in the Nomenclature.

It therefore includes kernels of peaches (including nectarines), apricots and plums (used mainly as substitutes for almonds). These products remain in the heading even though they may also be used for the extraction of oil.

The heading also includes unroasted chicory roots of the variety *Cichorium intybus sativum*, whether fresh or dried, whole or chopped. The roasted chicory root of this variety, which is used as a coffee substitute, is **excluded** (**heading 21.01**). Other unroasted chicory roots are classified in **heading 06.01**.

Angelica stems, used mainly to prepare candied angelica or angelica preserved by sugar, also fall in this heading. They are generally provisionally preserved in brine.

The heading also covers sweet sorghums, such as *saccharatum*, which are used primarily for the manufacture of syrup or molasses.

The heading **excludes** fruit stones and pips of a kind used for carving (e.g., date stones) (**heading 14.04**) and roasted fruit kernels (generally classified as coffee substitutes - **heading 21.01**).

13.01

12.13 - Cereal straw and husks, unprepared, whether or not chopped, ground, pressed or in the form of pellets.

This heading is restricted to cereal straw and husks in an unprepared state as obtained from the threshing of cereals, or chopped, ground or pressed, or put up in the form of pellets (i.e. agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight), but not further prepared. It **excludes** cleaned, bleached or dyed straw (**heading 14.01**).

13.01

12.14 - Swedes, mangolds, fodder roots, hay, lucerne (alfalfa), clover, sainfoin, forage kale, lupines, vetches and similar forage products, whether or not in the form of pellets.

1214.10 - Lucerne (alfalfa) meal and pellets

1214.90 - Other

This heading covers :

- (1) Swedes (rutabagas) (*Brassica napobrassica*), mangolds, forage turnips, forage carrots (white or pale yellow in colour) and other forage roots. These roots remain classified in this heading even though some of them may be suitable for human consumption.
- (2) Hay, lucerne (alfalfa), clover, sainfoin, forage kale, lupines, vetches and similar forage products, fresh or dried, whole, cut, chopped or pressed. These products remain in the heading whether or not they have been salted or otherwise treated in a silo to prevent fermentation or deterioration.

The expression "similar forage products" refers only to plants specially grown for animal food. It **does not include** vegetable waste which may be used for the same purpose (**heading 23.08**).

The forage products of this heading may also be in the form of pellets, i.e. agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight.

The heading also **excludes** :

- (a) Carrots (reddish-yellow in colour) of **heading 07.06**.
 - (b) Cereal straw and husks (**heading 12.13**).
 - (c) Vegetable products which, though used for animal food, are not specially grown for that purpose, e.g., beet or carrot tops and maize (corn) leaves (**heading 23.08**).
 - (d) Preparations of a kind used in animal feeding (e.g., sweetened forage) (**heading 23.09**).
-

13.01

Chapter 13

Lac; gums, resins and other vegetable saps and extracts

Note.

1.- Heading 13.02 applies, *inter alia*, to liquorice extract and extract of pyrethrum, extract of hops, extract of aloes and opium.

The heading does not apply to :

- (a) Liquorice extract containing more than 10 % by weight of sucrose or put up as confectionery (heading 17.04);
- (b) Malt extract (heading 19.01);
- (c) Extracts of coffee, tea or maté (heading 21.01);
- (d) Vegetable saps or extracts constituting alcoholic beverages (Chapter 22);
- (e) Camphor, glycyrrhizin or other products of heading 29.14 or 29.38;
- (f) Concentrates of poppy straw containing not less than 50 % by weight of alkaloids (heading 29.39);
- (g) Medicaments of heading 30.03 or 30.04 or blood-grouping reagents (heading 30.06);
- (h) Tanning or dyeing extracts (heading 32.01 or 32.03);
- (ij) Essential oils, concretes, absolutes, resinoids, extracted oleoresins, aqueous distillates or aqueous solutions of essential oils or preparations based on odoriferous substances of a kind used for the manufacture of beverages (Chapter 33); or
- (k) Natural rubber, balata, gutta-percha, guayule, chicle or similar natural gums (heading 40.01).

13.01

13.01 - Lac; natural gums, resins, gum-resins and oleoresins (for example, balsams).

1301.20 - Gum Arabic

1301.90 - Other

(I) Lac.

Lac is a resinous substance produced on several kinds of tropical trees by an insect belonging to the same family as the cochineal and the kermes.

The most important commercial varieties are the following :

- (A) **Stick lac**, usually consisting of twigs on which the lac has been deposited in a more or less thick layer; it is dark red and the most highly coloured variety of lac.
- (B) **Seed lac**, the crushed lac detached from the branches, usually by washing which removes part of its colouring matter.
- (C) **Shellac**, also known as sheet, plate, or slab-lac, obtained by fusion and filtering which purifies the gum. It takes the form of thin, vitreous flakes, amber-coloured or reddish. A similar product in the shape of discs is known as "button lac".

Shellac is used largely in the preparation of varnishes, in the electrical industry and for the production of sealing wax.

- (D) **Refuse lac** (or garnet lac) obtained from the residues left from the preparation of shellac.

Lac may also be decolourised or bleached and is then sometimes put up in the form of twisted hanks.

The sap of certain oriental trees which hardens, forming a resistant film when exposed to air (known as "Japan lacquer", "Chinese lacquer", etc.), is excluded (heading 13.02).

(II) Natural gums, resins, gum-resins and oleoresins.

Natural gums, resins, gum-resins and oleoresins are vegetable secretions, which may solidify on contact with air. These terms are often used indiscriminately. These products have the following distinguishing features :

- (A) True **gums** are odourless, tasteless and more or less soluble in water, forming sticky substances. They burn without melting and without odour.
- (B) **Resins** are insoluble in water, have a slight odour, are poor conductors of electricity and acquire a negative electric charge. They soften and melt more or less completely on the application of heat, and when ignited burn with a smoky flame and characteristic odour.
- (C) **Gum-resins**, as the name implies, consist of natural mixtures of gums and resins in variable proportions, and are therefore partly soluble in water; they generally have a penetrating and characteristic odour and taste.

(D) **Oleoresins** are exudates consisting mainly of volatile and resinous constituents. **Balsams** are oleoresins characterized by a high content of benzoic or cinnamic compounds.

The principal products are :

- (1) Gum Arabic (from various acacias) (sometimes also called Nile gum, Aden gum, Senegal gum); gum tragacanth (obtained from certain varieties of *Astragalus*); Basra gum; *Anacardium* (gum of the cashew nut tree); Indian gum; certain so-called "indigenous" gums from various species of *Rosaceae*, such as cherry, plum, apricot, peach or almond trees.
- (2) Fresh oleoresins (liquids) of the pine (including turpentine), fir or other conifers (crude or refined), as well as conifer resins (galipot, etc.) which are dried on the incision on the tree and which contain vegetable waste.
- (3) Copal (India, Brazil, Congo, etc.), including fossil copal; kauri gum; damar; mastic; elemi; sandarac; dragon's blood.
- (4) Gamboge; gum ammoniac; asafoetida; scammony; euphorbia; galbanum; opopanax; olibanum or incense; myrrh; acaroid; guaiacum.
- (5) Gum benzoin; styrax or storax (solid or liquid); tolu balsam; Peruvian balsam; Canada balsam; copaiba balsam; Mecca balsam; thapsia.
- (6) Cannabis resin (crude or purified) obtained from the Cannabis plant. (Cannabis resin is a narcotic drug see the list at the end of Chapter 29.)

The natural gums, resins, gum-resins and oleoresins covered by this heading may be crude, washed, purified, bleached, crushed or powdered. They are, however, **excluded** from this heading when they have been subjected to processes such as treatment with water under pressure, treatment with mineral acids or heat-treatment; for example : gums and gum-resins rendered water-soluble by treatment with water under pressure (**heading 13.02**), gums rendered soluble by treatment with sulphuric acid (**heading 35.06**), and resins which have been heat-treated to make them soluble in drying oils (**heading 38.06**).

The heading also **excludes** :

- (a) Amber (**heading 25.30**).
- (b) Medicaments containing natural balsams and prepared medicaments of various kinds known as balsams (**heading 30.03** or **30.04**).
- (c) Lac-dye, the colouring matter extracted from lac (**heading 32.03**).
- (d) Resinoids (extracted from the substances of this heading) and extracted oleoresins (**heading 33.01**).
- (e) Tall oil (sometimes known as " liquid rosin ") (**heading 38.03**).
- (f) Spirits of turpentine (**heading 38.05**).
- (g) Rosin, resin acids, rosin spirit and rosin oils, resinates, rosin pitch, brewers' pitch and similar preparations based on rosin (**Chapter 38**).

13.02 - Vegetable saps and extracts; pectic substances, pectinates and pectates; agar-agar and other mucilages and thickeners, whether or not modified, derived from vegetable products.

- Vegetable saps and extracts :

1302.11 -- Opium

1302.12 -- Of liquorice

1302.13 -- Of hops

1302.14 -- Of ephedra

1302.19 -- Other

1302.20 - Pectic substances, pectinates and pectates

- Mucilages and thickeners, whether or not modified, derived from vegetable products :

1302.31 -- Agar-agar

1302.32 -- Mucilages and thickeners, whether or not modified, derived from locust beans, locust bean seeds or guar seeds

1302.39 -- Other

(A) Vegetable saps and extracts.

The heading covers saps and extracts (vegetable products usually obtained by natural exudation or by incision, or extracted by solvents), **provided** that they are not specified or included in more specific headings of the Nomenclature (see list of exclusions at the end of Part (A) of this Explanatory Note).

These saps and extracts differ from the essential oils, resinoids and extracted oleoresins of heading 33.01, in that, apart from volatile odoriferous constituents, they contain a far higher proportion of other plant substances (e.g., chlorophyll, tannins, bitter principles, carbohydrates and other extractive matter).

The saps and extracts classified here include :

- (1) **Opium**, the dried sap of the unripe capsules of the poppy (*Papaver somniferum*) obtained by incision of, or by extraction from, the stems or seed pods. It is generally in the form of balls or cakes of varying size and shape. However, concentrates of poppy straw containing not less than 50 % by weight of alkaloids are **excluded** from this heading (see Note 1 (f) to this Chapter).
- (2) **Liquorice** extracted from the dried roots of a plant of the *Leguminosae* family (*Glycyrrhiza glabra*) by hot water under pressure and then concentrated. It may be in liquid form or in blocks, cakes, sticks, slices or powder. (Liquorice containing more than 10 % by weight of sucrose, or put up (i.e., prepared) as confectionery whatever the sugar content, is **excluded**, see **heading 17.04**.)
- (3) **Extract of hops.**

- (4) **Pyrethrum extract**, obtained mainly from the flowers of various pyrethrum varieties (e.g., *Chrysanthemum cinerariaefolium*) by extraction with an organic solvent such as normal hexane or “petroleum ether”.
- (5) **Extracts of the roots of plants containing rotenone** (derris, cubé, timbo, barbasco, etc.).
- (6) **Extracts and tinctures of any plant of the genus Cannabis**.
Cannabis resin, whether crude or purified, is **excluded (heading 13.01)**.
- (7) **Ginseng extract**, obtained by water or alcohol extraction, whether or not put up for retail sale.
Mixtures of ginseng extract with other ingredients (e.g., lactose or glucose) used for the preparation of ginseng “tea” or beverage are **excluded (heading 21.06)**.
- (8) **Aloes**, a thickened sap with a very bitter taste, obtained from several varieties of the plant with the same name (*Liliaceae* family).
- (9) **Podophyllum**, a resinous substance extracted by alcohol from the dried rhizomes of *Podophyllum peltatum*.
- (10) **Curare**, an aqueous extract from the leaves and bark of various plants of the *Strychnos* family.
- (11) **Quassia amara** extract, obtained from the wood of the shrub of the same name (*Simaroubaceae* family), which grows in South America.
Quassin, the principal bitter extract of the wood of the *Quassia amara*, is a heterocyclic compound of **heading 29.32**.
- (12) **Other medicinal extracts**, e.g., belladonna, black alder (alder buckthorn), cascara sagrada, garlic, gentian, jalap, cinchona, rhubarb, sarsaparilla, tamarind, valerian, pine buds, coca, colocynth, male fern, witch hazel, henbane, ergot of rye.
- (13) **Manna**, a solid, sweet sap obtained by incision from certain varieties of ash tree.
- (14) **Bird lime**, the viscous and stringy glue, greenish in colour, extracted from mistletoe berries or holly.
- (15) **Aqueous extract** obtained from cassia pulp. Cassia pods and cassia pulp are, however, **excluded (heading 12.11)**.
- (16) **Gum kino**, a thickened sap of certain tropical trees used in tanning and medicine.
- (17) **Japan (or Chinese) lacquer** (natural lacquer), a sap obtained by incision from certain species of shrubs known as rhus (urushi) growing in the Far East (e.g., *Rhus vernicifera*). It is used for coating or decorating various articles (trays, chests, etc.).
- (18) **Papaw juice**, whether or not dried, but not purified as papain enzyme. (The agglomerated latex globules can still be observed on microscopic examination.) Papain is **excluded (heading 35.07)**.
- (19) **Cola (kola) extract**, obtained from cola nuts (seeds of various *Cola* species, e.g., *Cola nitida*) and used mainly in the manufacture of certain beverages.
- (20) **Cashew nutshell extract**. The polymers of cashew nutshell liquid extract are, however, **excluded** (generally **heading 39.11**).

(21) **Vanilla oleoresin** (sometimes erroneously known as "vanilla resinoid" or "vanilla extract").

Saps are usually thickened or solidified. **Extracts** may be in liquid, paste or solid form. "**Tinctures**" are extracts still dissolved in the alcohol by means of which they are extracted; the so-called "**fluid extracts**" are solutions of extracts in, for example, alcohol, glycerol or mineral oil. Tinctures and fluid extracts are generally standardised (for instance, pyrethrum extract may be standardised by adding mineral oil to produce commercial grades with a standard pyrethrins content of, e.g., 2 %, 20 % or 25 %). **Solid extracts** are obtained by evaporating the solvent. Inert substances are sometimes added to certain extracts so that they can be more easily reduced to powder (e.g., belladonna extract, to which powdered gum Arabic is added), or to obtain a standard strength (for instance, certain quantities of starch are added to opium in order to obtain a product containing a known portion of morphine). The addition of such substances does not affect the classification of these solid extracts.

Extracts may be simple or compound. Simple extracts are obtained by the treatment of only one variety of plant. Compound extracts are obtained either by mixing simple extracts or by treating mixtures of different varieties of plants. Compound extracts (whether in the form of alcoholic tinctures or in any other forms) therefore contain the constituents of several kinds of plant; they include compound jalap extract, compound extract of aloes, compound extract of cinchona, etc.

The vegetable saps and extracts of this heading are generally raw materials for various manufactured products. They are **excluded** from the heading when, because of the addition of other substances, they have the character of food preparations, medicaments, etc.

Certain products of this heading, which are regarded as narcotic drugs under international instruments, are indicated in the list appearing at the end of Chapter 29.

Examples of **excluded** preparations are :

- (i) **Flavoured syrups** containing vegetable extracts (**heading 21.06**).
- (ii) **Preparations used for making beverages**. These preparations are obtained by compounding vegetable extracts of this heading with lactic acid, tartaric acid, citric acid, phosphoric acid, preserving agents, foaming agents, fruit juices, etc., and sometimes with essential oils. The preparations thus obtained are generally classified in **heading 21.06** or **33.02**.
- (iii) **Medicinal preparations** (some of which are also known as "tinctures") consisting of mixtures of vegetable extracts with other products (e.g., preparations which consist of a mixture of extract of capsicum, spirits of turpentine, camphor and methyl salicylate, or of a mixture of tincture of opium, anise oil, camphor and benzoic acid) (**heading 30.03** or **30.04**).
- (iv) **Intermediate products for the manufacture of insecticides**, consisting of pyrethrum extracts diluted by addition of mineral oil in such quantities that the pyrethrins content is less than 2 %, or with other substances such as synergists (e.g., piperonyl butoxide) added (**heading 38.08**).

The heading also **excludes** vegetable extracts which have been mixed or compounded (without the addition of other substances) for therapeutic or prophylactic purposes. Such mixtures, and similar medicinal compound extracts made by treating a mixture of plants, are classified in **heading 30.03** or **30.04**. That latter heading also covers simple vegetable extracts (whether or not standardised or dissolved in any solvent) when put up in measured doses for therapeutic or prophylactic purposes or in forms or packings for retail sale for such purposes.

The heading **excludes** essential oils, resinoids and extracted oleoresins (**heading 33.01**). **Essential oils** (which may also be obtained by solvent extraction) differ from the extracts classified under this heading in that they are essentially composed of volatile odoriferous substances. **Resinoids** differ from the extracts of this heading in that they are obtained by the organic solvent or super-critical fluid (e.g., carbon dioxide gas under pressure) extraction of dried natural non-cellular vegetable or animal resinous materials. **Extracted oleoresins** differ from the extracts provided for in this heading in that they (1) are obtained from natural cellular raw plant materials (almost always spices or aromatic plants), either by organic solvent extraction or by super-critical fluid extraction, and (2) contain volatile odoriferous principles together with non-volatile flavouring principles, which define the characteristic odour or flavour of the spice or aromatic plant.

The heading further **excludes** the following vegetable products, classified under more specific headings of the Nomenclature :

- (a) Natural gums, resins, gum-resins and oleoresins (**heading 13.01**).
- (b) Malt extract (**heading 19.01**).
- (c) Extracts of coffee, tea or maté (**heading 21.01**).
- (d) Vegetable saps and extracts constituting alcoholic beverages (**Chapter 22**).
- (e) Tobacco extracts (**heading 24.03**).
- (f) Camphor (**heading 29.14**) and glycyrrhizin and glycyrrhizates (**heading 29.38**).
- (g) Extracts used as blood-grouping reagents (**heading 30.06**).
- (h) Tanning extracts (**heading 32.01**).
- (ij) Dyeing extracts (**heading 32.03**).
- (k) Natural rubber, balata, gutta-percha, guayule, chicle and similar natural gums (**heading 40.01**).

(B) Pectic substances, pectinates and pectates.

Pectic substances (generally known in commerce as "pectins") are polysaccharides, the basic structure of which consists of polygalacturonic acids. They occur in the cells of plants, particularly fruit and vegetables, and are commercially extracted from the residues of apples, pears, quinces, citrus fruit, sugar beet, etc. Pectins are mainly used as "setting" agents in the preparation of jam and other preserves. They may be liquids or powders, and are classified in this heading whether or not standardised by the addition of sugars (glucose, sucrose, etc.) or other products (in order to ensure a constant activity in use). They sometimes contain sodium citrate or other buffer salts.

Pectinates are salts of pectinic acids (partially methoxylated polygalacturonic acids) and **pectates** are salts of pectic acids (demethoxylated pectinic acids). They have much the same properties and uses as pectins.

(C) **Agar-agar and other mucilages and thickeners, whether or not modified, derived from vegetable products.**

Mucilages and thickeners, derived from vegetable products, swell in cold water and dissolve in hot, forming a homogeneous, gelatinous and generally tasteless mass on cooling. They are chiefly used as alternatives to gelatin in the preparation of food, in the manufacture of textile or paper dressings, to clarify certain liquids, for bacterial culture, in pharmacy and in the manufacture of cosmetics. They may be modified by chemical treatment (for example, esterified, etherified, treated with borax, acids or alkalis).

These products remain classified in this heading whether or not standardized by the addition of sugars (glucose, sucrose, etc.) or other products (in order to ensure a constant activity in use).

The most important are :

- (1) **Agar-agar (or agar)** obtained by extraction from certain marine algae found mainly in the Indian and Pacific Oceans, and usually presented in the form of dried fibres, flakes, powder or in a gelatinous form obtained by treatment with acids. It is commercially known as " gelose " and also as Japanese vegetable gelatin (or moss) or *Alga spinosa*.
- (2) **Endosperm flour of locust beans** (*Ceratonia siliqua*) or guar seeds (*Cyamopsis psoraloides* or *Cyamopsis tetragonoloba*). These flours are included in this heading, whether or not modified by chemical treatment in order to improve or stabilise their mucilaginous properties (viscosity, solubility, etc.).
- (3) **Carrageenan** extracted from carrageen (known also as Irish moss or pearl moss) and usually in the form of fibrous threads, flakes or powder. The heading also includes mucilaginous substances obtained from carrageenan by chemical transformation (e.g., " sodium carrageenate ").
- (4) **Thickeners** obtained from gums or gum-resins rendered water-soluble by treatment with water under pressure or by any other process.
- (5) **Cotyledon flour of tamarind seeds** (*Tamarindus indica*). These flours are included in this heading even if modified by heat or chemical treatment.

The heading **excludes** :

- (a) Raw or dried seaweed and other algae (generally **heading 12.12**).
 - (b) Alginic acid and alginates (**heading 39.13**).
-

Chapter 14

Vegetable plaiting materials; vegetable products not elsewhere specified or included

Notes.

- 1.- This Chapter does not cover the following products which are to be classified in Section XI : vegetable materials or fibres of vegetable materials of a kind used primarily in the manufacture of textiles, however prepared, or other vegetable materials which have undergone treatment so as to render them suitable for use only as textile materials.
- 2.- Heading 14.01 applies, *inter alia*, to bamboos (whether or not split, sawn lengthwise, cut to length, rounded at the ends, bleached, rendered non-inflammable, polished or dyed), split osier, reeds and the like, to rattan cores and to drawn or split rattans. The heading does not apply to chipwood (heading 44.04).
- 3.- Heading 14.04 does not apply to wood wool (heading 44.05) and prepared knots or tufts for broom or brush making (heading 96.03).

GENERAL

This Chapter covers :

- (1) Vegetable materials, raw or simply worked, of a kind used primarily for plaiting, broom or brush making, or as stuffing or padding.
- (2) Seeds, pips, hulls and nuts of a kind used for carving, for the manufacture of buttons and other small fancy-goods.
- (3) Other vegetable products not elsewhere specified.

The Chapter **excludes** vegetable materials of a kind used primarily in the manufacture of textiles, however prepared, and other vegetable materials processed for use as textile materials (**Section XI**).

14.01 - Vegetable materials of a kind used primarily for plaiting (for example, bamboos, rattans, reeds, rushes, osier, raffia, cleaned, bleached or dyed cereal straw, and lime bark).

1401.10 - Bamboos

1401.20 - Rattans

1401.90 - Other

This heading covers raw vegetable materials of a kind used primarily for the manufacture, by joining or plaiting, of articles such as mats and matting, trays, basket-ware of all kinds (including baskets for packing fruit, vegetables, oysters, etc.), hampers, valises, furniture (e.g., chairs and tables), hats, etc. These raw materials may also be used for the manufacture of brushes, umbrella handles, walking sticks, fishing rods, pipe stems, coarse ropes, etc., for the manufacture of paper pulp, or as litter.

The heading covers, *inter alia*, the following raw materials :

- (1) **Bamboos**, special varieties of grasses, which grow profusely in some regions and particularly in China, Japan and India. Bamboos have a very light, shiny, generally hollow stalk, in some cases with a groove between alternate pairs of nodes. Bamboos (whether or not split, sawn lengthwise or cut to length, rounded at the ends, bleached, rendered non-inflammable, polished or dyed) are covered by this heading.
- (2) **Rattans** are stems of climbing palms usually of the genus *Calamus* and come mainly from Southern Asia. They are cylindrical, solid and flexible and generally vary between 0.3 cm and 6 cm in diameter and in colour vary from yellow to brown; they may have a dull (matt) or glossy surface. The heading includes rattan cores and the hard outer canes; it also covers the long strips obtained by cutting longitudinally these cores or canes or the whole rattans.
- (3) **Reeds and rushes**, collective terms applied to many herbaceous plants which grow in damp places, both in temperate zones and in the tropics. **Reeds** generally have the more rigid stalks or stems, straight and hollow, with nodes at fairly regular intervals, marking the place of the leaves. The best known varieties include water rushes (*Scirpus lacustris*), common or wild reeds (*Arundo donax* and *Phragmites communis*), various species of *Cyperus* (e.g., *Cyperus tegetiformis*, the Chinese mat grass) and species of *Juncus* (e.g., *Juncus effusus*, the Japanese mat rush).
- (4) **Osier** (white, yellow, green or red), the long, pliable young shoots or branches of certain varieties of the willow tree (*Salix*).
- (5) **Raffia**, the commercial name for the fibrous strips obtained from the leaves of certain palm trees of the genus *Raphia*, of which the most important is the *Raphia ruffia* grown chiefly in Madagascar. Raffia is used for plaiting and as a tying material in horticulture. Fabrics of unspun raffia are **excluded (heading 46.01)**. The heading includes other leaves and grasses (e.g., those of the Panama and latania) which are used for the same purposes as raffia and in hat-making.
- (6) **Cereal straw**, with or without ears, which has been cleaned, bleached or dyed (see below).

- (7) **The inner bark (bast) of several varieties of lime** (*Tilia* species). The fibres of this bark are very strong and are used for the manufacture of ropes, packing cloth and coarse matting and also for tying plants. The heading includes baobab bark and the bark of certain willows or poplars, which serve similar purposes.

Apart from cereal straws, which in the unprepared state are **excluded (heading 12.13)**, vegetable plaiting materials fall in this heading whether or not washed and whether raw, or split in strips, peeled, polished, bleached, prepared for dyeing, dyed, varnished or lacquered, or rendered non-inflammable. The goods of the heading may also be cut to length, whether or not rounded at the ends (straw for making drinking straws, canes for making fishing-rods, bamboos for dyeing, etc.), or assorted in bundles or hanks which may be lightly twisted for convenience of packing, storage, transport, etc.; the materials of this heading which have been assembled by twisting so as to be suitable for use in that state in place of plaits are classified in **heading 46.01**.

The heading also **excludes** :

- (a) Chipwood (**heading 44.04**).
- (b) Vegetable materials described above which have been rolled, crushed, combed or otherwise prepared for spinning (**headings 53.03 or 53.05**).

[14.02]

[14.03]

14.04 - Vegetable products not elsewhere specified or included.

1404.20 - Cotton linters

1404.90 - Other

This heading covers all vegetable products, not specified or included elsewhere in the Nomenclature.

It includes :

(A) Cotton linters.

The seeds of certain varieties of cotton plants, after separation from the cotton fibres by ginning, are still covered with a fine down formed of very short fibres (usually less than 5 mm long). These fibres are known as cotton linters.

Linters are too short for spinning; their very high cellulose content makes them an ideal raw material for the preparation of smokeless powders and the manufacture of man-made fibres (e.g., rayon) and cellulose plastics. They are also sometimes used in the manufacture of certain varieties of paper, filter blocks and as a filler in the rubber industry.

Cotton linters are classified here irrespective of their intended use and whether raw, cleaned, bleached, dyed or rendered absorbent. They may be presented in bulk or strongly compressed in the form of sheets or slabs.

The heading **does not cover** :

- (a) Wadding, medicated or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes (**heading 30.05**).
- (b) Other wadding (**heading 56.01**).

(B) Raw vegetable materials of a kind used primarily in dyeing or tanning.

Such products are used primarily in dyeing or tanning either directly or in the preparation of dyeing or tanning extracts. The materials may be untreated, cleaned, dried, ground or powdered (whether or not compressed).

The more important are :

- (1) **Wood** : Sumach, fustic (including the so-called "young fustic"), logwood, quebracho, Brazil wood (including Pernambuco wood and sappan wood), chestnut, red sandalwood.

It should be noted that woods of a kind used primarily in dyeing or in tanning are classified here only if in chips, in shavings or in ground or powdered form. In other forms, such wood is **excluded** (**Chapter 44**).

- (2) **Bark** : oaks of various kinds (including the black oak (quercitron) and the second bark of the cork-oak), chestnut, silver birch, sumach, "young fustic", wattle, mimosa, mangrove, hemlock and willow.

- (3) **Roots and the like** : madder, canaigre, *Berberis vulgaris* and alkanet.
 - (4) **Fruit, berries and seeds** : Algarobilla pods, vallonia, myrobalans, dividivi (libidibi), buckthorn berries (known also as Persian berries, Turkish seeds, yellow berries, etc.), annatto seeds and pulp, walnut hulls and almond hulls.
 - (5) **Gall nuts** : Aleppo galls, Chinese galls, Hungarian galls, pine galls, etc.
- Gall nuts are excrescences produced on the leaves or twigs of various oak and other trees when punctured by certain insects such as those of the *Cynips* genus. They contain tannin and gallic acid, and are used in dyeing and in the preparation of certain writing inks.
- (6) **Stems, stalks, leaves and flowers** : stems, stalks and leaves of woad, sumach, “ young fustic ”, holly, myrtle, sunflower, henna, reseda, indigo plant; leaves of lentiscus (mastic); flowers of safflower (bastard saffron) and dyer’s greenwood (*Genista tinctoria*; woadwaxen).

It is to be noted that saffron stigmas and styles are **excluded (heading 09.10)**.

- (7) **Lichens** : lichens from which the dyes known as orchil (or archil), cudbear and litmus are obtained (*Roccella tinctoria* and *fuciformis*, *Lichen tartareus* and *Lichen parellus*, pustulous lichen or *Umbilicaria pustulata*).

The heading **excludes** :

- (a) Tanning extracts of vegetable origin and tannins (tannic acids) including water-extracted gall-nut tannin (**heading 32.01**).
- (b) Dyewood extract and other vegetable dyeing extracts (**heading 32.03**).

(C) Hard seeds, pips, hulls and nuts of a kind used for carving.

These products are primarily used for the manufacture of buttons, beads, rosaries and other small fancy-goods.

They include, *inter alia* :

- (1) **Corozo**, the seeds (“ nuts ”) of several varieties of palm trees which grow mainly in South America. Its texture, hardness and colour resemble those of ivory, hence its common name, “ vegetable ivory ”.
- (2) **The seeds (“ nuts ”) of the doum palm** which grows chiefly in East and Central Africa (Eritrea, Somaliland, the Sudan, etc.).
- (3) **Similar “ nuts ” of certain other palms** (e.g., Palmyra or Tahiti nuts).
- (4) **Seeds of the *Canna indica* variety of reed (Indian shot); the seeds of the *Abrus precatorius* (also called bead-tree); date stones; the nuts of the piassava palm.**
- (5) **Coconut shells.**

The above products remain in this heading whether whole or (as is frequently the case with corozo and doum nuts) sliced, but not if otherwise worked. When otherwise worked, they are **excluded** (usually **heading 96.02** or **96.06**).

(D) **Vegetable materials of a kind used primarily as stuffing or as padding (for example, kapok, vegetable hair and eel-grass), whether or not put up as a layer with or without supporting material.**

This category includes vegetable materials primarily used for stuffing furniture, cushions, mattresses, pillows, saddlery and harness, life-buoys, etc. These materials remain classified in the heading even if they have subsidiary uses.

The heading **excludes** vegetable materials used as stuffing but specified elsewhere or used principally for other purposes, e.g., wood wool (**heading 44.05**), cork wool (**heading 45.01**), coconut fibres (or coir) (**heading 53.05**) and waste of vegetable textile fibres (**Chapter 52 or 53**).

The products of this group include, *inter alia* :

- (1) **Kapok**, the commercial name for the pale yellow or sometimes brownish floss surrounding the seeds of various trees of the *Bombacaceae* family. The fibres are 15 to 30 mm in length, according to the variety, and are elastic, impermeable to water, light in weight but fragile.
- (2) **Certain other vegetable downs** (sometimes known as vegetable silks), formed by the unicellular hairs of the seeds of certain varieties of tropical plants (e.g., *Asclepias*).
- (3) **The products known as vegetable hair, including Algerian fibre (*crin vegetal*),** obtained from the leaves of certain varieties of dwarf palm trees (particularly the *Chamaerops humilis*).
- (4) **Eel-grass** (e.g., *Zostera marina*), a variety of marine plant, which is hair-like or grass-like in form.
- (5) **A naturally curled product (*foin frisé*)** obtained from the leaves of certain reeds of the genus *Carex*.

The heading covers these materials if raw, or if cleaned, bleached, dyed, carded or otherwise prepared (except for spinning). They remain classified in the heading when imported in hanks.

The heading also covers a layer of vegetable materials of the types described above on a support of textile fabric, paper, etc., or put up between sheets of textile fabric, paper, etc., by stapling or simple sewing.

(E) **Vegetable materials of a kind used primarily in brooms or in brushes (for example, broomcorn, piassava, couch-grass and istle), whether or not in hanks or bundles.**

This category includes vegetable materials primarily used in brooms and brushes, etc., even if they have subsidiary uses for other purposes. But it **excludes** vegetable materials specified elsewhere in the Nomenclature or not used principally for broom or brush making, for example, bamboos, whether or not split, reeds and rushes (**heading 14.01**), alfa, esparto grass and stalks of broom, if prepared for textile use (**heading 53.03** (broom) or **heading 53.05** (alfa and esparto grass)), coconut fibres (or coir) (**heading 53.05**).

The products of this group include, *inter alia* :

- (1) **The panicles of rice, broomcorn** (*Sorghum vulgare var. technicum*) **or certain millets, with their seeds removed.**
- (2) **Piassava**, the fibres obtained from the leaves of certain tropical palms. The best known varieties are Brazilian and African piassava.
- (3) **Roots of couch-grass**, a graminaceous plant of the genus *Andropogon*, which grows in dry, sandy soil. This plant, sometimes known as "brush-grass", is a weed found in Europe, particularly in Hungary and Italy. The couch-grass roots should not be confused with those of vetiver (Khus-Khus grass or Indian couch-grass) which give an essential oil, nor with medicinal couch-grass the roots of which have curative properties (**heading 12.11**).
- (4) **The roots of certain other graminaceous plants** of Central America such as those of the genus *Epicampes* (e.g., the broomroot or zacaton).
- (5) **Gomuti fibres** obtained from the *Arenga saccharifera* or *pinnata*.
- (6) **Istle or ixtle** (Tampico, Tampico-fibre, or Mexican fibre) composed of fibres, including the short stiff fibres obtained from the short-leaved Mexican agave.

All these materials remain in this heading whether or not cut, bleached, dyed or combed (other than for spinning), and whether or not in hanks or bundles.

The heading **does not**, however, **include** prepared knots or tufts of fibre, ready for incorporation without division in brooms or brushes (or requiring only certain minor processes to be ready for such incorporation). These are classified in **heading 96.03** (see Note 3 to Chapter 96).

(F) **Other vegetable products.**

These products include :

- (1) **Esparto**, from the esparto grass (*Stipa tenacissima*) and the grass *Lygeum spartum* which grow in Africa and Spain. Their main use is in the manufacture of paper pulp, but they are also used in the manufacture of ropes and nets, of plaited articles such as carpets, matting, baskets, footwear, etc., and as stuffing and padding materials for chairs and mattresses.

Esparto is classified in this heading only if in the form of stems or leaves, whether raw, bleached or dyed; when rolled, crushed or combed as a textile fibre it is **excluded** (**heading 53.05**).

- (2) **Alfa**, if not prepared for textile use.
- (3) **Raw stalks of broom**, a leguminous plant the fibres of which are used in the textile industry; combed broom fibres or tow are **excluded** (**heading 53.03**).

(4) **Loofah**, also known as vegetable sponge, composed of the cellular tissue of a variety of gourd (*Luffa cylindrica*).

Sponges of animal origin are **excluded (heading 05.11)**.

(5) **Flours of corozo**, of doum palm “ nuts ”, of coconut shell or the like.

(6) **Lichens** (but not those used for dyeing (see Item (A) (7)), medicinal or ornamental purposes). Agar-agar, carrageenan and other natural mucilages and thickeners extracted from vegetable materials are **excluded (heading 13.02)**. Seaweeds and other algae of **heading 12.12** and dead unicellular algae (**heading 21.02**) are also **excluded**.

(7) **Teazle-heads**, including those prepared for use in textile finishing, but unmounted.

(8) **Japanese rice paper (so-called)** made by slicing the pith of certain trees indigenous to the Far East. It is used for making artificial flowers, for paintings, etc. Sheets of this rice paper remain classified in this heading whether or not they have been calendered to level their surface or have been cut to rectangular (including square) shape.

(9) **Betel leaves**, consisting of the fresh, green leaves of the vine *Piper betle L.* Betel leaves are most commonly chewed after meals for their refreshing and stimulating effects.

(10) **Quillaia bark (soap bark or Panama bark) (*Quillaia saponaria*)**.

(11) **Sapindus berries or seeds** (soapberries) (*Sapindus mukorossi*, *S. trifoliatus*, *S. saponaria*, *S. marginatus*, *S. drummondii*).

A layer of vegetable materials (of the types proper to this heading) on a support of textile fabric, paper, etc., or put up between sheets of textile fabric, paper, etc., by stapling or simple sewing, is also classified in this heading.

Section III

**ANIMAL OR VEGETABLE FATS AND OILS AND
THEIR CLEAVAGE PRODUCTS; PREPARED EDIBLE FATS;
ANIMAL OR VEGETABLE WAXES**

Chapter 15

Animal or vegetable fats and oils and their cleavage products; prepared edible fats; animal or vegetable waxes

Notes.

- 1.- This Chapter does not cover :
 - (a) Pig fat or poultry fat of heading 02.09;
 - (b) Cocoa butter, fat or oil (heading 18.04);
 - (c) Edible preparations containing by weight more than 15 % of the products of heading 04.05 (generally Chapter 21);
 - (d) Greaves (heading 23.01) or residues of headings 23.04 to 23.06;
 - (e) Fatty acids, prepared waxes, medicaments, paints, varnishes, soap, perfumery, cosmetic or toilet preparations, sulphonated oils or other goods of Section VI; or
 - (f) Factice derived from oils (heading 40.02).
- 2.- Heading 15.09 does not apply to oils obtained from olives by solvent extraction (heading 15.10).
- 3.- Heading 15.18 does not cover fats or oils or their fractions, merely denatured, which are to be classified in the heading appropriate to the corresponding undenatured fats and oils and their fractions.
- 4.- Soap-stocks, oil foots and dregs, stearin pitch, glycerol pitch and wool grease residues fall in heading 15.22.

◦
◦ ◦

Subheading Note.

- 1.- For the purposes of subheadings 1514.11 and 1514.19, the expression “ low erucic acid rape or colza oil ” means the fixed oil which has an erucic acid content of less than 2 % by weight.

GENERAL

(A) This Chapter covers :

- (1) Animal or vegetable fats and oils, whether crude, purified or refined or treated in certain ways (e.g., boiled, sulphurised or hydrogenated).
- (2) Certain products derived from fats or oils, particularly their cleavage products (e.g., crude glycerol).
- (3) Compounded edible fats and oils (e.g., margarine).

- (4) Animal or vegetable waxes.
- (5) Residues resulting from the treatment of fatty substances or of animal or vegetable waxes.

The following are, however, **excluded** :

- (a) Pig fat, free of lean meat, and poultry fat, not rendered or otherwise extracted, of **heading 02.09**.
- (b) Butter and other fats and oils derived from milk (**heading 04.05**); dairy spreads of **heading 04.05**.
- (c) Cocoa butter, fat and oil (**heading 18.04**).
- (d) Greaves (**heading 23.01**); oil cake, residual olive pulp and other residues (except dregs) resulting from the extraction of vegetable fats or oils (**headings 23.04 to 23.06**).
- (e) Fatty acids, acid oils from refining, fatty alcohols, glycerol (other than crude glycerol), prepared waxes, medicaments, paints, varnishes, soap, perfumery, cosmetic or toilet preparations, sulphonated oils or other goods of **Section VI**.
- (f) Factice derived from oils (**heading 40.02**).

With the exception of sperm oil and jojoba oil, **animal or vegetable fats and oils** are esters of glycerol with fatty acids (such as palmitic, stearic and oleic acids).

They may be either solid or fluid, but are all lighter than water. On fairly long exposure to air they become rancid due to hydrolysis and oxidation. When heated they decompose, giving off an acrid, irritant odour. They are all insoluble in water, but completely soluble in diethyl ether, carbon disulphide, carbon tetrachloride, benzene, etc. Castor oil is soluble in alcohol but the other animal or vegetable fats and oils are only slightly soluble in alcohol. They all leave a persistent greasy stain on paper.

The esters forming triglyceride fats can be broken up (saponification) by the action of superheated steam, dilute acids, enzymes or catalysts, giving glycerol and fatty acids, or by the action of alkalis, which give glycerol and the alkali salts of fatty acids (soaps).

Headings 15.04 and 15.06 to 15.15 also cover fractions of the fats and oils mentioned in those headings, provided they are not more specifically described elsewhere in the Nomenclature (e.g., spermaceti, **heading 15.21**). The main methods used for fractionation are as follows :

- (a) dry fractionation which includes pressing, decantation, winterisation and filtration;
- (b) solvent fractionation; and
- (c) fractionation with the assistance of a surface-active agent.

Fractionation does not cause any changes in the chemical structure of the fats or oils.

The expression “ fats or oils or their fractions, merely denatured ” mentioned in Note 3 to this Chapter refers to fats or oils or their fractions to which a denaturant, such as fish oil, phenols, petroleum oils, oil of turpentine, toluene, methyl salicylate (wintergreen oil), oil of rosemary, has been added to render them inedible. These substances are added in small quantities (generally not more than 1 %) which render the fats or oils or their fractions, e.g., rancid, sour, pungent, bitter. It should be noted, however, that Note 3 to this Chapter does not apply to denatured mixtures or preparations of fats or oils or their fractions (**heading 15.18**).

Subject to the exclusions in Note 1 to this Chapter, vegetable or animal fats and oils and their fractions are classified in this Chapter whether used as foodstuffs or for technical or industrial purposes (e.g., the manufacture of soap, candles, lubricants, varnishes or paints).

Vegetable or animal waxes consist essentially of the esters of certain higher fatty acids (palmitic, cerotic, myristic) with certain alcohols other than glycerol (cetyl, etc.). They contain a certain proportion of their acids and alcohols in the free state, and also some hydrocarbons.

These waxes do not yield glycerol on hydrolysis and on heating they do not give off the acrid odour of fats and do not become rancid. Waxes are generally harder than fats.

- (B) Headings 15.07 to 15.15 of this Chapter cover the single (i.e., not mixed with fats or oils of another nature), fixed vegetable fats and oils mentioned in the headings, together with their fractions, whether or not refined, but not chemically modified.

Vegetable fats and oils occur widely in nature and are found in the cells of certain parts of plants (e.g., seeds and fruit), from which they are extracted by pressure or by means of solvents.

The vegetable fats and oils classified in these headings are fixed fats and oils - i.e., fats and oils which cannot easily be distilled without decomposition, which are not volatile and which cannot be carried off by superheated steam (which decomposes and saponifies them).

With the exception of, e.g., jojoba oil, vegetable fats and oils are mixtures of glycerides, but whereas palmitic and stearic glycerides, which are solid at room temperature, predominate in solid oils, fluid oils are mainly composed of glycerides which are liquid at room temperature (glycerides of oleic acid, linoleic acid, linolenic acid, etc.).

These headings cover crude fats and oils and their fractions, as well as those which have been refined or purified, e.g., by clarifying, washing, filtering, decolourising, deacidifying or deodorising.

The by-products of the refining of oils, e.g., “ oil foots and dregs ”, and soap-stocks fall in **heading 15.22**. Acid oils from refining fall in **heading 38.23** and are prepared by decomposing with mineral acid the soap-stock obtained during the refining of crude oils.

The fats and oils covered by these headings are mainly obtained from the oil seeds and oleaginous fruits of headings 12.01 to 12.07, but may also be obtained from vegetable materials classified elsewhere (e.g. : olive oil, oils obtained from the kernels of peaches, apricots or plums of heading 12.12, oils obtained from almonds, walnuts, pignolia nuts, pistachio nuts, etc., of heading 08.02, oil obtained from germ of cereals).

These headings **do not cover** edible or inedible mixtures or preparations, or vegetable fats and oils that have been chemically modified (**heading 15.16, 15.17 or 15.18, unless** they have the character of products classified elsewhere, e.g., in **headings 30.03, 30.04, 33.03 to 33.07, 34.03**).

15.01 - Pig fat (including lard) and poultry fat, other than that of heading 02.09 or 15.03.

1501.10 - Lard

1501.20 - Other pig fat

1501.90 - Other

The fats of this heading may be obtained by any process, e.g., by rendering, pressing or solvent-extraction. The most commonly used processes are wet rendering (steam or low-temperature) and dry rendering. In the dry rendering process a portion of the fat is drained off by application of high temperature; another portion of the fat is pressed out and added to the drained-off fat. In some cases, the remainder of the fat contained in the residues may be solvent-extracted.

Subject to the above considerations, the heading includes :

- **Lard**, an edible soft creamy white solid or semi-solid fat obtained from the fatty tissue of pigs. Depending on the production method and the fatty tissue used, different lards are produced. For example, the best grade of edible pig fat is obtained, generally by dry rendering, from the internal fat of the abdomen of the pig. Most lards are deodorised and in some cases, antioxidants may be added to prevent rancidity.

Lard containing bay leaves or other spices, added only in small quantities insufficient to change its essential character, is classified in this heading, but edible mixtures or preparations containing lard are **excluded (heading 15.17)**.

- **Other pig fats**, including bone fat, fats obtained from waste and other inedible fats for uses other than human consumption, such as for manufacturing and animal feeding.
- **Poultry fats**, including bone fat and fats obtained from waste.

Bone fat obtained from fresh bones is a white or yellowish fat with the consistency and smell of tallow; but from stale bones it is soft, granular, dirty yellow or brown, with a disagreeable odour. It is used in soap or candle making and as a lubricant.

Fats obtained from waste are carcass fats, fats from certain other animal waste or residues (tongue parings, paunches, trimming, etc.) or greases obtained from the trimming or cleaning of skins. They generally have the following characteristic features : dark colour, unpleasant odour, higher content of e.g., free fatty acids (oleic, palmitic, etc.), cholesterol and impurities, and lower melting point than the lard or other fats of this heading. They are mainly used for technical purposes.

These fats may be crude or refined. Refining is effected by neutralisation, by treatment with Fuller's earth, insufflation with superheated steam, filtering, etc.

These products are used in the preparation of foods, for manufacturing ointments, soaps, etc.

The heading also **excludes** :

- (a) Pig fat, free of lean meat, and poultry fat, not rendered or otherwise extracted, of **heading 02.09**.
- (b) Lard stearin and lard oil (**heading 15.03**).
- (c) Fats obtained from animals other than those mentioned in this heading (**heading 15.02, 15.04 or 15.06**).
- (d) Bone oil of **heading 15.06**.
- (e) Imitation lard (**heading 15.17**).

15.02 - Fats of bovine animals, sheep or goats, other than those of heading 15.03.

1502.10 - Tallow

1502.90 - Other

This heading covers the fat surrounding the viscera and muscles of bovine animals, sheep or goats, that from bovine animals being the most important. This fat may be raw (fresh, chilled or frozen), salted, in brine, dried, smoked or in the form of rendered fat (tallow). The rendering processes used are the same as those for obtaining the fats of heading 15.01. The heading also covers fats obtained by pressing or solvent-extraction.

“*Premier jus*” (oleo stock) is the best grade of edible tallow. It is a solid white or yellowish product which is odourless if of recent preparation but develops a characteristic rancid odour after exposure to air.

Tallow is almost exclusively composed of glycerides of oleic, stearic and palmitic acids.

Tallow is used for the preparation of edible fats or of lubricants, in the manufacture of soap or candles, for dressing leather, in the preparation of animal feeds, etc.

The heading also includes bone fat and fats obtained from waste, of bovine animals, sheep or goats. The description of the corresponding fats in the Explanatory Note to heading 15.01 applies also to such fats of this heading.

The heading **excludes** :

- (a) Oleostearin, oleo-oil and tallow oil (**heading 15.03**).
- (b) Fat obtained from horses (**heading 15.06**).
- (c) Bone fat and fats obtained from waste, of animals other than those mentioned in this heading (**heading 15.01, 15.04 or 15.06**).
- (d) Oils of animal origin (e.g., neat's foot oil and bone oil, of **heading 15.06**).
- (e) Certain vegetable fats known as “vegetable tallow”, e.g., “Chinese vegetable tallow” (stillingia fat) and “Borneo tallow” (**heading 15.15**).

15.03 - Lard stearin, lard oil, oleostearin, oleo-oil and tallow oil, not emulsified or mixed or otherwise prepared.

This heading covers products obtained by pressing lard (i.e., lard stearin and lard oil) or by pressing tallow (i.e., oleo-oil, tallow oil and oleostearin). In these processes the lard or tallow is held in heated tanks for three to four days during which time crystals of lard stearin or oleostearin are formed. The resulting grainy mass is then pressed to separate the oils from the stearins. This pressing differs from the pressing in dry rendering which is conducted at higher temperature to remove the residual fat from the other animal materials such as protein and connective tissue, etc. The products of this heading may also be obtained by other methods of fractionation.

Lard stearin is the solid white fat left after lard or other rendered pig fat has been pressed. The heading covers both the edible and inedible forms. Edible lard stearin is sometimes mixed with soft lard to give it a firmer consistency (**heading 15.17**). Inedible lard stearin is used as a lubricant or as a source of glycerol, olein or stearin.

Lard oil is a product obtained by the cold pressing of lard or other rendered pig fat. It is a yellowish liquid with a faintly greasy odour and pleasant taste, used in certain industrial processes (wool processing, soap manufacture, etc.) or as a lubricant or sometimes for food purposes.

Oleo-oil (edible) is a white or yellowish solid fat of soft consistency with a faint smell of tallow and an agreeable flavour. It is crystalline but may become granular on rolling or smoothing. It is composed mainly of the glyceride of oleic acid (triolein). Oleo-oil is chiefly used for the manufacture of edible products, such as margarine or imitation lard, and as a lubricant.

Tallow oil (inedible oleo-oil) is a yellowish liquid, smells of tallow, and turns rancid very easily when exposed to air. It is used for soap-making and is mixed with mineral oils for use as a lubricant.

The harder part which remains after the extraction of the oleo-oil or tallow oil is a mixture consisting mainly of the glycerides of stearic and palmitic acids (tristearin and tripalmitin). Known as **oleostearin** or **tallow stearin** ("pressed tallow"), it is generally in the form of hard, brittle cakes or tablets. It is white, odourless and tasteless.

The heading **excludes** products which have been emulsified, mixed or otherwise prepared (**heading 15.16, 15.17 or 15.18**).

15.04 - Fats and oils and their fractions, of fish or marine mammals, whether or not refined, but not chemically modified.

1504.10 - Fish-liver oils and their fractions

1504.20 - Fats and oils and their fractions, of fish, other than liver oils

1504.30 - Fats and oils and their fractions, of marine mammals

This heading covers fats and oils and their fractions, derived from several varieties of fish (cod, halibut, menhaden, herring, sardines, anchovy, pilchard, etc.) or marine mammals (whales, dolphins, seals, etc.). They are extracted from the body or liver of the fish or marine mammal or from waste thereof. They usually have a characteristic fishy smell and a disagreeable taste, and vary in colour from yellow to reddish-brown.

Cod liver and halibut liver and other fish liver yield oils with a high content of vitamins and other organic substances. They are, therefore, chiefly used in medicine. These oils remain in this heading whether or not their vitamin content has been increased by irradiation or otherwise, but they fall in **Chapter 30** when put up as medicaments, or emulsified or containing other substances added with a view to therapeutic use.

This heading also includes "fish stearin", a solid product obtained by pressing and decanting chilled fish oil. It is a yellowish or brown substance smelling of fish, and is used for the preparation of degras, lubricants and low-grade soap.

The fats and oils derived from fish or marine mammals remain in this heading when refined, but are **excluded** if partly or wholly hydrogenated, inter-esterified, re-esterified or elaidinised (**heading 15.16**).

15.05 - Wool grease and fatty substances derived therefrom (including lanolin)

Wool grease is a sticky fat with a disagreeable odour, extracted from the soapy water in which the wool has been scoured or cloth fulled. It may also be extracted from greasy wool by means of volatile solvents (carbon disulphide, etc.). Wool grease does not consist of glycerol esters and, therefore, chemically it should be regarded as a wax rather than a fat. It is employed in the preparation of lubricants and for other industrial purposes, but it is mostly used as lanolin (its refined product) or for the extraction of wool grease olein or wool grease stearin.

Lanolin, obtained by purifying wool grease, has the consistency of an ointment; it ranges in colour from yellowish-white to brown according to the degree of refining, deteriorates only very slightly in the air and has a faint, characteristic odour. Lanolin is very soluble in boiling spirit but insoluble in water, although it can absorb a large quantity of water, turning into an unctuous emulsion known as hydrated lanolin.

Anhydrous lanolin is used for the preparation of lubricants, emulsifiable oils or dressings. Hydrated or emulsified lanolin is mainly used for the preparation of ointments or cosmetics.

Slightly modified lanolin, which retains the essential character of lanolin, and wool alcohols (also known as lanolin alcohols - mixtures of cholesterol, isoocholesterol and other higher alcohols) are also covered by this heading.

The heading **excludes** chemically defined alcohols (generally **Chapter 29**) and preparations based on lanolin, for example lanolin to which medicated or perfumed substances have been added (**heading 30.03** or **30.04**, or **Chapter 33**). Also **excluded** are lanolins so extensively modified chemically that they have lost the essential character of lanolin, for example lanolin ethoxylated to such an extent as to be water soluble (usually **heading 34.02**).

When wool-grease is steam-distilled and pressed, it separates into a liquid, a solid and a residue.

The liquid, known as **wool grease olein** is cloudy, reddish-brown and with a faint odour of wool grease. It is soluble in alcohol, diethyl ether, motor spirit, etc. It is used as a textile greasing agent in spinning mills.

The solid part (**wool grease stearin**) is a waxy substance, yellow-brown in colour and smelling strongly of wool grease, soluble in boiling spirit and other organic solvents. It is used in the leather industry, for the preparation of lubricants or adhesive greases, and in the manufacture of candles or soap.

The heading **excludes** wool grease residues (**heading 15.22**).

15.06 - Other animal fats and oils and their fractions, whether or not refined, but not chemically modified.

This heading covers all fats and oils of animal origin and their fractions, **except** those which are classified in heading 02.09 or in earlier headings of this Chapter. It therefore covers all animal fats not obtained from pigs, poultry, bovine animals, sheep, goats, fish or marine mammals, and all animal oils except lard oil, oleo-oil, tallow oil, oils obtained from fish or marine mammals, and oils derived from wool grease.

The heading includes in particular :

- (1) **Fat obtained from horses, hippopotamuses, bears, rabbits, land-crabs, turtles, etc.** (including fats obtained from bone, marrow or waste of these animals).
- (2) **Neat's-foot and similar oils** obtained by cold pressing the grease obtained by boiling the foot or shin bones of bovine animals, horses or sheep.

These are pale yellow, sweetish oils, stable in air, chiefly used as lubricants for delicate mechanisms (watches, sewing-machines, fire-arms, etc.).

- (3) **Bone oil** extracted from bone fat by pressure, or by the treatment of bones with hot water. This is an odourless, yellowish liquid oil, which does not readily become rancid. It is used as a lubricant for delicate mechanisms and for dressing skins.
- (4) **Oil extracted from marrow.** A white or yellowish product used in pharmacy and in perfumery.
- (5) **Egg-yolk oil** extracted from hard-boiled egg-yolks by pressure or by solvents. It is a clear, golden-yellow or reddish oil, with a smell of boiled eggs.
- (6) **Turtle-egg oil.** Pale yellow and odourless; used for food.
- (7) **Chrysalis oil** extracted from silk-worm chrysalises. This is a reddish-brown oil with a pronounced and very disagreeable odour; it is used in soap manufacture.

This heading **excludes** :

- (a) Pig or poultry fat (**heading 02.09** or **15.01**).
- (b) Fats of bovine animals, sheep or goats (**heading 15.02**).
- (c) Fats and oils of fish or marine mammals and their fractions (**heading 15.04**).
- (d) Products consisting mainly of pyridine bases (known as Dippel's oil, also sometimes called bone-oil) (**heading 38.24**).

15.07 - Soya-bean oil and its fractions, whether or not refined, but not chemically modified (+).

1507.10 - Crude oil, whether or not degummed

1507.90 - Other

Soya-bean oil is obtained by extraction from the seeds of the soya bean (*Glycine max*), using hydraulic or expeller presses, or solvents. It is a pale yellow, fixed drying oil used for both food and industrial purposes, e.g., in margarine and salad dressings, in the manufacture of soap, paints, varnishes, plasticisers, and alkyd resins.

The heading also includes fractions of soya-bean oil. However, soya-bean lecithin, obtained from crude soya-bean oil during refining, is to be classified in **heading 29.23**.

1

Subheading Explanatory Note.

Subheading 1507.10

Fixed vegetable oils, fluid or solid, obtained by pressure, shall be considered as "crude" if they have undergone no processing other than decantation, centrifugation or filtration, provided that, in order to separate the oils from solid particles only mechanical force, such as gravity, pressure or centrifugal force, has been employed, excluding any adsorption filtering process, fractionation or any other physical or chemical process. If obtained by extraction an oil shall continue to be considered as "crude", provided it has undergone no change in colour, odour or taste when compared with the corresponding oil obtained by pressure.

15.08 - Ground-nut oil and its fractions, whether or not refined, but not chemically modified (+).

1508.10 - Crude oil

1508.90 - Other

Ground-nut oil or peanut oil is a non-drying oil obtained from the seeds or "nuts" of the common ground-nut (*Arachis hypogaea*), by solvent extraction or by pressing.

The filtered and refined oil is used, for example, as a salad oil, for cooking and for making margarine. Inferior grades are used for making soaps or lubricants.

○
○ ○

Subheading Explanatory Note.

Subheading 1508.10

See the Explanatory Note to subheading 1507.10.

15.09 - Olive oil and its fractions, whether or not refined, but not chemically modified.

1509.10 - Virgin

1509.90 - Other

Olive oil is the oil obtained from the fruit of the olive tree (*Olea europaea L.*).

This heading covers :

(A) **Virgin olive oils**, which are obtained from the fruit of the olive tree solely by mechanical or other physical means (e.g., by pressing) under conditions, and particularly thermal conditions, that do not lead to deterioration of the oil. They must have undergone no treatment other than washing, decantation, centrifugation or filtration.

Virgin olive oils include :

(1) Virgin olive oil suitable for consumption in the natural state. It has a clear, light yellow to green colour and a specific odour and taste.

(2) Lampante olive oil, which has either an off-flavour taste or odour, or a free fatty acid content (expressed in terms of oleic acid) exceeding 3.3 g per 100 g or both these characteristics. It may be used as such for technical purposes or, after refining, for human consumption.

(B) **Refined olive oil**, which is obtained from the virgin olive oils referred to under Part (A) above by refining methods which do not lead to alterations in the initial glyceridic structure, or to any other modification of the structure of the constituent fatty acids.

Refined olive oil is a clear, limpid oil containing no sediment and with a free fatty acid content (expressed in terms of oleic acid) not exceeding 0.3 g per 100 g.

It has a yellow colour and no specific odour or taste and is suitable for human consumption either by itself or as a blend with virgin olive oil.

(C) **Fractions** and blends of the oils described under (A) and (B) above.

*
* * *

The virgin olive oils of Part (A) can be distinguished from the oils of Parts (B) and (C) according to the Codex Alimentarius Standard 33-1981.

The absence of re-esterified oils may be confirmed by determination of the sum of the palmitic and stearic acid contents at the 2-position in the triglycerides (according to IUPAC method No. 2210, 6th Edition 1979). This sum (expressed as a percentage of the total fatty acids at the 2-position) must be less than 1.5 % for virgin olive oils and less than 1.8 % for refined olive oils.

The olive oils of this heading can be distinguished from those of heading 15.10 by a negative Bellier reaction.

In some cases, the presence of olive-residue oil can be established only by investigating the triterpenic diols in the unsaponifiable fraction.

This heading **does not cover** olive-residue oil and blends of olive oil and olive-residue oil (**heading 15.10**) or re-esterified oil obtained from olive oil (**heading 15.16**).

15.10 - Other oils and their fractions, obtained solely from olives, whether or not refined, but not chemically modified, including blends of these oils or fractions with oils or fractions of heading 15.09.

This heading covers oils obtained from olives, **other than** the oils of **heading 15.09**.

The oils of this heading may be crude or refined or otherwise treated, provided that no modification of the glyceridic structure has taken place.

The heading includes olive-residue oil, which is obtained by means of solvent-extraction from the residues left after the olives have been pressed to produce olive oil of heading 15.09.

Crude olive-residue oil may be rendered edible by refining methods which do not lead to alterations in the initial glyceridic structure.

The resulting oil is clear, limpid and of a yellow to yellow-brown colour, contains no sediment and has no off-flavour odour or taste.

The heading also covers fractions and blends of oils or fractions of this heading with oils or fractions of heading 15.09. The most common blend consists of a mixture of refined olive-residue oil and virgin olive oil.

*
* * *

The absence of re-esterified oils may be confirmed by determination of the sum of the palmitic and stearic acid contents at the 2-position in the triglycerides, which must be lower than 2.2 % (see the Explanatory Note to heading 15.09).

The oils of this heading may be distinguished from those of heading 15.09 by a positive Bellier reaction. In some cases, the presence of olive-residue oil can be established only by investigating the triterpenic diols in the unsaponifiable fraction.

This heading **does not cover** re-esterified oil obtained from olive oil (**heading 15.16**).

15.11 - Palm oil and its fractions, whether or not refined, but not chemically modified (+).

1511.10 - Crude oil

1511.90 - Other

Palm oil is a vegetable fat obtained from the pulp of the fruits of oil palms. The main source is the African oil palm (*Elaeis guineensis*) which is native to tropical Africa but is also grown in Central America, Malaysia and Indonesia; other examples are *Elaeis melanococca* (also known as noli palm) and various species of *Acrocomia* palms, including the Paraguayan palm (coco mbocaya), originating in South America. The oils are obtained by extraction or pressing and may be of various colours depending on their condition and whether they have been refined. They are distinguishable from palm kernel oils (**heading 15.13**), which are obtained from the same oil palms by having a very high palmitic and oleic acid content.

Palm oil is used in the manufacture of soap, candles, cosmetic or toilet preparations, as a lubricant, for hot-dipped tin coating, in the production of palmitic acid, etc. Refined palm oil is used as a food stuff, e.g., as a frying fat, and in the manufacture of margarine.

This heading **does not cover** palm kernel oil or babassu oil (**heading 15.13**).

Subheading Explanatory Note.

Subheading 1511.10

See the Explanatory Note to subheading 1507.10.

15.12 - Sunflower-seed, safflower or cotton-seed oil and fractions thereof, whether or not refined, but not chemically modified (+).

- Sunflower-seed or safflower oil and fractions thereof :

1512.11 -- Crude oil

1512.19 -- Other

- Cotton-seed oil and its fractions :

1512.21 -- Crude oil, whether or not gossypol has been removed

1512.29 -- Other

(A) SUNFLOWER-SEED OIL

This oil is obtained from the common sunflower (*Helianthus annuus*) and is a light golden-yellow oil. It is used as a salad oil and in margarine and lard substitutes. The oil has semi-drying properties which render it useful in the paint or varnish industries.

(B) SAFFLOWER OIL

The seeds of the safflower (*Carthamus tinctoris*), which is a very important dye plant, furnish a drying, edible oil. This is used in foods and medicines, for alkyd resins, paints and varnishes.

(C) COTTON-SEED OIL

This is the most important of the semi-drying oils and is obtained from the kernels of the seeds of several species of the genus *Gossypium*. Cotton-seed oil has a wide range of industrial uses, e.g., in leather dressing, in the manufacture of soap, lubricants, glycerol and waterproofing compositions, and as a base for cosmetic creams. The pure refined oil is of great value as a salad or cooking oil and for making margarine and lard substitutes.

○
○ ○

Subheading Explanatory Note.

Subheadings 1512.11 and 1512.21

See the Explanatory Note to subheading 1507.10.

15.13 - Coconut (copra), palm kernel or babassu oil and fractions thereof, whether or not refined, but not chemically modified (+).

- Coconut (copra) oil and its fractions :

1513.11 -- Crude oil

1513.19 -- Other

- Palm kernel or babassu oil and fractions thereof :

1513.21 -- Crude oil

1513.29 -- Other

(A) COCONUT (COPRA) OIL

This oil is obtained from the dried flesh or copra (as it is called) of the coconut (*Cocos nucifera*). Fresh coconut flesh can also be used. This non-drying oil is pale yellow or colourless and is solid below 25 °C. Coconut oil is used in soaps, in cosmetic or toilet preparations, for making lubricating greases, synthetic detergents, laundering or cleaning preparations and as a source of fatty acids, fatty alcohols and methyl esters.

Refined coconut oil is edible and is used for food products such as margarine, dietary supplements.

(B) PALM KERNEL OIL

This white oil is obtained from the kernel of the nut, rather than the pulp of the fruits of oil palms, mainly the African oil palm *Elaeis guineensis* (see Explanatory Note to heading 15.11). It is extensively used in the margarine and candy industries, as it has a pleasant odour and nutty flavour. It is also used in the manufacture of glycerol, shampoos, soap and candles.

(C) BABASSU OIL

This non-drying oil is obtained from the babassu palm *Orbignya martiana* and *O. oleifera*. It is expressed from the kernel of the nut of the fruits.

Babassu oil is used in making industrial products, e.g., soap. When refined it is used as a substitute for palm kernel oil in food products.

Subheading Explanatory Note.

Subheadings 1513.11 and 1513.21

See the Explanatory Note to subheading 1507.10.

15.14 - Rape, colza or mustard oil and fractions thereof, whether or not refined, but not chemically modified (+).

- Low erucic acid rape or colza oil and its fractions :

1514.11 -- Crude oil

1514.19 -- Other

- Other :

1514.91 -- Crude oil

1514.99 -- Other

(A) RAPE OR COLZA OILS

The seeds of several species of *Brassica*, particularly *B. napus* and *B. rapa* (or *B. campestris*), yield semi-drying oils with similar characteristics, which are classified commercially as rape or colza oils.

These oils generally contain high levels of erucic acid. This heading also covers low erucic acid rape seed oil and colza seed oil (which are produced from the low erucic acid oil bearing seeds of specially developed strains of rape or colza), e.g., canola oil or the European rape or colza oil "double zero".

They are used for salad dressings, in the manufacturing of margarine, etc. They are also used for making industrial products, e.g., as a lubricant additive. The refined oils, generally referred to as colza oil, are also edible.

(B) MUSTARD OIL

This is a fixed vegetable oil obtained from, for example, the following three species : white mustard (*Sinapis alba* and *Brassica hirta*), black mustard (*Brassica nigra*) or Indian mustard (*Brassica juncea*). It generally contains a high level of erucic acid and is used, e.g., in medicines, for cooking or in industrial products.

○
○ ○

Subheading Explanatory Note.

Subheadings 1514.11 and 1514.91

See the Explanatory Note to subheading 1507.10.

15.15 - Other fixed vegetable fats and oils (including jojoba oil) and their fractions, whether or not refined, but not chemically modified (+).

- Linseed oil and its fractions :

1515.11 - - Crude oil

1515.19 - - Other

- Maize (corn) oil and its fractions :

1515.21 - - Crude oil

1515.29 - - Other

1515.30 - Castor oil and its fractions

1515.50 - Sesame oil and its fractions

1515.90 - Other

This heading covers single, fixed vegetable fats and oils and their fractions (see the General Explanatory Note, Part (B)) **other than** those specified in **headings 15.07 to 15.14**. The following are of particular commercial importance :

- (1) **Linseed oil**, obtained from the seeds of the flax plant (*Linum usitatissimum*). This oil is one of the most important of the drying oils. Linseed oil varies from yellow to brownish in colour and has an acrid taste and smell. On oxidation it forms a very tough elastic film. The oil is used chiefly in making paints, varnishes, oil cloth, putty, soft soap, printing inks, alkyd resins or pharmaceuticals. Cold-pressed linseed oil is edible.
- (2) **Maize (corn) oil**, obtained from the kernels of maize or Indian corn. The crude oil has many industrial uses, e.g., in making soap, lubricants, leather dressing, etc. The refined oil is edible and is used for cooking, in bakeries, for mixing with other oils, etc. Maize oil is a semi-drying oil.
- (3) **Castor oil** comes from the seeds of *Ricinus communis*. It is a non-drying, thick, generally colourless or lightly coloured oil, which was formerly used chiefly in medicine as a purgative, but is now used in industry as a plasticiser in lacquers or nitrocellulose, in the production of dibasic acids, elastomers or adhesives, surface-active agents, hydraulic fluids, etc.

Sesame oil, obtained from the seeds of an annual herb, *Sesamum indicum*. It is a semi-drying oil, the finer grades of which are used in shortenings, salad oil, margarine and similar food products, and in medicines. The poorer grades are used for industrial purposes.

- (5) **Tung oil**, (China-wood oil) obtained from the seeds of different species of the genus *Aleurites* (e.g., *A. fordii*, *A. montana*). It is pale yellow to dark brown in colour, dries very rapidly and has preservative and waterproofing qualities. Its main use is in the manufacture of varnishes and paints

- (6) **Jojoba oil**, often described as a liquid wax, a colourless or yellowish, odourless liquid, consisting mainly of esters of higher fatty alcohols, obtained from the seeds of desert shrubs of the genus *Simmondsia* (*S. californica* or *S. chinensis*), used as a substitute for sperm oil, e.g., in cosmetic preparations.
- (7) The products known as **vegetable tallows** (chiefly Borneo tallow and Chinese vegetable tallow), obtained by processing certain oleaginous seeds. Borneo tallow is in the form of crystalline or granular cakes, white outside and greenish-yellow inside. Chinese tallow is a solid, waxy substance, greenish in colour and with a slightly aromatic odour, oily to the touch.
- (8) The products known by the trade as **myrtle-wax** and **Japan wax**, which are actually vegetable fats. Myrtle wax, extracted from various kinds of myrtle berries, is presented in the form of hard, greenish-yellow cakes with a waxy appearance and a characteristic odour reminiscent of balsam. Japan wax is a substance extracted from the fruit of several varieties of Chinese or Japanese trees of the *Rhus* family. It takes the form of greenish, yellowish or white, waxy-looking tablets or discs, crystalline and brittle, with a faintly resinous odour.

◦

Subheading Explanatory Note.

Subheadings 1515.11 and 1515.21

See the Explanatory Note to subheading 1507.10.

15.16 - Animal or vegetable fats and oils and their fractions, partly or wholly hydrogenated, inter-esterified, re-esterified or elaidinised, whether or not refined, but not further prepared.

1516.10 - Animal fats and oils and their fractions

1516.20 - Vegetable fats and oils and their fractions

This heading covers animal or vegetable fats and oils, which have undergone a specific chemical transformation of a kind mentioned below, but have not been further prepared.

The heading also covers similarly treated fractions of animal or vegetable fats and oils.

(A) Hydrogenated fats and oils.

Hydrogenation, which is effected by bringing the products into contact with pure hydrogen at a suitable temperature and pressure in the presence of a catalyst (usually finely divided nickel), raises the melting points of fats and increases the consistency of oils by transforming unsaturated glycerides (e.g., of oleic, linoleic, etc., acids) into saturated glycerides of higher melting points (e.g., of palmitic, stearic, etc., acids). The degree of hydrogenation and the final consistency of the products depend on the conditions employed in the process and the length of treatment. The heading covers such products whether they have been :

- (1) Partly hydrogenated (even if these products tend to separate into pasty and liquid layers). This also has the effect of converting the *cis*-form of the unsaturated fatty acids into the *trans*-form in order to raise the melting point.
- (2) Wholly hydrogenated (e.g., oils converted into pasty or solid fats).

The products most commonly hydrogenated are oils of fish or marine mammals and certain vegetable oils (cotton-seed oil, sesame oil, ground-nut oil, colza oil, soya-bean oil, maize (corn) oil, etc.). Wholly or partly hydrogenated oils of this type are frequently used as constituents in the preparation of edible fats of heading 15.17, since the hydrogenation not only increases their consistency but also makes them less liable to deterioration by atmospheric oxidation, and improves their taste and odour, and, by bleaching them, gives them a better appearance.

This part also covers hydrogenated castor oil, so called " opal wax ".

(B) Inter-esterified, re-esterified or elaidinised fats and oils.

- (1) **Inter-esterified (or trans-esterified) fats and oils.** The consistency of an oil or fat can be increased by suitable rearrangement of the fatty acid radicals in the triglycerides contained in the product. The necessary interaction and rearrangements of the esters is stimulated by the use of catalysts.
- (2) **Re-esterified fats and oils** (also called esterified fats and oils) are triglycerides obtained by direct synthesis from glycerol with mixtures of free fatty acids or acid oils from refining. The arrangement of the fatty acid radicals in the triglycerides is different from that normally found in natural oils.

Oils obtained from olives, containing re-esterified oils, fall in this heading.

- (3) **Elaidinised fats and oils** are fats and oils processed in such a way that the unsaturated fatty acid radicals are substantially converted from the *cis*-form to the corresponding *trans*-form.

The heading includes the products as described above, even if they have a waxy character and even if they have been subsequently deodorised or subjected to similar refining processes, and whether or not they can be used directly as food. But it **excludes** hydrogenated, etc., fats and oils and their fractions which have undergone such further preparation for food purposes as texturation (modification of the texture or crystalline structure) (**heading 15.17**). The heading further **excludes** hydrogenated, inter-esterified, re-esterified or elaidinised fats and oils or their fractions, where modification involves more than one fat or oil (**heading 15.17 or 15.18**).

15.17 - Margarine; edible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, other than edible fats or oils or their fractions of heading 15.16 (+).

1517.10 - Margarine, excluding liquid margarine

1517.90 - Other

This heading covers margarine and other edible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, **other than** those of **heading 15.16**. They are generally liquid or solid mixtures or preparations of :

- (1) Different animal fats or oils or their fractions;
- (2) Different vegetable fats or oils or their fractions; or
- (3) Both animal and vegetable fats or oils or their fractions.

The products of this heading, the fats or oils of which may previously have been hydrogenated, may be worked by emulsification (e.g., with skimmed milk), churning, texturation (modification of the texture or crystalline structure), etc., and may contain small quantities of added lecithin, starch, colouring, flavouring, vitamins, butter or other milkfat (subject to the restrictions in Note 1 (c) to this Chapter).

The heading also covers edible preparations made from a single fat or oil (or fractions thereof), whether or not hydrogenated, which have been worked by emulsification, churning, texturation, etc.

The heading includes hydrogenated, inter-esterified, re-esterified or elaidinised fats and oils or their fractions, where modification involves more than one fat or oil.

The principal products of this heading are :

- (A) **Margarine** (other than liquid margarine), which is a plastic mass, generally yellowish, obtained from fats or oils of animal or vegetable origin or from a mixture of these fats or oils. It is an emulsion of the water-in-oil type, generally made to resemble butter in appearance, consistency, colour, etc.
- (B) **Edible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, other than edible fats or oils or their fractions of heading 15.16**; for example, imitation lard, liquid margarine and *shortenings* (produced from texturised oils or fats).

The heading further includes edible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, of a kind used as mould release preparations.

The heading **does not include** single fats and oils simply refined, without further treatment; these remain classified in their respective headings even if they are put up for retail sale. The heading also **excludes** preparations containing more than 15 % by weight of butter or other milkfat (generally **Chapter 21**).

15.18

The heading further **excludes** products obtained by pressing tallow or lard (**heading 15.03**) as well as hydrogenated, inter-esterified, re-esterified or elaidinised fats and oils or their fractions, where modification involves only one fat or oil (**heading 15.16**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 1517.10 and 1517.90

For the purposes of subheadings 1517.10 and 1517.90, the physical properties of margarine shall be determined by means of visual examination at a temperature of 10 °C.

15.18

15.18 - Animal or vegetable fats and oils and their fractions, boiled, oxidised, dehydrated, sulphurised, blown, polymerised by heat in vacuum or in inert gas or otherwise chemically modified, excluding those of heading 15.16; inedible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, not elsewhere specified or included.

(A) **Animal or vegetable fats and oils and their fractions, boiled, oxidised, dehydrated, sulphurised, blown, polymerised by heat in vacuum or in inert gas or otherwise chemically modified, excluding those of heading 15.16.**

This part covers animal or vegetable fats and oils and their fractions which have been subjected to processes which modify their chemical structure thereby improving their viscosity, drying power (i.e., the property of absorbing oxygen when exposed to the air and forming elastic films) or modifying their other properties, **provided** they retain their original fundamental structure and are not more specifically covered elsewhere, e.g. :

- (1) **Boiled or oxidised oils** are obtained by heating oils, generally with the addition of small quantities of oxidising agents. These oils are used in the paint and varnish industry.
- (2) **Blown oils** are partially oxidised and polymerised oils produced by blowing air through the oil, with application of heat. They are used for the manufacture of insulating varnishes, imitation leather and, when mixed with mineral oils, lubricating preparations (compound oils).

Linoxyn, a semi-solid rubbery product, which is a highly oxidised linseed oil used in the manufacture of linoleum is also included in this heading.

- (3) **Dehydrated castor oil** is obtained by dehydrating castor oil in the presence of a catalyst. It is used in the preparation of paints or varnishes.
- (4) **Sulphurised oils** are oils which have been treated with sulphur or sulphur chloride to cause polymerisation in the molecules. Oil thus processed dries more rapidly and forms a film which absorbs less water than the usual film of dried oil, and has greater mechanical strength. Sulphurised oils are used for anti-rust paints and varnishes.

If the process is carried further, a solid product is obtained (factice derived from oils) (**heading 40.02**).

- (5) **Oils polymerised by heat in vacuum or in inert gas** are certain oils (particularly linseed oil and tung oil) which have been polymerised by simply heating, without oxidation, at 250 °C to 300 °C, either in inert carbon dioxide gas or in a vacuum. This process produces thick oils commonly called " stand-oils ", used for the manufacture of varnishes forming a particularly supple and waterproof film.

Stand-oils from which the non-polymerised portion has been extracted (Teka oils) and mixtures of stand-oils are included in this heading.

(6) The **other modified oils** in the heading include :

- (a) **Maleic oils** obtained by treating, e.g., soya-bean oil with limited amounts of maleic anhydride at a temperature of 200 °C or more, in conjunction with sufficient polyhydric alcohol to esterify the extra acid groups. Maleic oils so obtained have good drying properties.
- (b) **Drying oils** (such as linseed oil) to which have been added in the cold small quantities of driers (e.g., lead borate, zinc naphthenate, cobalt resinate) to increase their drying properties. These oils are used in the place of boiled oils, in the preparation of varnishes or paints. They are very different from the prepared liquid driers of **heading 32.11** (which are concentrated solutions of driers) and must not be confused with those products.
- (c) **Epoxidised oils** obtained by treating, for example, soya-bean oil with peracetic acid pre-formed or formed *in situ* by reaction between hydrogen peroxide and acetic acid in the presence of a catalyst. They are used as plasticisers or stabilisers for, e.g., vinyl resins.
- (d) **Brominated oils** used as an emulsion or suspension stabiliser for essential oils, for example, in the pharmaceutical industry.

(B) **Inedible mixtures or preparations of animal or vegetable fats or oils or of fractions of different fats or oils of this Chapter, not elsewhere specified or included.**

This part covers, *inter alia*, used deep-frying oil containing, for example, rape oil, soya-bean oil and a small quantity of animal fat, for use in the preparation of animal feeds.

The heading also includes hydrogenated, inter-esterified, re-esterified or elaidinised fats and oils or their fractions, where modification involves more than one fat or oil.

The heading **does not include** :

- (a) Fats or oils merely denatured (see Note 3 to this Chapter).
- (b) Hydrogenated, inter-esterified, re-esterified or elaidinised fats and oils or their fractions, where modification involves only one fat or oil (**heading 15.16**).
- (c) Preparations of a kind used in animal feeding (**heading 23.09**).
- (d) Sulphonated oils (i.e., oils treated with sulphuric acid) (**heading 34.02**).

[15.19]

15.20 - Glycerol, crude; glycerol waters and glycerol lyes.

Crude glycerol is a product of a purity of less than 95 % (calculated on the weight of the dry product). It may be obtained either by cleavage of fats or oils or synthetically from propylene. It is of varying quality according to the method of production, e.g. :

- (1) Obtained by hydrolysis with water, acids or alkalis, it is a sweetish liquid with a not unpleasant odour and ranges in colour from yellowish to brown.
- (2) Obtained from glycerol lyes, it is a pale yellow liquid with an astringent taste and a disagreeable odour.
- (3) Derived from the residues of soap-making, it is a blackish-yellow liquid with a sweetish flavour (sometimes tasting of garlic, if very impure) and a more or less disagreeable odour.
- (4) Obtained by catalytic and enzymatic hydrolysis, it is generally a liquid of disagreeable taste and odour, containing large quantities of organic substances and mineral matter.

Crude glycerol may also be obtained from inter-esterification of oils or fats with other alcohols.

The heading also includes **glycerol waters**, which are by-products of the production of fatty acids, and **glycerol lyes**, which are by-products of the production of soap.

The heading **excludes** :

- (a) Glycerol of a purity of 95 % or more (calculated on the weight of the dry product) (**heading 29.05**).
- (b) Glycerol put up as a medicament or with added pharmaceutical substances (**heading 30.03 or 30.04**).
- (c) Perfumed glycerol or glycerol with added cosmetics (**Chapter 33**).

15.21 - Vegetable waxes (other than triglycerides), beeswax, other insect waxes and spermaceti, whether or not refined or coloured.

1521.10 - Vegetable waxes

1521.90 - Other

(I) Vegetable waxes (other than triglycerides), whether or not refined or coloured.

The following are the principal vegetable waxes :

- (1) **Carnauba wax**, exuded from the leaves of a variety of palm tree (*Corypha cerifera* or *Copernicia cerifera*). It is greenish, greyish or yellowish in colour, more or less oily, nearly crystalline in structure, very brittle and with an agreeable odour of hay.
- (2) **Ouricury wax**, obtained from the leaves of a variety of palm tree (*Attalea excelsa*).
- (3) **Palm wax**, spontaneously exuded from the intersection of the leaves of another variety of palm tree (*Ceroxylon andicola*) and collected from the trunk of the tree. It generally appears in the form of porous and brittle spherical pieces, yellowish-white in colour.
- (4) **Candelilla wax**, obtained by boiling a Mexican plant (*Euphorbia antisyphilitica* or *Pedilanthus pavonis*) in water. It is a hard, translucent, brown substance.
- (5) **Sugar-cane wax**, existing in the natural state on the surface of the canes and industrially obtained from the defecation scum during the manufacture of sugar. It is blackish in the raw state, soft and with an odour resembling that of sugar-cane molasses.
- (6) **Cotton wax and flax wax**, contained in the vegetable fibres, from which they are extracted by solvents.
- (7) **Ocotilla wax**, extracted by solvents from the bark of a tree growing in Mexico.
- (8) **Pyzang wax**, obtained from a kind of dust found in Java on the leaves of certain banana trees.
- (9) **Esparto wax**, obtained from esparto grass and collected as a dust when the bales of the dried grass are opened.

The heading covers vegetable waxes, crude or refined, bleached or coloured, whether or not in cakes, sticks, etc.

The heading **excludes**, however :

- (a) Jojoba oil (**heading 15.15**).
- (b) The products known by the trade as myrtle wax and Japan wax (**heading 15.15**).
- (c) Mixtures of vegetable waxes.
- (d) Vegetable waxes mixed with animal, mineral or artificial waxes.

- (e) Vegetable waxes mixed with fats, resins, mineral or other materials (other than colouring matter).

These mixtures are, in general, classified in **Chapter 34** (usually **heading 34.04** or **34.05**).

(II) Beeswax and other insect waxes whether or not refined or coloured.

Beeswax is the substance with which bees build the hexagonal cells of the combs in the hives. In the natural state it has a granular structure and is light yellow, orange or sometimes brown, with a particularly agreeable smell; when bleached and purified, it is white or faintly yellow with a very slight smell.

It is used, *inter alia*, for the manufacture of candles, waxed cloth or paper, mastics, polishes, etc.

The best known among the other insect waxes are :

- (1) **Lac wax**, obtained from shellac by extraction with alcohol. It occurs in the form of brown lumps with the odour of shellac.
- (2) **Chinese wax** (also known as insect wax or tree wax). It is found mainly in China, secreted and deposited by insects on the branches of certain ash trees as a whitish efflorescence which is collected and purified (by melting in boiling water and filtering). It is a white or yellowish substance, glossy, crystalline and tasteless, with an odour akin to that of tallow.

Beeswax and other insect waxes are classified in this heading whether in the raw state (including in natural combs), or pressed or refined, whether or not bleached or coloured.

The heading **does not include** :

- (a) Mixtures of insect waxes, insect waxes mixed with spermaceti, vegetable, mineral or artificial waxes, or insect waxes mixed with fats, resins, mineral or other materials (other than colouring matter); these mixtures usually fall in **Chapter 34** (e.g., **heading 34.04** or **34.05**).
- (b) Wax prepared in combs for beehives (**heading 96.02**).

(III) Spermaceti, crude, pressed or refined, whether or not coloured.

Spermaceti is a waxy substance extracted from the fat or oil contained in the head cavities or the sub-cutaneous ducts of sperm whales and similar cetaceans.

Crude spermaceti, which consists of about one third pure spermaceti and two thirds fat, occurs in yellowish or brown lumps, with a disagreeable odour.

Pressed spermaceti is obtained when all the fat has been extracted. It occurs in the form of small, solid scales, yellowish-brown in colour, and leaves little or no stain on paper.

Refined spermaceti is obtained by treating pressed spermaceti with dilute caustic soda. It occurs in very white, shiny strips with a pearly sheen.

Spermaceti is used in the manufacture of certain candles, in perfumery, in pharmacy or as a lubricant.

All the above products remain classified in the heading whether coloured or not.

The heading **excludes** sperm oil, whether crude or refined by separation of the spermaceti (**heading 15.04**).

15.22 - Degras; residues resulting from the treatment of fatty substances or animal or vegetable waxes.

(A) Degras.

This heading covers both natural and artificial degras, used in the leather industry for greasing (stuffing) leather.

Natural degras (also known as “moellen” and “sod oil”) is a residue from the oil tanning of chamois leather, obtained by pressing or extracted with solvents. It is composed of rancid oil of marine animals, resinous substances due to the oxidation of the oil, water, mineral substances (soda, lime, sulphates), together with waste of hair, membranes and skin.

Natural degras takes the form of very thick, pasty, homogeneous liquids, smelling strongly of fish oil and coloured yellow or dark brown.

Artificial degras consists essentially of oxidised, emulsified or polymerised fish oils (including mixtures of any of these oils) mixed with wool grease, tallow, rosin oils, etc., and, sometimes, with natural degras. These mixtures are thick yellow liquids (more fluid than natural degras), with a characteristic odour of fish oil. They do not contain waste of hair, membranes or skin. When left to stand they tend to separate into two layers, with water at the bottom.

The heading **excludes**, however, fish oils which have been merely oxidised or polymerised (**heading 15.18**), sulphonated oils (**heading 34.02**) and preparations for greasing (stuffing) leather (**heading 34.03**).

The heading also includes degras obtained by treatment of chamois leather with an alkaline solution and the precipitation by sulphuric acid of the fatty hydroxyacids. These products are encountered commercially in the form of emulsions.

(B) Residues resulting from the treatment of fatty substances or animal or vegetable waxes.

This heading covers, *inter alia* :

- (1) **Oil foots and dregs.** Oily or mucilaginous residues resulting from the purification of oils. They are used in the manufacture of soaps or lubricants.
- (2) **Soap-stocks.** By-products of oil refining produced by the neutralisation of the free fatty acids with a base (sodium hydroxide), and consisting of a mixture of crude soap and neutral oils or fats. They are of a pasty consistency, varying in colour (brownish-yellow, whitish, brownish-green, etc.), according to the raw material from which the oils are extracted. They are used in soap-making.
- (3) **Stearin pitch** from the distillation of fatty acids. It consists of a sticky, blackish mass, fairly hard, sometimes elastic, partly soluble in light petroleum. It is used in the preparation of mastics, waterproof paperboard and electric insulators.
- (4) **Residues from the distillation of wool grease.** These look like stearin residues and are used for the same purposes.
- (5) **Glycerol pitch.** Residue resulting from the distillation of glycerol. It is used for dressing fabrics and waterproofing paper.

- (6) **Used decolourising earths containing fats or animal or vegetable waxes.**
 - (7) **Filtration residues of animal or vegetable waxes** consisting of impurities containing certain quantities of wax.
- This heading excludes :

- (a) Greaves, membranous residues obtained from rendering pig fat or other animal fats (**heading 23.01**).
 - (b) Oil-cakes, residual pulp and other residues (**except dregs**) resulting from the extraction of vegetable oils (**headings 23.04 to 23.06**).
-

Section IV

PREPARED FOODSTUFFS; BEVERAGES, SPIRITS AND VINEGAR; TOBACCO AND MANUFACTURED TOBACCO SUBSTITUTES

Note.

- 1.- In this Section the term "pellets" means products which have been agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight.

Chapter 16

Preparations of meat, of fish or of crustaceans, molluscs or other aquatic invertebrates

Notes.

- 1.- This Chapter does not cover meat, meat offal, fish, crustaceans, molluscs or other aquatic invertebrates, prepared or preserved by the processes specified in Chapter 2 or 3 or heading 05.04.
 - 2.- Food preparations fall in this Chapter provided that they contain more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof. In cases where the preparation contains two or more of the products mentioned above, it is classified in the heading of Chapter 16 corresponding to the component or components which predominate by weight. These provisions do not apply to the stuffed products of heading 19.02 or to the preparations of heading 21.03 or 21.04.
- ○ ○

Subheading Notes.

- 1.- For the purposes of subheading 1602.10, the expression "homogenised preparations" means preparations of meat, meat offal or blood, finely homogenised, put up for retail sale as food suitable for infants or young children or for dietetic purposes, in containers of a net weight content not exceeding 250 g. For the application of this definition no account is to be taken of small quantities of any ingredients which may have been added to the preparation for seasoning, preservation or other purposes. These preparations may contain a small quantity of visible pieces of meat or meat offal. This subheading takes precedence over all other subheadings of heading 16.02.
- 2.- The fish, crustaceans, molluscs and other aquatic invertebrates specified in the subheadings of heading 16.04 or 16.05 under their common names only, are of the same species as those mentioned in Chapter 3 under the same name.

GENERAL

This Chapter covers prepared foodstuffs obtained by processing meat, meat offal (e.g., feet, skins, hearts, tongues, livers, guts, stomachs), blood, fish (including skins thereof), crustaceans, molluscs or other aquatic invertebrates. The Chapter covers such products which have been prepared or preserved by processes not provided for in Chapter 2 or 3 or heading 05.04, for example, products which have been :

- (1) Prepared as sausages or similar products.
- (2) Boiled, steamed, grilled, fried, roasted or otherwise cooked, **except** smoked fish and smoked crustaceans, molluscs or other aquatic invertebrates, which may have been cooked before or during smoking (**headings 03.05, 03.06, 03.07 and 03.08**), crustaceans, in shell, cooked by steaming or boiling in water (**heading 03.06**) and flours, meals and pellets, obtained from cooked fish and cooked crustaceans, molluscs or other aquatic invertebrates (**headings 03.05, 03.06, 03.07 and 03.08**, respectively).
- (3) Prepared or preserved in the form of extracts, juices or marinades, prepared from fish eggs as caviar or caviar substitutes, merely covered with batter or bread crumbs, truffled, seasoned (e.g., with both pepper and salt), etc.

- (4) Finely homogenised and based solely on products of this Chapter (i.e., prepared or preserved meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates). These homogenised preparations may contain a small quantity of visible pieces of meat, fish, etc., as well as a small quantity of ingredients added for seasoning, preservation or other purposes. However, homogenisation, by itself, does not qualify a product for classification as a preparation in Chapter 16.

For the distinctions to be drawn between the products of Chapters 2 and 3 on the one hand and of Chapter 16 on the other, see the General Explanatory Notes to Chapters 2 and 3.

This Chapter also covers food preparations (including so-called "prepared meals") consisting, e.g., of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates together with vegetables, spaghetti, sauce, etc., **provided** they contain more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof. In cases where the preparation contains two or more of the products mentioned above (e.g., both meat and fish), it is classified in the heading of Chapter 16 corresponding to the component or components which predominate by weight. In all cases the weight to be considered is the weight of meat, fish, etc., in the preparation at the time it is presented and not the weight of the same products before preparation. (It should, however, be noted that stuffed products of **heading 19.02**, sauces and preparations therefor, condiments and seasonings, of the kind described in **heading 21.03**, soups and broths and preparations therefor and homogenised composite food preparations, of the kind described in **heading 21.04**, are always classified in those headings.)

The Chapter also **excludes** :

- (a) Flours and meals, fit for human consumption, made from meat or meat offal (including products from marine mammals) (**heading 02.10**) or from fish (**heading 03.05**).
- (b) Flours, meals and pellets, unfit for human consumption, made from meat (including those from the meat of marine mammals), from fish or from crustaceans, molluscs or other aquatic invertebrates (**heading 23.01**).
- (c) Preparations based on meat, meat offal, fish, etc., for animal feeding (**heading 23.09**).
- (d) Medicaments of **Chapter 30**.

16.01 - Sausages and similar products, of meat, meat offal or blood; food preparations based on these products.

This heading covers sausages and similar products, i.e., **preparations** consisting of meat or meat offal (including guts and stomachs), which have been chopped or minced, or blood, enclosed in guts, stomachs, bladders, skins or similar casings (natural or artificial). Some of these products may however be skinless, being merely pressed into the characteristic shape of sausages, i.e., a cylinder or similar shape having a cross-section which is round, oval or rectangular (with more or less rounded corners).

Sausages and similar products may be raw or cooked, smoked or not, and they may contain added fat, starch, condiments, spices, etc. In addition, they may contain relatively large (e.g., bite-sized) pieces of meat or meat offal. Sausages and the like remain classified in the heading whether or not they have been cut into slices or put up in airtight containers.

The heading includes, *inter alia* :

- (1) Sausages and similar products, with a basis of meat (e.g., Frankfurter, salami).
- (2) Liver sausages (including those made of poultry liver).
- (3) "Black puddings" and "white puddings".
- (4) "Andouillettes" (small sausages made of chitterlings), saveloys, bolognas and similar specialities.
- (5) Pâtés, meat pastes, galantines and rillettes (potted mince), if put up in sausage casings or pressed into the characteristic shape of sausages.

This heading also includes certain food preparations (including so-called "prepared meals") based on sausage or similar products (see the General Explanatory Note to this Chapter, third paragraph).

However this heading **excludes** :

- (a) Meats put up in bladders, guts or similar casings (natural or artificial) without prior mincing or chopping, e.g., rolled ham and shoulder (generally **heading 02.10** or **16.02**).
- (b) Raw meat, chopped or minced but not containing other ingredients, even if put up in a casing (**Chapter 2**).
- (c) Preparations put up in casings of a kind not normally used as sausage casings, unless these preparations were classifiable in this heading without such casings (generally **heading 16.02**).
- (d) Poultry cooked and merely boned, such as turkey roll (**heading 16.02**).

16.02 - Other prepared or preserved meat, meat offal or blood.

- 1602.10 - Homogenised preparations
- 1602.20 - Of liver of any animal
 - Of poultry of heading 01.05 :
- 1602.31 -- Of turkeys
- 1602.32 -- Of fowls of the species *Gallus domesticus*
- 1602.39 -- Other
 - Of swine :
- 1602.41 -- Hams and cuts thereof
- 1602.42 -- Shoulders and cuts thereof
- 1602.49 -- Other, including mixtures
- 1602.50 - Of bovine animals
- 1602.90 - Other, including preparations of blood of any animal

This heading covers all prepared or preserved meat, meat offal or blood of the kind falling in this Chapter, **except** sausages and similar products (**heading 16.01**), meat extracts and meat juices (**heading 16.03**).

The heading covers :

- (1) Meat or meat offal which has been boiled (**other than** by scalding or similar treatment - see the General Explanatory Note to Chapter 2), steamed, grilled, fried, roasted or otherwise cooked.
- (2) Pâtés, meat pastes, galantines and rillettes (potted mince), **provided** that they do not meet the requirements for classification in **heading 16.01** as sausages or similar products.
- (3) Meat and meat offal prepared or preserved by other processes not provided for in Chapter 2 or heading 05.04, including those merely covered with batter or bread crumbs, truffled, seasoned (e.g., with both pepper and salt) or finely homogenised (see the General Explanatory Note to this Chapter, Item (4)).
- (4) Preparations of blood, **other than** "black puddings" and similar products of **heading 16.01**.
- (5) Food preparations (including so-called "prepared meals") containing more than 20 % by weight of meat, meat offal or blood (see the General Explanatory Note to this Chapter).

The heading also **excludes** :

- (a) Pasta (ravioli, etc.) stuffed with meat or meat offal (**heading 19.02**).
- (b) Sauces and preparations therefor, mixed condiments and mixed seasonings (**heading 21.03**).
- (c) Soups and broths and preparations therefor and homogenised composite food preparations (**heading 21.04**).

16.03 - Extracts and juices of meat, fish or crustaceans, molluscs or other aquatic invertebrates.

Though obtained from different sources, the extracts of this heading have very similar physical characteristics (appearance, odour, flavour, etc.) and chemical composition.

The heading includes :

- (1) **Meat extracts.** These are concentrates generally obtained by boiling or steaming meat under pressure and concentrating the resultant liquid after removal of the fat by filtration or centrifuging. These extracts may be solid or liquid according to the degree of concentration.
- (2) **Meat juices** obtained by pressing raw meat.
- (3) **Extracts of fish or of crustaceans, molluscs or other aquatic invertebrates.** Extracts of fish are obtained, e.g., by concentrating water extracts of the flesh of herring or other fish or made from fish meal (whether or not defatted); during the production all or part of the constituents which give the fishy taste (e.g., trimethylamine in the case of sea fish) may be eliminated and such extracts therefore have characteristics similar to those of meat extracts.
- (4) **Juices** obtained by pressing raw fish or crustaceans, molluscs or other aquatic invertebrates.

All these products may contain salt or other substances added in sufficient quantities to ensure their preservation.

Extracts are used for making certain food preparations such as soups (whether or not concentrated) and sauces. Juices are used mainly as dietetic foods.

The heading **does not cover** :

- (a) Soups and broths and preparations therefor and homogenised composite food preparations containing meat, fish, etc., extract (including soups and broths in the form of tablets or cubes) which in addition to such products contain other substances such as fat, gelatin and usually a large proportion of salt (**heading 21.04**).
- (b) Fish or marine mammal solubles of **heading 23.09**.
- (c) Medicaments in which any products of this heading serve merely as a support or vehicle for medicinal substances (**Chapter 30**).
- (d) Peptones and peptonates (**heading 35.04**).

16.04 - Prepared or preserved fish; caviar and caviar substitutes prepared from fish eggs.

- Fish, whole or in pieces, but not minced :

1604.11 -- Salmon

1604.12 -- Herrings

1604.13 -- Sardines, sardinella and brisling or sprats

1604.14 -- Tunas, skipjack and bonito (*Sarda spp.*)

1604.15 -- Mackerel

1604.16 -- Anchovies

1604.17 -- Eels

1604.18 -- Shark fins

1604.19 -- Other

1604.20 - Other prepared or preserved fish

- Caviar and caviar substitutes :

1604.31 -- Caviar

1604.32 -- Caviar substitutes

This heading covers :

- (1) Fish which has been boiled, steamed, grilled, fried, roasted or otherwise cooked; it should be noted, however, that smoked fish which has been cooked before or during smoking remains classified in **heading 03.05 provided** it has not been prepared in any other way.
- (2) Fish prepared or preserved in vinegar, oil, etc.; fish marinades (fish prepared in wine, vinegar, etc., with added spices or other ingredients); fish sausages; fish paste; the products known as "anchovy paste" and "salmon paste" (pastes made from these fish with added fat), etc.
- (3) Fish, and their parts, prepared or preserved by other processes not provided for in headings 03.02 to 03.05, e.g., fish fillets merely covered with batter or bread crumbs, prepared milt and livers, finely homogenised fish (see the General Explanatory Note to this Chapter, Item (4)) and pasteurised or sterilised fish.
- (4) Certain food preparations (including so-called "prepared meals") containing fish (see the General Explanatory Note to this Chapter).
- (5) Caviar. This is prepared from the roe of the sturgeon, a fish found in the rivers of several regions (Italy, Alaska, Turkey, Iran and Russia); the main varieties are Beluga, Schirp, Ossiotr and Sewrufe. Caviar is usually in the form of a soft, granular mass, composed of eggs between 2 and 4 mm in diameter and ranging in colour from silver-grey to greenish-black; it has a strong smell and a slightly salty taste. It may also be presented pressed - i.e., reduced to a homogeneous paste, sometimes shaped into small slender cylinders or packed in small containers.
- (6) Caviar substitutes. These are products consumed as caviar but prepared from the eggs of fish other than sturgeon (e.g., salmon, carp, pike, tuna, mullet, cod, lumpfish), which have been washed, cleaned of adherent organs, salted and sometimes pressed or dried. Such fish eggs may also be seasoned and coloured.

All these products remain classified in the heading whether or not put up in airtight containers.

This heading also **excludes** :

- (a) Fish roes, i.e., fish eggs, and milt, not prepared or preserved or prepared or preserved only by processes provided for in Chapter 3, other than those suitable for immediate consumption as caviar or caviar substitutes (**Chapter 3**).
- (b) Fish extracts and juices (**heading 16.03**).
- (c) Pasta stuffed with fish (**heading 19.02**).
- (d) Sauces and preparations therefor, mixed condiments and mixed seasonings (**heading 21.03**).
- (e) Soups and broths and preparations therefor and homogenised composite food preparations (**heading 21.04**).

16.05 - Crustaceans, molluscs and other aquatic invertebrates, prepared or preserved.

1605.10 - Crab

- Shrimps and prawns :

1605.21 -- Not in airtight container

1605.29 -- Other

1605.30 - Lobster

1605.40 - Other crustaceans

- Molluscs :

1605.51 -- Oysters

1605.52 -- Scallops, including queen scallops

1605.53 -- Mussels

1605.54 -- Cuttle fish and squid

1605.55 -- Octopus

1605.56 -- Clams, cockles and arkshells

1605.57 -- Abalone

1605.58 -- Snails, other than sea snails

1605.59 -- Other

- Other aquatic invertebrates :

1605.61 -- Sea cucumbers

1605.62 -- Sea urchins

1605.63 -- Jellyfish

1605.69 -- Other

The Explanatory Note to heading 16.04 applies, *mutatis mutandis*, to crustaceans, molluscs and other aquatic invertebrates, **except** that crustaceans, in shell, which have been cooked by steaming or by boiling in water (whether or not with small quantities of provisional chemical preserving agents) fall in **heading 03.06**.

The crustaceans and molluscs most commonly prepared or preserved include crab, shrimps and prawns, lobster, crawfish, crayfish, mussels, octopus, squid and snails. The principal other aquatic invertebrates, prepared or preserved, of this heading are sea-urchins, sea cucumbers (bêches-de-mer) and jellyfish.

Chapter 17

Sugars and sugar confectionery

Note.

1.- This Chapter does not cover :

- (a) Sugar confectionery containing cocoa (heading 18.06);
- (b) Chemically pure sugars (other than sucrose, lactose, maltose, glucose and fructose) or other products of heading 29.40; or
- (c) Medicaments or other products of Chapter 30.

◦
◦ ◦

Subheading Notes.

- 1.- For the purposes of subheadings 1701.12, 1701.13 and 1701.14, " raw sugar " means sugar whose content of sucrose by weight, in the dry state, corresponds to a polarimeter reading of less than 99.5 °.
- 2.- Subheading 1701.13 covers only cane sugar obtained without centrifugation, whose content of sucrose by weight, in the dry state, corresponds to a polarimeter reading of 69 ° or more but less than 93 °. The product contains only natural anhedral microcrystals, of irregular shape, not visible to the naked eye, which are surrounded by residues of molasses and other constituents of sugar cane.

GENERAL

This Chapter covers not only sugars as such (e.g., sucrose, lactose, maltose, glucose and fructose), but also sugar syrups, artificial honey, caramel, molasses resulting from the extraction or refining of sugar and sugar confectionery. Solid sugar and molasses of this Chapter may contain added colouring matter, flavouring matter (e.g., citric acid or vanilla) or artificial sweeteners (e.g., aspartame or stevia), as long as they retain their original character as sugar or molasses.

The Chapter **does not include** :

- (a) Sugar confectionery containing cocoa or chocolate (**other than** white chocolate) in any proportion, and sweetened cocoa powders (**heading 18.06**).
- (b) Sweetened food preparations of **Chapter 19, 20, 21 or 22**.
- (c) Sweetened forage (**heading 23.09**).
- (d) Chemically pure sugars (other than sucrose, lactose, maltose, glucose and fructose), and aqueous solutions thereof (**heading 29.40**).
- (e) Medicaments containing sugar (**Chapter 30**).

17.01 - Cane or beet sugar and chemically pure sucrose, in solid form (+).

- Raw sugar not containing added flavouring or colouring matter :

1701.12 -- Beet sugar

1701.13 -- Cane sugar specified in Subheading Note 2 to this Chapter

1701.14 -- Other cane sugar

- Other :

1701.91 -- Containing added flavouring or colouring matter

1701.99 -- Other

Cane sugar is derived from the juices of the sugar cane stalk. **Beet sugar** is derived from the juices obtained by extraction from the root of the sugar beet.

Raw or crude cane or beet sugars occur in the form of brown crystals or other solid forms, the colour being due to the presence of impurities. Their sucrose content by weight, in the dry state, corresponds to a polarimeter reading of less than 99.5 ° (see Subheading Note 1). They are generally destined for processing into refined sugar products. Raw sugar may, however, be of such a high degree of purity that it is suitable for human consumption without refining.

Refined cane or beet sugars are produced by the further processing of raw sugar. They are generally produced as a white crystalline substance which is marketed in various degrees of fineness or in the form of small cubes, loaves, slabs, or sticks or regularly moulded, sawn or cut pieces.

In addition to the raw or refined sugars mentioned above, this heading covers brown sugar consisting of white sugar mixed with small quantities of, e.g., caramel or molasses, and sugar candy consisting of large crystals produced by slow crystallisation of concentrated solutions of sugar.

It should be noted that cane and beet sugar fall in this heading **only** when in the solid form (including powders); such sugar may contain added flavouring or colouring matter.

Sugar syrups of cane or beet sugar, consisting of aqueous solutions of sugars, are classified in **heading 17.02** when not containing added flavouring or colouring matter and otherwise in **heading 21.06**.

The heading further **excludes** preparations in solid form (including granules or powders) which have lost the character of sugar, of a kind used for making beverages (**heading 21.06**).

The heading also includes chemically pure sucrose in solid form, whatever its origin. Sucrose (other than chemically pure sucrose) obtained from sources other than sugar cane or sugar beet is **excluded** (**heading 17.02**).

○
○ ○

Subheading Explanatory Note.

Subheadings 1701.12, 1701.13 and 1701.14

Raw cane sugar in trade always contains more than 0.1 % of invert sugar while the invert sugar content of raw beet sugar is normally less than 0.1 %. These two types of raw sugars may also be distinguished from each other by their difference in odour which develops on overnight storage in stoppered containers of samples in aqueous solution.

17.02 - Other sugars, including chemically pure lactose, maltose, glucose and fructose, in solid form; sugar syrups not containing added flavouring or colouring matter; artificial honey, whether or not mixed with natural honey; caramel.

- Lactose and lactose syrup :

1702.11 -- Containing by weight 99 % or more lactose, expressed as anhydrous lactose, calculated on the dry matter

1702.19 -- Other

1702.20 - Maple sugar and maple syrup

1702.30 - Glucose and glucose syrup, not containing fructose or containing in the dry state less than 20 % by weight of fructose

1702.40 - Glucose and glucose syrup, containing in the dry state at least 20 % but less than 50 % by weight of fructose, excluding invert sugar

1702.50 - Chemically pure fructose

1702.60 - Other fructose and fructose syrup, containing in the dry state more than 50 % by weight of fructose, excluding invert sugar

1702.90 - Other, including invert sugar and other sugar and sugar syrup blends containing in the dry state 50 % by weight of fructose

This heading covers other sugars in solid form, sugar syrups and also artificial honey and caramel.

(A) OTHER SUGARS

This part covers sugars, **other than** sugars of **heading 17.01** or chemically pure sugars of **heading 29.40**, in solid form (including powders), whether or not containing added flavouring or colouring matter. The principal sugars of this heading are :

- (1) **Lactose** (also known as milk sugar) ($C_{12}H_{22}O_{11}$), which occurs in milk and is produced commercially from whey. This heading covers both commercial and chemically pure lactose. Such products must contain by weight more than 95 % lactose, expressed as anhydrous lactose, calculated on the dry matter. For the purposes of calculating the percentage weight of lactose in a product the expression "dry matter" should be taken to exclude both free water and water of crystallisation. Products obtained from whey and containing 95 % or less by weight of lactose, expressed as anhydrous lactose, calculated on the dry matter, are **excluded** (generally **heading 04.04**).

Commercial lactose, when refined, is a white, slightly sweet, crystalline powder. Chemically pure lactose, whether anhydrous or hydrated, occurs as hard colourless crystals, which absorb odours.

Lactose is used extensively, with milk, in the preparation of infant foods; it is also used in confectionery, in jam-making or in pharmacy.

- (2) **Invert sugar**, the main constituent of natural honey. It is usually prepared commercially by the hydrolysis of refined sucrose solutions and consists of equal proportions by weight of glucose and fructose. It may be presented in solid form or as a viscous syrup (see Part (B)). It is used in pharmacy, in bread making, in the manufacture of fruit preserves and artificial honey and in the brewing industry.
- (3) **Glucose**, which occurs naturally in fruits and honey. Together with an equal part of fructose it constitutes invert sugar.

The heading includes dextrose (chemically pure glucose) and commercial glucose.

Dextrose ($C_6H_{12}O_6$) is a white crystalline powder. It is used in the food and pharmaceutical industries.

Commercial glucose is obtained by hydrolysing starch with acids and/or enzymes. It always contains, in addition to dextrose, a variable proportion of di-, tri- and other polysaccharides (maltose, maltotriose, etc.). It has a reducing sugar content, expressed as dextrose on the dry substance, of not less than 20 %. It is usually in the form of a colourless, more or less viscous liquid (glucose syrup, see Part (B)) or of lumps or cakes (glucose aggregates) or of an amorphous powder. It is used mainly in the food industry, in brewing, in tobacco fermentation and in pharmacy.

- (4) **Fructose** ($C_6H_{12}O_6$) which is present in large quantities, with glucose, in sweet fruits and in honey. Commercially it is produced from commercial glucose (e.g., corn syrup), from sucrose or by hydrolysis of inulin, a substance found mainly in the tubers of the dahlia and the Jerusalem artichoke. It occurs in the form of a whitish, crystalline powder or as a viscous syrup (see Part (B)); it is sweeter than ordinary sugar (sucrose) and is especially suitable for use by diabetics. This heading covers both commercial and chemically pure fructose.
- (5) **Sucrose sugars**, obtained from sources other than the sugar beet and the sugar cane. The most important is **maple** sugar, obtained from the sap of varieties of the maple tree, chiefly the *Acer saccharum* and the *Acer nigrum* which grow mainly in Canada and the North-Eastern United States. The sap is usually concentrated and crystallised unrefined in order to retain certain non-sugar constituents to which the sugar owes its delicate flavour. It is also marketed in the form of a syrup (see Part (B)). Other sucrose syrups (see Part (B)) are obtained from sweet sorghum (*Sorghum vulgare var. saccharatum*), carob beans, certain palms, etc.
- (6) **Malto-dextrins** (or **dextri-maltoses**), obtained by the same process as commercial glucose. They contain maltose and polysaccharides in variable proportions. However, they are less hydrolysed and therefore have a lower reducing sugar content than commercial glucose. The heading covers only such products with a reducing sugar content, expressed as dextrose on the dry substance, exceeding 10 % (but less than 20 %). Those with a reducing sugar content not exceeding 10 % fall in **heading 35.05**. Malto-dextrins are generally in the form of white powders, but they are also marketed in the form of a syrup (see Part (B)). They are used chiefly in the manufacture of baby food and low-calory dietetic foods, as extenders for flavouring substances or food colouring agents, and in the pharmaceutical industry as carriers.

- (7) **Maltose** ($C_{12}H_{22}O_{11}$) which is produced industrially from starch by hydrolysis with malt diastase and is produced in the form of a white crystalline powder. It is used in the brewing industry. This heading covers both commercial and chemically pure maltose.

(B) SUGAR SYRUPS

This part covers syrups of all sugars (including lactose syrups and aqueous solutions **other than** aqueous solutions of chemically pure sugars of **heading 29.40**), **provided** they do not contain added flavouring or colouring matter (see Explanatory Note to heading 21.06).

In addition to the syrups referred to in Part (A) above (i.e., glucose (starch) syrup, fructose syrup, syrup of malto-dextrins, inverted sugar syrup as well as sucrose syrup), this heading includes :

- (1) **Simple syrups** obtained by dissolving sugars of this Chapter in water.
- (2) **Juices and syrups** obtained during the extraction of sugars from sugar beet, sugar cane, etc. These may contain pectin, albuminoidal substances, mineral salts, etc., as impurities.
- (3) **Golden syrup**, a table or culinary syrup containing sucrose and invert sugar. Golden syrup is made from the syrup remaining during sugar refining after crystallisation and separation of refined sugar, or from cane or beet sugar, by inverting part of the sucrose or by the addition of invert sugar.

(C) ARTIFICIAL HONEY

The term "artificial honey" applies to mixtures based on sucrose, glucose or invert sugar, generally flavoured or coloured and prepared to imitate natural honey. Mixtures of natural and artificial honey are also included in this heading.

(D) CARAMEL

Caramel is a brown non-crystallisable substance with an aromatic odour. It may be in the form either of a more or less syrupy liquid or of a solid, usually a powder.

It is obtained by more or less prolonged pyrogenation, at a temperature of 120 - 180 °C, from sugars (usually glucose or sucrose) or from molasses.

Depending on the manufacturing process, a whole series of products is obtained ranging from **caramelised sugars** (or molasses) proper with a sugar content, calculated on the dry product, which is usually high (of the order of 90 %), to "**colouring**" **caramels**, with a very low sugar content.

Caramelised sugars or molasses are used for flavouring, particularly in making sweetened desserts, ice cream or pastry-cooks' products. Colouring caramels, because of a fairly high degree of conversion of the sugars into melanoidin (a colorant), are used as colouring substances in, for example, biscuit-making, brewing and the manufacture of certain non-alcoholic beverages.

17.03 - Molasses resulting from the extraction or refining of sugar (+).

1703.10 - Cane molasses

1703.90 - Other

Molasses of this heading is obtained only as a result of the extraction or refining of sugar. It is most commonly obtained as a normal by-product resulting from the extraction or refining of beet or cane sugar or from the production of fructose from maize (corn). It is a brown or blackish viscous substance containing an appreciable amount of sugar which cannot readily be crystallised. However, it may be powdered.

Beet sugar molasses is not normally eaten as such, but certain refined forms of sugar cane molasses and corn molasses are suitable for human consumption and are sold as treacle or as table syrups. The main uses of molasses are as the raw material from which alcohols and alcoholic beverages are distilled (e.g., rum from sugar cane molasses), in the preparation of cattle foods and coffee substitutes. It is also sometimes used for the extraction of sugar.

Molasses of this heading may be decolourised, coloured or flavoured.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 1703.10

Cane molasses can be distinguished from the other molasses of heading 17.03 on the basis of odour and chemical composition.

17.04 - Sugar confectionery (including white chocolate), not containing cocoa.

1704.10 - Chewing gum, whether or not sugar-coated

1704.90 - Other

This heading covers most of the sugar preparations which are marketed in a solid or semi-solid form, generally suitable for immediate consumption and collectively referred to as **sweetmeats, confectionery or candies**.

It includes, *inter alia* :

- (1) Gums containing sugar (including sweetened chewing gum and the like).
- (2) Boiled sweets (including those containing malt extract).
- (3) Caramels, cachous, candies, nougat, fondants, sugared almonds, Turkish delight.
- (4) Marzipan.
- (5) Preparations put up as throat pastilles or cough drops, consisting essentially of sugars (whether or not with other foodstuffs such as gelatin, starch or flour) and flavouring agents (including substances having medicinal properties, such as benzyl alcohol, menthol, eucalyptol and tolu balsam). However, throat pastilles or cough drops which contain substances having medicinal properties, other than flavouring agents, fall in **Chapter 30**, provided that the proportion of those substances in each pastille or drop is such that they are thereby given therapeutic or prophylactic uses.
- (6) White chocolate composed of sugar, cocoa butter, milk powder and flavouring agents, but not containing more than mere traces of cocoa (cocoa butter is not regarded as cocoa).
- (7) Liquorice extract (cakes, blocks, sticks, pastilles, etc.) containing more than 10 % by weight of sucrose. When put up (i.e., prepared) as confectionery, however, (flavoured or not), liquorice extract falls in the heading irrespective of the proportion of sugar.
- (8) Fruit jellies and fruit pastes put up in the form of sugar confectionery.
- (9) Pastes based on sugar and containing little or no added fat and suitable for transformation directly into sugar confectionery of this heading, but also used as a filling for products of this or other headings, for example :
 - (a) Fondant pastes prepared from sucrose, sucrose or glucose syrup or invert sugar syrup with or without flavouring, used for making fondants, as a filling for sweets or chocolates, etc.
 - (b) Nougat pastes, being aerated mixtures of sugar, water and colloidal materials (e.g., egg white) and sometimes with a small quantity of added fat, with or without the addition of nuts, fruits or other suitable vegetable products, used for making nougat, as filling for chocolates, etc.
 - (c) Almond pastes, prepared mainly from almonds and sugar, used essentially for making marzipan.
- (10) Preparations based on natural honey put up in the form of sugar confectionery (e.g., "halva").

The heading **excludes** :

- (a) Liquorice extract (not put up as confectionery) containing 10 % or less by weight of sucrose (**heading 13.02**).
- (b) Sugar preparations containing cocoa (**heading 18.06**). (For this purpose cocoa butter is not regarded as cocoa.)
- (c) Sweetened food preparations such as vegetables, fruit, fruit peel, etc., preserved by sugar (**heading 20.06**) and jams, fruit jellies, etc. (**heading 20.07**).
- (d) Sweets, gums and the like (for diabetics, in particular) containing synthetic sweetening agents (e.g., sorbitol) instead of sugar; pastes based on sugar, containing added fat in a relatively large proportion and, sometimes, milk or nuts, not suitable for transformation directly into sugar confectionery (**heading 21.06**).
- (e) Medicaments of **Chapter 30**.

Chapter 18

Cocoa and cocoa preparations

Notes.

- 1.- This Chapter does not cover the preparations of heading 04.03, 19.01, 19.04, 19.05, 21.05, 22.02, 22.08, 30.03 or 30.04.
- 2.- Heading 18.06 includes sugar confectionery containing cocoa and, subject to Note 1 to this Chapter, other food preparations containing cocoa.

GENERAL

This Chapter covers cocoa (including cocoa beans) in all forms, cocoa butter, fat and oil and preparations containing cocoa (in any proportion), **except** :

- (a) Yogurt and other products of **heading 04.03**.
- (b) White chocolate (**heading 17.04**).
- (c) Food preparations of flour, groats, meal, starch or malt extract, containing less than 40 % by weight of cocoa calculated on a totally defatted basis, and food preparations of goods of headings 04.01 to 04.04 containing less than 5 % by weight of cocoa calculated on a totally defatted basis, of **heading 19.01**.
- (d) Swelled or roasted cereals containing not more than 6 % by weight of cocoa calculated on a totally defatted basis (**heading 19.04**).
- (e) Pastry, cakes, biscuits and other bakers' wares, containing cocoa (**heading 19.05**).
- (f) Ice cream and other edible ice, containing cocoa in any proportion (**heading 21.05**).
- (g) Beverages, non-alcoholic or alcoholic (e.g., "*crème de cacao*"), containing cocoa and ready for consumption (**Chapter 22**).
- (h) Medicaments (**heading 30.03 or 30.04**).

The Chapter also **excludes** theobromine, an alkaloid extracted from cocoa (**heading 29.39**).

18.01 - Cocoa beans, whole or broken, raw or roasted.

Cocoa beans are the seeds, contained in large numbers (25 to 80), in the fruit (cocoa-pod) of the cacao-tree (*Theobroma cacao*). They are of flat ovoid form, generally violet or reddish in colour. They consist of a tough, brittle shell, and a very thin whitish inner husk or skin covering the kernel and dividing it into several sections.

In order to reduce their slightly bitter taste, to develop the aroma and to facilitate shelling, the beans are fermented; they may alternatively be steam treated and dried. They are roasted to facilitate removal of the shells, to render the kernels more friable, to concentrate the product and improve the flavour and aroma. They are then passed through corrugated rollers which break up the beans and detach the germs; subsequent processes separate the shells, husks and germs from the broken pieces of kernels (cocoa nibs).

The heading covers raw or roasted beans, whole (whether or not separated from their shells, husks, skins or germs) or broken.

The heading **does not include** :

- (a) Shells, husks, skins and other cocoa waste (**heading 18.02**).
- (b) Cocoa beans ground to paste (**heading 18.03**).

18.02 - Cocoa shells, husks, skins and other cocoa waste.

This heading covers the waste left from the manufacture of cocoa powder or cocoa butter. Some of these residues may be used for the further extraction of cocoa butter, and they may all be used for the extraction of theobromine. They may also be added, in relatively small proportions, to animal feeding stuffs. When ground, they are sometimes used instead of cocoa powder which they resemble in odour but not in flavour.

The heading includes :

- (1) **Shells, husks and skins** separated during the process of roasting and crushing the beans. They contain small fragments of the kernels (which remain attached to the shell, husk or skin and cannot readily be separated from them), from which a proportion of cocoa butter may be extracted.
- (2) **Cocoa germs**, resulting from the cocoa beans being passed through so-called de-germing machines. These contain practically no fat.
- (3) **Cocoa dust and cocoa shell dust**; normally, their fat content is sufficiently high for extraction to be economically justified.
- (4) **Cocoa cakes** (resulting from the extraction of the cocoa butter from shell, husk or skin waste containing fragments of kernel, or from the whole bean). These cakes contain particles of the shells, husks and skins and are therefore unsuitable for the manufacture of cocoa powder or chocolate.

The heading **excludes** cocoa cake free from shells, husks and skins, resulting from the extraction of cocoa butter from cocoa paste (**heading 18.03**).

18.03 - Cocoa paste, whether or not defatted.

1803.10 - Not defatted

1803.20 - Wholly or partly defatted

Cocoa paste is obtained by grinding roasted cocoa beans (cleaned of their shells, husks, skins and germs) between heated grindstones or disc crushers; the resulting product is solidified in tablets, lumps or blocks. The paste can be used in this state by confectioners but it is generally used for the manufacture of cocoa butter, cocoa powder and chocolate.

The heading also covers paste which has been wholly or partly defatted (cocoa cake); this is used for the manufacture of cocoa powder or chocolate, or in some cases for the manufacture of theobromine.

The heading **excludes** cocoa paste containing added sugar or other sweetening matter (**heading 18.06**).

18.04 - Cocoa butter, fat and oil.

Cocoa butter, the fatty matter contained in cocoa beans, is generally obtained by hot-pressing either cocoa paste or the whole bean. An inferior quality, often referred to as cocoa fat, can also be obtained from spoiled cocoa beans or from various kinds of cocoa waste (shells, husks, dust, etc.) either by pressure or by extraction with suitable solvents.

Cocoa butter is generally solid at room temperature, slightly oily and yellowish-white in colour; it has an odour similar to that of cocoa and an agreeable flavour. It is generally presented in slabs, and is used in chocolate-making (to enrich cocoa pastes), in confectionery (for the preparation of certain sweets), in perfumery (for extracting perfumes by the enfleurage process), in the manufacture of cosmetics and in pharmacy (for the preparation of ointments, suppositories, etc.).

18.05 - Cocoa powder, not containing added sugar or other sweetening matter.

Cocoa powder is obtained by pulverising the partly defatted cocoa paste referred to in heading 18.03.

This heading covers only cocoa powder not containing added sugar or other sweetening matter. The heading includes, *inter alia*, cocoa powder obtained after treating the nibs, paste or powder with alkaline substances (carbonate of sodium or potassium, etc.) to increase its solubility (soluble cocoa).

Cocoa powder containing added sugar or other sweetening matter and cocoa powder to which milk powder or peptones have been added fall in **heading 18.06**. However, medicaments in which cocoa powder serves merely as a support or vehicle for the medicinal substance fall in **heading 30.03** or **30.04**.

18.06 - Chocolate and other food preparations containing cocoa (+).

1806.10 - Cocoa powder, containing added sugar or other sweetening matter

1806.20 - Other preparations in blocks, slabs or bars weighing more than 2 kg or in liquid, paste, powder, granular or other bulk form in containers or immediate packings, of a content exceeding 2 kg

- Other, in blocks, slabs or bars :

1806.31 -- Filled

1806.32 -- Not filled

1806.90 - Other

Chocolate is composed essentially of cocoa paste and sugar or other sweetening matter, usually with the addition of flavouring and cocoa butter; in some cases, cocoa powder and vegetable oil may be substituted for cocoa paste. Milk, coffee, hazelnuts, almonds, orange-peel, etc., are sometimes also added.

Chocolate and chocolate goods may be put up either as blocks, slabs, tablets, bars, pastilles, croquettes, granules or powder, or in the form of chocolate products filled with creams, fruits, liqueurs, etc.

The heading also includes all sugar confectionery containing cocoa in any proportion (including chocolate nougat), sweetened cocoa powder, chocolate powder, chocolate spreads, and, in general, all food preparations containing cocoa (**other than** those **excluded** in the General Explanatory Note to this Chapter).

Chocolate enriched with vitamins is also classified in this heading.

The heading **does not include** :

- (a) White chocolate (composed of cocoa butter, sugar and powdered milk) (**heading 17.04**).
- (b) Biscuits and other bakers' wares covered with chocolate (**heading 19.05**).

○
○ ○

Subheading Explanatory Note.

Subheading 1806.31

For the purpose of this subheading, the term "filled" covers blocks, slabs or bars consisting of a centre composed of, e.g., cream, crusted sugar, desiccated coconut, fruit, fruit paste, liqueurs, marzipan, nuts, nougat, caramel or combinations of these products, enrobed with chocolate. Solid blocks, slabs or bars of chocolate containing, for example, cereal, fruit or nuts (whether or not in pieces), embedded throughout the chocolate, are **not** regarded as "filled".

Chapter 19

Preparations of cereals, flour, starch or milk; pastrycooks' products

Notes.

- 1.- This Chapter does not cover :
 - (a) Except in the case of stuffed products of heading 19.02, food preparations containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (Chapter 16);
 - (b) Biscuits or other articles made from flour or from starch, specially prepared for use in animal feeding (heading 23.09); or
 - (c) Medicaments or other products of Chapter 30.
- 2.- For the purposes of heading 19.01 :
 - (a) The term " groats " means cereal groats of Chapter 11;
 - (b) The terms " flour " and " meal " mean :
 - (1) Cereal flour and meal of Chapter 11, and
 - (2) Flour, meal and powder of vegetable origin of any Chapter, other than flour, meal or powder of dried vegetables (heading 07.12), of potatoes (heading 11.05) or of dried leguminous vegetables (heading 11.06).
- 3.- Heading 19.04 does not cover preparations containing more than 6 % by weight of cocoa calculated on a totally defatted basis or completely coated with chocolate or other food preparations containing cocoa of heading 18.06 (heading 18.06).
- 4.- For the purposes of heading 19.04, the expression " otherwise prepared " means prepared or processed to an extent beyond that provided for in the headings of or Notes to Chapter 10 or 11.

GENERAL

This Chapter covers a number of preparations, generally used for food, which are made either directly from the cereals of Chapter 10, from the products of Chapter 11 or from food flour, meal and powder of vegetable origin of other Chapters (cereal flour, groats and meal, starch, fruit or vegetable flour, meal and powder) or from the goods of headings 04.01 to 04.04. The Chapter also covers pastrycooks' products and biscuits, even when not containing flour, starch or other cereal products.

For the purposes of Note 3 to this Chapter and heading 19.01, the cocoa content of a product can normally be calculated by multiplying the combined theobromine and caffeine content by a factor of 31. It should be noted that the term " cocoa " covers cocoa in all forms, including paste and solid.

The Chapter **excludes** :

- (a) Food preparations (other than stuffed products of **heading 19.02**) containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (**Chapter 16**).
- (b) Food preparations of flour, groats, meal, starch or malt extract containing 40 % or more by weight of cocoa calculated on a totally defatted basis and food preparations of goods of headings 04.01 to 04.04 containing 5 % or more by weight of cocoa calculated on a totally defatted basis (**heading 18.06**).
- (c) Roasted coffee substitutes containing coffee in any proportion (**heading 09.01**) and other roasted coffee substitutes (e.g., roasted barley) (**heading 21.01**).
- (d) Powders for the manufacture of custards, desserts, ice cream or similar preparations but not being preparations based on flour, meal, starch, malt extract or goods of headings 04.01 to 04.04 (generally **heading 21.06**).
- (e) Products made from flour or from starch, specially prepared for use in animal feeding (e.g., dog biscuits) (**heading 23.09**).
- (f) Medicaments and other products of **Chapter 30**.

19.01 - Malt extract; food preparations of flour, groats, meal, starch or malt extract, not containing cocoa or containing less than 40 % by weight of cocoa calculated on a totally defatted basis, not elsewhere specified or included; food preparations of goods of headings 04.01 to 04.04, not containing cocoa or containing less than 5 % by weight of cocoa calculated on a totally defatted basis, not elsewhere specified or included.

1901.10 - Preparations suitable for infants or young children, put up for retail sale

1901.20 - Mixes and doughs for the preparation of bakers' wares of heading 19.05

1901.90 - Other

(I) Malt extract.

Malt extracts are made by concentrating the solution obtained on macerating malt in water.

They remain classified in this heading whether in block or powder form, or as more or less viscous liquids.

Malt extracts with added lecithin, vitamins, salts, etc., remain in this heading **provided** they do not constitute medicaments of **Chapter 30**.

Malt extracts are mainly employed for the preparation of products of a kind used as food suitable for infants or young children or for dietetic or culinary purposes, or for the manufacture of pharmaceutical products. The viscous forms may also be used without further preparation in the baking and textile industries.

This heading **does not cover** :

- (a) Sugar confectionery, containing malt extract, of **heading 17.04**.
- (b) Beers and other beverages (e.g., malton) with a basis of malt (**Chapter 22**).
- (c) Malt enzymes (**heading 35.07**).

(II) Food preparations of flour, groats, meal, starch or malt extract, not containing cocoa or containing less than 40 % by weight of cocoa calculated on a totally defatted basis, not elsewhere specified or included.

This heading covers a number of food preparations with a basis of flour, groats or meal, of starch or of malt extract, which derive their essential character from such materials whether or not these ingredients predominate by weight or volume.

Other substances may be added to these main ingredients, such as milk, sugar, eggs, casein, albumin, fat, oil, flavouring, gluten, colouring, vitamins, fruit or other substances to improve their dietetic value, or cocoa, in the latter case, in any proportion less than 40 % by weight of cocoa calculated on a totally defatted basis (see the General Explanatory Note to this Chapter).

It should be noted however that preparations containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof are **excluded** (**Chapter 16**).

For the purposes of this heading :

- (A) The terms “**flour**” and “**meal**” mean not only the cereal flour or meal of Chapter 11 but also food flour, meal and powder of vegetable origin of any Chapter, such as soya-bean flour. However, these terms **do not cover** flour, meal or powder of dried vegetables (**heading 07.12**), of potatoes (**heading 11.05**) or of dried leguminous vegetables (**heading 11.06**).
- (B) The term “**starch**” covers both untransformed starches and starches which have been pregelatinised or solubilised, **but not** more evolved starch products such as dextri-maltose.

The preparations of this heading may be liquid or in the form of powders, granules, doughs or other solid forms such as strips or discs.

These preparations are often used for making beverages, gruels, food suitable for infants or young children, dietetic foods, etc., by simply mixing with, or boiling in, milk or water, or for making cakes, puddings, custards or similar culinary preparations.

They may also constitute intermediate preparations for the food industry.

The heading includes, *inter alia*, preparations such as :

- (1) Flours obtained by evaporating a mixture of milk with sugar and flour.
- (2) Preparations consisting of a mixture of egg powder, milk powder, malt extract and cocoa powder.
- (3) Racahout, a food preparation composed of rice flour, various starches, flour of sweet acorns, sugar and cocoa powder, flavoured with vanilla.
- (4) Preparations composed of mixtures of cereal flour with fruit flours, generally containing added cocoa powder, or of fruit flours with added cocoa powder.
- (5) Malted milk and similar preparations composed of powdered milk and malt extract with or without added sugar.
- (6) “Knödel”, “Klösse”, “Nockerln”, with ingredients such as semolina, cereal flour, breadcrumbs, fat, sugar, eggs, spices, yeast, jam or fruit. However, such products based on potato flour are classified in **Chapter 20**.
- (7) Ready-mixed doughs, consisting essentially of cereal flour with sugar, fat, eggs or fruit (including those put up in moulds or formed into final shape).
- (8) Uncooked pizza consisting of a pizza base (dough) covered with various other ingredients such as cheese, tomato, oil, meat, anchovies. However, pizza that is pre-cooked or cooked is classified in **heading 19.05**.

Apart from the preparations excluded by the General Explanatory Note to this Chapter, this heading also **excludes** :

- (a) Self-raising flours and "swelling" (pregelatinised) flours of **heading 11.01 or 11.02**.
- (b) Mixed cereal flours (**heading 11.01 or 11.02**), mixed flours and meals of leguminous vegetables and mixed fruit flours, meals or powders (**heading 11.06**), not otherwise prepared.
- (c) Pasta and couscous of **heading 19.02**.
- (d) Tapioca and substitutes therefor (**heading 19.03**).
- (e) Fully or partially cooked bakers' wares, the latter requiring further cooking before consumption (**heading 19.05**).
- (f) Sauces and preparations therefor (**heading 21.03**).
- (g) Soups and broths and preparations therefor and homogenised composite food preparations (**heading 21.04**).
- (h) Textured vegetable protein products (**heading 21.06**).
- (i) Beverages of **Chapter 22**.

(III) Food preparations of goods of headings 04.01 to 04.04, not containing cocoa or containing less than 5 % by weight of cocoa calculated on a totally defatted basis, not elsewhere specified or included.

The preparations of this heading may be distinguished from the products of headings 04.01 to 04.04 in that they contain, in addition to natural milk constituents, other ingredients not permitted in the products of those earlier headings. Thus heading 19.01 includes, for example :

- (1) Preparations in powder or liquid form used as food suitable for infants or young children or for dietetic purposes and consisting of milk to which secondary ingredients (e.g., cereal groats, yeast) have been added.
- (2) Milk preparations obtained by replacing one or more constituents of milk (e.g., butyric fats) by another substance (e.g., oleic fats).

The products of this heading may be sweetened and may contain cocoa. However, the heading **excludes** products having the character of sugar confectionery (**heading 17.04**) and products containing 5 % or more by weight of cocoa calculated on a totally defatted basis (see the General Explanatory Note to this Chapter) (**heading 18.06**) and beverages (**Chapter 22**).

The heading also covers mixes and bases (e.g., powders) for making ice cream but it **excludes** ice cream and other edible ice based on milk constituents (**heading 21.05**).

19.02 - Pasta, whether or not cooked or stuffed (with meat or other substances) or otherwise prepared, such as spaghetti, macaroni, noodles, lasagne, gnocchi, ravioli, cannelloni; couscous, whether or not prepared.

- Uncooked pasta, not stuffed or otherwise prepared :

1902.11 -- Containing eggs

1902.19 -- Other

1902.20 - Stuffed pasta, whether or not cooked or otherwise prepared

1902.30 - Other pasta

1902.40 - Couscous

The pasta of this heading are unfermented products made from semolinas or flours of wheat, maize, rice, potatoes, etc.

These semolinas or flours (or intermixtures thereof) are first mixed with water and kneaded into a dough which may also incorporate other ingredients (e.g., very finely chopped vegetables, vegetable juice or purées, eggs, milk, gluten, diastases, vitamins, colouring matter, flavouring).

The doughs are then formed (e.g., by extrusion and cutting, by rolling and cutting, by pressing, by moulding or by agglomeration in rotating drums) into specific predetermined shapes (such as tubes, strips, filaments, cockleshells, beads, granules, stars, elbow-bends, letters). In this process a small quantity of oil is sometimes added. These forms often give rise to the names of the finished products (e.g., macaroni, tagliatelle, spaghetti, noodles).

The products are usually dried before marketing to facilitate transport, storage and conservation; in this dried form, they are brittle. The heading also covers undried (i.e., moist or fresh) and frozen products, for example, fresh gnocchi and frozen ravioli.

The pasta of this heading may be cooked, stuffed with meat, fish, cheese or other substances in any proportion or otherwise prepared (e.g., as prepared dishes containing other ingredients such as vegetables, sauce, meat). Cooking serves to soften the pasta without changing its basic original form.

Stuffed pasta may be fully closed (for example, ravioli), open at the ends (for example, cannelloni) or layered, such as lasagne.

The heading also covers couscous which is a heat-treated semolina. Couscous of this heading may be cooked or otherwise prepared (e.g., put up with meat, vegetables and other ingredients as the complete dish which bears the same name).

The heading **does not cover** :

- (a) Preparations, other than stuffed pasta, containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (**Chapter 16**).
- (b) Soups and broths and preparations therefor, containing pasta (**heading 21.04**).

19.03 - Tapioca and substitutes therefor prepared from starch, in the form of flakes, grains, pearls, siftings or in similar forms.

This heading covers edible products prepared from manioc starch (tapioca), sago starch (sago), potato starch (farinoca, potato tapioca, potato sago) or from similar starches (arrow-root, salep, yucca, etc.).

The starch is mixed with water to form a thick paste, which is put into a strainer or perforated pan from which it falls in drops on to a metallic plate heated to a temperature of 120 °C to 150 °C. The drops form small pellets or flakes which are sometimes crushed or granulated. In another method, the starch paste is agglomerated in a steam heated vessel.

The products are marketed in the form of flakes, grains, pearls, siftings, seeds or similar forms. They are used for the preparation of soups, puddings or dietetic foods.

19.04 - Prepared foods obtained by the swelling or roasting of cereals or cereal products (for example, corn flakes); cereals (other than maize (corn)) in grain form or in the form of flakes or other worked grains (except flour, groats and meal), pre-cooked, or otherwise prepared, not elsewhere specified or included.

1904.10 - Prepared foods obtained by the swelling or roasting of cereals or cereal products

1904.20 - Prepared foods obtained from unroasted cereal flakes or from mixtures of unroasted cereal flakes and roasted cereal flakes or swelled cereals

1904.30 - Bulgur wheat

1904.90 - Other

(A) Prepared foods obtained by the swelling or roasting of cereals or cereal products (for example, corn flakes).

This group covers a range of food preparations made from cereal grains (maize, wheat, rice, barley, etc.) which have been made crisp by swelling or roasting. They are mainly used, with or without milk, as breakfast foods. Salt, sugar, molasses, malt extract, fruit or cocoa (see Note 3 and the General Explanatory Note to this Chapter), etc., may have been added during or after their manufacture.

The group also includes similar foodstuffs obtained, by swelling or roasting, from flour or bran.

Corn flakes are made from grains of maize by removing the pericarp and the germ, adding sugar, salt and malt extract, softening with steam and then rolling into flakes and roasting in a rotary oven. The same process may be applied to wheat or other cereal grains.

“Puffed” rice and wheat also fall in this group. These products are prepared by subjecting the grains to pressure in a moist, heated chamber. Sudden removal of the pressure and ejection into a cold atmosphere causes the grain to expand to several times its original volume.

This group further includes crisp savoury food products, obtained by submitting moistened cereal grains (whole or in pieces) to a heating process which makes the grains swell, these being subsequently sprayed with a flavouring consisting of a mixture of vegetable oil, cheese, yeast extract, salt and monosodium glutamate. Similar products made from a dough and fried in vegetable oil are **excluded (heading 19.05)**.

(B) Prepared foods obtained from unroasted cereal flakes or from mixtures of unroasted cereal flakes and roasted cereal flakes or swelled cereals.

This group includes prepared foods obtained from unroasted cereal flakes or from mixtures of unroasted cereal flakes and roasted cereal flakes or swelled cereals. These products (often called “Müsli”) may contain dried fruit, nuts, sugar, honey, etc. They are generally put up as breakfast foods.

(C) Bulgur wheat.

This group includes bulgur wheat, in the form of worked grains, obtained by cooking hard wheat grains which are then dried, are husked or peeled and then broken, kibbled or milled and finally sieved into large and small size bulgur wheat. Bulgur wheat may also be in the form of whole grains.

(D) Other cereals, other than maize (corn), pre-cooked or otherwise prepared.

This group includes pre-cooked or otherwise prepared cereals in grain form (including broken grains). Thus, the group covers, for example, rice which has been pre-cooked either fully or partially and then dehydrated, with a consequential modification of the grain structure. Fully pre-cooked rice needs only to be soaked in water and brought to the boil before consumption while partially pre-cooked rice must be boiled for 5 to 12 minutes prior to consumption. Similarly, the group covers, for example, products consisting of pre-cooked rice to which other ingredients such as vegetables or seasonings have been added, **provided** that these other ingredients do not alter the character of the products as rice preparations.

The heading **does not cover** cereal grains merely worked or treated by the processes specified in **Chapter 10 or Chapter 11.**

*
* *

The heading also **excludes** :

- (a) Prepared cereals coated or otherwise containing sugar in a proportion which gives them the character of sugar confectionery (**heading 17.04**).
- (b) Preparations containing more than 6 % by weight of cocoa calculated on a totally defatted basis or completely coated with chocolate or other food preparations containing cocoa of heading 18.06 (**heading 18.06**).
- (c) Prepared edible maize (corn) cobs and grains (**Chapter 20**).

19.05 - Bread, pastry, cakes, biscuits and other bakers' wares, whether or not containing cocoa; communion wafers, empty cachets of a kind suitable for pharmaceutical use, sealing wafers, rice paper and similar products.

1905.10 - Crispbread

1905.20 - Gingerbread and the like

- Sweet biscuits; waffles and wafers :

1905.31 -- Sweet biscuits

1905.32 -- Waffles and wafers

1905.40 - Rusks, toasted bread and similar toasted products

1905.90 - Other

(A) Bread, pastry, cakes, biscuits and other bakers' wares, whether or not containing cocoa.

This heading covers all bakers' wares. The most common ingredients of such wares are cereal flours, leavens and salt but they may also contain other ingredients such as : gluten, starch, flour of leguminous vegetables, malt extract or milk, seeds such as poppy, caraway or anise, sugar, honey, eggs, fats, cheese, fruit, cocoa in any proportion, meat, fish, bakery " improvers ", etc. Bakery " improvers " serve mainly to facilitate the working of the dough, hasten fermentation, improve the characteristics and appearance of the products and give them better keeping qualities. The products of this heading may also be obtained from a dough based on flour, meal or powder of potatoes.

The heading includes the following products :

- (1) **Ordinary bread**, often containing only cereal flours, leavens and salt.
- (2) **Gluten bread** for diabetics.
- (3) **Unleavened bread** or *matzos*.
- (4) **Crispbread (also known as knäckebrot)**, which is a dry crisp bread usually in thin rectangular or round pricked pieces. Crispbread is made from a dough of flour, meal, groats or wholemeal of rye, oats, barley or wheat and leavened by means of yeast, sour dough or other leavening agents or by compressed air. The water content does not exceed 10 % by weight.
- (5) **Rusks, toasted bread and similar toasted products**, whether or not sliced or ground, with or without the addition of butter or other fats, sugar, eggs or other nutritive substances.

- (6) **Gingerbread and the like**, which are products of a spongy, often elastic consistency, made from rye or wheat flour, sweetening (for example, honey, glucose, invert sugar, refined molasses) and flavouring or spices, whether or not also containing egg yolk or fruit. Certain types of gingerbread are covered with chocolate or icing made from preparations of fat and cocoa. Other types may contain or may be covered with sugar.
- (7) “**Pretzels**”, i.e., brittle, glazed and salted crackers made of cylindrical length of dough often twisted into a form resembling the letter “B”.
- (8) **Biscuits**. These are usually made from flour and fat to which may have been added sugar or certain of the substances mentioned in Item (10) below. They are baked for a long time to improve the keeping qualities and are generally put up in closed packages. There are various types of biscuits including :
- (a) **Plain biscuits** containing little or no sweetening matter but a relatively high proportion of fat; this type includes cream crackers and water biscuits.
 - (b) **Sweet biscuits**, which are fine bakers’ wares with long-keeping qualities and a base of flour, sugar or other sweetening matter and fat (these ingredients constituting at least 50 % of the product by weight), whether or not containing added salt, almonds, hazelnuts, flavouring, chocolate, coffee, etc. The water content of the finished product must be 12 % or less by weight and the maximum fat content 35 % by weight (fillings and coatings are not to be taken into consideration in determining these contents). Commercial biscuits are not usually filled, but they may sometimes contain a solid or other filling (sugar, vegetable fat, chocolate, etc.). They are almost always industrially manufactured products.
 - (c) **Savoury and salted biscuits**, which usually have a low sucrose content.
- (9) **Waffles and wafers**, which are light fine bakers’ wares baked between patterned metal plates. This category also includes thin waffle products, which may be rolled, waffles consisting of a tasty filling sandwiched between two or more layers of thin waffle pastry, and products made by extruding waffle dough through a special machine (ice cream cornets, for example). Waffles may also be chocolatecovered. Wafers are products similar to waffles.
- (10) **Pastries and cakes**, containing ingredients such as flour, starches, butter or other fats, sugar, milk, cream, eggs, cocoa, chocolate, coffee, honey, fruit, liqueurs, brandy, albumen, cheese, meat, fish, flavourings, yeast or other leavening agents.
- (11) **Certain bakery products made without flour** (e.g., meringues made of white of egg and sugar).
- (12) **Crêpes and pancakes**.

- (13) **Quiche**, consisting of a pastry shell and a filling made from various ingredients, e.g., cheese, eggs, cream, butter, salt, pepper, nutmeg and, in the case of “quiche lorraine”, bacon or ham.
- (14) **Pizza** (pre-cooked or cooked), consisting of a pizza base (dough) covered with various other ingredients such as cheese, tomato, oil, meat, anchovies. However, uncooked pizza is classified in **heading 19.01**.
- (15) **Crisp savoury food products**, for example, those made from a dough based on flour, meal or powder of potatoes, or maize (corn) meal with the addition of a flavouring consisting of a mixture of cheese, monosodium glutamate and salt, fried in vegetable oil, ready for consumption.

The heading **excludes**:

- (a) Products containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (e.g., pies consisting of meat enclosed in pastry) (**Chapter 16**).
- (b) Products of heading **20.05**.

(B) Communion wafers, empty cachets of a kind suitable for pharmaceutical use, sealing wafers, rice paper and similar products.

This heading covers a number of products made from flour or starch pastes, generally baked in the form of discs or sheets. They are used for various purposes.

Communion wafers are thin discs made by cooking very pure wheat flour paste between iron plates.

Empty cachets of a kind suitable for pharmaceutical use are small, shallow cups made from flour or starch paste. They are made to fit together in pairs to form a container.

Sealing wafers are cut out of thin sheets of baked, dried and sometimes coloured paste. They may also contain adhesive substances.

Rice paper consists of thin sheets of baked and dried flour or starch paste. It is used for coating certain confectionery articles, particularly nougat. It should not be confused with the so-called “rice paper” made by slicing the pith of certain palms (see Explanatory Note to **heading 14.04**).

Chapter 20

Preparations of vegetables, fruit, nuts or other parts of plants

Notes.

- 1.- This Chapter does not cover :
 - (a) Vegetables, fruit or nuts, prepared or preserved by the processes specified in Chapter 7, 8 or 11;
 - (b) Food preparations containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (Chapter 16);
 - (c) Bakers' wares and other products of heading 19.05; or
 - (d) Homogenised composite food preparations of heading 21.04.
- 2.- Headings 20.07 and 20.08 do not apply to fruit jellies, fruit pastes, sugar-coated almonds or the like in the form of sugar confectionery (heading 17.04) or chocolate confectionery (heading 18.06).
- 3.- Headings 20.01, 20.04 and 20.05 cover, as the case may be, only those products of Chapter 7 or of heading 11.05 or 11.06 (other than flour, meal and powder of the products of Chapter 8) which have been prepared or preserved by processes other than those referred to in Note 1 (a).
- 4.- Tomato juice the dry weight content of which is 7 % or more is to be classified in heading 20.02.
- 5.- For the purposes of heading 20.07, the expression " obtained by cooking " means obtained by heat treatment at atmospheric pressure or under reduced pressure to increase the viscosity of a product through reduction of water content or other means.
- 6.- For the purposes of heading 20.09, the expression " juices, unfermented and not containing added spirit " means juices of an alcoholic strength by volume (see Note 2 to Chapter 22) not exceeding 0.5 % vol.

◦◦◦

Subheading Notes.

- 1.- For the purposes of subheading 2005.10, the expression " homogenised vegetables " means preparations of vegetables, finely homogenised, put up for retail sale as food suitable for infants or young children or for dietetic purposes, in containers of a net weight content not exceeding 250 g. For the application of this definition no account is to be taken of small quantities of any ingredients which may have been added to the preparation for seasoning, preservation or other purposes. These preparations may contain a small quantity of visible pieces of vegetables. Subheading 2005.10 takes precedence over all other subheadings of heading 20.05.
- 2.- For the purposes of subheading 2007.10, the expression " homogenised preparations " means preparations of fruit, finely homogenised, put up for retail sale as food suitable for infants or young children or for dietetic purposes, in containers of a net weight content not exceeding 250 g. For the application of this definition no account is to be taken of small quantities of any ingredients which may have been added to the preparation for seasoning, preservation or other purposes. These preparations may contain a small quantity of visible pieces of fruit. Subheading 2007.10 takes precedence over all other subheadings of heading 20.07.
- 3.- For the purposes of subheadings 2009.12, 2009.21, 2009.31, 2009.41, 2009.61 and 2009.71, the expression " Brix value " means the direct reading of degrees Brix obtained from a Brix hydrometer or of refractive index expressed in terms of percentage sucrose content obtained from a refractometer, at a temperature of 20 °C or corrected for 20 °C if the reading is made at a different temperature.

GENERAL

This Chapter includes :

- (1) Vegetables, fruit, nuts and other edible parts of plants prepared or preserved by vinegar or acetic acid.
- (2) Vegetables, fruit, nuts, fruit-peel and other parts of plants preserved by sugar.
- (3) Jams, fruit jellies, marmalades, fruit or nut purées, fruit or nut pastes, obtained by cooking.
- (4) Homogenised prepared or preserved vegetables and fruit.
- (5) Fruit or vegetable juices, neither fermented nor containing added alcohol, or of an alcoholic strength by volume not exceeding 0.5 % vol.
- (6) Vegetables, fruit, nuts and other edible parts of plants prepared or preserved by other processes not provided for in Chapter 7, 8 or 11 or elsewhere in the Nomenclature.
- (7) Products of heading 07.14, 11.05 or 11.06 (**other than** flour, meal and powder of the products of **Chapter 8**), which have been prepared or preserved by processes other than those specified in Chapter 7 or 11.
- (8) Fruit preserved by osmotic dehydration.

These products may be whole, in pieces or crushed.

The Chapter **does not cover** :

- (a) Food preparations containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (**Chapter 16**).
- (b) Products such as fruit tarts, prepared with pastry (**heading 19.05**).
- (c) Soups and broths and preparations therefor and homogenised composite food preparations of **heading 21.04**.
- (d) Fruit or vegetable juices of an alcoholic strength by volume exceeding 0.5 % vol (**Chapter 22**).

20.01 - Vegetables, fruit, nuts and other edible parts of plants, prepared or preserved by vinegar or acetic acid.

2001.10 - Cucumbers and gherkins

2001.90 - Other

This heading covers vegetables (see Note 3 to this Chapter), fruit, nuts and other edible parts of plants prepared or preserved by means of vinegar or acetic acid, whether or not containing salt, spices, mustard, sugar or other sweetening matter. These products may also contain oil or other additives. They may be in bulk (in casks, drums, etc.) or in jars, bottles, tins or airtight containers ready for retail sale. The heading includes certain preparations known as pickles, mustard pickles, etc.

The goods covered by this heading differ from sauces of **heading 21.03** in that the latter are mainly liquids, emulsions or suspensions, which are not intended to be eaten by themselves but are used as an accompaniment to food or in the preparation of certain food dishes.

The principal products preserved by the methods described in this heading are cucumbers, gherkins, onions, shallots, tomatoes, cauliflowers, olives, capers, sweet corn, artichoke hearts, palm hearts, yams, walnuts and mangoes.

20.02 - Tomatoes prepared or preserved otherwise than by vinegar or acetic acid.

2002.10 - Tomatoes, whole or in pieces

2002.90 - Other

This heading covers tomatoes, whether whole or in pieces, **other than** tomatoes prepared or preserved by vinegar or acetic acid (**heading 20.01**) and tomatoes presented in the states specified in **Chapter 7**. Tomatoes are classified in this heading irrespective of the type of container in which they are put up.

The heading also includes homogenised prepared or preserved tomatoes (e.g., tomato purée, paste or concentrate) and tomato juice of which the dry weight content is 7 % or more. However, the heading **excludes** tomato ketchup and other tomato sauces (**heading 21.03**) and tomato soup and preparations therefor (**heading 21.04**).

20.03 - Mushrooms and truffles, prepared or preserved otherwise than by vinegar or acetic acid.

2003.10 - Mushrooms of the genus *Agaricus*

2003.90 - Other

This heading covers all mushrooms (including stems) and truffles **except** those prepared or preserved by vinegar or acetic acid (**heading 20.01**) and those presented in the states specified in **Chapter 7**. The products of this heading may be whole, in pieces (e.g., sliced) or homogenised.

20.04 - Other vegetables prepared or preserved otherwise than by vinegar or acetic acid, frozen, other than products of heading 20.06.

2004.10 - Potatoes

2004.90 - Other vegetables and mixtures of vegetables

The frozen vegetables of this heading are those which fall in **heading 20.05** when not frozen (see the Explanatory Note to that heading). The term "frozen" is defined in the General Explanatory Note to Chapter 7.

Examples of commonly traded products which fall in the heading are :

- (1) **Potatoes (chips or French fries)**, cooked or partly cooked in oil and then frozen.
- (2) **Frozen sweet corn, on the cob or in grains, carrots, peas, etc.**, whether or not pre-cooked, put up with butter or other sauce in an airtight container (e.g., in a plastic bag).
- (3) **"Knödel", "Klösse", "Nockerln"**, based on potato flour, frozen.

20.05 - Other vegetables prepared or preserved otherwise than by vinegar or acetic acid, not frozen, other than products of heading 20.06.

2005.10 - Homogenised vegetables

2005.20 - Potatoes

2005.40 - Peas (*Pisum sativum*)

- Beans (*Vigna spp., Phaseolus spp.*) :

2005.51 -- Beans, shelled

2005.59 -- Other

2005.60 - Asparagus

2005.70 - Olives

2005.80 - Sweet corn (*Zea mays var. saccharata*)

- Other vegetables and mixtures of vegetables :

2005.91 -- Bamboo shoots

2005.99 -- Other

The term "vegetables" in this heading is limited to the products referred to in Note 3 to this Chapter. These products (**other than** vegetables prepared or preserved by vinegar or acetic acid of **heading 20.01**, frozen vegetables of **heading 20.04** and vegetables preserved by sugar of **heading 20.06**) are classified in the heading when they have been prepared or preserved by processes not provided for in Chapter 7 or 11.

Such products fall in the heading irrespective of the type of container in which they are put up (often in cans or other airtight containers).

These products, whole, in pieces or crushed, may be preserved in water, in tomato sauce or with other ingredients ready for immediate consumption. They may also be homogenised or mixed together (salads).

Examples of preparations which fall in the heading are :

- (1) **Olives**, rendered edible by special treatment with soda solution or prolonged maceration in brine. (Olives merely preserved provisionally in brine remain classified in **heading 07.11** - see the Explanatory Note to that heading.)
- (2) **Sauerkraut**, prepared by partial fermentation of shredded and salted cabbage.
- (3) **Sweet corn, on the cob or in grains, carrots, peas, etc.**, pre-cooked or put up with butter or other sauce.
- (4) **Products in the form of thin rectangular tablets made from potato flour**, salt and small quantities of sodium glutamate, and partly dextrinised by successive humidification and dessication. These products are intended for consumption as "chips" after deep frying for a few seconds.

The heading also **excludes** :

- (a) Crisp savoury food products of **heading 19.05**.
- (b) Vegetable juices of **heading 20.09**.
- (c) Vegetable juices of an alcoholic strength by volume exceeding 0.5 % vol (**Chapter 22**).

20.06 - Vegetables, fruit, nuts, fruit-peel and other parts of plants, preserved by sugar (drained, glacé or crystallised).

The products of this heading are prepared first by treating the vegetables, fruit, nuts, fruit-peel or other parts of plants with boiling water (which softens the material and facilitates penetration of the sugar), and then by repeated heating to boiling point and storage in syrups of progressively increasing sugar concentration until they are sufficiently impregnated with sugar to ensure their preservation.

The principal products preserved by sugar are whole fruit or nuts (cherries, apricots, pears, plums, chestnuts (*marrons glacés*), walnuts, etc.), sections or pieces of fruit (oranges, lemons, pineapples, etc.), fruit-peel (citron, lemon, orange, melon, etc.), other parts of plants (angelica, ginger, yams, sweet potatoes, etc.) and flowers (violets, mimosa, etc.).

Drained products are prepared by using a syrup (e.g., a mixture of invert sugar or glucose with a proportion of sucrose) which does not crystallise on exposure to the air. After impregnation the excess syrup is drained off leaving the product sticky to the touch.

Glacé products are obtained by dipping the drained product in a sucrose syrup which dries as a thin, shiny coating.

Crystallised products are prepared by allowing the sucrose syrup to penetrate into the product so that, on drying, it forms crystals on the surface or throughout the product.

Those goods preserved by sugar and put up in syrup, whatever the packing, are **excluded** from this heading (**heading 20.02, 20.03 or 20.05**, in the case of vegetables, or **heading 20.08**, in the case of fruit, nuts, fruit-peel and other edible parts of plants, e.g., *marrons glacés* or ginger).

Dried fruits (e.g., dates and prunes) remain classified in **Chapter 8** even if small quantities of sugar have been added, or if the exterior is covered with a deposit of dried **natural** sugar which may give the fruit an appearance somewhat similar to that of crystallised fruit of this heading.

20.07 - Jams, fruit jellies, marmalades, fruit or nut purée and fruit or nut pastes, obtained by cooking, whether or not containing added sugar or other sweetening matter.

2007.10 - Homogenised preparations

- Other :

2007.91 -- Citrus fruit

2007.99 -- Other

Jams are made by boiling whole fruit or fruit pulp or certain vegetables (e.g., marrows, aubergines) or other products (e.g., ginger, rose petals) with sugar in approximately equal proportions. When cool they are of moderately firm consistency and contain pieces of the fruit.

Marmalades are a variety of jam generally prepared from citrus fruit.

Fruit jellies are prepared by boiling fruit juices (expressed from raw or cooked fruit) with sugar until the product sets on cooling. They are of firm consistency, clear and free from pieces of fruit.

Fruit or nut purées are prepared by boiling sieved fruit pulp or powdered nuts with or without the addition of sugar, to a thickish consistency. Fruit purées differ from jams in having a higher proportion of fruit and a smoother consistency.

Fruit or nut pastes (apple, quince, pear, apricot, almond, etc.) are evaporated purées of a solid or almost solid consistency.

Products of this heading which are normally prepared with sugar may be sweetened with synthetic agents (e.g., sorbitol) instead of sugar.

This heading also includes homogenised preparations.

The heading **excludes** :

- (a) Jellies and pastes in the form of sugar confectionery or chocolate confectionery (**heading 17.04** or **18.06** respectively).
- (b) Table jellies prepared from gelatin, sugar and fruit juice or artificial fruit essences (**heading 21.06**).

20.08 - Fruit, nuts and other edible parts of plants, otherwise prepared or preserved, whether or not containing added sugar or other sweetening matter or spirit, not elsewhere specified or included.

- Nuts, ground-nuts and other seeds, whether or not mixed together :

2008.11 -- Ground-nuts

2008.19 -- Other, including mixtures

2008.20 - Pineapples

2008.30 - Citrus fruit

2008.40 - Pears

2008.50 - Apricots

2008.60 - Cherries

2008.70 - Peaches, including nectarines

2008.80 - Strawberries

- Other, including mixtures other than those of subheading 2008.19 :

2008.91 -- Palm hearts

2008.93 -- Cranberries (*Vaccinium macrocarpon*, *Vaccinium oxycoccus*, *Vaccinium vitis-idaea*)

2008.97 -- Mixtures

2008.99 -- Other

This heading covers fruit, nuts and other edible parts of plants, whether whole, in pieces or crushed, including mixtures thereof, prepared or preserved otherwise than by any of the processes specified in other Chapters or in the preceding headings of this Chapter.

It includes, *inter alia* :

- (1) Almonds, ground-nuts, areca (or betel) nuts and other nuts, dry-roasted, oil-roasted or fat-roasted, whether or not containing or coated with vegetable oil, salt, flavours, spices or other additives.
- (2) "Peanut butter", consisting of a paste made by grinding roasted ground-nuts, whether or not containing added salt or oil.
- (3) Fruit (including fruit-peel and seeds) preserved in water, in syrup, in chemicals or in alcohol.
- (4) Fruit pulp, sterilised, whether or not cooked.
- (5) Whole fruits, such as peaches (including nectarines), apricots, oranges (whether or not peeled or with the stones or pips removed) crushed and sterilised, whether or not containing added water or sugar syrup but in a proportion insufficient to render them ready for direct consumption as beverages. When rendered ready for direct consumption as beverages by addition of a sufficient quantity of water or of sugar syrup, these products fall in **heading 22.02**.

- (6) Cooked fruit. However, fruit cooked by steaming or boiling in water and frozen remains in **heading 08.11**.
- (7) Stems, roots and other edible parts of plants (e.g., ginger, angelica, yams, sweet potatoes, hop shoots, vine leaves, palm hearts) conserved in syrup or otherwise prepared or preserved.
- (8) Tamarind pods in sugar syrup.
- (9) Fruit, nuts, fruit-peel and other edible parts of plants (other than vegetables), preserved by sugar and put up in syrup (e.g., *marrons glacés* or ginger), whatever the packing.
- (10) Fruit preserved by osmotic dehydration. The expression “osmotic dehydration” refers to a process whereby pieces of fruit are subjected to prolonged soaking in a concentrated sugar syrup so that much of the water and the natural sugar of the fruit is replaced by sugar from the syrup. The fruit may subsequently be air-dried to further reduce the moisture content.

The products of this heading may be sweetened with synthetic sweetening agents (e.g., sorbitol) instead of sugar. Other substances (e.g., starch) may be added to the products of this heading, provided that they do not alter the essential character of fruit, nuts or other edible parts of plants.

The products of this heading are generally put up in cans, jars or airtight containers, or in casks, barrels or similar containers.

The heading **does not cover** fruit, nuts or other edible parts of plants transformed into sugar confectionery (including those based on natural honey), of **heading 17.04**.

The heading also **excludes** products consisting of a mixture of plants or parts of plants (including seeds or fruits) of different species or consisting of plants or parts of plants (including seeds or fruits) of a single or of different species mixed with other substances such as one or more plant extracts, which are not consumed as such, but which are of a kind used for making herbal infusions or herbal “teas” (e.g., **heading 08.13, 09.09 or 21.06**).

The heading further **excludes** mixtures of plants, parts of plants, seeds or fruit (whole, cut, crushed, ground or powdered) of species falling in different Chapters (e.g., Chapters 7, 9, 11, 12), not consumed as such, but of a kind used either directly for flavouring beverages or for preparing extracts for the manufacture of beverages (**Chapter 9 or heading 21.06**).

20.09 - Fruit juices (including grape must) and vegetable juices, unfermented and not containing added spirit, whether or not containing added sugar or other sweetening matter (+).

- Orange juice :

2009.11 -- Frozen

2009.12 -- Not frozen, of a Brix value not exceeding 20

2009.19 -- Other

- Grapefruit (including pomelo) juice :

2009.21 -- Of a Brix value not exceeding 20

2009.29 -- Other

- Juice of any other single citrus fruit :

2009.31 -- Of a Brix value not exceeding 20

2009.39 -- Other

- Pineapple juice :

2009.41 -- Of a Brix value not exceeding 20

2009.49 -- Other

2009.50 - Tomato juice

- Grape juice (including grape must) :

2009.61 -- Of a Brix value not exceeding 30

2009.69 -- Other

- Apple juice :

2009.71 -- Of a Brix value not exceeding 20

2009.79 -- Other

- Juice of any other single fruit or vegetable :

2009.81 -- Cranberry (*Vaccinium macrocarpon*, *Vaccinium oxycoccus*, *Vaccinium vitis-idaea*) juice

2009.89 -- Other

2009.90 - Mixtures of juices

As regards juices, unfermented and not containing added spirit, see Note 6 to this Chapter.

The fruit and vegetable juices of this heading are generally obtained by pressing fresh, healthy and ripe fruit or vegetables. This may be done (as in the case of citrus fruits) by means of mechanical "extractors" operating on the same principle as the household lemon-squeezer, or by pressing which may or may not be preceded either by crushing or grinding (for apples in particular) or by treatment with cold or hot water or with steam (e.g., tomatoes, blackcurrants and certain vegetables such as carrots and celery).

The liquids thus obtained are then generally submitted to the following processes :

- (a) **Clarification**, to separate the juice from most of the solids, by means of clarifying substances (gelatin, albumin, infusorial earth, etc.) or of enzymes, or by centrifuging.
- (b) **Filtration**, often by means of filter plates faced with kieselguhr, asbestos, cellulose, etc.
- (c) **De-aeration**, to eliminate oxygen which would spoil the colour and flavour.
- (d) **Homogenisation**, in the case of certain juices obtained from very fleshy fruits (tomatoes, peaches, etc.).
- (e) **Sterilisation**, to prevent fermentation. Various methods may be employed, for example, pasteurisation (prolonged or "flash"), electric sterilisation in machines fitted with electrodes, sterilisation by filtration, preservation under pressure using carbon dioxide, refrigeration, chemical sterilisation (e.g., by means of sulphur dioxide, sodium benzoate), treatment with ultra-violet rays or ion exchangers.

As a result of these various treatments the fruit or vegetable juices may consist of clear, unfermented liquids. Certain juices, however (in particular those obtained from pulpy fruits such as apricots, peaches and tomatoes) still contain part of the pulp in finely divided form, either in suspension or as a deposit.

The heading also includes juices, relatively few in practice, obtained from dried fruits provided that they are of a kind which contain juice when fresh. One example is "prune juice", extracted from prunes by heating with water for several hours in diffusers. The heading **does not**, however, **cover** the more or less liquid products obtained by the heating in water of fresh or dried fruits (e.g., juniper berries, rose hips) which contain practically no juice; such products are generally classified in **heading 21.06**.

The juices of this heading may be **concentrated** (whether or not frozen) or in the form of **crystals or powder** provided, in the latter case, that they are entirely or almost entirely soluble in water. Such products are usually obtained by processes involving either heat (whether or not in a vacuum) or cold (lyophilisation).

Certain concentrated juices can be distinguished from their corresponding non-concentrated juices on the basis of their Brix value (see Subheading Note 3 to this Chapter).

Provided they retain their original character, the fruit or vegetable juices of this heading may contain substances of the kinds listed below, whether these result from the manufacturing process or have been added separately :

- (1) Sugar.
- (2) Other sweetening agents, natural or synthetic, provided that the quantity added does not exceed that necessary for normal sweetening purposes and that the juices otherwise qualify for this heading, in particular as regards the balance of the different constituents (see Item (4) below).
- (3) Products added to preserve the juice or to prevent fermentation (e.g., sulphur dioxide, carbon dioxide, enzymes).

- (4) Standardising agents (e.g., citric acid, tartaric acid) and products added to restore constituents destroyed or damaged during the manufacturing process (e.g., vitamins, colouring matter), or to "fix" the flavour (e.g., sorbitol added to powdered or crystalline citrus fruit juices). However, the heading **excludes** fruit juices in which one of the constituents (citric acid, essential oil extracted from the fruit, etc.) has been added in such quantity that the balance of the different constituents as found in the natural juice is clearly upset; in such case the product has lost its original character.

The vegetable juices of this heading may also contain added salt (sodium chloride), spices or flavouring substances.

Similarly, intermixtures of the juices of fruits or vegetables of the same or different types remain classified in this heading, as do reconstituted juices (i.e., products obtained by the addition, to the concentrated juice, of a quantity of water not exceeding that contained in similar non-concentrated juices of normal composition).

However, the addition of water to a normal fruit or vegetable juice, or the addition to a concentrated juice of a greater quantity of water than is necessary to reconstitute the original natural juice, results in diluted products which have the character of beverages of **heading 22.02**. Fruit or vegetable juices containing a greater quantity of carbon dioxide than is normally present in juices treated with that product (aerated fruit juices), and also lemonades and aerated water flavoured with fruit juice are also **excluded** (**heading 22.02**).

The heading also covers grape must for any use, provided it is unfermented. As it has been submitted to much the same processes as other fruit juices, grape must is very similar to ordinary grape juice. It may be presented in the form of a concentrate or even of crystals (in the latter form, it is known in the trade as "grape sugar" or "grape honey" and is used in fine bakery or confectionery for making gingerbread, sweetmeats, etc.).

Grape must partially fermented, whether or not fermentation has been arrested, as well as unfermented grape must, with alcohol added, both having an alcoholic strength by volume exceeding 0.5 % vol., falls in **heading 22.04**.

The heading further **excludes** :

- (a) Tomato juice, the dry weight content of which is 7 % or more (**heading 20.02**).
 - (b) Fruit or vegetable juices of an alcoholic strength by volume exceeding 0.5 % vol (**Chapter 22**).
- ○ ○

Subheading Explanatory Note.

Subheading 2009.11

The term "frozen orange juice" also covers concentrated orange juice which, although subjected to and maintained at a temperature around -18 °C, is not frozen solid throughout.

Chapter 21

Miscellaneous edible preparations

Notes.

- 1.- This Chapter does not cover :
 - (a) Mixed vegetables of heading 07.12;
 - (b) Roasted coffee substitutes containing coffee in any proportion (heading 09.01);
 - (c) Flavoured tea (heading 09.02);
 - (d) Spices or other products of headings 09.04 to 09.10;
 - (e) Food preparations, other than the products described in heading 21.03 or 21.04, containing more than 20 % by weight of sausage, meat, meat offal, blood, fish or crustaceans, molluscs or other aquatic invertebrates, or any combination thereof (Chapter 16);
 - (f) Yeast put up as a medicament or other products of heading 30.03 or 30.04; or
 - (g) Prepared enzymes of heading 35.07.
- 2.- Extracts of the substitutes referred to in Note 1 (b) above are to be classified in heading 21.01.
- 3.- For the purposes of heading 21.04, the expression “homogenised composite food preparations” means preparations consisting of a finely homogenised mixture of two or more basic ingredients such as meat, fish, vegetables, fruit or nuts, put up for retail sale as food suitable for infants or young children or for dietetic purposes, in containers of a net weight content not exceeding 250 g. For the application of this definition, no account is to be taken of small quantities of any ingredients which may be added to the mixture for seasoning, preservation or other purposes. Such preparations may contain a small quantity of visible pieces of ingredients.

21.01 - Extracts, essences and concentrates, of coffee, tea or maté and preparations with a basis of these products or with a basis of coffee, tea or maté; roasted chicory and other roasted coffee substitutes, and extracts, essences and concentrates thereof.

- Extracts, essences and concentrates of coffee, and preparations with a basis of these extracts, essences or concentrates or with a basis of coffee :

2101.11 -- Extracts, essences and concentrates

2101.12 -- Preparations with a basis of extracts, essences or concentrates or with a basis of coffee

2101.20 - Extracts, essences and concentrates, of tea or maté, and preparations with a basis of these extracts, essences or concentrates or with a basis of tea or maté

2101.30 - Roasted chicory and other roasted coffee substitutes, and extracts, essences and concentrates thereof

The heading covers :

- (1) **Coffee extracts, essences and concentrates.** These may be made from real coffee (whether or not caffeine has been removed) or from a mixture of real coffee and coffee substitutes in **any** proportion. They may be in liquid or powder form, usually highly concentrated. This group includes products known as instant coffee. This is coffee which has been brewed and dehydrated or brewed and then frozen and dried by vacuum.
- (2) **Tea or maté extracts, essences and concentrates.** These products correspond, *mutatis mutandis*, to those referred to in paragraph (1).
- (3) **Preparations with a basis of the coffee, tea or maté extracts, essences or concentrates of paragraphs (1) and (2) above.** These are preparations based on extracts, essences or concentrates of coffee, tea or maté (and not on coffee, tea or maté themselves), and include extracts, etc., with added starches or other carbohydrates.
- (4) **Preparations with a basis of coffee, tea or maté.** These preparations include, *inter alia* :
 - (a) "coffee pastes" consisting of mixtures of ground, roasted coffee with vegetable fats and sometimes other ingredients, and
 - (b) tea preparations consisting of a mixture of tea, milk powder and sugar.
- (5) **Roasted chicory and other roasted coffee substitutes and extracts, essences and concentrates thereof.** These are all kinds of roasted products intended to replace or imitate coffee when infused with hot water, or to be added to coffee. These products are sometimes described as "coffee", prefixed by the name of the basic substance (e.g., barley "coffee", malt "coffee", acorn "coffee").

Roasted chicory is obtained by roasting the chicory root (*Cichorium intybus var. sativum*) of heading 12.12. It is blackish-brown in colour and has a bitter flavour.

Other roasted coffee substitutes include those derived from sugar beet, carrots, figs, cereals (especially barley, wheat and rye), split peas, lupine seeds, edible acorns, soya beans, date stones, almonds, dandelion roots or chestnuts. The heading also includes roasted malt so put up that it is clearly intended for use as a coffee substitute.

These products may be presented in lump, granular or powder form, or as liquid or solid extracts. They may also be mixed either with one another or with other ingredients (e.g., salt or alkaline carbonates), and may be put up in various types of containers.

The heading **does not cover** :

- (a) Roasted coffee substitutes containing coffee in any proportion (**heading 09.01**).
- (b) Flavoured tea (**heading 09.02**).
- (c) Caramel (caramelised molasses and caramelised sugars) (**heading 17.02**).
- (d) Products of **Chapter 22**.

21.02 - Yeasts (active or inactive); other single-cell micro-organisms, dead (but not including vaccines of heading 30.02); prepared baking powders.

2102.10 - Active yeasts

2102.20 - Inactive yeasts; other single-cell micro-organisms, dead

2102.30 - Prepared baking powders

(A) YEASTS

The yeasts of this heading may be in the active or inactive state.

Active yeasts generally provoke fermentation. They consist essentially of certain micro-organisms (almost exclusively of the genus *Saccharomyces*), which multiply during alcoholic fermentation. Yeasts may also be produced by partial or total prevention of fermentation, according to the aeration process.

The active yeasts include :

- (1) **Brewery yeast.** This forms in beer fermentation vats. It is presented as a yellowish-brown paste or solid generally with the bitter flavour of hops and the odour of beer.
- (2) **Distillery yeast.** This is produced during the fermentation, of, e.g., grain, potatoes or fruit, in distilleries. It is a firm cream-coloured paste varying in odour according to the product used in the distillation.
- (3) **Bakers' yeast,** produced by the propagation under special conditions of specially cultured strains of yeast in a carbohydrate medium such as molasses. It is generally marketed in the form of pressed yellowish-grey cakes (pressed yeast) which sometimes have an alcoholic odour. It is, however, also marketed in the dried form (usually in grains) or as liquid yeast.
- (4) **Culture yeast,** a pure strain of yeast prepared under laboratory conditions. It may be suspended in distilled water or in gelatin or agar-agar. It is usually marketed in measured quantities put up in sealed containers to protect it from contamination.
- (5) **Seed yeast,** produced from culture yeast by successive fermentation processes, is used to "seed" commercial yeast. It is usually marketed in the form of a moist pressed and plastic mass or in the form of a liquid suspension.

Inactive yeasts, obtained by drying, are generally brewery, distillery or bakers' yeasts which have become insufficiently active for further use in those industries. They are used for human consumption (source of vitamin B) or for feeding animals. It should, however, be noted that, owing to their growing importance, these dried yeasts are to an increasing extent being produced directly from specially prepared active yeasts.

The heading also covers other types of dried yeasts (e.g., *Candida lipolytica* or *tropicalis*, *Candida maltosa*) developed from the yeasts not belonging to *Saccharomyces*. They are obtained by drying the yeasts which have been cultivated on substrates containing hydrocarbons (such as gas-oils or n-paraffins) or carbohydrates. These dried yeasts are particularly rich in protein and are used in animal feeding. They are commonly known as **petroproteins** or **yeast bioproteins**.

(B) OTHER SINGLE-CELL MICRO-ORGANISMS, DEAD

This category covers single-cell micro-organisms such as bacteria and unicellular algae, which are **not** alive. *Inter alia*, covered here are those which have been obtained by cultivation on substrates containing hydrocarbons or carbon dioxide. These products are particularly rich in protein and are generally used in animal feeding.

Certain products of this group may be put up as food supplements for human consumption or animal feeding (e.g., in powder or tablet form) and may contain small quantities of excipients, e.g., stabilising agents and anti-oxidants. Such products remain classified here **provided** that the addition of such ingredients does not alter their character as micro-organisms.

(C) PREPARED BAKING POWDERS

The “prepared baking powders” classified in this heading consist of mixtures of chemical products (e.g., sodium bicarbonate, tartaric acid, ammonium carbonate, phosphates), with or without added starch. Under suitable conditions they evolve carbon dioxide and are therefore used in baking for leavening dough. They are usually sold in retail packings (sachets, tins, etc.) under various names (baking powder, Alsatian leaven, etc.).

The heading **excludes**, *inter alia* :

- (a) Self-raising cereal flour, e.g., flour to which baking powder has been added (**heading 11.01 or 11.02**).
- (b) Autolysed yeast (**heading 21.06**).
- (c) Cultures of micro-organisms (other than yeasts) and vaccines (**heading 30.02**).
- (d) Medicaments of **heading 30.03 or 30.04**.
- (e) Enzymes (amylases, pepsin, rennet, etc.) (**heading 35.07**).

21.03 - Sauces and preparations therefor; mixed condiments and mixed seasonings; mustard flour and meal and prepared mustard.

2103.10 - Soya sauce

2103.20 - Tomato ketchup and other tomato sauces

2103.30 - Mustard flour and meal and prepared mustard

2103.90 - Other

(A) SAUCES AND PREPARATIONS THEREFOR; MIXED CONDIMENTS AND MIXED SEASONINGS

This heading covers preparations, generally of a highly spiced character, used to flavour certain dishes (meat, fish, salads, etc.), and made from various ingredients (eggs, vegetables, meat, fruit, flours, starches, oil, vinegar, sugar, spices, mustard, flavourings, etc.). Sauces are generally in liquid form and preparations for sauces are usually in the form of powders to which only milk, water, etc. need to be added to obtain a sauce.

Sauces are normally added to a food as it cooks or as it is served. Sauces provide flavour, moisture, and a contrast in texture and colour. They may also serve as a medium in which food is contained, for example, the velouté sauce of creamed chicken. Seasoning liquids (soy sauce, hot pepper sauce, fish sauce) are used both as ingredients in cooking and at table as condiments.

The heading also includes certain preparations, based on vegetables or fruit, which are mainly liquids, emulsions or suspensions, and sometimes contain visible pieces of vegetables or fruit. These preparations differ from prepared or preserved vegetables and fruit of Chapter 20 in that they are used as sauces, i.e., as an accompaniment to food or in the preparation of certain food dishes, but are not intended to be eaten by themselves.

Mixed condiments and mixed seasonings containing spices differ from the spices and mixed spices of headings 09.04 to 09.10 in that they also contain one or more flavouring or seasoning substances of Chapters other than Chapter 9, in such proportions that the mixture has no longer the essential character of a spice within the meaning of Chapter 9 (see the General Explanatory Note to that Chapter).

Examples of products covered by the heading are : mayonnaise, salad dressings, Béarnaise, bolognaisse (consisting of chopped meat, tomato purée, spices, etc.), soya sauces, mushroom sauce, Worcester sauce (generally made with a base of thick soya sauce, an infusion of spices in vinegar, with added salt, sugar, caramel and mustard), tomato ketchup (a preparation made from tomato purée, sugar, vinegar, salt and spices) and other tomato sauces, celery salt (a mixture of cooking salt and finely ground celery seeds), certain mixed seasonings for sausage making, and products of Chapter 22 (other than those of heading 22.09) prepared for culinary purposes and thereby rendered unsuitable for consumption as beverages (e.g., cooking wines and cooking Cognac).

Besides the products of **Chapters 9** and **20** mentioned above, the heading **does not cover** :

- (a) Extracts and juices of meat, fish or crustaceans, molluscs or other aquatic invertebrates (**heading 16.03**).
- (b) Soups and broths and preparations therefor (**heading 21.04**).
- (c) Protein hydrolysates, consisting mainly of a mixture of amino-acids and sodium chloride, used as additives in food preparations (**heading 21.06**).
- (d) Autolysed yeast (**heading 21.06**).

(B) MUSTARD FLOUR AND MEAL AND PREPARED MUSTARD

Mustard flour and meal are obtained by grinding and sifting mustard seed of heading 12.07. They may be made from white or black mustard seeds or from a mixture of the two varieties. They remain in the heading whether or not the seeds were defatted or the seed coats removed before grinding, and irrespective of their intended use.

The heading also covers prepared mustard consisting of mustard flour mixed with small quantities of other ingredients (cereal flour, turmeric, cinnamon, pepper, etc.), or of a paste composed of a mixture of mustard flour with vinegar, grape must or wine, to which salt, sugar, spices or other condiments may be added.

This heading **excludes**, *inter alia* :

- (a) Mustard seeds (**heading 12.07**).
- (b) Fixed mustard oil (**heading 15.14**).
- (c) Mustard-seed oilcake, i.e., the product remaining after the fixed oil has been extracted from mustard seeds (**heading 23.06**).
- (d) Essential oil of mustard (**heading 33.01**).

21.04 - Soups and broths and preparations therefor; homogenised composite food preparations.

2104.10 - Soups and broths and preparations therefor

2104.20 - Homogenised composite food preparations

(A) SOUPS AND BROTHS AND PREPARATIONS THEREFOR

This category includes :

- (1) Preparations for soups or broths requiring only the addition of water, milk, etc.
- (2) Soups and broths ready for consumption after heating.

These products are generally based on vegetable products (flour, starches, tapioca, macaroni, spaghetti and the like, rice, plant extracts, etc.), meat, meat extracts, fat, fish, crustaceans, molluscs or other aquatic invertebrates, peptones, amino-acids or yeast extract. They may also contain a considerable proportion of salt.

They are generally put up as tablets, cakes, cubes, or in powder or liquid form.

(B) HOMOGENISED COMPOSITE FOOD PREPARATIONS

In accordance with Note 3 to this Chapter, the homogenised composite food preparations of this heading are those which consist of a finely homogenised mixture of two or more basic ingredients such as meat, fish, vegetables or fruit, put up for retail sale as food suitable for infants or young children or for dietetic purposes, in containers of a net weight content not exceeding 250 g. Besides the basic ingredients, these preparations may contain small quantities of substances such as cheese, egg yolk, starch, dextrin, salt or vitamins, which are added either for dietetic purposes (balanced diet), or for seasoning, preservation or for other purposes. They may also contain visible pieces of ingredients, **provided** that such pieces are present only in small quantities, i.e., that they do not alter the character of the products as homogenised preparations.

Homogenised composite food preparations are generally used as food suitable for infants or young children and take the form of a smooth paste, of varying consistency, suitable for consumption either directly or after re-heating. They are usually put up in airtight jars or cans in a quantity generally corresponding to one whole meal.

The heading **excludes** homogenised composite food preparations which are put up otherwise than for retail sale as food suitable for infants or young children or for dietetic purposes, or in containers of a net weight content exceeding 250 g. It also **excludes** preparations of this kind which consist of one basic ingredient such as meat, meat offal, fish, vegetable or fruit (generally **Chapter 16** or **20**), whether or not containing small quantities of any ingredients added for seasoning, preservation or for other purposes.

The heading also **excludes** :

- (a) Mixtures of dried vegetables (*julienne*), whether or not in powder form (**heading 07.12**).
- (b) Flour, meal and powder of dried leguminous vegetables (**heading 11.06**).

- (c) Extracts and juices of meat, fish, etc. and other products of **Chapter 16**.
- (d) Food preparations containing cocoa (generally **heading 18.06** or **19.01**).
- (e) Mixtures of vegetables of **heading 20.04** or **20.05**, even if sometimes used for the preparation of soups.
- (f) Autolysed yeast (**heading 21.06**).

21.05 - Ice cream and other edible ice, whether or not containing cocoa.

This heading covers ice cream, which is usually prepared with a basis of milk or cream, and other edible ice (e.g., sherbet, iced lollipops), whether or not containing cocoa in any proportion. However, the heading **excludes** mixes and bases for ice cream which are classified according to their essential constituents (e.g., **heading 18.06, 19.01 or 21.06**).

21.06 - Food preparations not elsewhere specified or included.

2106.10 - Protein concentrates and textured protein substances

2106.90 - Other

Provided that they are not covered by any other heading of the Nomenclature, this heading covers :

- (A) Preparations for use, either directly or after processing (such as cooking, dissolving or boiling in water, milk, etc.), for human consumption.
- (B) Preparations consisting wholly or partly of foodstuffs, used in the making of beverages or food preparations for human consumption. The heading includes preparations consisting of mixtures of chemicals (organic acids, calcium salts, etc.) with foodstuffs (flour, sugar, milk powder, etc.), for incorporation in food preparations either as ingredients or to improve some of their characteristics (appearance, keeping qualities, etc.) (see the General Explanatory Note to Chapter 38).

However, the heading **does not cover** enzymatic preparations containing foodstuffs (e.g., meat tenderisers consisting of a proteolytic enzyme with added dextrose or other foodstuffs). Such preparations fall in **heading 35.07 provided** that they are not covered by a more specific heading in the Nomenclature.

The heading includes, *inter alia* :

- (1) Powders for table creams, jellies, ice creams or similar preparations, whether or not sweetened.

Powders based on flour, meal, starch, malt extract or goods of headings 04.01 to 04.04, whether or not containing added cocoa, fall in **heading 18.06 or 19.01** according to their cocoa content (see the General Explanatory Note to Chapter 19). The other powders are classified in **heading 18.06** if they contain cocoa. Powders which have the character of flavoured or coloured sugars used as sweetener fall in heading 17.01 or 17.02 as the case may be.

- (2) Flavouring powders for making beverages, whether or not sweetened, with a basis of sodium bicarbonate and glycyrrhizin or liquorice extract (sold as "Cocoa-powder").
- (3) Preparations based on butter or other fats or oils derived from milk and used, e.g., in bakers' wares.
- (4) Pastes based on sugar, containing added fat in a relatively large proportion and, sometimes, milk or nuts, not suitable for transformation directly into sugar confectionery but used as fillings, etc., for chocolates, fancy biscuits, pies, cakes, etc.
- (5) Natural honey enriched with bees' royal jelly.
- (6) Protein hydrolysates consisting mainly of a mixture of amino-acids and sodium chloride, used in food preparations (e.g., for flavouring); protein concentrates obtained by the elimination of certain constituents of defatted soya-bean flour, used for protein-enrichment of food preparations; soya-bean flour and other protein substances, textured. However, the heading **excludes** non-textured defatted soya-bean flour, whether or not fit for human consumption (**heading 23.04**) and protein isolates (**heading 35.04**).

- (7) Non-alcoholic or alcoholic preparations (**not based** on odorous substances) of a kind used in the manufacture of various non-alcoholic or alcoholic beverages. These preparations can be obtained by compounding vegetable extracts of heading 13.02 with lactic acid, tartaric acid, citric acid, phosphoric acid, preserving agents, foaming agents, fruit juices, etc. The preparations contain (in whole or in part) the flavouring ingredients which characterize a particular beverage. As a result, the beverage in question can usually be obtained simply by diluting the preparation with water, wine or alcohol, with or without the addition, for example, of sugar or carbon dioxide gas. Some of these products are specially prepared for domestic use; they are also widely used in industry in order to avoid the unnecessary transport of large quantities of water, alcohol, etc. As presented, these preparations are not intended for consumption as beverages and thus can be distinguished from the beverages of Chapter 22.

The heading **excludes** preparations of a kind used for the manufacture of beverages, based on one or more odorous substances (**heading 33.02**).

- (8) Edible tablets with a basis of natural or artificial perfumes (e.g., vanillin).
- (9) Sweets, gums and the like (for diabetics, in particular) containing synthetic sweetening agents (e.g., sorbitol) instead of sugar.
- (10) Preparations (e.g., tablets) consisting of saccharin and a foodstuff, such as lactose, used for sweetening purposes.
- (11) Autolysed yeast and other yeast extracts, products obtained by the hydrolysis of yeast. These products cannot provoke fermentation and they have a high protein value. They are used mainly in the food industry (e.g., for the preparation of certain seasonings).
- (12) Preparations for the manufacture of lemonades or other beverages, consisting, for example, of :
- flavoured or coloured syrups, being sugar solutions with natural or artificial substances added to give them the flavour of, for example, certain fruits or plants (raspberry, blackcurrant, lemon, mint, etc.), whether or not containing added citric acid and preservatives;
 - syrup flavoured with an added compound preparation of this heading (see paragraph (7) above) containing, in particular, either cola essence and citric acid, coloured with caramelised sugar, or citric acid and essential oils of fruit (e.g., lemon or orange);
 - syrup flavoured with fruit juices which have been modified by the addition of constituents (citric acid, essential oil extracted from the fruit, etc.) in such quantities that the balance of the fruit juice constituents as found in the natural juice is clearly upset;
 - concentrated fruit juice with the addition of citric acid (in such a proportion that the total acid content is appreciably greater than that of the natural juice), essential oils of fruit, synthetic sweetening agents, etc.

Such preparations are intended to be consumed as beverages after simple dilution with water or after further treatment. Certain preparations of this kind are intended for adding to other food preparations.

- (13) Mixtures of ginseng extract with other ingredients (e.g., lactose or glucose) used for the preparation of ginseng “ tea ” or beverage.
- (14) Products consisting of a mixture of plants or parts of plants (including seeds or fruits) of different species or consisting of plants or parts of plants (including seeds or fruits) of a single or of different species mixed with other substances such as one or more plant extracts, which are not consumed as such, but which are of a kind used for making herbal infusions or herbal “ teas ”, (e.g., those having laxative, purgative, diuretic or carminative properties), including products which are claimed to offer relief from ailments or contribute to general health and well-being.

The heading **excludes** products where an infusion constitutes a therapeutic or prophylactic dose of an active ingredient specific to a particular ailment (**heading 30.03** or **30.04**).

The heading also **excludes** such products classifiable in **heading 08.13** or **Chapter 9**.

- (15) Mixtures of plants, parts of plants, seeds or fruit (whole, cut, crushed, ground or powdered) of species falling in different Chapters (e.g., Chapters 7, 9, 11, 12) or of different species falling in heading 12.11, not consumed as such, but of a kind used either directly for flavouring beverages or for preparing extracts for the manufacture of beverages.

However, products of this type whose essential character is given by their content of species falling within Chapter 9 are **excluded (Chapter 9)**.

- (16) Preparations, often referred to as *food supplements*, based on extracts from plants, fruit concentrates, honey, fructose, etc. and containing added vitamins and sometimes minute quantities of iron compounds. These preparations are often put up in packagings with indications that they maintain general health or well-being. Similar preparations, however, intended for the prevention or treatment of diseases or ailments are **excluded (heading 30.03 or 30.04)**.
- (17) Preparations in the form of granules or powders consisting of sugar, flavouring or colouring matter (e.g., plant extracts or certain fruits or plants such as orange, blackcurrant, etc.), antioxidants (e.g., ascorbic acid or citric acid or both), preserving agents, etc., of a kind used for making beverages. However, preparations which have the character of sugar fall in **heading 17.01** or **17.02**, as the case may be.

The heading further **excludes** :

- (a) Preparations made from fruit, nuts or other edible parts of plants of heading 20.08, **provided** that the essential character of the preparations is given by such fruit, nuts or other edible parts of plants (**heading 20.08**).
 - (b) Micro-organisms of heading 21.02 put up as food supplements for human consumption (**heading 21.02**).
-

Chapter 22

Beverages, spirits and vinegar

Notes.

1.- This Chapter does not cover :

- (a) Products of this Chapter (other than those of heading 22.09) prepared for culinary purposes and thereby rendered unsuitable for consumption as beverages (generally heading 21.03);
 - (b) Sea water (heading 25.01);
 - (c) Distilled or conductivity water or water of similar purity (heading 28.53);
 - (d) Acetic acid of a concentration exceeding 10 % by weight of acetic acid (heading 29.15);
 - (e) Medicaments of heading 30.03 or 30.04; or
 - (f) Perfumery or toilet preparations (Chapter 33).

2.- For the purposes of this Chapter and of Chapters 20 and 21, the " alcoholic strength by volume " shall be determined at a temperature of 20 °C.

3.- For the purposes of heading 22.02, the term " non-alcoholic beverages " means beverages of an alcoholic strength by volume not exceeding 0.5 % vol. Alcoholic beverages are classified in headings 22.03 to 22.06 or heading 22.08 as appropriate.

Three small black circles arranged in a triangular pattern, with one circle at the top and two at the bottom.

Subheading Note.

1.- For the purposes of subheading 2204.10, the expression " sparkling wine " means wine which, when kept at a temperature of 20 °C in closed containers, has an excess pressure of not less than 3 bars.

GENERAL

The products of this Chapter constitute a group quite distinct from the foodstuffs covered by the preceding Chapters of the Nomenclature.

They fall into four main groups:

- (A) Water and other non-alcoholic beverages and ice.
 - (B) Fermented alcoholic beverages (beer, wine, cider, etc.).
 - (C) Distilled alcoholic liquids and beverages (liqueurs, spirits, etc.) and ethyl alcohol.
 - (D) Vinegar and substitutes for vinegar.

This Chapter **does not cover**:

- (a) Liquid dairy products of **Chapter 4**.

- (b) Products of this Chapter (**other than** those of **heading 22.09**) prepared for culinary purposes and thereby rendered unsuitable for consumption as beverages (e.g., cooking wines and cooking Cognac) (generally **heading 21.03**).
- (c) Medicaments of **heading 30.03** or **30.04**.
- (d) Perfumery or toilet preparations (**Chapter 33**).

22.01 - Waters, including natural or artificial mineral waters and aerated waters, not containing added sugar or other sweetening matter nor flavoured; ice and snow.

2201.10 - Mineral waters and aerated waters

2201.90 - Other

This heading covers :

- (A) **Ordinary natural water** of all kinds (**other than** sea water - see **heading 25.01**). Such waters remain in the heading, whether or not clarified or purified, **except** that distilled or conductivity water and water of similar purity are classified in **heading 28.53**.

The heading **excludes** sweetened or flavoured water (**heading 22.02**).

- (B) **Mineral waters**, whether natural or artificial.

Natural mineral waters contain mineral salts or gases. The composition of these waters varies considerably and they are generally classified according to the chemical characteristics of their salts, e.g. :

- (1) Alkaline waters.
- (2) Sulphated waters.
- (3) Halide waters.
- (4) Sulphuretted waters.
- (5) Arsenical waters.
- (6) Ferruginous waters.

Such natural mineral waters may also contain natural or added carbon dioxide.

Artificial mineral waters are prepared from ordinary potable water by adding the active principles (mineral salts or gases) present in the corresponding natural waters so as to produce waters of the same properties.

The heading **excludes** sweetened or flavoured (orange, lemon, etc.) mineral waters (natural or artificial) (**heading 22.02**).

- (C) **Aerated waters** (carbonated waters), i.e., ordinary potable waters charged with carbon dioxide gas under pressure. They are often called "soda waters" or "Seltzer" waters although true "Seltzer" water is a natural mineral water.

The heading **excludes** sweetened or flavoured aerated waters (**heading 22.02**).

- (D) **Ice and snow**, i.e., natural snow and ice, and artificially frozen water.

The heading **excludes** edible ice of **heading 21.05** and "carbonic acid snow" or "dry ice" (i.e., solid carbon dioxide) (**heading 28.11**).

22.02 - Waters, including mineral waters and aerated waters, containing added sugar or other sweetening matter or flavoured, and other non-alcoholic beverages, not including fruit or vegetable juices of heading 20.09.

2202.10 - Waters, including mineral waters and aerated waters, containing added sugar or other sweetening matter or flavoured

2202.90 - Other :

2202.91 - Non-alcoholic beer

2202.92 - Other

This heading covers non-alcoholic beverages, as defined in Note 3 to this Chapter, not classified under other headings, particularly **heading 20.09 or 22.01**.

(A) **Waters, including mineral waters and aerated waters, containing added sugar or other sweetening matter or flavoured.**

This group includes, *inter alia* :

- (1) **Sweetened or flavoured mineral waters** (natural or artificial).
- (2) **Beverages such as lemonade, orangeade, cola**, consisting of ordinary drinking water, sweetened or not, flavoured with fruit juices or essences, or compound extracts, to which citric acid or tartaric acid are sometimes added. They are often aerated with carbon dioxide gas, and are generally presented in bottles or other airtight containers.

(B) **Other non-alcoholic beverages, not including fruit or vegetable juices of heading 20.09.**

This group includes, *inter alia* :

- (1) **Tamarind nectar rendered ready for consumption as a beverage** by the addition of water and sugar and straining.
- (2) **Certain other beverages ready for consumption**, such as those with a basis of milk and cocoa.

This heading **does not include** :

- (a) Liquid yogurt and other fermented or acidified milk and cream containing cocoa, fruit or flavourings (**heading 04.03**).
- (b) Sugar syrups of **heading 17.02** and flavoured sugar syrups of **heading 21.06**.
- (c) Fruit or vegetable juices, whether or not used as beverages (**heading 20.09**).
- (d) Medicaments of **heading 30.03 or 30.04**.

22.03 - Beer made from malt.

Beer is an alcoholic beverage obtained by fermenting a liquor (wort) prepared from malted barley or wheat, water and (usually) hops. Certain quantities of non-malted cereals (e.g., maize (corn) or rice) may also be used for the preparation of the liquor (wort). The addition of hops imparts a bitter and aromatic flavour and improves the keeping qualities. Cherries or other flavouring substances are sometimes added during fermentation.

Sugar (particularly glucose), colouring matter, carbon dioxide and other substances may also be added.

According to the fermenting process employed, the products may be **bottom fermentation beer**, obtained at a low temperature with bottom yeasts, or **top fermentation beer**, obtained at a higher temperature with top yeasts.

Beer may be pale or dark, sweet or bitter, mild or strong. It may be put up in barrels, bottles or in airtight tins and may be marketed as ale, stout, etc.

This heading also covers concentrated beer prepared by vacuum-condensing beer of low alcoholic strength (but with a high content of malt extract) to between one fifth and one sixth of its original volume.

The heading **does not cover** :

- (a) Certain beverages which, although they are sometimes described as beers, do not contain alcohol (e.g., beverages prepared from water and caramelised sugar) (**heading 22.02**).
- (b) Beverages called non-alcoholic beer consisting of beer made from malt, the alcoholic strength of which by volume has been reduced to 0.5 % vol or less (**heading 22.02**).
- (c) Medicaments of **heading 30.03** or **30.04**.

22.04 - Wine of fresh grapes, including fortified wines; grape must other than that of heading 20.09.

2204.10 - Sparkling wine

- Other wine; grape must with fermentation prevented or arrested by the addition of alcohol :

2204.21 -- In containers holding 2 l or less

2204.22 -- In containers holding more than 2 l but not more than 10 l

2204.29 -- Other

2204.30 - Other grape must

(I) Wine of fresh grapes

The wine classified in this heading is the final product of the alcoholic fermentation of the must of fresh grapes.

The heading includes :

(1) **Ordinary wines** (red, white or *rosé*).

(2) **Wines fortified with alcohol.**

(3) **Sparkling wines.** These wines are charged with carbon dioxide, either by conducting the final fermentation in a closed vessel (sparkling wines proper), or by adding the gas artificially after bottling (aerated wines).

(4) **Dessert wines (sometimes called liqueur wines).** These are rich in alcohol and are generally obtained from must with a high sugar content, only part of which is converted to alcohol by fermentation. In some cases they are fortified by the addition of alcohol, or of concentrated must with added alcohol. Dessert (or liqueur) wines include, *inter alia*, Canary, Cyprus, Lacryma Christi, Madeira, Malaga, Malmsey, Marsala, Port, Samos and Sherry.

The heading **does not cover** :

(a) Beverages with a basis of wine of **heading 22.05**.

(b) Medicaments of **heading 30.03 or 30.04**.

(II) Grape must

Grape must, obtained by pressing fresh grapes, is a greenish-yellow, cloudy liquid with a sweet flavour. It contains in solution a mixture of sugars (glucose and fructose), acids (tartaric, malic, etc.), albuminous, mineral and mucilaginous substances and the aromatic principles which give the wine its characteristic aroma and flavour.

Grape must, unless prevented, ferments spontaneously (the sugars being converted into alcohol); the end-product of this fermentation is wine.

The natural tendency of must to ferment can be inhibited by the process known as mutage which may either retard fermentation or arrest it completely.

Mutage may be effected in different ways :

- (1) By the action of salicylic acid or other antiseptics.
- (2) By impregnating the must with sulphur dioxide.
- (3) By adding alcohol. This type of product is often consumed as a wine without further processing. Others, known as mistelles, are used in the manufacture of liqueur wines and aperitives, etc.
- (4) By refrigeration.

It should be noted that this group covers grape must partially fermented, whether or not fermentation has been arrested, as well as unfermented grape must, with alcohol added, both having an alcoholic strength by volume exceeding 0.5 % vol.

The heading **excludes** grape juice and grape must, whether or not concentrated, unfermented or having an alcoholic strength by volume not exceeding 0.5 % vol (**heading 20.09**).

22.05 - Vermouth and other wine of fresh grapes flavoured with plants or aromatic substances.

2205.10 - In containers holding 2 l or less

2205.90 - Other

This heading includes a variety of beverages (generally used as aperitifs or tonics) made with wine of fresh grapes of heading 22.04, and flavoured with infusions of plant substances (leaves, roots, fruits, etc.) or aromatic substances.

It may also include the above types of beverages which contain added vitamins or iron compounds. These products which are sometimes referred to as "food supplements" are designed to maintain general health or well-being.

The heading **does not cover** :

- (a) Wines obtained from dried grapes and prepared with aromatic plants or substances (**heading 22.06**).
- (b) Medicaments of **heading 30.03** or **30.04**.

22.06 - Other fermented beverages (for example, cider, perry, mead, saké); mixtures of fermented beverages and mixtures of fermented beverages and non-alcoholic beverages, not elsewhere specified or included.

This heading covers all fermented beverages **other than** those in headings **22.03 to 22.05**.

It includes *inter alia* :

- (1) **Cider**, an alcoholic beverage obtained by fermenting the juice of apples.
- (2) **Perry**, a fermented beverage somewhat similar to cider made with the juice of pears.
- (3) **Mead**, a beverage prepared by fermenting a solution of honey in water. (The heading includes *hydromel vineux* - mead containing added white wine, aromatics and other substances.)
- (4) **Raisin wine**.
- (5) **Wines obtained by the fermentation of fruit juices**, other than juice of fresh grapes (fig, date or berry wines), or of vegetable juices, with an alcoholic strength by volume exceeding 0.5 % vol.
- (6) “**Malton**”, a fermented beverage prepared from malt extract and wine lees.
- (7) **Spruce**, a beverage made from leaves or small branches of the spruce fir or from spruce essence.
- (8) **Saké or rice wine**.
- (9) **Palm wine**, prepared from the sap of certain palm trees.
- (10) **Ginger beer and herb beer**, prepared from sugar and water and ginger or herbs, fermented with yeast.

All these beverages may be either naturally sparkling or artificially charged with carbon dioxide. They remain classified in the heading when fortified with added alcohol or when the alcohol content has been increased by further fermentation, provided that they retain the character of products falling in the heading.

This heading also covers mixtures of non-alcoholic beverages and fermented beverages and mixtures of fermented beverages of the foregoing headings of Chapter 22, e.g., mixtures of lemonade and beer or wine, mixtures of beer and wine, having an alcoholic strength by volume exceeding 0.5 % vol.

Some of these beverages may also contain added vitamins or iron compounds. These products which are sometimes referred to as “ food supplements ” are designed to maintain general health or well-being.

This heading **excludes** fruit juices (apple, pear, etc.) and other beverages having an alcoholic strength by volume not exceeding 0.5 % vol (**headings 20.09 and 22.02** respectively).

22.07 - Undenatured ethyl alcohol of an alcoholic strength by volume of 80 % vol or higher; ethyl alcohol and other spirits, denatured, of any strength.

2207.10 - Undenatured ethyl alcohol of an alcoholic strength by volume of 80 % vol or higher

2207.20 - Ethyl alcohol and other spirits, denatured, of any strength

Ethyl alcohol is not classified with the other acyclic alcohols of heading 29.05 but is excluded from Chapter 29 by Note 2 (b) to that Chapter.

The heading covers :

- (1) Undenatured ethyl alcohol of an alcoholic strength by volume of 80 % vol or higher.
- (2) Ethyl alcohol and other spirits, denatured, of any strength.

Fermented beverages and spirituous beverages contain ethyl alcohol obtained by the fermentation of certain kinds of sugar by means of yeast or other ferments. Undenatured ethyl alcohol of headings 22.07 or 22.08 is produced when a fermented product is treated by subsequent purification processes (e.g., distillation, filtration, etc.) such that its characteristics as a fermented product are lost, producing a clear, colourless, non-sparkling liquid exhibiting only the smell and taste of ethyl alcohol. Ethyl alcohol may also be produced synthetically.

Ethyl alcohol and other spirits, denatured, are spirits mixed with substances to render them unfit for drinking but not to prevent their use for industrial purposes. The denaturants used vary in different countries according to national legislation. They include wood naphtha, methanol, acetone, pyridine, aromatic hydrocarbons (benzene, etc.), colouring matter.

This heading also covers **neutral spirits**, i.e., ethyl alcohol containing water from which the secondary constituents (higher alcohols, esters, aldehydes, acids, etc.) present in the first distillate have been almost completely removed by purification processes (e.g., fractional distillation)

Ethyl alcohol is used for many industrial purposes, e.g., as a solvent in the manufacture of chemicals, varnishes, etc., for heating or lighting, for the preparation of spirituous beverages.

The heading **does not cover** :

- (a) Undenatured ethyl alcohol of an alcoholic strength by volume of less than 80 % vol (**heading 22.08**).
- (b) Other spirits (unless denatured) (**heading 22.08**).
- (c) Solid or semi-solid fuels with a basis of alcohol (often sold as “ solidified alcohol ”) (**heading 36.06**).

22.08 - Undenatured ethyl alcohol of an alcoholic strength by volume of less than 80 % vol; spirits, liqueurs and other spirituous beverages.

- 2208.20 - Spirits obtained by distilling grape wine or grape marc
- 2208.30 - Whiskies
- 2208.40 - Rum and other spirits obtained by distilling fermented sugar-cane products
- 2208.50 - Gin and Geneva
- 2208.60 - Vodka
- 2208.70 - Liqueurs and cordials
- 2208.90 - Other

The heading covers, **whatever their alcoholic strength** :

- (A) **Spirits** produced by distilling wine, cider or other fermented beverages or fermented grain or other vegetable products, without adding flavouring; they retain, wholly or partly, the secondary constituents (esters, aldehydes, acids, higher alcohols, etc.) which give the spirits their peculiar individual flavours and aromas.
- (B) **Liqueurs and cordials**, being spirituous beverages to which sugar, honey or other natural sweeteners and extracts or essences have been added (e.g., spirituous beverages produced by distilling, or by mixing, ethyl alcohol or distilled spirits, with one or more of the following : fruits, flowers or other parts of plants, extracts, essences, essential oils or juices, whether or not concentrated). These products also include liqueurs and cordials containing sugar crystals, fruit juice liqueurs, egg liqueurs, herb liqueurs, berry liqueurs, spice liqueurs, tea liqueurs, chocolate liqueurs, milk liqueurs and honey liqueurs.
- (C) **All other spirituous beverages not falling** in any preceding heading of this Chapter.

Provided that **their alcoholic strength by volume is less than 80 % vol**, the heading also covers undenatured spirits (ethyl alcohol and neutral spirits) which, contrary to those at (A), (B) and (C) above, are characterised by the absence of secondary constituents giving a flavour or aroma. These spirits remain in the heading whether intended for human consumption or for industrial purposes.

In addition to undenatured ethyl alcohol of an alcoholic strength by volume of less than 80 % vol, the heading includes, *inter alia* :

- (1) Spirits obtained by distilling grape wine or grape marc (Cognac, Armagnac, brandy, grappa, pisco, singani, etc.).
- (2) Whiskies and other spirits obtained by distilling fermented mash of cereal grains (barley, oats, rye, wheat, corn, etc.).
- (3) Spirits obtained exclusively by distilling fermented products of the sugar cane (sugar-cane juice, sugar-cane syrup, sugar-cane molasses), e.g., rum, tafia, cachaça.
- (4) Spirituous beverages known as gin or Geneva, containing the aromatic principles of juniper berries.

- (5) Vodka obtained by distilling fermented mash of agricultural origin (e.g., cereals, potatoes) and sometimes further treated with activated charcoal or carbon.
- (6) Spirituous beverages (generally known as liqueurs), such as anisette (obtained from green anise and badian), curaçao, (manufactured with the peel of the bitter orange), kummel (flavoured with caraway or cumin seeds).
- (7) The liqueurs known as “crèmes”, because of their consistency or colour. They are generally of relatively low alcoholic content and very sweet (for example, creams of cocoa, bananas, vanilla, coffee). The heading also covers spirits consisting of emulsions of spirit with products such as egg yolk or cream.
- (8) Ratafias. These are kinds of liqueurs obtained from fruit juice; they often contain a small quantity of added aromatic substances (ratafias of cherries, of black currants, of raspberries, of apricots, etc.).
- (9) Aquavit and other spirituous beverages obtained by distilling alcohol with fruits or other parts of plants or herbs.
- (10) Spirits obtained from cider (calvados), from plums (mirabelle, quetsch), from cherries (kirsch) or other fruits.
- (11) Arrack, spirits obtained from rice or palm wine.
- (12) Spirits obtained by distillation of the fermented juice of locust beans.
- (13) Alcoholic aperitives (absinth, bitters, etc.) **other than** those with a basis of wine of fresh grapes which fall in **heading 22.05**.
- (14) Alcoholic lemonade (unmedicated).
- (15) Fruit or vegetable juices containing added alcohol and of an alcoholic strength by volume exceeding 0.5 % vol, **other than** products of **heading 22.04**.
- (16) Spirituous beverages, sometimes referred to as “ food supplements ”, designed to maintain general health or well-being. They may, for example, be based on extracts from plants, fruit concentrates, lecithins, chemicals, etc., and contain added vitamins or iron compounds.
- (17) Beverages formulated to simulate wine by mixing distilled spirits with fruit juice and/or water, sugar, colouring, flavouring or other ingredients, **other than** products of **heading 22.04**.
- (18) Spirits obtained by distilling fermented sugar beet molasses.

The heading **does not**, however, **include** :

- (a) Vermouths, and other aperitives with a basis of wine of fresh grapes (**heading 22.05**).
- (b) Ethyl alcohol and other spirits, denatured (of any strength), or undenatured ethyl alcohol of an alcoholic strength by volume of 80 % vol or higher (**heading 22.07**).

22.09 - Vinegar and substitutes for vinegar obtained from acetic acid.

(I) VINEGAR

Vinegar is an acid liquid obtained by the acetic fermentation in the presence of air and at a constant temperature generally not exceeding 20 °C to 30 °C, of alcoholic liquids of any source or of various sugar or starch solutions having undergone alcoholic fermentation, under the action of vinegar bacteria *Mycoderma aceti* or acetobacter.

The heading includes the following varieties of vinegar, distinguished according to their origin :

- (1) **Wine vinegar.** This is pale yellow to red in colour according to the type of wine from which it is prepared; it has a special *bouquet* due to the presence, e.g., of wine esters.
- (2) **Beer or malt vinegar; cider, perry or other fermented fruit vinegars.** These are generally yellowish in colour.
- (3) **Spirit vinegar,** colourless in its natural state.
- (4) **Vinegar obtained from cereal grains, molasses, hydrolysed potatoes, lactoserum, etc.**

(II) SUBSTITUTES FOR VINEGAR

Substitutes for vinegar are obtained by diluting acetic acid with water. They are often coloured with caramel or other organic colouring substances (see also exclusion (a) below).

*
* * *

Vinegar and substitutes for vinegar which are used to flavour or pickle foodstuffs, may themselves be flavoured with vegetables such as tarragon or contain added spices.

The heading **does not include** :

- (a) Aqueous solutions containing more than 10 % by weight of acetic acid (**heading 29.15**). However, the provisions of Note 1 (d) to Chapter 22 do not apply to such solutions, usually containing 10 to 15 % by weight of acetic acid, which have been flavoured or coloured for use with foodstuffs as substitutes for vinegar; these remain in this heading.
 - (b) Medicaments of **heading 30.03** or **30.04**.
 - (c) Toilet vinegars (**heading 33.04**).
-

Chapter 23

Residues and waste from the food industries; prepared animal fodder

Note.

1.- Heading 23.09 includes products of a kind used in animal feeding, not elsewhere specified or included, obtained by processing vegetable or animal materials to such an extent that they have lost the essential characteristics of the original material, other than vegetable waste, vegetable residues and by-products of such processing.

○
○ ○

Subheading Note.

1.- For the purposes of subheading 2306.41, the expression " low erucic acid rape or colza seeds " means seeds as defined in Subheading Note 1 to Chapter 12.

GENERAL

This Chapter covers the various residues and wastes derived from vegetable materials used by food-preparing industries, and also certain products of animal origin. The main use of most of these products is as animal feeding stuffs, either alone or mixed with other materials, although some of them are fit for human consumption. Certain products (e.g., wine lees, argol, oil-cake) also have industrial uses.

References in this Chapter to " pellets " mean products which have been agglomerated either directly by compression or by the addition of a binder (molasses, starchy substances, etc.) in a proportion not exceeding 3 % by weight.

23.01 - Flours, meals and pellets, of meat or meat offal, of fish or of crustaceans, molluscs or other aquatic invertebrates, unfit for human consumption; greaves.

2301.10 - Flours, meals and pellets, of meat or meat offal; greaves

2301.20 - Flours, meals and pellets, of fish or of crustaceans, molluscs or other aquatic invertebrates

This heading covers :

- (1) **Flours and meals**, unfit for human consumption, obtained by processing either the whole animal (including poultry, marine mammals, fish or crustaceans, molluscs or other aquatic invertebrates) or animal products (such as meat or meat offal) **other than** bones, horns, shells, etc. These products (obtained mainly from slaughter houses, floating factories which process fishery products, canning or packing industries, etc.) are usually steam-heated and pressed or treated with a solvent to remove oil and fat. The resultant product is then dried and sterilised by prolonged heating, and finally ground.

The heading also covers the above products in the form of pellets (see the General Explanatory Note to this Chapter).

The flours, meals and pellets of this heading are used mainly in animal feeding, but may also be used for other purposes (e.g., as fertilisers).

- (2) **Greaves**, the membranous tissues remaining after pig or other animal fats have been rendered. They are used mainly in the preparation of animal foods (e.g., dog biscuits), but they remain in the heading even if suitable for human consumption.

23.02 - Bran, sharps and other residues, whether or not in the form of pellets, derived from the sifting, milling or other working of cereals or of leguminous plants.

2302.10 - Of maize (corn)

2302.30 - Of wheat

2302.40 - Of other cereals

2302.50 - Of leguminous plants

This heading covers :

(A) **Bran, sharps and other residues from the milling of cereal grains.** This category essentially comprises by-products from the milling of wheat, rye, barley, oats, maize (corn), rice, grain sorghum or buckwheat, which do not comply with the requirements of Note 2 (A) to Chapter 11 as regards starch content and ash content.

These are, in particular :

- (1) Bran consisting of the outer skins of cereal grains with a small proportion of the adhering endosperm and a little flour.
- (2) Sharps (or middlings), obtained from ground cereals as a by-product in the manufacture of flour and consisting largely of the finer portions of the skins left after screening and sieving and of a little flour.

(B) **Residues from the sifting or other working of cereal grains.** Sifting residues, obtained during pre-milling operations, consist essentially of :

- grains of the basic cereal, smaller, mis-shapen, broken or crumbled;
- seeds of various stray plants mixed with the basic cereal;
- fragments of leaves, stalks, minerals, etc.

This category further includes :

- (1) Residues from the cleaning of silos, ships' holds, etc., which have much the same composition as the above.
- (2) The pericarp removed from the rice grain during the bleaching operation.
- (3) Residues resulting from hulling, rolling, flaking, pearlting, slicing or kibbling of cereal grain.

(C) **Residues and waste of a similar kind resulting from the grinding or other working of leguminous plants.**

The heading also covers the above products in the form of pellets (see the General Explanatory Note to this Chapter).

The heading also covers whole maize (corn) cobs ground with or without their husks, not fulfilling the criteria as to starch content and ash content provided for products from the milling of maize (corn) in Note 2 (A) to Chapter 11.

Cereal husks, obtained from the threshing of cereals, are classified in **heading 12.13**.

The heading **does not include** oil-cake or other solid residues resulting from the extraction of vegetable fats or oils (**headings 23.04 to 23.06**).

23.03 - Residues of starch manufacture and similar residues, beet-pulp, bagasse and other waste of sugar manufacture, brewing or distilling dregs and waste, whether or not in the form of pellets.

2303.10 - Residues of starch manufacture and similar residues

2303.20 - Beet-pulp, bagasse and other waste of sugar manufacture

2303.30 - Brewing or distilling dregs and waste

This heading covers, *inter alia* :

- (A) **Residues of starch manufacture and similar residues** (from maize (corn), rice, potatoes, etc.) consist largely of fibrous and protein substances usually presented in the form of pellets or meal but occasionally as cake. They are used for animal fodder or as fertilisers; some of these residues (e.g., maize steeping liquors) are used in the production of cultures for the manufacture of antibiotics.
- (B) **Beet-pulp** is the residue which remains after the sugar has been extracted from the root of the sugar beet. This pulp is classified in this heading whether wet or dried but, if with added molasses or otherwise prepared as animal food, it falls in **heading 23.09**.
- (C) **Bagasse** is a residue consisting of the fibrous portion of the sugar cane after the juice has been extracted. It is used in the paper-making industry and in the preparation of animal food.
- (D) **Other waste products of sugar manufacture** covered by this heading include defecation scum, filter press residues, etc.
- (E) **Brewing or distilling dregs and waste** comprise in particular :
 - (1) **Dregs of cereals** (barley, rye, etc.), obtained in the manufacture of beer and consisting of the exhausted grains remaining after the wort has been drawn off.
 - (2) **Malt sprouts** separated from the malted grain during the kilning process.
 - (3) **Spent hops**.
 - (4) **Dregs** resulting from the distillation of spirits from grain, seeds, potatoes, etc.
 - (5) **Beet pulp wash** (residues from the distillation of beet molasses).

(All these products remain classified in the heading whether presented wet or dry.)

The heading also covers the above products in the form of pellets (see the General Explanatory Note to this Chapter).

This heading **does not include** :

- (a) Molasses resulting from the extraction or refining of sugar (**heading 17.03**).
- (b) Inactive or spent yeast (**heading 21.02**).

- (c) Crude potassium salts obtained by burning and washing residues of beet molasses (**heading 26.21**).
- (d) Bagasse pulp (**heading 47.06**).

23.04 - Oil-cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of soyabean oil.

This heading covers **oil-cake and other solid residues** remaining after the extraction of oil from soya beans by solvents or in a press or rotary expeller. These residues constitute valuable animal foods.

The residues classified in this heading may be in the form of slabs (cakes), meal or pellets (see the General Explanatory Note to this Chapter).

This heading also includes non-textured defatted soya-bean flour fit for human consumption.

This heading **excludes** :

- (a) Oil dregs (**heading 15.22**).
- (b) Protein concentrates obtained by the elimination of certain constituents of defatted soya-bean flour (used as additives in food preparations) and textured soya-bean flour (**heading 21.06**).

23.05 - Oil-cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of ground-nut oil.

The Explanatory Note to heading 23.04 applies, *mutatis mutandis*, to this heading.

23.06 - Oil-cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of vegetable fats or oils, other than those of heading 23.04 or 23.05 (+).

2306.10 - Of cotton seeds

2306.20 - Of linseed

2306.30 - Of sunflower seeds

- Of rape or colza seeds :

2306.41 -- Of low erucic acid rape or colza seeds

2306.49 -- Other

2306.50 - Of coconut or copra

2306.60 - Of palm nuts or kernels

2306.90 - Other

This heading covers **oil-cake and other solid residues other than** those of **heading 23.04** or **23.05**, remaining after the extraction of oil from oil seeds, oleaginous fruits and germ of cereals by solvents or in a press or rotary expeller.

This heading also includes de-oiled bran obtained as a residue after the extraction of oil from rice bran.

Certain oil-cakes and other solid residues (linseed, cotton seed, sesame, copra, etc.) constitute valuable animal foods; some (e.g., castor) are unsuitable for animal fodder and are used as fertilisers; others (e.g., bitter almond and mustard cake) are used for the extraction of essential oils.

The residues classified in this heading may be in the form of slabs (cakes), meal or pellets (see the General Explanatory Note to this Chapter).

This heading also includes non-textured defatted flour fit for human consumption.

The heading **excludes** oil dregs (**heading 15.22**).

Subheading Explanatory Note.

Subheading 2306.41

As regards “ low erucic acid rape or colza seeds ”, see Subheading Note 1 to Chapter 12 and the Explanatory Note to heading 12.05.

23.07 - Wine lees; argol.

Wine lees originate as a muddy deposit during the fermentation and maturing of wine. When the deposit is filter-pressed, wine lees in the solid form are obtained. Dried wine lees may be in powder or granular form, or in the form of irregular fragments.

Argol is a concretion which forms in wine vats during the fermentation of grape must, or in casks in which wine is stored. It occurs in the form of powder or flakes or crystalline pieces of irregular shape; it varies in colour from grey to dark red. After a first washing, argol is in the form of greyish-yellow or reddish-brown crystals, the colour depending on the colour of the wine from which it was obtained. This washed argol is also classified in this heading.

Both wine lees and argol (including washed argol) are crude potassium hydrogen tartrates containing a fairly high proportion of calcium tartrate. They are used as a source of potassium bitartrate (cream of tartar) which occurs in the form of white crystals or as a crystalline powder, odourless, acid to taste and stable in air. Wine lees are used in the preparation of animal foods, while argol is used as a mordant in dyeing.

This heading **excludes** cream of tartar (**heading 29.18**) and calcium tartrate (**heading 29.18 or 38.24**, as the case may be).

23.08 - Vegetable materials and vegetable waste, vegetable residues and by-products, whether or not in the form of pellets, of a kind used in animal feeding, not elsewhere specified or included.

Provided they are not included in any other more specific heading of the Nomenclature and are of a kind used in animal feeding, this heading covers vegetable products, vegetable waste, and residues and by-products from the industrial processing of vegetable materials in order to extract some of their constituents.

It covers, *inter alia* :

- (1) Acorns and horse-chestnuts.
- (2) Maize (corn) cobs after removal of the grain; maize (corn) stalks and leaves.
- (3) Beet or carrot tops.
- (4) Peelings of vegetables (pea or bean pods, etc.).
- (5) Waste of fruit (peel and cores of apples, pears, etc.) and fruit pomace and marc (from the pressing of grapes, apples, pears, citrus fruit, etc.), even if they may also be used for the extraction of pectin.
- (6) Bran obtained as a by-product from the crushing of mustard seed.
- (7) Residues left after the preparation of coffee substitute (or extracts thereof) from cereal grains or other vegetable materials.
- (8) By-products obtained by concentrating residual waters from citrus fruit juice manufacture, sometimes known as "citrus fruit molasses".
- (9) Residues from the hydrolysis of maize (corn) cobs to obtain 2-furaldehyde, known as "hydrolysed ground corn cobs".

The products of this heading may be in the form of pellets (see the General Explanatory Note to this Chapter).

23.09 - Preparations of a kind used in animal feeding.

2309.10 - Dog or cat food, put up for retail sale

2309.90 - Other

This heading covers sweetened forage and prepared animal feeding stuffs consisting of a mixture of several nutrients designed :

- (1) to provide the animal with a rational and balanced daily diet (**complete feed**);
- (2) to achieve a suitable daily diet by supplementing the basic farm-produced feed with organic or inorganic substances (**supplementary feed**); or
- (3) for use in making complete or supplementary feeds.

The heading includes products of a kind used in animal feeding, obtained by processing vegetable or animal materials to such an extent that they have lost the essential characteristics of the original material, for example, in the case of products obtained from vegetable materials, those which have been treated to such an extent that the characteristic cellular structure of the original vegetable material is no longer recognisable under a microscope.

(I) SWEETENED FORAGE

Sweetened forage is a mixture of molasses or other similar sweetening substances (generally more than 10 % by weight) with one or more other nutrients. It is used mainly for feeding cattle, sheep, horses or pigs.

Besides being highly nutritive, molasses enhances the palatability of foodstuffs and thus extends the use of products of low nutritive value such as straw, cereal husks, linseed flakes and fruit pomace which the animals would otherwise be reluctant to accept.

As a rule, these sweetened preparations are fed directly to the animals. However, some of them combine molasses with highly nutritive foods, such as wheat bran, palm kernel or copra oil-cake, and are used to make **complete** feeds or **supplementary** feeds.

(II) OTHER PREPARATIONS

(A) PREPARATIONS DESIGNED TO PROVIDE THE ANIMAL WITH ALL THE NUTRIENT ELEMENTS REQUIRED TO ENSURE A RATIONAL AND BALANCED DAILY DIET (COMPLETE FEEDS)

The characteristic feature of these preparations is that they contain products from each of the three groups of nutrients described below :

- (1) "Energy" nutrients, consisting of high-carbohydrate (high-calorie) substances such as starch, sugar, cellulose, and fats, which are "burned up" by the animal organism to produce the energy necessary for life and to attain the breeders' aims. Examples of such substances include cereals, half-sugar mangolds, tallow, straw.

- (2) "Body-building" protein-rich nutrients or minerals. Unlike energy nutrients, these nutrients are not "burned up" by the animal organism but contribute to the formation of animal tissues and of the various animal products (milk, eggs, etc.). They consist mainly of proteins or minerals. Examples of the protein-rich substances used for this purpose are seeds of leguminous vegetables, brewing dregs, oil-cake, dairy by-products.

The minerals serve mainly for building up bones and, in the case of poultry, making egg-shells. The most commonly used contain calcium, phosphorus, chlorine, sodium, potassium, iron, iodine, etc.

- (3) "Function" nutrients. These are substances which promote the assimilation of carbohydrates, proteins and minerals. They include vitamins, trace elements and antibiotics. Lack or deficiency of these nutrients usually causes disorders.

The above three groups of nutrients meet the full food requirements of animals. The mixing and proportions depend upon the animal production in view.

(B) PREPARATIONS FOR SUPPLEMENTING (BALANCING) FARM-PRODUCED FEED (FEED SUPPLEMENTS)

Farm-produced feed is usually rather low in proteins, minerals or vitamins. The preparations devised to compensate for these deficiencies, so as to ensure a well-balanced animal diet, consist of proteins, minerals or vitamins plus additional-energy feeds (carbohydrates) which serve as a carrier for the other ingredients.

Although, qualitatively, these preparations have much the same composition as those described in paragraph (A), they are distinguished by a relatively high content of one particular nutrient.

This group includes :

- (1) Fish or marine mammal solubles in liquid or viscous solutions or in paste or dried form, made by concentrating and stabilising the residual water (containing water-soluble elements, viz. proteins, vitamins B, salts, etc.), and derived from the manufacture of fish or marine mammal meal or oil.
- (2) Whole green leaf protein concentrate and green fraction leaf protein concentrate, obtained from alfalfa (lucerne) juice by heat treatment.

(C) PREPARATIONS FOR USE IN MAKING THE COMPLETE FEEDS OR SUPPLEMENTARY FEEDS DESCRIBED IN (A) AND (B) ABOVE

These preparations, known in trade as "premixes", are, generally speaking, compound compositions consisting of a number of substances (sometimes called additives) the nature and proportions of which vary according to the animal production required. These substances are of three types :

- (1) Those which improve digestion and, more generally, ensure that the animal makes good use of the feeds and safeguard its health : vitamins or provitamins, amino-acids, antibiotics, coccidiostats, trace elements, emulsifiers, flavourings and appetisers, etc.
- (2) Those designed to preserve the feeding stuffs (particularly the fatty components) until consumption by the animal : stabilisers, anti-oxidants, etc.
- (3) Those which serve as carriers and which may consist either of one or more organic nutritive substances (manioc or soya flour or meal, middlings, yeast, various residues of the food industries, etc.) or of inorganic substances (e.g., magnesite, chalk, kaolin, salt, phosphates).

The concentration of the substances described in (1) above and the nature of the carrier are determined so as to ensure, in particular, homogeneous dispersion and mixing of these substances in the compound feeds to which the preparations are added.

Provided they are of a kind used in animal feeding, this group also includes :

- (a) Preparations consisting of several mineral substances.
- (b) Preparations consisting of an active substance of the type described in (1) above with a carrier, for example products of the antibiotics manufacturing process obtained by simply drying the mass, i.e. the entire contents of the fermentation vessel (essentially mycelium, the culture medium and the antibiotic). The resulting dry substance, whether or not standardised by adding organic or inorganic substances, has an antibiotic content ranging generally between 8 % and 16 % and is used as basic material in preparing, in particular, " premixes ".

The preparations of this group should not, however, be confused with certain preparations for veterinary uses. The latter are generally identifiable by the medicinal nature and much higher concentration of the active substance, and are often put up in a different way.

*
* * *

The heading further includes :

- (1) Preparations for cats, dogs, etc., consisting of a mixture of meat, meat offal and other ingredients, put up in airtight containers and containing approximately the quantity required for one feed.
- (2) Biscuits for dogs or other animals, usually made with flour, starch or cereal products mixed with greaves or meat meal.
- (3) Sweet preparations, whether or not containing cocoa, designed solely for consumption by dogs or other animals.
- (4) Feeding preparations for birds (e.g., a preparation consisting of millet, canary seeds, shelled oats and linseed, used as a main or complete food for budgerigars) or fish.

The animal feeding preparations of this heading are often put up in the form of pellets (see the General Explanatory Note to this Chapter).

The heading **excludes** :

- (a) Pellets made from a single material, or from a mixture of several materials which is classified as such in one specific heading, even with an added binder (molasses, starchy substances, etc.) in a proportion not exceeding 3 % by weight (**headings 07.14, 12.14, 23.01**, etc.).
 - (b) Simple mixtures of cereal grains (**Chapter 10**), of cereal flours or of flours of leguminous vegetables (**Chapter 11**).
 - (c) Preparations which, when account is taken, in particular, of the nature, purity and proportions of the ingredients, the hygiene requirements complied with during manufacture and, when appropriate, the indications given on the packaging or any other information concerning their use, can be used either for feeding animals or for human consumption (**headings 19.01** and **21.06**, in particular).
 - (d) Vegetable waste, residues and by-products of **heading 23.08**.
 - (e) Vitamins, whether or not chemically defined or intermixed, whether or not put up in any solvent or stabilised by the addition of antioxidants or anticaking agents, by adsorption on a substrate or by applying a protective coating of, for example, gelatin, waxes, fats, etc., **provided that** the quantity of such additives, substrate or coating does not exceed that required for preservation or transport and provided that such additives, substrates or coating do not alter the character of the vitamins and do not render them particularly suitable for specific use rather than for general use (**heading 29.36**).
 - (f) Other products of **Chapter 29**.
 - (g) Medicaments of **heading 30.03** or **30.04**.
 - (h) Protein substances of **Chapter 35**.
 - (ij) Preparations in the nature of antimicrobial disinfectants used in the manufacture of animal feeds to control undesirable micro-organisms (**heading 38.08**).
 - (k) Intermediate products of the antibiotics manufacturing process obtained by filtering and first-stage extraction and the residues of this process, with an antibiotic content generally not exceeding 70 % (**heading 38.24**).
-

Chapter 24

Tobacco and manufactured tobacco substitutes

Note.

- 1.- This Chapter does not cover medicinal cigarettes (Chapter 30).

GENERAL

Tobacco is obtained from various cultivated varieties of the genus *Nicotiana* of the *Solanaceae* family. The size and shape of the leaves differ from one variety to another.

The harvesting method and curing process depend on the variety (type) of tobacco. The plant may be cut whole, at average maturity (stalk cutting), or the leaves may be picked separately, according to their state of maturity (priming). Thus, tobacco may be cured either as whole plants (on the stalk) or as separate leaves.

The various methods of curing are sun curing (in the open air), air curing (in closed sheds with free circulation of air), flue curing (in hot air flues), or fire curing (with open fires).

Before packing for shipment, the dried leaves are treated in order to ensure their preservation. This may be done by controlled natural fermentation (Java, Sumatra, Havana, Brazil, Orient, etc.) or by artificial re-drying. This treatment, and the curing, affect the flavour and aroma of tobacco, which undergoes spontaneous ageing after packing.

Tobacco so treated is packed in bundles, bales (of various shapes), in hogsheads or in crates. When so packed, the leaves are either aligned (Orient) or tied in hands (several leaves tied together with a band or with another tobacco leaf), or simply left as loose leaves. They are always tightly compressed in order to ensure preservation.

In some cases, in addition to (or instead of) fermentation, flavouring or moistening substances are added (casing) in order to improve the aroma or keeping qualities.

This Chapter covers not only unmanufactured and manufactured tobacco but also manufactured tobacco substitutes which do not contain tobacco.

Subheading Note.

- 1.- For the purposes of subheading 2403.11, the expression "water pipe tobacco" means tobacco intended for smoking in a water pipe and which consists of a mixture of tobacco and glycerol, whether or not containing aromatic oils and extracts, molasses or sugar, and whether or not flavoured with fruit. However, tobacco-free products intended for smoking in a water pipe are excluded from this subheading.

24.01 - Unmanufactured tobacco; tobacco refuse.

2401.10 - Tobacco, not stemmed/stripped

2401.20 - Tobacco, partly or wholly stemmed/stripped

2401.30 - Tobacco refuse

This heading covers :

- (1) **Unmanufactured tobacco** in the form of whole plants or leaves in the natural state or as cured or fermented leaves, whole or stemmed/stripped, trimmed or untrimmed, broken or cut (including pieces cut to shape, but **not** tobacco ready for smoking).

Tobacco leaves, blended, stemmed/stripped and “ cased ” (“ sauced ” or “ liquored ”) with a liquid of appropriate composition mainly in order to prevent mould and drying and also to preserve the flavour are also covered in this heading.

- (2) **Tobacco refuse**, e.g., waste resulting from the manipulation of tobacco leaves, or from the manufacture of tobacco products (stalks, stems, midribs, trimmings, dust, etc.).

24.02 - Cigars, cheroots, cigarillos and cigarettes, of tobacco or of tobacco substitutes.

2402.10 - Cigars, cheroots and cigarillos, containing tobacco

2402.20 - Cigarettes containing tobacco

2402.90 - Other

This heading is restricted to cigars (wrapped or not), cheroots, cigarillos and cigarettes, made of tobacco or of tobacco substitutes. Other smoking tobacco, whether or not containing tobacco substitutes in any proportion, is **excluded (heading 24.03)**.

This heading covers :

(1) **Cigars, cheroots and cigarillos, containing tobacco.**

Such products may be made wholly of tobacco or of mixtures of tobacco and tobacco substitutes, regardless of the proportions of tobacco and tobacco substitutes present in the mixture.

(2) **Cigarettes containing tobacco.**

Apart from cigarettes containing only tobacco, this heading also includes those made from mixtures of tobacco and tobacco substitutes, regardless of the proportions of tobacco and tobacco substitutes in the mixture.

(3) **Cigars, cheroots, cigarillos and cigarettes of tobacco substitutes**, for example, “cigarettes” (“smokes”) made from specially processed leaves of a variety of lettuce, containing neither tobacco nor nicotine.

The heading **does not cover** medicinal cigarettes (**Chapter 30**). However, cigarettes containing certain types of products specifically formulated to discourage the habit of smoking but which do not possess medicinal properties remain classified in this heading.

24.03 - Other manufactured tobacco and manufactured tobacco substitutes; "homogenised" or "reconstituted" tobacco; tobacco extracts and essences (+).

- Smoking tobacco, whether or not containing tobacco substitutes in any proportion:

2403.11 - Water pipe tobacco specified in Subheading Note 1 to this Chapter

2403.19 -- Other

- Other :

2403.91 -- "Homogenised" or "reconstituted" tobacco

2403.99 - - Other

This heading covers :

- (1) **Smoking tobacco, whether or not containing tobacco substitutes in any proportion**, for example, manufactured tobacco for use in pipes or for making cigarettes.
 - (2) **Chewing tobacco**, usually highly fermented and liquored.
 - (3) **Snuff**, more or less flavoured.
 - (4) **Tobacco compressed or liquored for making snuff**.
 - (5) **Manufactured tobacco substitutes**, for example, smoking mixtures not containing tobacco. However, products such as cannabis are **excluded (heading 12.11)**.
 - (6) “**Homogenised**” or “**reconstituted**” **tobacco** made by agglomerating finely divided tobacco from tobacco leaves, tobacco refuse or dust, whether or not on a backing (e.g., sheet of cellulose from tobacco stems), generally put up in the form of rectangular sheets or strip. It can be either used in the sheet form (as a wrapper) or shredded/chopped (as a filler).
 - (7) **Tobacco extracts and essences**. These are liquids extracted from moist leaves by pressure, or prepared by boiling waste tobacco in water. They are used mainly for the manufacture of insecticides and parasiticides.

The heading **does not cover**:

- (a) Nicotine (the alkaloid extracted from tobacco) (**heading 29.39**).
 - (b) Insecticides of **heading 38.08**.

Three small circles are arranged in a triangular pattern: one at the top center and two at the bottom corners.

Subheading Explanatory Note.

Subheading 2403.11

This subheading covers, *inter alia*, products consisting of a mixture of tobacco, molasses or sugar, flavoured with fruit, glycerol, aromatic oils and extracts (e.g., "Meassel" or "Massel"). It also covers products not containing molasses or sugar (e.g., "Tumbak" or "Ajami"). However, the subheading **excludes** tobacco-free products for water pipes (e.g., "Jurak") (**subheading 2403.99**).

A water pipe is also known by other names such as "narguile", "argila", "boury", "gouza", "hookah", "shisha" or "hubble-bubble".

Section V

MINERAL PRODUCTS

Chapter 25

Salt; sulphur; earths and stone; plastering materials, lime and cement

Notes.

- 1.- Except where their context or Note 4 to this Chapter otherwise requires, the headings of this Chapter cover only products which are in the crude state or which have been washed (even with chemical substances eliminating the impurities without changing the structure of the product), crushed, ground, powdered, levigated, sifted, screened, concentrated by flotation, magnetic separation or other mechanical or physical processes (except crystallisation), but not products which have been roasted, calcined, obtained by mixing or subjected to processing beyond that mentioned in each heading.

The products of this Chapter may contain an added anti-dusting agent, provided that such addition does not render the product particularly suitable for specific use rather than for general use.

- 2.- This Chapter does not cover :

- (a) Sublimed sulphur, precipitated sulphur or colloidal sulphur (heading 28.02);
 - (b) Earth colours containing 70 % or more by weight of combined iron evaluated as Fe₂O₃ (heading 28.21);
 - (c) Medicaments or other products of Chapter 30;
 - (d) Perfumery, cosmetic or toilet preparations (Chapter 33);
 - (e) Setts, curbstones or flagstones (heading 68.01); mosaic cubes or the like (heading 68.02); roofing, facing or damp course slates (heading 68.03);
 - (f) Precious or semi-precious stones (heading 71.02 or 71.03);
 - (g) Cultured crystals (other than optical elements) weighing not less than 2.5 g each, of sodium chloride or of magnesium oxide, of heading 38.24; optical elements of sodium chloride or of magnesium oxide (heading 90.01);
 - (h) Billiard chalks (heading 95.04); or
 - (ij) Writing or drawing chalks or tailors' chalks (heading 96.09).
- 3.- Any products classifiable in heading 25.17 and any other heading of the Chapter are to be classified in heading 25.17.
 - 4.- Heading 25.30 applies, *inter alia*, to : vermiculite, perlite and chlorites, unexpanded; earth colours, whether or not calcined or mixed together; natural micaceous iron oxides; meerschaum (whether or not in polished pieces); amber; agglomerated meerschaum and agglomerated amber, in plates, rods, sticks or similar forms, not worked after moulding; jet; strontianite (whether or not calcined), other than strontium oxide; broken pieces of pottery, brick or concrete.

GENERAL

As provided in Note 1, this Chapter covers, except where the context otherwise requires, mineral products **only** in the crude state or washed (including washing with chemical substances to eliminate impurities provided that the structure of the product itself is not changed), crushed, ground, powdered, levigated, sifted, screened or concentrated by flotation, magnetic separation or other mechanical or physical processes (not including crystallisation). The products of this Chapter may also be heated to remove moisture or impurities or for other purposes, provided that the heat treatment does not modify their chemical or crystalline structures. However, other heat treatments (e.g., roasting, fusion or calcination) are not allowed, unless specifically permitted by the heading text. Thus, for example, heat treatment which could entail a change in chemical or crystalline structure is allowed for products of headings 25.13 and 25.17, because the texts of these headings explicitly refer to heat treatment.

The products of this Chapter may contain an added anti-dusting agent, provided that such addition does not render the product particularly suitable for specific use rather than for general use. Minerals which have been **otherwise** processed (e.g., purified by re-crystallisation, obtained by mixing minerals falling in the same or different headings of this Chapter, made up into articles by shaping, carving, etc.) **generally fall in later Chapters** (for example, **Chapter 28 or 68**).

In certain cases, however, the headings :

- (1) Refer to goods which by their nature must have been subjected to a process not provided for by Note 1 to this Chapter. Examples include pure sodium chloride (heading 25.01), certain forms of refined sulphur (heading 25.03), chamotte earth (heading 25.08), plasters (heading 25.20), quicklime (heading 25.22) and hydraulic cements (heading 25.23).
- (2) Specify conditions or processes which are admissible in those cases in addition to those allowed generally under Note 1 to this Chapter. For example, witherite (heading 25.11), siliceous fossil meals and similar siliceous earths (heading 25.12) and dolomite (heading 25.18) may be calcined; magnesite and magnesia (heading 25.19) may be fused or calcined (dead-burned (sintered) or caustic-burned). In the case of dead-burned (sintered) magnesia, other oxides (e.g., iron oxide, chromium oxide) may have been added to facilitate sintering. Similarly the materials of headings 25.06, 25.14, 25.15, 25.16, 25.18 and 25.26 may be roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape.

When products are classifiable in heading 25.17 and any other heading of this Chapter, they are to be classified in heading 25.17.

The Chapter **excludes** precious or semi-precious stones of **Chapter 71**.

25.01 - Salt (including table salt and denatured salt) and pure sodium chloride, whether or not in aqueous solution or containing added anti-caking or free-flowing agents; sea water.

This heading relates to sodium chloride, commonly known as salt. Salt is used for culinary purposes (cooking salt, table salt), but it also has many other uses and, if necessary, may be denatured to render it unfit for human consumption.

The heading includes :

(A) Salt which is extracted from underground :

- either by conventional mining (rock salt),
- or by solution mining (water is injected under pressure into a layer of salt and returns to the surface as saturated brine).

(B) Evaporated salt :

- solar salt (sea salt) is obtained by evaporation of sea water by the sun;
- refined salt is obtained by evaporation of saturated brine.

(C) Sea water, brine and other saline solutions.

The heading also covers :

- (1) Salt (e.g., table salt) which has been slightly iodised, phosphated, etc., or treated so that it will remain dry.
- (2) Salt to which anti-caking agents or free-flowing agents have been added.
- (3) Salt which has been denatured by any process.
- (4) Residuary sodium chloride, in particular that left after chemical processing (e.g., electrolysis) or obtained as a by-product of the treatment of certain ores.

This heading **does not include** :

- (a) Salted condiments such as celery salt (**heading 21.03**).
- (b) Sodium chloride solutions, including sea water, put up in ampoules, and sodium chloride otherwise put up as medicaments (**Chapter 30**), and sodium chloride solutions put up for hygiene use in packings for retail sale, other than medical or pharmaceutical, whether or not sterile (**heading 33.07**).
- (c) Cultured sodium chloride crystals weighing not less than 2.5 g each (other than optical elements) (**heading 38.24**).
- (d) Optical elements of sodium chloride (**heading 90.01**).

25.02 - Unroasted iron pyrites.

This heading relates to all unroasted iron pyrites, including unroasted cupreous iron pyrites.

Pyrites are mainly composed of iron sulphide; they are grey or yellowish, with a metallic lustre when stripped of their gangue. In powder form, they are usually greyish.

Unroasted pyrites are mainly used for the extraction of sulphur, although certain cupreous pyrites may also serve for the recovery of copper, as a by-product.

The heading **excludes** all roasted pyrites (**heading 26.01**).

It also **excludes** :

- (a) Chalcopyrite (mixed copper-iron sulphides) (**heading 26.03**).
- (b) Marcasite (semi-precious stone) (**heading 71.03**).

25.03 - Sulphur of all kinds, other than sublimed sulphur, precipitated sulphur and colloidal sulphur.

The heading includes :

- (1) Crude mineral sulphur occurring in the free state, whether or not concentrated by mechanical processes to remove part of the rocky matter.
- (2) Unrefined sulphur extracted from mineral sulphur by melting. This process may be carried out in sulphur kilns (calcaroni), furnaces (Gill furnaces), etc., or may be effected in the deposit itself by forcing superheated steam through pipes sunk in a bore hole (Frasch process).
- (3) Unrefined sulphur obtained by the roasting of pyrites or by the treatment of other sulphur minerals.
- (4) Unrefined sulphurs recovered as by-products in the purification of coal gas, by the scrubbing of sulphurous furnace gases, from sour natural gas and from the refining of sour crude mineral oils, etc. These recovered sulphurs, sometimes referred to as "purified sulphur" or "precipitated sulphur", must not be confused with the precipitated sulphur defined in the Explanatory Note to **heading 28.02**.

The unrefined sulphurs in the last three paragraphs are sometimes fairly pure. This is especially true of the sulphur produced by the Frasch process which contains such small proportions of impurities that it is practically never refined; it is usually presented in rough lumps or as dust.

- (5) Refined sulphur, obtained by rapidly distilling crude sulphur and condensing it in the liquid state; sulphur thus obtained can then be moulded into sticks or cakes, or crushed after solidification.
- (6) Triturated sulphur, which is sulphur (impure or refined) in the form of a finely divided powder obtained by grinding and then sieving, either mechanically or by gas suction. These products are known as "sieved sulphur", "winnowed sulphur", "atomised sulphur", etc., according to the process employed and the fineness of the particles.
- (7) Sulphur, obtained by the sudden cooling of sulphur vapours without passing through the liquid phase, which is insoluble, particularly in carbon disulphide (sulphur μ).

The various types of sulphur classified in this heading are used in the chemical industry (preparation of numerous sulphur compounds, sulphur dyestuffs, etc.) for vulcanising rubber, as a fungicide in viticulture, in the manufacture of matches and sulphur wicks and for the preparation of sulphur dioxide in the bleaching industries, etc.

The heading **excludes** sublimed sulphur, precipitated sulphur and colloidal sulphur (**heading 28.02**). Sulphur put up in forms or packings for retail sale as fungicides, etc., falls in **heading 38.08**.

25.04 - Natural graphite.

2504.10 - In powder or in flakes

2504.90 - Other

Natural graphite (otherwise known as plumbago or black lead) is a variety of carbon distinguished by its lustre and its property of marking paper (for which reason it is used as pencil lead). Its apparent specific gravity varies, according to its degree of purity, between 1.9 and 2.26; the carbon content of the purest grades ranges from 90 to 96 %, while the cheaper grades contain only 40 to 80 %.

Natural graphite remains in this heading when it has been heat treated merely to remove impurities.

Apart from its use in pencils, natural graphite is also used as a polish, for the manufacture of crucibles and other refractory articles, furnace electrodes and other electric parts.

The heading **excludes** artificial graphite (which closely resembles natural graphite but has a higher degree of purity and lower specific gravity), colloidal or semi-colloidal graphite and preparations based on graphite in the form of pastes, blocks, plates and other semi-manufactures (**heading 38.01**). It also excludes articles of natural graphite (usually **heading 68.15, 69.02, 69.03 or 85.45**).

25.05 - Natural sands of all kinds, whether or not coloured, other than metal-bearing sands of chapter 26.

2505.10 - Silica sands and quartz sands

2505.90 - Other

With the **exception** of metal-bearing sands from which metals are commercially extractable (**Chapter 26**), this heading covers all natural sea, lake, river or quarry sand (i.e., sand in the form of more or less fine particles resulting from the natural disintegration of minerals), but **excludes** sands and powders obtained artificially, for example, by crushing (classified in **heading 25.17** or in the heading for the rock concerned).

The heading covers, *inter alia* :

- (1) Silica sands and quartz sands, used in building, in the glass industry, for cleaning metals, etc.
- (2) Clayey sands including kaolinic sands, used mainly for preparing foundry moulds and refractory products.
- (3) Feldspathic sands, used in the ceramic industry.

Natural sands remain in this heading when they have been heat treated merely to remove impurities.

On the other hand, this heading **does not include** gold-bearing or platinum-bearing sands, zircon sands, rutile sands and ilmenite sands, nor monazite sands (monazites) which are classified as thorium ores; all these fall in **Chapter 26**. Nor **does** the heading **cover** tar sands or “asphaltic sands” (**heading 27.14**).

25.06 - Quartz (other than natural sands); quartzite, whether or not roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape.

2506.10 - Quartz

2506.20 - Quartzite

Quartz is the naturally occurring crystal form of silica.

It falls in this heading **only** if complying with both of the following two conditions :

- (a) It must be in the crude state or have not undergone any process beyond that allowed in Note 1 to this Chapter; for this purpose, heat treatment designed solely to facilitate crushing is regarded as a process permitted by Chapter Note 1.
- (b) It must **not** be of a variety and quality suitable for the manufacture of gem-stones (e.g., rock crystal and smoky quartz, amethyst and rose quartz). Such quartz is **excluded (heading 71.03)**, even if intended to be used for technical purposes, e.g., as piezo-electric quartz or for the manufacture of parts of tools.

Quartzite is the name of very hard compact rock composed of grains of quartz agglomerated by a siliceous binder.

Quartzite falls in this heading when in the crude state or when it has not undergone any process beyond that allowed by Note 1 to this Chapter or when it has been roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape. It is to be noted, however, that quartzite in shapes identifiable as road or paving setts, flagstones or curbstones is **excluded (heading 68.01)**, even if merely shaped or processed as specified in the heading text.

The heading also **excludes** :

- (a) Natural quartz sand (**heading 25.05**).
- (b) Flint or other products of **heading 25.17**.
- (c) Optical elements of quartz (**heading 90.01**).

25.07 - Kaolin and other kaolinic clays, whether or not calcined.

This heading covers kaolin and other kaolinic clays, the main constituents of which are kaolin minerals such as kaolinite, dickite and nacrite, anauxite, and halloysite. Such clays remain in the heading even when calcined.

Kaolin, also known as China clay, is a high grade, white or nearly white clay used in the porcelain and paper-making industries. Kaolin-bearing sands are **excluded (heading 25.05)**.

25.08 - Other clays (not including expanded clays of heading 68.06), andalusite, kyanite and sillimanite, whether or not calcined; mullite; chamotte or dinas earths (+).

- 2508.10 - Bentonite
- 2508.30 - Fire-clay
- 2508.40 - Other clays
- 2508.50 - Andalusite, kyanite and sillimanite
- 2508.60 - Mullite
- 2508.70 - Chamotte or dinas earths

This heading covers all natural clayey substances (**other than** kaolin and other kaolinic clays of **heading 25.07**) consisting of earths or rocks of sedimentary origin with a basis of aluminium silicates. The characteristic properties of these products are plasticity, the faculty of hardening when fired and resistance to heat. Because of these properties clays are used as raw materials in the ceramic industry (bricks, building tiles, porcelain, china, earthenware, refractory bricks and other refractory goods, etc.); common clay is also used for soil improvement.

These products remain in this heading even if they have been heated to remove some or most of the associated water (to produce absorbent clay) or when fully calcined.

In addition to common clays, the following special products also fall in the heading :

- (1) **Bentonite**, a clay derived from volcanic ash; largely used as an ingredient of moulding sand, as a filtering and decolouring agent in oil refining and for degreasing of textiles.
- (2) **Fuller's earth**, a natural earthy material with high absorptive power, composed chiefly of attapulgite. It is used for decolourising oils, for degreasing textiles, etc.
- (3) **Andalusite**, **kyanite** (or disthene) and **sillimanite**, natural anhydrous aluminium silicates used as refractories.
- (4) **Mullite**, obtained by heat treatment of sillimanite, kyanite or andalusite or by fusing a mixture of silica or clay and aluminium oxide in an electric furnace; used in the preparation of refractory products with great resistance to heat.
- (5) **Chamotte earth**, also called "fire-clay grog", obtained either by crushing fire-clay bricks or by crushing a calcined mixture of clay with other refractory materials.
- (6) **Dinas earth**, a refractory material which consists of quartzose earth containing clay or may be obtained by mixing clay with ground quartz or quartz sand.

This heading **does not include** :

- (a) Clays which are earth colours within the meaning of **heading 25.30**.
- (b) Activated clay (**heading 38.02**).
- (c) Special preparations for the manufacture of certain ceramic goods (**heading 38.24**).

- (d) Expanded clays (used in lightweight concrete aggregates or for heat insulation) even if obtained solely by calcining natural clays (**heading 68.06**).

◦◦◦

Subheading Explanatory Notes.

Subheading 2508.10

Subheading 2508.10 includes sodium bentonites (swelling bentonites) and calcium bentonites (non-swelling bentonites).

Subheading 2508.30

Subheading 2508.30 **does not cover** clays composed mainly of kaolin, some of which are “ fire-clays ”. Such clays are to be classified in **heading 25.07**.

25.09 - Chalk.

Chalk is a naturally occurring variety of calcium carbonate, composed predominantly of the shells of aquatic micro-organisms.

The heading **does not include** :

- (a) Phosphated chalk (**heading 25.10**).
- (b) Steatite or talc (sometimes known as “ French chalk ” or “ Venice chalk ”) (**heading 25.26**).
- (c) Powdered chalk prepared as a dentifrice (**heading 33.06**).
- (d) Metal polishes and similar preparations of **heading 34.05**.
- (e) Calcium carbonate in powder form, the particles of which are coated with a water-repellent film of fatty acids (e.g., stearic acid) (**heading 38.24**).
- (f) Billiard chalks (**heading 95.04**).
- (g) Writing or drawing chalks and tailor’s chalks (**heading 96.09**).

25.10 - Natural calcium phosphates, natural aluminium calcium phosphates and phosphatic chalk.

2510.10 - Unground

2510.20 - Ground

This heading covers **only** apatite and other natural calcium phosphates (tricalcium phosphates or phosphorites), natural aluminium calcium phosphates and phosphatic chalks (chalk naturally mixed with calcium phosphate).

These products remain in this heading even when ground for use as fertilisers or if they have been heat treated merely to remove impurities. But the heading **does not include** the products when they are calcined or further heat treated than for the removal of impurities (**heading 31.03 or 31.05**).

25.11 - Natural barium sulphate (barytes); natural barium carbonate (witherite), whether or not calcined, other than barium oxide of heading 28.16.

2511.10 - Natural barium sulphate (barytes)

2511.20 - Natural barium carbonate (witherite)

This heading covers **only** the naturally occurring barium sulphate (barytes - sometimes known as heavy spar) and barium carbonate (witherite). Refined or chemically produced barium sulphate and barium carbonate are **excluded** (**headings 28.33 and 28.36** respectively).

Calcined witherite, which consists largely of impure barium oxide, remains in this heading.

The heading **excludes** purified barium oxide (**heading 28.16**).

25.12 - Siliceous fossil meals (for example, kieselguhr, tripolite and diatomite) and similar siliceous earths, whether or not calcined, of an apparent specific gravity of 1 or less.

These materials are siliceous earths formed of small fossilised organisms (diatoms, etc.) and are very light. Their "apparent specific gravity", which must not exceed 1, is to be taken as their effective weight in kg/1,000 cm³, uncompressed, in the form in which they are presented.

The principal siliceous earths are kieselguhr, tripolite, diatomite and moler earth. Although certain earths classified here are sometimes referred to as "tripoli", they must not be confused with the true tripoli known as "rotten-stone", which, since it results from the natural decomposition of certain rocks, is not diatomaceous. This latter product, which is used as a mild abrasive for polishing, falls in **heading 25.13**.

The various earths of this heading are sometimes incorrectly called "infusorial earths".

Most of these earths are used for the manufacture of heat-resisting or heat- or sound-insulating articles of heading 68.06 or 69.01. Thus, sawn blocks of diatomite fall in **heading 68.06**, if they have not been fired; otherwise, they are classified in **heading 69.01**.

Some of the products of this heading are used as abrasive or polishing powders.

This heading **excludes** activated diatomite, e.g., diatomite calcined with sintering agents such as sodium chloride or sodium carbonate (**heading 38.02**). On the other hand, diatomite calcined (without the addition of other products) in order to eliminate impurities or washed for that purpose in acid, without altering the structure of the product, remains in this heading.

25.13 - Pumice stone; emery; natural corundum, natural garnet and other natural abrasives, whether or not heat-treated.

2513.10 - Pumice stone

2513.20 - Emery, natural corundum, natural garnet and other natural abrasives

Pumice stone is a very porous variety of volcanic rock, rough to the touch and extremely light in weight, usually whitish or grey, but sometimes brown or red. The heading also covers crushed pumice (bimskies).

Emery is a dense rock formed of small hard aluminium oxide crystals mixed with iron oxide and particles of mica. It is often presented in rock form for use as an abrasive powder after simple crushing. Crushed emery is a dirty brown powder interspersed with occasional glittering grains; a magnet attracts the particles of iron oxide.

Natural corundum is also composed largely of aluminium oxide but, unlike emery, it is often presented in bags, in the form of more or less fine grains. Ground or crushed corundum is mainly composed of small white granules with a few black or yellow particles. Natural corundum remains classified in this heading even if it has been heat treated.

Other natural abrasives include the tripoli known as “ rotten-stone ”, an ash grey product used as a mild abrasive or for polishing, and garnet (including dust and powder) **other than** that of **Chapter 71**. The natural abrasives of this paragraph remain classified in this heading even if they have been heat-treated; natural garnet, for example, is sometimes heat-treated after grading to improve its capillarity and hardness.

The heading **does not include** :

- (a) Abrasive materials referred to in **other headings of this Chapter**.
- (b) Precious or semi-precious stones (e.g., ruby, sapphire) of **heading 71.03**.
- (c) Artificial abrasives such as artificial corundum (**heading 28.18**), silicon carbide (**heading 28.49**) and synthetic precious or semi-precious stones (**heading 71.04**).
- (d) Dust and powder of natural or synthetic precious or semi-precious stones (**heading 71.05**).

25.14 - Slate, whether or not roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape.

Slate, which splits readily into thin sheets, is generally bluish-grey but sometimes black or tending towards purple.

The heading covers slate in the mass or roughly trimmed or merely cut, by sawing or otherwise (e.g., with a wire strand), into blocks or slabs of a rectangular (including square) shape. Slate powder and waste are also included in this heading.

On the other hand, this heading **does not cover** mosaic cubes of **heading 68.02**, or the following goods which are to be classified in **heading 68.03** :

- (a) Blocks, slabs and sheets further worked than described above, e.g., cut or sawn to shapes other than rectangular (including square), ground, polished, chamfered or otherwise worked.
- (b) Roofing, facing and damp course slates, even if shaped or processed as specified in the text of this heading.
- (c) Articles of agglomerated slate.

The heading also **excludes** slates and slate blackboards prepared for writing or drawing, whether framed or not (**heading 96.10**) and slate pencils (**heading 96.09**).

25.15 - Marble, travertine, ecaussine and other calcareous monumental or building stone of an apparent specific gravity of 2.5 or more, and alabaster, whether or not roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape (+).

- Marble and travertine :

2515.11 -- Crude or roughly trimmed

2515.12 -- Merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape

2515.20 - Ecaussine and other calcareous monumental or building stone; alabaster

Marble is a hard calcareous stone, homogeneous and fine-grained, often crystalline and either opaque or translucent. Marble is usually variously tinted by the presence of mineral oxides (coloured veined marble, onyx marble, etc.), but there are pure white varieties.

Travertines are varieties of calcareous stone containing layers of open cells.

Ecaussine is extracted from various quarries in Belgium and particularly at Ecaussines. It is a bluish-grey stone with an irregular crystalline structure and contains many fossilised shells. On fracture Ecaussine shows a granular surface similar to granite and is therefore sometimes known as " Belgian granite ", " Flanders granite " or " petit granit ".

The heading covers **other similar hard calcareous monumental or building stones, provided their apparent specific gravity is 2.5 or more** (i.e., effective weight in kg/1,000 cm³). Calcareous monumental or building stones of an apparent specific gravity of less than 2.5 are classified in **heading 25.16**.

The heading also includes both **gypseous alabaster**, which is usually white and uniformly translucent, and **calcareous alabaster**, normally yellowish and veined.

The heading is restricted to the stones specified, presented in the mass or roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape. In the form of granules, chippings or powder, they fall in **heading 25.17**.

Blocks, etc., which have been further worked, i.e., bossed, dressed with the pick, bushing hammer or chisel, etc., sand-dressed, ground, polished, chamfered, etc., are classified in **heading 68.02**. The same classification applies to blanks of articles.

The heading also **excludes** :

- (a) Serpentine or ophite (a magnesium silicate sometimes called marble) (**heading 25.16**).
- (b) Limestone (known as " lithographic stone " and used in the printing industry) (**heading 25.30** when in the crude state).
- (c) Stones identifiable as mosaic cubes or as paving flagstones, even if merely shaped or processed as specified in the text of this heading (**heading 68.02** or **68.01** respectively).

Subheading Explanatory Notes.

Subheading 2515.11

For the purposes of this subheading, "crude" refers to blocks or slabs which have been merely split along the natural cleavage planes of the stone. Their surfaces are often uneven or undulating and frequently bear marks of the tools used to separate them (crowbars, wedges, picks, etc.).

This subheading also covers unshaped stone (quarrystone, rubble) obtained by breaking out rocks from the quarry face (using picks, explosives, etc.). They have uneven, broken surfaces and irregular edges. This type of stone often bears the marks of quarrying (blast holes, wedge marks, etc.). Unshaped stone is used for the construction of dykes, breakwaters, road foundations, etc.

The subheading also includes waste of irregular shape arising from the actual extraction or from subsequent working (quarry stones, waste from sawing, etc.), but only if large enough to be used for cutting or construction. Otherwise it is classified in **heading 25.17**.

"Roughly-trimmed" stone is stone which has been very crudely worked after quarrying, to form blocks or slabs, still having some rough, uneven surfaces. This working involves removing superfluous protuberances by means of hammer or chisel-type tools.

This subheading **does not cover** blocks or slabs which have been cut to a rectangular (including square) shape.

Subheading 2515.12

To fall in this subheading, the blocks and slabs which have been merely cut by sawing must bear discernible traces of the sawing (by wire strand or other saws) on their surfaces. If care was taken with the sawing, these traces may be very slight. In such cases, it is useful to apply a sheet of thin paper to the stone and to rub it gently and evenly with a pencil held as flat as possible. This often reveals saw marks even on carefully sawn or very granular surfaces.

This subheading also covers blocks and slabs of a rectangular (including square) shape obtained otherwise than by sawing, e.g., by working with a hammer or chisel.

25.16 - Granite, porphyry, basalt, sandstone and other monumental or building stone, whether or not roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape (+).

- Granite :

2516.11 -- Crude or roughly trimmed

2516.12 -- Merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape

2516.20 - Sandstone

2516.90 - Other monumental or building stone

Granite is a very hard, granular igneous rock formed by the agglomeration of quartz crystals with feldspar and mica. It varies in colour (grey, green, pink, red, etc.) according to the relative proportions of these three substances and the presence of iron oxide or manganese oxide.

Porphyry is a finely grained, slightly translucent variety of granite.

Sandstone is a rock of sedimentary origin composed of small quartzose or siliceous particles naturally agglomerated by calcareous or siliceous materials.

Basalt is also an igneous rock, blackish, very compact and extremely hard.

The heading also includes other hard igneous rocks (e.g., syenite, gneiss, trachyte, lava, diabase, diorite, phonolite), as well as calcareous monumental or building stone **not falling** in heading 25.15 (including building limestone or Portland stone) and serpentine marble (or ophite) which, being a natural form of magnesium silicate, cannot be classified in heading 25.15.

The stones of this heading may be shaped or processed in the same ways as the stones of heading 25.15 (see the Explanatory Note to that heading). It should be noted that when broken up in the form of macadam these rocks are classified in **heading 25.17**, and that stones in shapes identifiable as road or paving setts, flagstones or curbstones are classified in **heading 68.01** even if merely shaped or processed as specified in the text of this heading.

Ecaussine, sometimes known as “*petit granit*”, “Belgian granite” or “Flanders granite”, falls in **heading 25.15**. Fused basalt is classified in **heading 68.15**.

When in the form of granules, chippings or powder, the stones of this heading fall in **heading 25.17**.

○
○ ○

Subheading Explanatory Notes.

Subheadings 2516.11

See the Explanatory Note to subheading 2515.11.

Subheadings 2516.12

See the Explanatory Note to subheading 2515.12.

25.17 - Pebbles, gravel, broken or crushed stone, of a kind commonly used for concrete aggregates, for road metalling or for railway or other ballast, shingle and flint, whether or not heat-treated; macadam of slag, dross or similar industrial waste, whether or not incorporating the materials cited in the first part of the heading; tarred macadam; granules, chippings and powder, of stones of heading 25.15 or 25.16, whether or not heat-treated.

2517.10 - Pebbles, gravel, broken or crushed stone, of a kind commonly used for concrete aggregates, for road metalling or for railway or other ballast, shingle and flint, whether or not heat-treated

2517.20 - Macadam of slag, dross or similar industrial waste, whether or not incorporating the materials cited in subheading 2517.10

2517.30 - Tarred macadam

- Granules, chippings and powder, of stones of heading 25.15 or 25.16, whether or not heat-treated:

2517.41 -- Of marble

2517.49 -- Other

This heading covers pebbles, gravel and broken or crushed stone (including mixtures of different kinds of stone), of a kind commonly used for concrete aggregates, for road metalling or for railway track or other ballast. Segregated materials of construction and demolition waste consisting essentially of broken pieces of stone which are used for the same purposes, either as such or after crushing, also fall in this heading.

The heading also includes shingle and flint. Round modules of flint are used in ball mills for crushing lime, cement, etc. Flint is, however, mainly used, after crushing, in the ceramic industry or as an abrasive material. Other shingle is used in ball mills (e.g., for grinding lime, cement, etc.) or for road metalling.

It should be noted that the heading **does not cover** flint in cut blocks, or stones which have been manufactured by artificial rounding into pebbles for use in ball mills. These fall in **heading 68.02**.

The heading also covers macadam and tarred macadam.

Macadam is composed of roughly graded crushed stones, pebbles, slag, dross or similar industrial waste, or intermixtures of these materials. When mixed with tar, bitumen, etc., it is known as tarred macadam.

Products specially prepared (e.g., by fusion of a mixture of minerals) e.g., for addition to road surfacing materials, to improve hardness, anti-skid properties, visibility, etc., are **excluded** from this heading (generally **heading 38.24**).

The heading also includes granules, chippings and powder of stones of heading 25.15 or 25.16; when artificially coloured (e.g., for shop window displays), such chippings and granules are, however, classified in **heading 68.02**.

The following products remain classified in this heading even when they have been heat treated :

- (1) Pebbles, gravel and broken or crushed stone.
- (2) Shingle and flint.
- (3) Granules, chippings and powder of stones of heading 25.15 or 25.16.

In accordance with Note 3 to this Chapter, any products classifiable in this heading and any other heading of the Chapter are to be classified in this heading.

25.18 - Dolomite, whether or not calcined or sintered, including dolomite roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape; dolomite ramming mix.

2518.10 - Dolomite not calcined or sintered

2518.20 - Calcined or sintered dolomite

2518.30 - Dolomite ramming mix

Dolomite is a natural double carbonate of calcium and magnesium.

The heading covers crude dolomite as well as calcined and sintered dolomite. Dolomite is calcined at a temperature range of 700 °C - 1000 °C to convert it into magnesium and calcium oxides by releasing carbon dioxide. On the other hand, sintered dolomite is obtained by heating dolomite to a temperature range of 1700 °C - 1900 °C when it becomes a refractory material. The heading also includes dolomite which has been roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape.

This heading further includes dolomite ramming mixes which are used as refractory materials (e.g., for furnace lining). These products are traded in powder or granular form consisting predominantly of crushed sintered dolomite. Depending on the field of application or temperature at which the mix will be used, different non-hydraulic binding agents (e.g., tar, pitch, resins) are used.

However, the heading **does not cover** crushed dolomite for concrete aggregates, road metalling or railway ballast (**heading 25.17**).

25.19 - Natural magnesium carbonate (magnesite); fused magnesia; dead-burned (sintered) magnesia, whether or not containing small quantities of other oxides added before sintering; other magnesium oxide, whether or not pure.

2519.10 - Natural magnesium carbonate (magnesite)

2519.90 - Other

This heading covers magnesite (or gibertite) which is a naturally occurring magnesium carbonate with impurities in various proportions.

The heading also covers various types of magnesia (magnesium oxide) obtained from natural magnesium carbonate, basic magnesium carbonate, magnesium hydroxide precipitated from sea water, etc. The main types are :

- (1) **Fused magnesia**, obtained by fusion. It is usually colourless but may be slightly yellowish or greenish. It is less soluble than other types of magnesia and is used, for example, in the manufacture of crucibles or heating elements for electric ovens.
- (2) **Dead-burned (sintered) magnesia**, obtained by high temperature (about 1400-1800 °C) calcination. Sintered magnesia may contain small quantities of other oxides (e.g., iron oxide or chromium oxide), added before sintering in order to lower the sintering temperature. It is used in the manufacture of refractory bricks.
- (3) **Caustic-burned magnesia**, usually obtained from magnesite by relatively low temperature (lower than 900 °C) calcination. It is more chemically reactive than fused or sintered magnesia and is used, for example, in the production of magnesium compounds, decolouring agents or oxychloride cement.

Light and **heavy** magnesium oxides are usually obtained by calcination of pure precipitated magnesium hydroxide or basic carbonate at temperatures from 600 °C to 900 °C. These magnesium oxides are practically insoluble in water but are readily soluble in dilute acids and are more chemically reactive than other types of magnesia (i.e., sintered magnesia and fused magnesia). They are used in the manufacture of medicaments, cosmetics, etc.

The heading **does not cover** :

- (a) Hydrated basic magnesium carbonate, sometimes known as “pharmacist’s white magnesia” (**heading 28.36**).
- (b) Cultured crystals (**other than** optical elements), of magnesium oxide, weighing not less than 2.5 g each (**heading 38.24**); optical elements of magnesium oxide (**heading 90.01**).

25.20 - Gypsum; anhydrite; plasters (consisting of calcined gypsum or calcium sulphate) whether or not coloured, with or without small quantities of accelerators or retarders.

2520.10 - Gypsum; anhydrite

2520.20 - Plasters

Gypsum is a natural hydrated calcium sulphate generally white and friable.

Anhydrite is a natural anhydrous calcium sulphate used in the manufacture of sulphuric acid or of certain types of plaster.

Plasters consist of gypsum partly or completely dehydrated by calcination.

The characteristic of gypsum is that, when calcined, it loses part of its water thus forming plasters which on being mixed with water set hard. In order that the plasters should not set too quickly small quantities of retarders are often added to the calcined gypsum. For special purposes gypsum is calcined until all its water is lost, and a small quantity of an accelerator such as alum is added (Keene's cement or English cement). Similar plasters are made by adding alum to natural anhydrite. All these prepared plasters remain in this heading.

This heading also covers :

- (1) Plaster reduced to a floury consistency for use in dressing woven fabrics or surfacing paper.
- (2) Plaster containing added colouring matter.
- (3) Plaster which has been specially calcined or finely ground for use in dentistry, whether or not containing small quantities of accelerators or retarders. This heading does not include preparations for use in dentistry with a basis of plaster (**heading 34.07**).

25.21 - Limestone flux; limestone and other calcareous stone, of a kind used for the manufacture of lime or cement.

This heading covers limestone flux and limestone and other calcareous rocks commonly used for the manufacture of lime or cement, **not being** building or monumental stone (**heading 25.15** or **25.16**). Dolomite falls in **heading 25.18** and chalk in **heading 25.09**.

Limestone flux is chiefly employed as a flux in the iron and steel industry.

The heading also includes these materials when presented in powder form for soil improvement. However, it **does not cover** crushed or broken stone for use as concrete aggregates, road metalling or railway ballast (**heading 25.17**).

25.22 - Quicklime, slaked lime and hydraulic lime, other than calcium oxide and hydroxide of heading 28.25.

2522.10 - Quicklime

2522.20 - Slaked lime

2522.30 - Hydraulic lime

Quicklime (an impure calcium oxide) is obtained by calcining limestone containing very little or no clay. It combines very rapidly with water, giving off considerable heat and producing slaked lime (calcium hydroxide). **Slaked lime** is usually employed for soil improvement or in the sugar industry.

Hydraulic lime is obtained by low temperature calcination of limestone containing sufficient clay (although usually less than 20 %) to ensure that the product sets under water. Hydraulic lime differs from natural cement in that it still contains appreciable amounts of uncombined quicklime, which may be slaked with water.

The heading **excludes** purified calcium oxide and calcium hydroxide (**heading 28.25**).

25.23 - Portland cement, aluminous cement, slag cement, supersulphate cement and similar hydraulic cements, whether or not coloured or in the form of clinkers (+).

2523.10 - Cement clinkers

- Portland cement :

2523.21 -- White cement, whether or not artificially coloured

2523.29 -- Other

2523.30 - Aluminous cement

2523.90 - Other hydraulic cements

Portland cement is obtained by firing limestone containing in its natural state, or mixed artificially with, a suitable proportion of clay. Other materials such as silica, alumina or iron bearing substances may also be added. As a result of the firing process, semi-finished products known as **clinkers** are obtained. These clinkers are subsequently ground to produce Portland cement, which may incorporate additives and accelerators to modify its hydraulic properties. The principal types of Portland cement are normal Portland cement, moderate Portland cement and white Portland cement.

The heading also covers aluminous cement, slag cement, supersulphate cement (ground blast furnace slag mixed with an accelerator and calcined gypsum), pozzolana cement, Roman cement, etc., and mixtures of the above-mentioned cements.

The cements of this heading may be coloured.

This heading **does not include** certain products sometimes known under the name of cement, such as, Keene's cement or English cement (alumated plaster gypsum) (**heading 25.20**), and pozzolana earth, santorin earth and similar substances, sometimes called natural cements (**heading 25.30**).

The heading also **excludes** :

- (a) Finely ground blast furnace slag which requires the addition of a small quantity of accelerator at the time of making up (**heading 26.19**); the ground slag mixed with an accelerator, ready for use, **does**, however, fall in this heading.
- (b) Dental cements and bone reconstruction cements (**heading 30.06**).
- (c) Cements of **heading 32.14**.
- (d) Refractory cements and mortars, based on chamotte or dinas earths, etc. (**heading 38.16**).
- (e) Non-refractory mortars and concretes (**heading 38.24**).

Subheading Explanatory Note.

Subheadings 2523.21 and 2523.29

For the purposes of subheadings 2523.21 and 2523.29, "Portland cement" means cement obtained by grinding Portland clinker with the possible addition of a small quantity of calcium sulphate. It is to be noted :

- that Portland clinker is a product of subheading 2523.10 consisting mostly of calcium silicates which is obtained by heating to partial fusion a predetermined and homogeneous mixture of materials principally containing lime (CaO) and silica (SiO_2) with a smaller proportion of alumina (Al_2O_3) and iron oxide (Fe_2O_3) and;
- that the term "calcium sulphate" covers gypsum and its derivatives and anhydrite and other calcium sulphate products appropriate to the manufacture of cements.

25.24 - Asbestos.

2524.10 - Crocidolite

2524.90 - Other

Asbestos is a natural mineral substance produced by the decomposition of certain rocks. It has a very characteristic fibrous texture; it is sometimes silky in appearance and the colour varies greatly, being usually white, but sometimes grey, greenish, blue or dark brown. Its main property is its resistance to fire and acids.

Crocidolite is the asbestos form of riebeckite. It is found in the form of fibre bundles in magmatic rock which is acid with a high alkali content and also in metamorphic rock. It is dark blue to black or dark green and is translucent to partially opaque. Crocidolite asbestos, also known as blue asbestos, has a greater tensile strengths but a lower resistance to heat and less elastic fibres than other forms of asbestos and is acid resistant but not base resistant. It is considered the most dangerous form of asbestos.

The heading applies to crude asbestos in rock form, to raw, beaten or washed fibres, whether graded to length or not, to asbestos in flakes or powder and also to asbestos waste. The heading **excludes** fibre which has been further processed (carded, dyed, etc.) and finished articles of asbestos (**heading 68.12**).

25.25 - Mica, including splittings; mica waste.

2525.10 - Crude mica and mica rifted into sheets or splittings

2525.20 - Mica powder

2525.30 - Mica waste

Mica (muscovite, phlogopite, biotite, etc.) constitutes a group of natural complex aluminium silicates characterised by the fact that they are readily split into glistening, transparent, flexible sheets of varied colour.

The heading includes :

- (A) **Crude mica**, which consists of mica crystals, of irregular shape, size and thickness, covered with earth ("books").
- (B) **Mica sheets**, obtained by rifting cobbed and trimmed books. The sheets take the shape of irregular polygons, like the crystals from which they were obtained, and their edges are roughly trimmed and bevelled. Their thickness usually varies from 200 to 750 micrometres (microns).
- (C) **Mica splittings**, obtained by rifting sheet mica. Like the sheets from which they have been rifted, they have the shape of irregular polygons. Their edges are roughly trimmed.

They are marketed as :

- (1) Condenser film, usually of a thickness between 25 and 200 micrometres (microns), or
- (2) Splittings, usually of a thickness between 12 and 30 micrometres (microns), used solely for the manufacture of built-up mica (e.g., micanite).

The heading also includes mica waste and powder.

The heading **excludes** products obtained by cutting-out or die-stamping from mica sheets or splittings (**heading 68.14** or **Chapter 85**), and products made from bonded (built-up) splittings (e.g., micanite, micafolium) or from pulped (reconstituted) mica (**heading 68.14**).

Vermiculite, a mineral allied to mica, falls in **heading 25.30**, as do perlite and the chlorites (minerals chemically related to vermiculite).

25.26 - Natural steatite, whether or not roughly trimmed or merely cut, by sawing or otherwise, into blocks or slabs of a rectangular (including square) shape; talc.

2526.10 - Not crushed, not powdered

2526.20 - Crushed or powdered

Both natural steatite and talc are mineral substances rich in hydrous magnesium silicate. The former is more compact and massive than talc. Talc is foliated and softer and soapier to the touch.

Natural steatite of this heading may be shaped or processed in the same ways as the stones of heading 25.15 (see the Explanatory Note to that heading) and may be submitted to the processes allowed by Note 1 to this Chapter. Soapstone is a variety of natural steatite.

Talc of this heading may be submitted to the processes allowed by Note 1 to this Chapter. The more commonly met forms of talc are crude or powdered.

The term "French chalk" is used to designate certain varieties of steatite or talc in powder form.

The heading **excludes** "tailor's chalks" which are composed of steatite (**heading 96.09**).

[25.27]

25.28 - Natural borates and concentrates thereof (whether or not calcined), but not including borates separated from natural brine; natural boric acid containing not more than 85 % of H₃BO₃ calculated on the dry weight.

This heading covers **only** natural borate minerals as extracted, concentrates (whether or not calcined) of such materials, and natural boric acid as obtained by evaporation of the water left after the condensation of the natural vapours escaping from the earth in certain regions (the Italian soffioni), or by evaporating water drawn from underground sources in those regions. However, the heading **excludes** boric acid containing more than 85 % of H₃BO₃ calculated on the dry weight (**heading 28.10**).

The natural borates classified here include :

- (1) **Kernite** or **tincal**, sodium borates also known as “ natural borax ”.
- (2) **Pandermite** and **priceite**, calcium borates.
- (3) **Boracite**, magnesium chloroborate.

The heading **excludes** the sodium borate (refined borax) obtained by chemical treatment of kernite or tincal and the sodium borates obtained by evaporating complex brines from certain salt lakes (**heading 28.40**).

25.29 - Feldspar; leucite; nepheline and nepheline syenite; fluorspar.

2529.10 - Feldspar

- Fluorspar :

2529.21 -- Containing by weight 97 % or less of calcium fluoride

2529.22 -- Containing by weight more than 97 % of calcium fluoride

2529.30 - Leucite; nepheline and nepheline syenite

Feldspar, leucite, nepheline and **nepheline syenite** are composed of complex silicates of aluminium and alkali or alkaline-earth metals. They are used as fluxes in the ceramic industry. The heading **excludes** feldspathic sands (**heading 25.05**).

Fluorspar (or fluorite) is natural calcium fluoride occurring as solid masses streaked with varied colours or in agglomerated crystals of various colours; it is principally used in the manufacture of hydrofluoric acid and as a flux for metallurgical purposes.

The heading also covers fluorspar obtained from the mineral by a heat treatment which causes the product to break up into its constituent particles; as these differ in size, simple screening then permits removal of part of the silica content.

The heading **excludes** feldspar or fluorspar in the form of precious or semi-precious stones (**Chapter 71**).

25.30 - Mineral substances not elsewhere specified or included.

- 2530.10 - Vermiculite, perlite and chlorites, unexpanded
- 2530.20 - Kieserite, epsomite (natural magnesium sulphates)
- 2530.90 - Other

**(A) EARTH COLOURS, WHETHER OR NOT CALCINED
OR MIXED TOGETHER; NATURAL MICACEOUS IRON OXIDES**

The colours classified here are usually naturally occurring clays mixed with white or coloured mineral substances, particularly iron oxide; because of their colouring properties, they are generally used as pigments.

They include :

- (1) **Ochres** (yellow, brown, red, Spanish red, etc.).
- (2) **Siennas** (Italian sienna, yellow-brown; and burnt sienna, orange-brown, etc.).
- (3) **Umbers** (including burnt umber), which are brown or dark brown.
- (4) **Black earths** and **natural vandyke brown** (Cassel and Cologne earths). **Soluble** vandyke brown is a prepared pigment which falls in **heading 32.06**.
- (5) **Verona earth** and **Cyprus earth** (green).

Calcination or the mixing together of various earth colours does not affect their classification. However, when mixed with other substances or presented as dispersions in water, oil, etc., they fall in **Chapter 32**.

The heading **excludes** iron ores (**heading 26.01**) and earth colours containing 70 % or more by weight of combined iron evaluated as Fe_2O_3 (**heading 28.21**).

However, **micaceous iron oxides**, used mainly as anti-rust pigments are classified in this heading although they naturally contain more than 70 % by weight of combined iron.

**(B) MEERSCHAUM (WHETHER OR NOT IN POLISHED PIECES)
AND AMBER; AGGLOMERATED MEERSCHAUM AND AGGLOMERATED
AMBER, IN PLATES, RODS, STICKS OR SIMILAR FORMS,
NOT WORKED AFTER MOULDING; JET**

- (1) **Natural meerschaum** is a very light and porous hydrated silicate of magnesia, white, yellowish, grey or pink, found almost exclusively in Asia Minor. It is obtained in small pieces (the sides seldom exceed 30 cm). These pieces are submitted to a preliminary cleaning, scraping, wool polishing and drying (in the sun or in an oven), followed by further flannel and wax polishing, in order to improve their appearance and to establish their grade or quality.

Agglomerated meerschaum is obtained by agglomerating shavings and other waste of natural meerschaum with binding agents (oils, alum, etc.) under the influence of heat. It falls here **only** when in plates, rods, sticks or similar forms, not worked after moulding.

- (2) **Amber** is a fossilised resin (also known as " succinite " or " Karabé "). It generally ranges in colour from yellow to deep orange. Care should be taken not to confuse amber or succinite with ambergris, a secretion of the whale, classified in **heading 05.10**.
Agglomerated amber (or ambroid) is an opaque mineral substance formed by agglomerating amber waste. It falls in this heading **only** when in plates, rods, sticks or similar forms, not worked after moulding.
- (3) **Jet** is a compact variety of lignite. It is intensely black, easily carved and takes a high polish. Although employed in the manufacture of jewellery, it is not regarded as a precious stone for the purpose of the Nomenclature.

**(C) STRONTIANITE (WHETHER OR NOT CALCINED),
OTHER THAN STRONTIUM OXIDE**

This group covers strontianite (natural strontium carbonates) and calcined strontianite, which consists mainly of impure strontium oxide.

The heading **excludes** pure strontium oxide (**heading 28.16**).

**(D) MINERAL SUBSTANCES NOT ELSEWHERE SPECIFIED
OR INCLUDED; BROKEN POTTERY**

This group covers, *inter alia* :

- (1) Natural arsenic sulphides. The two main varieties are :
 - (i) Realgar, which is an arsenic disulphide, bright red in colour, used in pyrotechnics.
 - (ii) Orpiment, which is an arsenic trisulphide, bright yellow, used in paint-making.Mispickel (arsenical pyrites or iron thioarsenide) is also included in this heading.
- (2) Alumite, also called alumstone because it is employed in the manufacture of alum. It is a stony substance, reddish-grey or yellowish in colour, and stains the fingers.
- (3) Vermiculite, a mineral allied to mica and similar in colour but usually in the form of smaller flakes; also chlorites and perlite, minerals chemically related to vermiculite. These minerals expand when heated and then constitute heat-insulating materials. In the expanded (or exfoliated) forms they are, however, classified in **heading 68.06**.
- (4) Lydite, a very hard, rough, fine-textured and even-grained, dark stone, not attacked by acids. Touchstones made of lydite (e.g., for testing precious metals) fall in **heading 68.15**.
- (5) Celestite (natural strontium sulphate); Iceland spar (or calcite) and aragonite, which are crystallised calcium carbonates; lepidolite (lithium mica) (fluosilicoaluminate of potassium and lithium) and amblygonite (aluminium phosphatelithium fluoride).

- (6) Garden earth, heath earth, marsh earth, marl, alluvium, leaf moulds and excavated soil and subsoil, which, although used in agriculture or in landscaping, are not included under Chapter 31 (Fertilisers) whether or not they contain in the natural state small quantities of nitrogen, phosphorus or potassium. However, the heading **excludes** excavated natural sands of all kinds (**heading 25.05**).
- (7) Pozzolana, santorin, trass and similar earths, sometimes called natural cements because they are used in cement manufacture.
- (8) Limestone (known as “ lithographic stone ” and used in the printing industry), in the crude state.
- (9) Broken pottery, broken pieces of brick and broken pieces of concrete.
- (10) Ores of the rare earth metals (e.g., bastnasite, xenotime, gadolinite), but **not** including monazites and other ores used solely or principally for the extraction of uranium or thorium (**heading 26.12**).
- (11) Opacifiers used in enamelling, obtained by the treatment (purification with hydrochloric acid and micronisation) of zircon sand.
- (12) Molybdenite “ concentrates ” obtained from molybdenum ores by certain physical treatments such as washing, grinding, flotation and by heat treatment (other than calcination) designed to drive off traces of oil and water, for non-metallurgical uses (lubrication).
- (13) Nsutite, a manganese ore containing not less than 79 % by weight of manganese oxides, not used in the metallurgical industry for the extraction of manganese but in electric batteries.
- (14) Natural cryolite, obtained mainly from Greenland, snow-white, occasionally tinged with colour, shiny and almost transparent, used as a flux particularly in the electrolytic production of aluminium; natural chiolite, which, like cryolite, may be regarded as a sodium fluoroaluminate. The heading **excludes** chemically produced fluorides of similar composition to cryolite and chiolite (**heading 28.26**).

The heading **does not cover** precious or semi-precious stones of **Chapter 71**.

Chapter 26

Ores, slag and ash

Notes.

1.- This Chapter does not cover :

- (a) Slag or similar industrial waste prepared as macadam (heading 25.17);
- (b) Natural magnesium carbonate (magnesite), whether or not calcined (heading 25.19);
- (c) Sludges from the storage tanks of petroleum oils consisting mainly of such oils (heading 27.10);
- (d) Basic slag of Chapter 31;
- (e) Slag wool, rock wool or similar mineral wools (heading 68.06);
- (f) Waste or scrap of precious metal or of metal clad with precious metal; other waste or scrap containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal (heading 71.12); or
- (g) Copper, nickel or cobalt mattes produced by any process of smelting (Section XV).

2.- For the purposes of headings 26.01 to 26.17, the term "ores" means minerals of mineralogical species actually used in the metallurgical industry for the extraction of mercury, of the metals of heading 28.44 or of the metals of Section XIV or XV, even if they are intended for non-metallurgical purposes. Headings 26.01 to 26.17 do not, however, include minerals which have been submitted to processes not normal to the metallurgical industry.

3.- Heading 26.20 applies only to :

- (a) Slag, ash and residues of a kind used in industry either for the extraction of metals or as a basis for the manufacture of chemical compounds of metals, excluding ash and residues from the incineration of municipal waste (heading 26.21); and
- (b) Slag, ash and residues containing arsenic, whether or not containing metals, of a kind used either for the extraction of arsenic or metals or for the manufacture of their chemical compounds.

◦ ◦

Subheading Notes.

- 1.- For the purposes of subheading 2620.21, "leaded gasoline sludges and leaded anti-knock compound sludges" mean sludges obtained from storage tanks of leaded gasoline and leaded anti-knock compounds (for example, tetraethyllead), and consisting essentially of lead, lead compounds and iron oxide.
- 2.- Slag, ash and residues containing arsenic, mercury, thallium or their mixtures, of a kind used for the extraction of arsenic or those metals or for the manufacture of their chemical compounds, are to be classified in subheading 2620.60.

GENERAL

Headings 26.01 to 26.17 are **limited** to metallic ores and concentrates which :

- (A) Are of mineralogical species actually used in the metallurgical industry for the extraction of the metals of Section XIV or XV, of mercury or of the metals of heading 28.44, even if they are intended for non-metallurgical purposes, **and**
- (B) Have not been submitted to processes not normal to the metallurgical industry.

The term "**ores**" applies to metalliferous minerals associated with the substances in which they occur and with which they are extracted from the mine; it also applies to native metals in their gangue (e.g., metalliferous sands).

Ores are seldom marketed before "preparation" for subsequent metallurgical operations. The most important preparatory processes are those aimed at concentrating the ores.

For the purposes of headings 26.01 to 26.17, the term "**concentrates**" applies to ores which have had part or all of the foreign matter removed by special treatments, either because such foreign matter might hamper subsequent metallurgical operations or with a view to economical transport.

Processes to which products of headings 26.01 to 26.17 may have been submitted include physical, physico-chemical or chemical operations, provided they are normal to the preparation of the ores for the extraction of metal. With the exception of changes resulting from calcination, roasting or firing (with or without agglomeration), such operations must not alter the chemical composition of the basic compound which furnishes the desired metal.

The physical or physico-chemical operations include crushing, grinding, magnetic separation, gravimetric separation, flotation, screening, grading, agglomeration of powders (e.g., by sintering or pelletting) into grains, balls or briquettes (whether or not with the addition of small quantities of binders), drying, calcination, roasting to oxidise, reduce or magnetise the ore, etc. (but not roasting for purposes of sulphating, chloridating, etc.).

The chemical processes are aimed at eliminating the unwanted matter (e.g., dissolution).

Concentrates of ores obtained by treatments, other than calcining or roasting, which alter the chemical composition or crystallographic structure of the basic ore are **excluded** (generally **Chapter 28**). Also **excluded** are more or less pure products obtained by repeated physical changes (fractional crystallisation, sublimation, etc.), even if there has been no change in the chemical composition of the basic ore.

The ores of headings 26.01 to 26.17 are used commercially to obtain :

- (1) The precious metals as defined in Chapter 71 (viz., silver, gold, platinum, iridium, osmium, palladium, rhodium and ruthenium).
- (2) The metallurgical base metals referred to in Section XV (viz., iron, copper, nickel, aluminium, lead, zinc, tin, tungsten (wolfram), molybdenum, tantalum, cobalt, bismuth, cadmium, titanium, zirconium, antimony, manganese, chromium, germanium, vanadium, beryllium, gallium, hafnium, indium, niobium (colombium), rhenium, thallium).
- (3) Mercury of heading 28.05.

(4) Metals of heading 28.44.

In certain cases, the ores are used to obtain alloys such as ferro-manganese or ferro-chromium.

Except where the context otherwise requires, ores and concentrates comprising more than one mineralogical species are to be classified in headings 26.01 to 26.17 as appropriate by application of General Interpretative Rule 3 (b) or failing that by application of Rule 3 (c).

Headings 26.01 to 26.17 **do not cover** :

(a) Minerals containing the above metals if :

- (i) They are specified in another heading, e.g., unroasted iron pyrites (**heading 25.02**), natural cryolite and natural chiolite (**heading 25.30**).
- (ii) The metals are not extracted commercially, e.g., earth colours, alunite or alumstone (**heading 25.30**), precious or semi-precious stones (**Chapter 71**).
- (b) The minerals which at present are used for the extraction of magnesium, i.e., dolomite (**heading 25.18**), magnesite or gibbsite (**heading 25.19**) and carnallite (**heading 31.04**).
- (c) Minerals of the alkaline or alkaline-earth metals of heading 28.05 (i.e., lithium, sodium, potassium, rubidium, caesium, calcium, strontium and barium); such minerals include salt (**heading 25.01**), barytes and witherite (**heading 25.11**), strontianite, celestite, Iceland spar and aragonite (**heading 25.30**).
- (d) Native metals (e.g., nuggets or grains) and natural alloys separated from their gangues or matrices, such native metals and natural alloys being classified in **Section XIV** or **XV**.
- (e) Ores of the rare earth metals of **heading 25.30**.

26.01 - Iron ores and concentrates, including roasted iron pyrites.

- Iron ores and concentrates, other than roasted iron pyrites :

2601.11 -- Non-agglomerated

2601.12 -- Agglomerated

2601.20 - Roasted iron pyrites

The principal ores generally classified in this heading are:

- (a) Red haematite, including specular iron ore and martite - iron oxides - and brown haematite (minettes) - hydrated iron oxide containing iron and calcium carbonates.
- (b) Limonite, hydrated iron oxide.
- (c) Magnetite, magnetic iron oxide.
- (d) Siderite or chalybite, iron carbonate.
- (e) Roasted iron pyrites or pyrites cinders, whether or not agglomerated.

The heading also covers iron ores and concentrates with a manganese content of less than 20 % calculated on the dry weight (the ores and concentrates being heated to a temperature of 105 to 110 °C) (see Explanatory Note to heading 26.02). Depending upon their manganese content, these ores are known either as manganiferous iron ores or as ferruginous manganese ores.

The heading **excludes** finely ground magnetite and other finely ground iron ores for use as pigments (**Chapter 32**).

26.02 - Manganese ores and concentrates, including ferruginous manganese ores and concentrates with a manganese content of 20 % or more, calculated on the dry weight.

The principal ores generally covered by this heading are :

- (a) Braunite, manganese oxide.
- (b) Rhodochrosite (or dialogite), manganese carbonate.
- (c) Hausmannite, saline manganese oxide.
- (d) Manganite, hydrated manganese oxide.
- (e) Psilomelane, hydrated manganese dioxide.
- (f) Pyrolusite (or polianite), manganese dioxide.

The heading also covers ferruginous manganese ores and concentrates, provided they have a manganese content of 20 % or more, calculated on the dry weight (the ores and concentrates being heated to a temperature of 105 to 110 °C); those with a manganese content of less than 20 % calculated on the dry weight are **excluded (heading 26.01)**.

The heading also **excludes** pyrolusite prepared for use in dry batteries (**heading 25.30**).

26.03 - Copper ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Atacamite, natural copper hydroxychloride.
- (b) Azurite, basic copper carbonate.
- (c) Bornite (or erubescite), sulphide of copper and iron.
- (d) Bournonite, sulphide of copper, lead and antimony.
- (e) Brochantite, basic copper sulphate.
- (f) Chalcocite, copper sulphide.
- (g) Chalcopyrite (copper pyrites), sulphide of copper and iron.
- (h) Chrysocolla, hydrated copper silicate.
- (ij) Covellite, copper sulphide.
- (k) Cuprite, cuprous oxide.
- (l) Dioptase, copper silicate.
- (m) Grey copper ore (often silver-bearing), a sulphide of copper and antimony (tetrahedrite or fahlerz) or a sulphide of copper and arsenic (tennantite, enargite).
- (n) Malachite, basic copper carbonate.
- (o) Tenorite, cupric oxide.

26.04 - Nickel ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Garnierite, double silicate of nickel and magnesium.
- (b) Niccolite (nickelin), nickel arsenide.
- (c) Pentlandite, sulphide of nickel and iron.
- (d) Nickeliferous pyrrhotite, nickel-bearing iron sulphide.

26.05 - Cobalt ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Cobaltite, sulphide and arsenide of cobalt.
- (b) Heterogenite, hydrated oxide of cobalt.
- (c) Linnaeite, sulphide of cobalt and nickel.
- (d) Smaltite, cobalt arsenide.

26.06 - Aluminium ores and concentrates.

This heading covers bauxite (hydrated aluminium oxide containing variable proportions of iron oxide, silica, etc.).

The heading also covers bauxite, heat-treated (1,200 °C to 1,400 °C) suitable for use in metallurgy for the manufacture of aluminium (carbo-thermo-reduction in electric furnace, Gross, etc., processes) or for other uses (in particular, for the manufacture of abrasives).

26.07 - Lead ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Anglesite, lead sulphate.
- (b) Cerussite, lead carbonate.
- (c) Galena, lead sulphide, often silver-bearing.
- (d) Pyromorphite, phosphate and chloride of lead.

26.08 - Zinc ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Blende (sphalerite), zinc sulphide.
- (b) Hemimorphite (or calamine), zinc hydrosilicate.
- (c) Smithsonite, zinc carbonate.
- (d) Zincite, zinc oxide.

26.09 - Tin, ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Cassiterite (or tin-stone), tin oxide.
- (b) Stannite (or tin pyrites), sulphide of tin, copper and iron.

26.10 - Chromium ores and concentrates.

This heading covers chromite (or chrome iron ore), i.e., oxide of chromium and iron.

26.11 - Tungsten ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Ferberite, iron tungstate.
- (b) Hubnerite, manganese tungstate.
- (c) Scheelite, calcium tungstate.
- (d) Wolframite, tungstate of iron and manganese.

26.12 - Uranium or thorium ores and concentrates.

2612.10 - Uranium ores and concentrates

2612.20 - Thorium ores and concentrates

The principal uranium ores generally classified in this heading are :

- (a) Autunite, hydrated phosphate of uranium and calcium.
- (b) Brannerite, uranium titanate.
- (c) Carnotite, hydrated vanadate of uranium and potassium.
- (d) Coffinite, uranium silicate.
- (e) Davidite, uranium iron titanate.
- (f) Parsonsite, hydrated phosphate of uranium and lead.
- (g) Pitchblende and uraninite, saline uranium oxides.
- (h) Torbernite (or chalcolite), hydrated phosphate of uranium and copper.
- (ij) Tyuyamunite, hydrated vanadate of uranium and calcium.
- (k) Uranophane, calcium-uranium silicate.
- (l) Uranothorianite, oxide of uranium and thorium.

The principal thorium ores generally classified in this heading are :

- (a) Monazite, phosphate of thorium and rare earths.
- (b) Thorite, hydrated thorium silicate.

The heading **excludes** those products known in trade as "concentrates" of uranium which are obtained by processes not normal to the metallurgical industry (**heading 28.44**).

26.13 - Molybdenum ores and concentrates.

2613.10 - Roasted

2613.90 - Other

The principal molybdenum ores generally classified in this heading are :

- (a) Molybdenite, molybdenum sulphide.
- (b) Wulfenite, lead molybdate.

The heading also covers roasted molybdenite concentrates ("technical molybdic oxide", obtained by merely roasting molybdenite concentrates).

The heading **excludes** molybdenite prepared for use as a lubricant (**heading 25.30**).

26.14 - Titanium ores and concentrates.

The principal ores generally classified in this heading are :

- (a) Ilmenite (or titaniferous iron ore), iron titanate.
- (b) Rutile, anatase and brookite, titanium oxides.

The heading **excludes** finely ground titanium ores for use as pigments (**Chapter 32**).

26.15 - Niobium, tantalum, vanadium or zirconium ores and concentrates.

2615.10 - Zirconium ores and concentrates

2615.90 - Other

The principal zirconium ores generally classified in this heading are :

- (a) Baddeleyite, zirconium oxide.
- (b) Zircon and zircon sands, zirconium silicates. (When in the form of a precious stone, zircon falls in **heading 71.03**.)

The principal tantalum and niobium (columbium) ores generally classified in this heading are tantalite and niobite (columbite) (i.e., tantal-niobate of iron and manganese).

The principal vanadium ores generally classified in this heading are :

- (a) Descloizite, basic vanadate of lead and zinc.
- (b) Patronite, vanadium sulphide.
- (c) Roscoelite (vanadium mica), complex vanado-silicate of aluminium and magnesium.
- (d) Vanadinite, vanadate and chloride of lead.

Fused vanadium oxides obtained by treatments, other than calcining or roasting, which alter the chemical composition or crystallographic structure of the basic ore are **excluded** (generally **Chapter 28**).

The heading also **excludes** zircon sand micronised for use as an opacifier in enamel manufacture (**heading 25.30**).

26.16 - Precious metal ores and concentrates.

2616.10 - Silver ores and concentrates

2616.90 - Other

The principal ores generally classified in this heading are :

- (a) Argentite, silver sulphide.
- (b) Calaverite, telluride of gold and silver.
- (c) Cerargyrites (or horn silver), silver chlorides and iodides.
- (d) Polybasite, sulphide of silver and antimony.
- (e) Proustite, sulphide of silver and arsenic.
- (f) Pyrargyrite, sulphide of silver and antimony.
- (g) Stephanite, sulphide of silver and antimony.
- (h) Gold and platinum-bearing sands; the latter frequently contain other metals of the platinum group (i.e., iridium, osmium, palladium, rhodium and ruthenium).

26.17 - Other ores and concentrates.

2617.10 - Antimony ores and concentrates

2617.90 - Other

The principal ores generally classified in this heading are :

(1) Antimony ores.

- (a) Cervantite, antimony oxide.
- (b) Kermesite, antimony oxysulphide.
- (c) Senarmontite, antimony oxide.
- (d) Stibnite (or antimonite), antimony sulphide.
- (e) Valentinite or white antimony, antimony oxide.

(2) Beryllium ores.

- (a) Beryl, double silicate of beryllium and aluminium. (When in the form of a precious stone, beryl or common emerald falls within **heading 71.03**.)
- (b) Bertrandite.

(3) Bismuth ores.

- (a) Bismuthinite (or bismuth glance), bismuth sulphide.
- (b) Bismutite, hydrated bismuth carbonate.
- (c) Bismuth ochre (or bismite), hydrated bismuth oxide.

(4) Germanium ores.

Germanite, copper germano-sulphide.

The heading **excludes** those products known in trade as "concentrates" of germanium, which are obtained by processes not normal to the metallurgical industry (generally **heading 28.25**).

(5) Mercury ores.

Cinnabar, sulphide of mercury.

Indium, gallium, rhenium, hafnium, thallium and cadmium are not extracted directly from one particular ore, but are obtained as by-products of the metallurgy of other metals (e.g., zinc, lead, copper, aluminium, zirconium, molybdenum).

26.18 - Granulated slag (slag sand) from the manufacture of iron or steel.

This heading covers granulated slag (slag sand) obtained, for example, by pouring liquid dross into water as it leaves the blast furnace.

On the other hand, it does **not** include slag wool obtained by blowing steam or compressed air through molten slag, nor foamed slag made by adding small amounts of water to molten slag (**heading 68.06**). The heading also **excludes** slag cements (**heading 25.23**).

26.19 - Slag, dross (other than granulated slag), scalings and other waste from the manufacture of iron or steel.

The slags covered by this heading are silicates of aluminium, calcium or iron obtained during the smelting of iron ore (blast furnace slag), the refining of pig iron or the manufacture of steel (converter slag). The heading includes these slags whether or not they contain sufficient iron to permit the recovery of the metal. But it **excludes** the phosphatic slags (" basic slag " or " Thomas slag "); these are important fertilisers and are classified in **Chapter 31**.

Slag and dross are used in the manufacture of cement, for ballast and in road construction. Slag crushed and roughly graded as macadam falls in **heading 25.17**. The heading also **excludes** granulated slag (slag sand) of **heading 26.18**.

Scalings are chips of iron oxide which result from the forging, hot-rolling, etc., of iron or steel.

The heading also includes dust from blast furnaces and other kinds of waste resulting from the manufacture of iron and steel, but **not** scrap metal produced during cutting, shaping or other metal working processes, which falls in **heading 72.04**.

26.20 - Slag, ash and residues (other than from the manufacture of iron or steel) containing metals, arsenic, or their compounds.

- Containing mainly zinc :

2620.11 -- Hard zinc spelter

2620.19 -- Other

- Containing mainly lead :

2620.21 -- Leaded gasoline sludges and leaded anti-knock compound sludges

2620.29 -- Other

2620.30 - Containing mainly copper

2620.40 - Containing mainly aluminium

2620.60 - Containing arsenic, mercury, thallium or their mixtures, of a kind used for the extraction of arsenic or those metals or for the manufacture of their chemical compounds

- Other :

2620.91 -- Containing antimony, beryllium, cadmium, chromium or their mixtures

2620.99 -- Other

This heading covers slag, ash and residues (**other than** those of heading **26.18, 26.19 or 71.12**) which containing metals, arsenic (whether or not containing metals) or their compounds, and which are of a kind used in industry either for the extraction of arsenic or metals or as a basis for the manufacture of their chemical compounds. They result from the treatment of ores or intermediate metallurgical products (such as mattes) or from electrolytic, chemical or other processes which do not involve the mechanical working of metal. Waste which derives from the mechanical working of metal, or scrap which consists of worn-out or broken metal articles is **excluded (Section XIV or XV)**. On the other hand, scalings, which are essentially oxides although deriving from the mechanical working of non-ferrous metal, also fall in this heading.

The heading includes :

- (1) Mattes (**other than** copper, nickel or cobalt mattes (**Section XV**)) and slag or dross, for example those rich in copper, zinc, tin, lead, etc.
- (2) Hard zinc spelter, residue from galvanisation by dipping in molten zinc.
- (3) Sludge from electrolytic baths after the preparation or refining of metal, and electro-galvanising sludge.
- (4) Accumulator sludge.
- (5) Residues from electrolytic metal refining, dried or concentrated in block form.

- (6) Residues from the manufacture of copper sulphate.
- (7) Impure cobalt oxides resulting from the treatment of silver-bearing ores.
- (8) Spent catalysts usable only for the extraction of metal or for the manufacture of chemicals.
- (9) Residual carnallite lyes, mainly used for obtaining magnesium chloride.
- (10) Leaded gasoline sludges and leaded anti-knock compound sludges from storage tanks of leaded gasoline and leaded anti-knock compounds, consisting essentially of lead, lead compounds (including tetraethyllead and tetramethyllead) and iron oxide (due to rusting of storage tanks). In general, such sludges are used for recovery of lead or lead compounds, and contain practically no petroleum oils.
- (11) Flue dusts from zinc, lead or copper smelting. Generally, arsenic is present in the flue dusts from copper and lead smelting, and thallium is present in the flue dusts from lead and zinc smelting.
- (12) Slag, ash and residues from zinc, lead or copper smelting and rich in mercury usually as oxide, sulphide or as an amalgam with other metals.
- (13) Slag, ash and residues containing antimony, beryllium, cadmium, chromium or their mixtures. These are generally in the form of wastes arising from processing (e.g., heat treatment) of goods containing these metals.
- (14) Slag, ash and residues from wastes resulting from the production, formulation and use of inks, dyes, pigments, paints, lacquers and varnishes, of a kind used for the recovery of metals or their compounds.

The heading also **excludes** :

- (a) Ash and residues from the incineration of municipal waste (**heading 26.21**).
- (b) Sludges from the storage tanks of petroleum oils consisting mainly of such oils (**heading 27.10**).
- (c) Chemically defined compounds of **Chapter 28**.
- (d) Waste and scrap of precious metals or of metal clad with precious metal (including e.g., spent or damaged catalysts in the form of platinum alloy gauze) and other waste and scrap containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal (**heading 71.12**).
- (e) Scrap metal resulting from the mechanical working of the metals of **Section XV**.
- (f) Zinc dust (**heading 79.03**).

26.21 - Other slag and ash, including seaweed ash (kelp); ash and residues from the incineration of municipal waste.

2621.10 - Ash and residues from the incineration of municipal waste

2621.90 - Other

This heading covers slag and ash **not falling in heading 26.18, 26.19 or 26.20**, derived from the working of ores or from metallurgical processes, as well as those derived from any other material or process. Although many of the products are used as fertilisers they are classified here and not in Chapter 31 (**except** in the case of basic slag).

The products covered include :

- (1) Ash and clinker of mineral origin produced primarily from burning coal, lignite, peat or oil in utility boilers. Its principal uses are as a raw material for cement manufacture, as a supplement to cement in concrete, in mine backfill, as a mineral filler in plastics and paints, as a lightweight aggregate in building block manufacture and in civil engineering structures such as embankments, highway ramps and bridge abutments. It includes :
 - (a) Fly ash – finely divided particles entrained in furnace flue gases and removed from the gas stream by bag or electrostatic filters;
 - (b) Bottom ash – more coarse ash removed by settlement from the gas stream immediately after leaving the furnace;
 - (c) Boiler slag – coarse residues removed from the bottom of the furnace;
 - (d) Fluidised bed combustor ash (FBC-ash) - inorganic residues from burning coal or oil in a fluidised bed of limestone or of dolomite.
- (2) Kelp and other vegetable ash. Kelp covered by this heading is material produced by incinerating certain types of seaweed. In its raw state it is a heavy, rough, blackish material but, when refined, it is a dull white powder. It is mainly used for extracting iodine or in the glass industry.

This group also includes rice husk ash, composed almost entirely of silica, and used primarily for the manufacture of sound-insulating bricks or other sound-insulating products.

- (3) Bone ash obtained from the calcination of bones in the open air. Apart from its use for soil improvement, this product is also used for coating ingot moulds in copper smelting. The heading **excludes** animal black, obtained from the calcination of bones in a closed vessel (**heading 38.02**).
- (4) Crude potassium salts obtained in the sugar industry from residues of beet molasses by incineration, washing, etc.
- (5) Ash and residues resulting from the incineration of municipal waste (see Note 4 to Chapter 38). Such ash and residues are frequently a mixture of clinker and some toxic metals (e.g., lead) and generally used for the construction of temporary roadways on landfill sites as a substitute for aggregates. Metal content of this type of ash and residues does not warrant the recovery of metals or metal compounds.

Chapter 27

Mineral fuels, mineral oils and products of their distillation; bituminous substances; mineral waxes

Notes.

- 1.- This Chapter does not cover :
 - (a) Separate chemically defined organic compounds, other than pure methane and propane which are to be classified in heading 27.11;
 - (b) Medicaments of heading 30.03 or 30.04; or
 - (c) Mixed unsaturated hydrocarbons of heading 33.01, 33.02 or 38.05.
- 2.- References in heading 27.10 to "petroleum oils and oils obtained from bituminous minerals" include not only petroleum oils and oils obtained from bituminous minerals but also similar oils, as well as those consisting mainly of mixed unsaturated hydrocarbons, obtained by any process, provided that the weight of the non-aromatic constituents exceeds that of the aromatic constituents.
However, the references do not include liquid synthetic polyolefins of which less than 60 % by volume distils at 300 °C, after conversion to 1,013 millibars when a reduced-pressure distillation method is used (Chapter 39).
- 3.- For the purposes of heading 27.10, "waste oils" means waste containing mainly petroleum oils and oils obtained from bituminous minerals (as described in Note 2 to this Chapter), whether or not mixed with water. These include :
 - (a) Such oils no longer fit for use as primary products (for example, used lubricating oils, used hydraulic oils and used transformer oils);
 - (b) Sludge oils from the storage tanks of petroleum oils, mainly containing such oils and a high concentration of additives (for example, chemicals) used in the manufacture of the primary products; and
 - (c) Such oils in the form of emulsions in water or mixtures with water, such as those resulting from oil spills or storage tank washings, or from the use of cutting oils for machining operations.

◦
◦ ◦

Subheading Notes.

- 1.- For the purposes of subheading 2701.11, "anthracite" means coal having a volatile matter limit (on a dry, mineral-matter-free basis) not exceeding 14 %.
- 2.- For the purposes of subheading 2701.12, "bituminous coal" means coal having a volatile matter limit (on a dry, mineral-matter-free basis) exceeding 14 % and a calorific value limit (on a moist, mineral-matter-free basis) equal to or greater than 5,833 kcal/kg.
- 3.- For the purposes of subheadings 2707.10, 2707.20, 2707.30 and 2707.40 the terms "benzol (benzene)", "toluol (toluene)", "xylol (xylenes)" and "naphthalene" apply to products which contain more than 50 % by weight of benzene, toluene, xylenes or naphthalene respectively.
- 4.- For the purposes of subheading 2710.12, "light oils and preparations" are those of which 90 % or more by volume (including losses) distil at 210 °C according to the ISO 3405 method (equivalent to the ASTM D 86 method).
- 5.- For the purposes of the subheadings of heading 27.10, the term "biodiesel" means mono-alkyl esters of fatty acids of a kind used as a fuel, derived from animal or vegetable fats and oils whether or not used.

GENERAL

The Chapter covers, in general, coal and other natural mineral fuels, petroleum oils and oils obtained from bituminous minerals, their distillation products, and products of a similar kind obtained by any other process. It also covers mineral waxes and natural bituminous substances. Goods of this Chapter may be crude or refined; however, with the exception of methane and propane, when they are separate chemically defined organic compounds in the pure or commercially pure state, they are to be classified in **Chapter 29**. For certain of these compounds (e.g., ethane, benzene, phenol, pyridine) there are specific purity criteria indicated in Explanatory Notes 29.01, 29.07 and 29.33. Methane and propane are classified in heading 27.11, even when pure.

The expression " aromatic constituents " as used in Note 2 to this Chapter and in heading 27.07 should be taken to refer to entire molecules with an aromatic part irrespective of the number and length of side-chains and not to the aromatic portions of such molecules only.

The Chapter **does not cover** :

- (a) Medicaments of **heading 30.03 or 30.04**.
- (b) Perfumery, cosmetic or toilet preparations (**headings 33.03 to 33.07**).
- (c) Liquid or liquefied-gas fuels in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³ (**heading 36.06**).

27.01 - Coal; briquettes, ovoids and similar solid fuels manufactured from coal.

- Coal, whether or not pulverised, but not agglomerated :

2701.11 -- Anthracite

2701.12 -- Bituminous coal

2701.19 -- Other coal

2701.20 - Briquettes, ovoids and similar solid fuels manufactured from coal

This heading covers the various types of coal and anthracite, whether or not pulverised or agglomerated (ovoids, briquettes, etc.). It also covers briquettes and similar manufactured fuels which have been carbonised to render them smokeless.

The heading also includes pulverised coal dispersed in water (slurry coal) and containing small amounts of dispersing agents, especially surface-active agents.

The heading **does not cover** jet (**heading 25.30**), brown coal (lignite) (**heading 27.02**), nor coke and semi-coke of coal (**heading 27.04**).

27.02 - Lignite, whether or not agglomerated, excluding jet.

2702.10 - Lignite, whether or not pulverised, but not agglomerated

2702.20 - Agglomerated lignite

This heading covers lignite (brown coal), a fuel intermediate between coal and peat, whether or not dehydrated, pulverised or agglomerated.

The heading **excludes** jet, a variety of lignite (**heading 25.30**).

27.03 - Peat (including peat litter), whether or not agglomerated.

Peat, which is formed of partly carbonised vegetable material, is generally light and fibrous.

The heading covers all kinds of peat, including dried or agglomerated peat used as fuel, crushed peat, peat litter, etc., used in stables, for soil improvement or for other purposes.

Mixtures of peat and sand or clay, the essential character of which is given by the peat, are also included in this heading, whether or not they contain small quantities of the fertilising elements nitrogen, phosphorus or potassium. Such products are generally used as potting soils.

However, the heading **does not cover** :

- (a) Fibres of peat (known as “ berandine ”) prepared for textile use (**Section XI**).
- (b) Flower pots or other articles of peat, including insulating sheets for buildings, obtained by cutting or moulding (**Chapter 68**).

27.04 - Coke and semi-coke of coal, of lignite or of peat, whether or not agglomerated; retort carbon.

Coke is the solid residue obtained from the distillation (or carbonisation or gasification) of coal, lignite or peat in the absence of air. It is obtained in coke ovens from various qualities of bituminous coals.

Semi-coke results from the distillation of coal or lignite at low temperature.

Coke and semi-coke of this heading may be pulverised or agglomerated.

Retort carbon (gas carbon) is a hard, black, brittle form of carbon which gives a metallic ring when struck. It is obtained as a by-product in gas works or coke ovens where it is deposited on the walls of the ovens or retorts. The carbon usually consists of irregular lumps of which one face is either flat or slightly curved according to the shape of the retort.

In some countries, retort carbon is called " artificial graphite ", but this name is more correctly applied to artificially produced graphite of **heading 38.01**.

The heading **excludes** :

- (a) Pitch coke and petroleum coke (**headings 27.08** and **27.13**, respectively).
- (b) Articles of retort carbon of a kind used for electrical purposes (**heading 85.45**).

27.05 - Coal gas, water gas, producer gas and similar gases, other than petroleum gases and other gaseous hydrocarbons.

Coal gas is obtained by the distillation of coal in the absence of air, usually in gas works or coke ovens. It is a complex mixture of hydrogen, methane, carbon monoxide, etc., and is used for lighting or heating purposes.

The heading includes the gas produced by underground gasification and also water gas, producer gas and similar gases, for example blast-furnace gas. It also covers mixtures of gases formed by cracking or reforming of mineral oils, petroleum gases or natural gases, usually in the presence of steam. These mixtures are similar in composition to coal gas and are used for heating or lighting purposes and in the synthesis of chemicals, e.g., methanol, ammonia. In the latter case, they are sometimes called "synthesis gas". However, the heading **excludes** the gases specified in **heading 27.11**.

27.06 - Tar distilled from coal, from lignite or from peat, and other mineral tars, whether or not dehydrated or partially distilled, including reconstituted tars.

These tars are very complex mixtures of variable proportions of aromatic and aliphatic constituents, usually resulting from the distillation of coal, lignite or peat.

The heading covers all such tars including :

- (1) The tars produced by high temperature distillation of coal, which consist predominantly of aromatic constituents such as benzene, phenol, naphthalene, anthracene and phenol homologues, pyridine bases.
- (2) The tars obtained by the distillation of lignite or peat or by the low temperature distillation of coal. These tars are similar to those referred to in (1) above, but contain a larger proportion of aliphatic, naphthenic and phenolic compounds.
- (3) Other mineral tars, including those obtained from water gas producers during the gasification of coals.

The heading also includes dehydrated or partially distilled tars and reconstituted tars obtained by blending pitch with creosote oils or with other coal tar distillation products.

Tars are mainly used in further distillation which produces a series of oils and other coal tar products. They are also used for waterproofing materials and for surfacing roads, etc.

The heading **does not cover** tars extracted from non-mineral sources, e.g., wood tar (**heading 38.07**).

27.07 - Oils and other products of the distillation of high temperature coal tar; similar products in which the weight of the aromatic constituents exceeds that of the non-aromatic constituents.

2707.10 - Benzol (benzene)

2707.20 - Toluol (toluene)

2707.30 - Xylol (xylenes)

2707.40 - Naphthalene

2707.50 - Other aromatic hydrocarbon mixtures of which 65 % or more by volume (including losses) distils at 250 °C by the ISO 340 5 method (equivalent to the ASTM D 86 method)

- Other :

2707.91 -- Creosote oils

2707.99 -- Other

This heading covers :

- (1) The oils and other products obtained by the distillation of high temperature coal tar in more or less broad fractions, which produces mixtures consisting predominantly of aromatic hydrocarbons and other aromatic compounds.

These oils and other products include :

- Benzol (benzene), toluol (toluene), xylol (xylenes) and solvent naphtha.
- Naphthalene oils and crude naphthalene.
- Anthracene oils and crude anthracene.
- Phenolic oils (phenols, cresols, xylenols, etc.).
- Pyridine, quinoline and acridine bases.
- Creosote oils.

- (2) Similar oils and products with a predominance of aromatic constituents obtained by the distillation of low temperature coal tar or other mineral tar, by the "stripping" of coal gas, by the processing of petroleum or by any other process.

The heading includes the oils and products referred to above whether crude or refined, but it **excludes** separate chemically defined compounds in the pure or commercially pure state obtained by further fractionation or by other processing of tar oils (**Chapter 29**). For benzene, toluene, xylene, naphthalene, anthracene, phenol, cresols, xylenols, pyridine and certain derivatives of pyridine, there are specific purity criteria, indicated in the relevant parts of Explanatory Notes 29.02, 29.07 and 29.33.

Wood tar oils fall in **Chapter 38**.

The heading **does not cover** mixed alkylbenzenes or mixed alkynaphthalenes obtained by the alkylation of benzene or naphthalene, and having fairly long side-chains (**heading 38.17**).

27.08 - Pitch and pitch coke, obtained from coal tar or from other mineral tars.

2708.10 - Pitch

2708.20 - Pitch coke

The **pitch** covered by this heading is a residue of the distillation of either high temperature coal tars or other mineral tars. It contains a small proportion of heavy tar oils. It is black or brown in colour and may be soft or brittle. It is used in the manufacture of electrodes, road tars, waterproofing mixtures, for agglomerating coal-dust, etc.

Pitch which has been slightly modified by air-blowing is similar to unblown pitch and remains in this heading.

Pitch coke is the final residual product left from the distillation of either high temperature or low temperature coal tars or of other mineral tars or of their pitches. It is used for making electrodes or as a fuel.

27.09 - Petroleum oils and oils obtained from bituminous minerals, crude.

This heading covers crude petroleum oils and crude oils obtained from bituminous minerals (e.g., from shale, calcareous rock, sand), i.e., natural products, whatever their composition, whether obtained from normal or condensation oil-deposits or by the destructive distillation of bituminous minerals. The crude oils thus obtained remain classified in this heading even when they have been subjected to the following processes :

- (1) Decantation.
- (2) De-salting.
- (3) Dehydration.
- (4) Stabilisation in order to normalise the vapour pressure.
- (5) Elimination of very light fractions with a view to returning them to the oil-deposits in order to improve the drainage and maintain the pressure.
- (6) The addition of **only** those hydrocarbons previously recovered by physical methods during the course of the above-mentioned processes.
- (7) Any other minor process, provided it does not change the essential character of the product.

The heading also covers gas condensates, i.e., crude oils obtained during the stabilisation of natural gas immediately upon its extraction. This operation consists of obtaining, mainly by cooling and depressurisation, the condensable hydrocarbons (C4 to approximately C20) from the wet natural gas.

27.10 - Petroleum oils and oils obtained from bituminous minerals, other than crude; preparations not elsewhere specified or included, containing by weight 70 % or more of petroleum oils or of oils obtained from bituminous minerals, these oils being the basic constituents of the preparations; waste oils.

- Petroleum oils and oils obtained from bituminous minerals (other than crude) and preparations not elsewhere specified or included, containing by weight 70 % or more of petroleum oils or of oils obtained from bituminous minerals, these oils being the basic constituents of the preparations, other than those containing biodiesel and other than waste oils :

2710.12 -- Light oils and preparations

2710.19 -- Other

2710.20 - Petroleum oils and oils obtained from bituminous minerals (other than crude) and preparations not elsewhere specified or included, containing by weight 70 % or more of petroleum oils or of oils obtained from bituminous minerals, these oils being the basic constituents of the preparations, containing biodiesel, other than waste oils

- Waste oils :

2710.91 -- Containing polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs) or polybrominated biphenyls (PBBs)

2710.99 -- Other

(I) PRIMARY PRODUCTS

The products covered by the first part of this heading are those which have undergone any process **other than** those specified in the Explanatory Note to heading 27.09.

The heading includes :

(A) “ Topped crudes ” (where certain lighter fractions have been removed by distillation), as well as light, medium and heavy oils obtained in more or less broad fractions by the distillation or refining of crude petroleum oils or of crude oils obtained from bituminous minerals. These oils, which are more or less liquid or semi-solid, consist predominantly of **non-aromatic** hydrocarbons such as paraffinic, cyclanic (naphthenic).

They include :

- (1) Petroleum spirit.
- (2) White spirit.
- (3) Kerosene.
- (4) Gas-oils.
- (5) Fuel oils.
- (6) Spindle-oils and lubricating oils.
- (7) White oils.

The heading covers fractions as described above, even if they have been further treated to eliminate impurities (e.g., treatment with acids or alkalis, with selective solvents, with zinc chloride, with absorbent earths, etc., or by re-distillation), **provided** this treatment **does not** produce separate chemically defined compounds in a pure or commercially pure state (**Chapter 29**).

- (B) Similar oils in which the weight of the non-aromatic constituents exceeds that of the aromatic constituents. They may be obtained by the low temperature distillation of coal, by hydrogenation or by any other process (e.g., by cracking, reforming, etc.).

The heading includes **mixed alkynes**, called **tripropylene**, **tetrapropylene**, **di-isobutylene**, **tri-isobutylene**, etc. These are mixtures of unsaturated acyclic hydrocarbons (octylenes, nonylenes, homologues and isomers thereof, etc.) and saturated acyclic hydrocarbons.

They are obtained either by very low polymerisation of propylene, isobutylene or other ethylenic hydrocarbons or by separation (e.g., fractional distillation) from certain products of the cracking of mineral oils.

Mixed alkynes are mainly used in chemical synthesis, as solvents or as diluents. Because of their high octane rating, they can also be incorporated, with appropriate additives, in petroleum spirit.

However, this heading **does not include** liquid synthetic polyolefins of which less than 60 % by volume distils at 300 °C, after conversion to 1,013 millibars (101.3 kPa) when a reduced-pressure distillation method is used (**Chapter 39**).

Further, the heading **does not include** oils with a predominance by weight of aromatic constituents, obtained by the processing of petroleum or by any other process (**heading 27.07**).

- (C) The oils described in (A) and (B) above to which various substances have been added to render them suitable for particular uses, **provided** the products contain by weight 70 % or more of petroleum oils or of oils obtained from bituminous minerals as a basis and that they are not covered by a more specific heading in the Nomenclature.

Examples of the types of products referred to are :

- (1) **Petroleum spirit** containing small quantities of added anti-knock products (e.g., tetraethyllead, dibromoethane) and anti-oxidants (e.g., para-butylaminophenol).
- (2) **Lubricants** consisting of mixtures of lubricating oils with widely varying quantities of other products (e.g., products for improving their lubricating properties (such as vegetable oils and fats), anti-oxidants, rust preventives, anti-foam agents such as silicones). These lubricants include compounded oils, oils for heavy duty work, oils blended with graphite (graphite suspensions in petroleum oils or in oils obtained from bituminous minerals), upper cylinder lubricants, textile oils, and solid lubricants (greases) composed of a lubricating oil with about 10 to 15 % of soaps of aluminium, calcium, lithium, etc.
- (3) **Transformer and circuit-breaker oils** (not used for their lubricating properties), which are stabilised, specially refined oils with added anti-oxidants such as ditertiarybutylparacresol.
- (4) **Cutting oils** used for cooling cutting tools, etc., and the material being worked. They consist of heavy oils with the addition of about 10 to 15 % of an emulsifying agent (e.g., alkali sulphoricinoleate) and are used as emulsions in water.

- (5) **Cleansing oils** used for cleaning motors, engines and other appliances. These are heavy oils usually containing, in addition, small quantities of peptising agents to facilitate removal of gum, carbon deposits, etc., formed during the running of the machine.
- (6) **Mould release oils** used to facilitate the removal of ceramic articles, concrete pillars, etc., from the mould. These include heavy oils containing, for example, about 10 % of vegetable fats.
- (7) **Liquids for hydraulic brakes**, etc., consisting of heavy oils to which have been added products to improve their lubricating properties, anti-oxidants, rust preventives, anti-foam agents, etc.
- (8) **Blends of biodiesel**, containing by weight 70% or more of petroleum oils or of oils obtained from bituminous minerals. However, biodiesel and its blends, containing less than 70 % by weight of petroleum oils or of oils obtained from bituminous minerals, fall in **heading 38.26**.

(II) WASTE OILS

Waste oils are waste containing mainly petroleum oils and oils obtained from bituminous minerals (as described in Note 2 to this Chapter), whether or not mixed with water. They include:

- (1) Waste petroleum and similar waste oils no longer fit for use as primary products (e.g., used lubricating oils, used hydraulic oils and used transformer oils). Waste oils containing polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs) and polybrominated biphenyls (PBBs) result mainly from draining out of these chemicals from electrical equipment such as heat exchangers, transformers or switch gears;
- (2) Sludge oils from the storage tanks of petroleum oils, mainly containing such oils and a high concentration of additives (e.g., chemicals) used in the manufacture of the primary products; and
- (3) Waste oils in the form of emulsions in water or mixtures with water, such as those resulting from oil spills or storage tank washings, or from the use of cutting oils for machining operations.
- (4) Waste oils resulting from the production, formulation and use of inks, dyes, pigments, paints, lacquers and varnishes.

The heading **does not include** :

- (a) Leaded gasoline sludges and leaded anti-knock compound sludges from storage tanks of leaded gasoline and leaded anti-knock compounds, consisting essentially of lead, lead compounds and iron oxide and containing practically no petroleum oils, generally used for recovery of lead or lead compounds (**heading 26.20**).
- (b) Preparations containing less than 70 % by weight of petroleum oils or of oils obtained from bituminous minerals, e.g., textile greasing or oiling preparations and other lubricating preparations of **heading 34.03** and hydraulic brake fluids of **heading 38.19**.
- (c) Preparations containing petroleum oils or oils obtained from bituminous minerals in any proportion (even exceeding 70 % by weight) covered by a more specific heading in the Nomenclature or based on products other than petroleum oils or oils obtained from bituminous minerals. This is the case with the anti-rust preparations of **heading 34.03**, which consist of lanolin in solution in white spirit, the lanolin being the basic material and the white spirit acting merely as a solvent and evaporating after application. It is also the case with disinfecting, insecticidal, fungicidal, etc., preparations (**heading 38.08**), prepared additives for mineral oils (**heading 38.11**), composite solvents and thinners for varnishes (**heading 38.14**) and certain preparations of **heading 38.24**, such as starting fluid for petrol (gasoline) engines, the fluid consisting of diethyl ether, 70 % or more by weight of petroleum oils and also other constituents, the diethyl ether being the basic constituent.

27.11 - Petroleum gases and other gaseous hydrocarbons.

- Liquefied :

2711.11 -- Natural gas

2711.12 -- Propane

2711.13 -- Butanes

2711.14 -- Ethylene, propylene, butylene and butadiene

2711.19 -- Other

- In gaseous state :

2711.21 -- Natural gas

2711.29 -- Other

This heading covers **crude** gaseous hydrocarbons obtained as natural gases or from petroleum, or produced chemically. **Methane** and **propane** are, however, included even when pure.

These hydrocarbons are gaseous at a temperature of 15 °C and under a pressure of 1,013 millibars (101.3 kPa). They may be presented under pressure as liquids in metal containers and are often treated, as a safety measure, by the addition of small quantities of highly odiferous substances to indicate leaks.

They include, in particular, the following gases, whether or not liquefied :

- I. Methane and propane, whether or not pure.
- II. Ethane and ethylene less than 95 % pure. (Ethane and ethylene not less than 95 % pure fall in **heading 29.01**.)
- III. Propene (propylene) less than 90 % pure. (Propene not less than 90 % pure falls in **heading 29.01**.)
- IV. Butane containing less than 95 % of n-butane and less than 95 % of isobutane. (Butane containing not less than 95 % of n-butane or isobutane falls in **heading 29.01**.)
- V. Butenes (butylenes) and butadienes less than 90 % pure. (Butenes and butadienes not less than 90 % pure fall in **heading 29.01**.)
- VI. Intermixtures of propane and butane.

The above percentages are calculated by reference to volume for gaseous products and to weight for liquefied products.

The heading **does not cover** :

- (a) Separate chemically defined hydrocarbons (**other than** methane and propane) in a pure or commercially pure state (**heading 29.01**). (As regards such hydrocarbons with added odiferous substances, see the General Explanatory Note to Chapter 29, Part (A), fifth paragraph. For ethane, ethylene, propene, butane, butenes and butadienes, there are specific purity criteria as indicated in paragraphs II, III, IV and V above.)

- (b) Liquefied butane in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³ (**other than** those constituting parts of cigarette or similar lighters) (**heading 36.06**).
- (c) Cigarette or other lighter parts containing liquefied butane (**heading 96.13**).

27.12 - Petroleum jelly; paraffin wax, microcrystalline petroleum wax, slack wax, ozokerite, lignite wax, peat wax, other mineral waxes, and similar products obtained by synthesis or by other processes, whether or not coloured.

2712.10 - Petroleum jelly

2712.20 - Paraffin wax containing by weight less than 0.75 % of oil

2712.90 - Other

(A) Petroleum jelly.

Petroleum jelly is unctuous to the touch. It is white, yellowish or dark brown in colour. It is obtained from the residues of the distillation of certain crude petroleum oils or by mixing fairly high viscosity petroleum oils with such residues or by mixing paraffin wax or ceresine with a sufficiently refined mineral oil. The heading includes the jelly, whether crude (sometimes called **petrolatum**), decolourised or refined. It also covers petroleum jelly obtained by synthesis.

To fall in this heading petroleum jelly must have a congealing point, as determined by the rotating thermometer method (ISO 2207 equivalent to the ASTM D 938 method), of not less than 30 °C, a density at 70 °C of less than 0.942 g/cm³, a Worked Cone Penetration at 25 °C, as determined by the ISO 2137 method (equivalent to the ASTM D 217 method), of less than 350, a Cone Penetration at 25 °C, as determined by the ISO 2137 method (equivalent to the ASTM D 937 method), of not less than 80.

This heading **does not**, however, **include** petroleum jelly, suitable for use for the care of the skin, put up in packings of a kind sold by retail for such use (**heading 33.04**).

(B) Paraffin wax, microcrystalline petroleum wax, slack wax, ozokerite, lignite wax, peat wax, other mineral waxes, and similar products obtained by synthesis or by other processes, whether or not coloured.

Paraffin wax is a hydrocarbon wax extracted from certain distillates of petroleum oils or of oils obtained from shale or other bituminous minerals. This wax is translucent, white or yellowish in colour and has a relatively marked crystalline structure.

Microcrystalline petroleum wax is also a hydrocarbon wax. It is extracted from petroleum residues or from vacuum-distilled lubricating oil fractions. It is more opaque than paraffin wax and has a finer and less apparent crystalline structure. Normally it has a higher melting point than paraffin wax. It can vary from soft and plastic to hard and brittle and from dark brown to white in colour.

Ozokerite is a natural mineral wax. When purified it is known as **ceresine**.

Lignite (or Montan) wax and the product known as "Montan pitch" are ester waxes extracted from lignite. They are hard and dark when crude, but may be white when refined.

Peat wax is physically and chemically similar to lignite wax, but is slightly softer.

The **other mineral waxes** of this heading (**slack wax** and **scale wax**) result from the de-waxing of lubricating oils. They are less refined and have a higher oil content than paraffin wax. Their colour varies from white to light brown.

The heading also includes products similar to those referred to in the heading and obtained by synthesis or by any other process (e.g., synthetic paraffin wax and synthetic microcrystalline wax). However, the heading **does not include** high polymer waxes such as polyethylene wax. These fall in **heading 34.04**.

All these waxes are covered by the heading whether crude or refined, mixed together or coloured. They are used for making candles (especially paraffin wax), polishes, etc., for insulating, dressing textiles, impregnating matches, protection against rust, etc.

However, the following products are classified in **heading 34.04** :

- (a) Artificial waxes obtained by the chemical modification of lignite wax or other mineral waxes.
- (b) Mixtures, not emulsified or containing solvents, consisting of :
 - (i) Waxes of this heading mixed with animal waxes (including spermaceti), vegetable waxes or artificial waxes.
 - (ii) Waxes of this heading mixed with fats, resins, mineral substances or other materials, provided they have a waxy character.

27.13 - Petroleum coke, petroleum bitumen and other residues of petroleum oils or of oils obtained from bituminous minerals.

- Petroleum coke :

2713.11 -- Not calcined

2713.12 -- Calcined

2713.20 - Petroleum bitumen

2713.90 - Other residues of petroleum oils or of oils obtained from bituminous minerals

(A) **Petroleum coke** (green coke or calcined coke) is a black, porous, solid residue resulting from the cracking or destructive distillation of petroleum or obtained from oils of bituminous minerals. It is used mainly as a raw material for the manufacture of electrodes (calcined coke) or as a fuel (green coke).

(B) **Petroleum bitumen** (also known as petroleum pitch, refinery pitch, petroleum asphalt) is usually obtained as a residue of the distillation of crude petroleum. It is brown or black and may be soft or brittle. It is used for road-surfacing, waterproofing, etc. Petroleum bitumen which has been slightly modified by air-blowing is similar to unblown bitumen and remains in this heading.

(C) **Other residues of petroleum oils** include :

- (1) Extracts derived from the treatment of lubricating oils with certain selective solvents.
- (2) Petroleum gum and other resinous substances obtained from petroleum.
- (3) Acid residues and spent bleaching earths, containing a proportion of oil.

Bitumen, coke and other residues fall in this heading if they result from the treatment of shale oils or of other oils obtained from bituminous minerals.

The heading **does not cover** :

- (a) Water-soluble naphthenates or water-soluble petroleum sulphonates (including those containing a certain proportion of mineral oils), such as those of alkali metals, of ammonium or of ethanolamines (**heading 34.02**).
- (b) Water-insoluble naphthenates or water-insoluble petroleum sulphonates (**heading 38.24**, provided they are not covered by a more specific heading).
- (c) Naphthenic acids, crude or refined (**heading 38.24**).

27.14 - Bitumen and asphalt, natural; bituminous or oil shale and tar sands; asphaltites and asphaltic rocks (+).

2714.10 - Bituminous or oil shale and tar sands

2714.90 - Other

This heading covers natural bitumen and natural asphalt (including “ Trinidad Lake asphalt ” and materials known in some countries as “ asphaltic sands ”). They are brown or black, solid or very viscous mixtures of naturally occurring hydrocarbons with inert mineral matter, which in the case of asphalts may be substantial.

The heading also includes :

- (1) Bituminous or oil shale and tar sands.
- (2) Asphaltites.
- (3) Asphaltic limestone and other asphaltic rocks.

The above materials remain classified in this heading whether or not treated to remove water or gangue and whether or not pulverised or mixed together. The mere addition of water to natural bitumen does not change the classification of the product for the purposes of heading 27.14. Further, the heading also includes dehydrated and pulverized natural bitumen dispersed in water and containing a small amount of an emulsifier (surfactant), added solely to facilitate safety, handling or transport.

They are used for road surfacing, waterproofing, varnish or enamel manufacture, etc. Bituminous shale and tar sands are used as a source of mineral oils.

The heading **does not cover** :

- (a) Tarred macadam (**heading 25.17**).
 - (b) Bituminous coal (**heading 27.01**).
 - (c) Bituminous lignite (**heading 27.02**).
 - (d) Bitumen obtained from petroleum (**heading 27.13**).
 - (e) Bituminous mixtures based on natural bitumen with added substances, other than water and emulsifiers (surfactants) necessary solely to facilitate safety, handling or transport (**heading 27.15**).
 - (f) Articles of asphalt of **heading 68.07**.
- ◦ ◦

Subheading Explanatory Note.

Subheading 2714.10

This subheading covers sedimentary rock or sand containing hydrocarbons, which can be separated in the form of products of heading 27.09 (Petroleum oils and oils obtained from bituminous minerals, crude), or in a form from which these products can be extracted. Gas and other products may also be obtained. The separation is achieved by heating or other extraction processes (e.g., by distillation, retorting or mechanical processes). The hydrocarbons contained in shale may be in the form of organic materials called kerogens.

27.15 - Bituminous mixtures based on natural asphalt, on natural bitumen, on petroleum bitumen, on mineral tar or on mineral tar pitch (for example, bituminous mastics, cut-backs).

The bituminous mixtures of this heading include :

- (1) **Cut-backs** consisting generally of 60 % or more of bitumen with a solvent. They are used for road surfacing.
- (2) **Emulsions** or stable suspensions of asphalt, bitumen, pitch or tar, in water, of the kinds used in particular for road surfacing.
- (3) **Mastics** of asphalt and other bituminous mastics, as well as similar bituminous mixtures incorporating mineral substances such as sand or asbestos. These substances are used for caulking, as moulding materials, etc.

The heading extends to these products when agglomerated in blocks, etc., of the kind re-melted before use, but it **excludes** finished articles of regular shape (such as paving flagstones, sheets and tiles) (**heading 68.07**).

The heading also **excludes** :

- (a) Tarred macadam (crushed stones mixed with tar) (**heading 25.17**).
- (b) Dolomite agglomerated with tar (**heading 25.18**).
- (c) Blends of pitch with creosote oils or other coal tar distillation products (**heading 27.06**).
- (d) Dehydrated and pulverized natural bitumen dispersed in water and containing a small amount of an emulsifier (surfactant), added solely to facilitate safety, handling or transport (**heading 27.14**).
- (e) Bituminous paints and varnishes (**heading 32.10**), which differ from certain mixtures of this heading by, for example, the greater fineness of the fillers (if used), the possible presence of one or more film producing agents (other than asphalt, bitumen, tar or pitch), the ability to dry on exposure to air in the manner of paints or varnishes and the thinness and hardness of the film formed.
- (f) Lubricating preparations of **heading 34.03**.

27.16 - Electrical energy. (optional heading)

No remarks.

Section VI

PRODUCTS OF THE CHEMICAL OR ALLIED INDUSTRIES

Notes.

- 1.- (A) Goods (other than radioactive ores) answering to a description in heading 28.44 or 28.45 are to be classified in those headings and in no other heading of the Nomenclature.
(B) Subject to paragraph (A) above, goods answering to a description in heading 28.43, 28.46 or 28.52 are to be classified in those headings and in no other heading of this Section.
- 2.- Subject to Note 1 above, goods classifiable in heading 30.04, 30.05, 30.06, 32.12, 33.03, 33.04, 33.05, 33.06, 33.07, 35.06, 37.07 or 38.08 by reason of being put up in measured doses or for retail sale are to be classified in those headings and in no other heading of the Nomenclature.
- 3.- Goods put up in sets consisting of two or more separate constituents, some or all of which fall in this Section and are intended to be mixed together to obtain a product of Section VI or VII, are to be classified in the heading appropriate to that product, provided that the constituents are :
 - (a) having regard to the manner in which they are put up, clearly identifiable as being intended to be used together without first being repacked;
 - (b) presented together; and
 - (c) identifiable, whether by their nature or by the relative proportions in which they are present, as being complementary one to another.

GENERAL

Note 1.

Under the provisions of paragraph (A) of this Note, all radioactive chemical elements and radioactive isotopes, and compounds of such elements and isotopes (whether inorganic or organic, and whether or not chemically defined), are classified under heading 28.44, even though they could also fall under some other heading of the Nomenclature. Thus, for example, radioactive sodium chloride and radioactive glycerol fall in heading 28.44 and not in heading 25.01 or 29.05. Similarly, radioactive ethyl alcohol, radioactive gold and radioactive cobalt are in all circumstances classified in heading 28.44. It should be noted, however, that radioactive ores are classified in **Section V** of the Nomenclature.

In the case of non-radioactive isotopes and their compounds, the Note provides that these (whether inorganic or organic, and whether or not chemically defined) are classified in heading 28.45 and not elsewhere in the Nomenclature. Thus, the isotope of carbon is classified under heading 28.45 and not under heading 28.03.

Paragraph (B) of the Note provides that goods described in heading 28.43, 28.46 or 28.52 are to be classified under whichever of those headings is appropriate and under no other heading in Section VI, provided always they are not radioactive or in the form of isotopes (in which case they are classified in either heading 28.44 or heading 28.45). This paragraph of the Note provides, therefore, that, e.g., silver caseinate is classified in heading 28.43 and not in heading 35.01, and that silver nitrate, even when put up for retail sale ready for photographic use, is classified in heading 28.43 and not in heading 37.07.

It should be noted, however, that headings 28.43, 28.46 and 28.52 take precedence **only over the other headings in Section VI**. Where goods described in heading 28.43, 28.46 or 28.52 are also covered by headings in other Sections of the Nomenclature, the classification of such goods is dependent on the application of any relevant Section or Chapter Notes and of the General Rules for the interpretation of the Harmonized System. Thus gadolinite, a compound of rare-earth metals and therefore covered by heading 28.46 is classified in heading 25.30 because Note 3 (a) to Chapter 28 **excludes** all mineral products of **Section V**.

Note 2.

Section Note 2 provides that goods (other than those described in heading 28.43 to 28.46 or 28.52) which are covered by heading 30.04, 30.05, 30.06, 32.12, 33.03, 33.04, 33.05, 33.06, 33.07, 35.06, 37.07 or 38.08 by reason of being put up in measured doses or for retail sale, are to be classified in those headings notwithstanding that they could also fall in some other heading of the Nomenclature. For example, sulphur put up for retail sale for therapeutic purposes is classified in **heading 30.04** and not in heading 25.03 or 28.02, and dextrin put up for retail sale as a glue is classified in **heading 35.06** and not in heading 35.05.

Note 3.

This Note deals with the classification of goods put up in sets consisting of two or more separate constituents, some or all of which fall in Section VI. The Note is, however, limited to sets of which the constituents are intended to be mixed together to obtain a product of Section VI or VII. Such sets are to be classified in the heading appropriate to that product **provided** that the constituents meet conditions (a) to (c) of the Note.

Examples of goods in such sets are dental cements and other dental fillings of heading 30.06 and certain varnishes and paints of headings 32.08 to 32.10 and mastics, etc., of heading 32.14. As regards the classification of goods put up without a necessary hardener, - see, in particular, General Explanatory Note to Chapter 32 and Explanatory Note to heading 32.14.

It should be noted that goods put up in sets consisting of two or more separate constituents, some or all of which fall in Section VI, intended to be used **successively without prior mixing**, are not covered by Note 3 to this Section. Such goods put up for retail sale are to be classified by application of the General Interpretative Rules (generally Rule 3 (b)); in the case of those not put up for retail sale the constituents are to be classified separately.

Chapter 28

Inorganic chemicals; organic or inorganic compounds of precious metals, of rare-earth metals, of radioactive elements or of isotopes

Notes.

- 1.- Except where the context otherwise requires, the headings of this Chapter apply only to :
 - (a) Separate chemical elements and separate chemically defined compounds, whether or not containing impurities;
 - (b) The products mentioned in (a) above dissolved in water;
 - (c) The products mentioned in (a) above dissolved in other solvents provided that the solution constitutes a normal and necessary method of putting up these products adopted solely for reasons of safety or for transport and that the solvent does not render the product particularly suitable for specific use rather than for general use;
 - (d) The products mentioned in (a), (b) or (c) above with an added stabiliser (including an anti-caking agent) necessary for their preservation or transport;
 - (e) The products mentioned in (a), (b), (c) or (d) above with an added anti-dusting agent or a colouring substance added to facilitate their identification or for safety reasons, provided that the additions do not render the product particularly suitable for specific use rather than for general use.
- 2.- In addition to dithionites and sulphoxylates, stabilised with organic substances (heading 28.31), carbonates and peroxocarbonates of inorganic bases (heading 28.36), cyanides, cyanide oxides and complex cyanides of inorganic bases (heading 28.37), fulminates, cyanates and thiocyanates, of inorganic bases (heading 28.42), organic products included in heading 28.43 to 28.46 and 28.52 and carbides (heading 28.49), only the following compounds of carbon are to be classified in this Chapter :
 - (a) Oxides of carbon, hydrogen cyanide and fulminic, isocyanic, thiocyanic and other simple or complex cyanogen acids (heading 28.11);
 - (b) Halide oxides of carbon (heading 28.12);
 - (c) Carbon disulphide (heading 28.13);
 - (d) Thiocarbonates, selenocarbonates, tellurocarbonates, selenocyanates, tellurocyanates, tetrathiocyanatodiamminochromates (reineckates) and other complex cyanates, of inorganic bases (heading 28.42);
 - (e) Hydrogen peroxide, solidified with urea (heading 28.47), carbon oxysulphide, thiocarbonyl halides, cyanogen, cyanogen halides and cyanamide and its metal derivatives (heading 28.53) other than calcium cyanamide, whether or not pure (Chapter 31).
- 3.- Subject to the provisions of Note 1 to Section VI, this Chapter does not cover :
 - (a) Sodium chloride or magnesium oxide, whether or not pure, or other products of Section V;
 - (b) Organo-inorganic compounds other than those mentioned in Note 2 above;
 - (c) Products mentioned in Note 2, 3, 4 or 5 to Chapter 31;
 - (d) Inorganic products of a kind used as luminophores, of heading 32.06; glass frit and other glass in the form of powder, granules or flakes, of heading 32.07;

(e) Artificial graphite (heading 38.01); products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades, of heading 38.13; ink removers put up in packings for retail sale, of heading 38.24; cultured crystals (other than optical elements) weighing not less than 2.5 g each, of the halides of the alkali or alkaline-earth metals, of heading 38.24;

(f) Precious or semi-precious stones (natural, synthetic or reconstructed) or dust or powder of such stones (headings 71.02 to 71.05), or precious metals or precious metal alloys of Chapter 71;

(g) The metals, whether or not pure, metal alloys or cermets, including sintered metal carbides (metal carbides sintered with a metal), of Section XV; or

(h) Optical elements, for example, of the halides of the alkali or alkaline-earth metals (heading 90.01).

4.- Chemically defined complex acids consisting of a non-metal acid of sub-Chapter II and a metal acid of sub-Chapter IV are to be classified in heading 28.11.

5.- Headings 28.26 to 28.42 apply only to metal or ammonium salts or peroxy salts.

Except where the context otherwise requires, double or complex salts are to be classified in heading 28.42.

6.- Heading 28.44 applies only to :

(a) Technetium (atomic No. 43), promethium (atomic No. 61), polonium (atomic No. 84) and all elements with an atomic number greater than 84;

(b) Natural or artificial radioactive isotopes (including those of the precious metals or of the base metals of Sections XIV and XV), whether or not mixed together;

(c) Compounds, inorganic or organic, of these elements or isotopes, whether or not chemically defined, whether or not mixed together;

(d) Alloys, dispersions (including cermets), ceramic products and mixtures containing these elements or isotopes or inorganic or organic compounds thereof and having a specific radioactivity exceeding 74 Bq/g (0.002 µCi/g);

(e) Spent (irradiated) fuel elements (cartridges) of nuclear reactors;

(f) Radioactive residues whether or not usable.

The term "isotopes", for the purposes of this Note and of the wording of headings 28.44 and 28.45, refers to :

- individual nuclides, excluding, however, those existing in nature in the monoisotopic state;
- mixtures of isotopes of one and the same element, enriched in one or several of the said isotopes, that is, elements of which the natural isotopic composition has been artificially modified.

7.- Heading 28.53 includes copper phosphide (phosphor copper) containing more than 15 % by weight of phosphorus.

8.- Chemical elements (for example, silicon and selenium) doped for use in electronics are to be classified in this Chapter, provided that they are in forms unworked as drawn, or in the form of cylinders or rods. When cut in the form of discs, wafers or similar forms, they fall in heading 38.18.

Subheading Note.

1.- For the purposes of subheading 2852.10, the expression "chemically defined" means all organic or inorganic compounds of mercury meeting the requirements of paragraphs (a) to (e) of Note 1 to Chapter 28 or paragraphs (a) to (h) of Note 1 to Chapter 29.

GENERAL

Unless the context otherwise requires, Chapter 28 is limited to separate chemical elements and separate chemically defined compounds.

A separate chemically defined compound is a substance which consists of one molecular species (e.g., covalent or ionic) whose composition is defined by a constant ratio of elements and can be represented by a definitive structural diagram. In a crystal lattice, the molecular species corresponds to the repeating unit cell.

The elements of a separate chemically defined compound combine in a specific characteristic proportion determined by the valency and the bonding requirements of the individual atoms. The proportion of each element is constant and specific to each compound and it is therefore said to be stoichiometric.

Small deviations in the stoichiometric ratios can occur because of gaps or insertions in the crystal lattice. These compounds are described as quasi-stoichiometric and are permitted as separate chemically defined compounds provided that the deviations have not been intentionally created.

(A) Chemically defined elements and compounds.

(Note 1)

Separate chemical elements and separate chemically defined compounds containing **impurities**, or **dissolved in water**, remain classified in Chapter 28.

The term " impurities " applies exclusively to substances whose presence in the single chemical compound results solely and directly from the manufacturing process (including purification). The substances may result from any of the factors involved in the process and are principally the following :

- (a) Unconverted starting materials.
- (b) Impurities present in the starting materials.
- (c) Reagents used in the manufacturing process (including purification).
- (d) By-products.

It should be noted, however, that such substances are **not** in all cases regarded as "impurities" permitted under Note 1 (a). When such substances are deliberately left in the product with a view to rendering it particularly suitable for specific use rather than for general use, they are **not** regarded as permissible impurities.

Such elements and compounds are **excluded** from Chapter 28 when they are dissolved in **solvents other than water**, unless the solution constitutes a normal and necessary method of putting up these products adopted solely for reasons of safety or for transport (in which case the solvent must not render the product particularly suitable for some types of use rather than for general use).

Thus, carbon chloride oxides dissolved in benzene, alcoholic solutions of ammonia and colloidal solutions of aluminium hydroxide are **excluded** from this Chapter and fall to be classified in **heading 38.24**. Generally speaking, colloidal dispersions fall in **heading 38.24**, **unless** covered by a more specific heading.

Separate chemically defined elements and compounds as described above, put up with an added **stabiliser** necessary for their preservation or transport, remain classified in this Chapter. For example, hydrogen peroxide stabilised by addition of boric acid remains classified in heading 28.47; but sodium peroxide mixed with catalysts (for production of hydrogen peroxide) is **excluded** from Chapter 28 and is classified in **heading 38.24**.

Products added to certain chemicals to keep them in their original physical state are also to be regarded as stabilisers, **provided** that the quantity added in no case exceeds that necessary to achieve the desired result and that the addition does not alter the character of the basic product and render it particularly suitable for specific use rather than for general use. By application of these provisions **anti-caking agents** may be added to the products of this Chapter. Such products with added **water-repellents** are, on the other hand, **excluded** since such agents modify the original characteristics of the products.

On the same condition that the additions do not render them particularly suitable for specific use rather than for general use, the products of this Chapter may also contain :

- (a) Added anti-dusting agents (e.g., mineral oil added to certain poisonous chemicals to prevent dusting during handling).
- (b) Colouring substances added to facilitate identification or added for safety reasons to dangerous or poisonous chemicals (e.g., lead arsenate of heading 28.42) as a "marker" or warning to those handling the products. Products to which colouring substances have been added for other reasons (e.g., silica gel with cobalt salts added for use as a humidity indicator (**heading 38.24**)) are, however, **excluded**.

**(B) Distinction between the compounds of Chapter 28
and those of Chapter 29.**
(Note 2)

The following is an exhaustive list of compounds containing carbon which are to be classified in Chapter 28, and of the headings in which they are to be classified :

- Heading 28.11 - Oxides of carbon.
Hydrogen cyanide, hydrogen hexacyanoferrate (II) and hydrogen hexacyano-ferrate (III).
Isocyanic, fulminic, thiocyanic, cyanomolybdic and other simple or complex cyanogen acids.
- Heading 28.12 - Halide oxides of carbon.
- Heading 28.13 - Carbon disulphide.
- Heading 28.31 - Dithionites and sulphoxylates, stabilised with organic substances.
- Heading 28.36 - Carbonates and peroxocarbonates, of inorganic bases.
- Heading 28.37 - Cyanides, cyanide oxides and complex cyanides (hexacyanoferrates (II), hexacyanoferates (III), nitrosylpentacyanoferates (II), nitrosylpentacyano-ferrates (III), cyanomanganates, cyanocadmates, cyanochromates, cyano-cobaltates, cyanoniccolates, cyanocuprates, etc.), of inorganic bases.
- Heading 28.42 - Thiocarbonates, selenocarbonates, tellurocarbonates, selenocyanates, telluro-cyanates, tetrathiocyanatodiumaminochromates (reineckates) and other double or complex cyanates, of inorganic bases.
- Headings 28.43 - Inorganic and organic compounds of :
 - to (i) Precious metals.
 - 28.46 (ii) Radioactive elements.
 - (iii) Isotopes.
 - (iv) Rare-earth metals, yttrium or scandium.

- Heading 28.47 - Hydrogen peroxide, solidified with urea, whether or not stabilised.
- Heading 28.49 - Carbides (binary carbides, borocarbides, carbonitrides, etc.), **other than** hydrogen carbides (hydrocarbons).
- Heading 28.52 - Inorganic and organic compounds of mercury, whether or not chemically defined, excluding amalgams
- Heading 28.53 - Carbon oxysulphide.
Thiocarbonyl halides.
Cyanogen and halogen compounds of cyanogen.
Cyanamide and its metal derivatives (**other than** calcium cyanamide, whether or not pure - see Chapter 31).

All other carbon compounds are excluded from Chapter 28.

**(C) Products which remain classified in Chapter 28,
even when they are not separate chemical elements
nor separate chemically defined compounds.**

There are certain exceptions to the rule that this Chapter is limited to separate chemical elements and separate chemically defined compounds. These exceptions include the following products :

- Heading 28.02 - Colloidal sulphur.
- Heading 28.03 - Carbon blacks.
- Heading 28.07 - Oleum.
- Heading 28.08 - Sulphonitric acids.
- Heading 28.09 - Polyphosphoric acids.
- Heading 28.13 - Phosphorus trisulphide.
- Heading 28.18 - Artificial corundum.
- Heading 28.21 - Earth colours containing 70 % or more by weight of combined iron evaluated as Fe₂O₃.
- Heading 28.22 - Commercial cobalt oxides.
- Heading 28.24 - Red lead and orange lead.
- Heading 28.28 - Commercial calcium hypochlorite.
- Heading 28.30 - Polysulphides.
- Heading 28.31 - Dithionites and sulphoxylates, stabilised with organic substances.
- Heading 28.35 - Polyphosphates.
- Heading 28.36 - Commercial ammonium carbonate containing ammonium carbamate.
- Heading 28.39 - Commercial alkali metal silicates.
- Heading 28.42 - Aluminosilicates.
- Heading 28.43 - Colloidal precious metals.
 - Amalgams of precious metals.
 - Inorganic or organic compounds of precious metals.
- Heading 28.44 - Radioactive elements, radioactive isotopes, or compounds (inorganic or organic) and mixtures containing these substances.
- Heading 28.45 - Other isotopes and their compounds (inorganic or organic).
- Heading 28.46 - Compounds, inorganic or organic, of rare-earth metals, of yttrium or of scandium or of mixtures of these metals.
- Heading 28.49 - Carbides.
- Heading 28.50 - Hydrides, nitrides, azides, silicides and borides.
- Heading 28.52 - Inorganic and organic compounds of mercury, excluding amalgams
- Heading 28.53 - Phosphides, liquid air and compressed air. Amalgams **other than** amalgams of precious metals - see under heading 28.43 above.

(D) Exclusion from Chapter 28 of certain separate chemical elements and of certain separate chemically defined inorganic compounds.
(Notes 3 and 8)

Certain separate chemical elements and certain separate chemically defined inorganic compounds are always excluded from Chapter 28, even when they are pure.

Examples are :

- (1) Certain products of **Chapter 25** (i.e., sodium chloride and magnesium oxide).
- (2) Certain inorganic salts of **Chapter 31** (viz : sodium nitrate, ammonium nitrate, double salts of ammonium sulphate and ammonium nitrate, ammonium sulphate, double salts of calcium nitrate and ammonium nitrate, double salts of calcium nitrate and magnesium nitrate, and ammonium dihydrogenorthophosphate and diammonium hydrogenorthophosphate (monoammonium or diammonium phosphates); also potassium chloride, though this may in certain cases fall in **heading 38.24** or **90.01**).
- (3) Artificial graphite of **heading 38.01**.
- (4) Precious or semi-precious stones (natural, synthetic or reconstructed), and dust or powder of such stones of **Chapter 71**.
- (5) Precious metals and base metals, including alloys of such metals, of **Section XIV** or **XV**.

Certain other separate elements or separate chemically defined compounds, which would otherwise have been classified in Chapter 28, may be **excluded** when put up in certain forms, or if they have been subjected to certain treatments which leave their chemical composition unchanged (*).

Examples are :

- (a) Products suitable for therapeutic or prophylactic uses, put up in measured doses or in forms or packings for retail sale (**heading 30.04**).
- (b) Products of a kind used as luminophores (e.g., calcium tungstate) which have been treated to render them luminescent (**heading 32.06**).
- (c) Perfumery, cosmetic or toilet preparations (e.g., alum), put up in packings of a kind sold by retail for such use (**headings 33.03** to **33.07**).
- (d) Products suitable for use as glues or adhesives (e.g., sodium silicate dissolved in water), put up for retail sale as glues or adhesives in packages not exceeding a net weight of 1 kg (**heading 35.06**).
- (e) Photographic products (e.g., sodium thiosulphate), put up in measured portions or put up for retail sale in a form ready for photographic use (**heading 37.07**).
- (f) Insecticides, etc. (e.g., sodium tetraborate) put up as described in **heading 38.08**.
- (g) Products (e.g., sulphuric acid) put up as charges for fire-extinguishers or put up in fire-extinguishing grenades (**heading 38.13**).
- (h) Chemical elements (for example, silicon and selenium) doped for use in electronics, in the form of discs, wafers or similar forms (**heading 38.18**).
- (ij) Ink removers put up in packings for retail sale (**heading 38.24**).
- (k) Halides of the alkali or of the alkaline-earth metals (e.g., lithium fluoride, calcium fluoride, potassium bromide, potassium bromoiodide, etc.), in the form of optical elements (**heading 90.01**) or of cultured crystals weighing not less than 2.5 g each (**heading 38.24**).

(*) These exclusions do not affect the products classifiable in headings 28.43 to 28.46 and 28.52 (see Notes 1 and 2 to Section VI).

(E) Products potentially classifiable in two or more headings of Chapter 28.

Note 1 to Section VI deals with the problems of products potentially classifiable :

- (a) In heading 28.44 or 28.45, and also in some other heading of Chapter 28.
- (b) In heading 28.43, 28.46 or 28.52, and also in some other heading of Chapter 28 (other than heading 28.44 or 28.45).

Chemically defined complex acids consisting of a non-metal acid (of sub-Chapter II) and a metal acid (of sub-Chapter IV) are classified in heading 28.11 (see Note 4 to Chapter 28 and Explanatory Note to heading 28.11).

Except where the context otherwise requires, double or complex inorganic salts are to be classified in heading 28.42 (see Note 5 to Chapter 28 and Explanatory Note to heading 28.42).

Sub-Chapter I

CHEMICAL ELEMENTS

GENERAL

Chemical elements can be divided into two classes, non-metals and metals. In general, this sub-Chapter includes all non-metals at least in some of their forms, whereas numerous metals are classified elsewhere : - precious metals (**Chapter 71** and **heading 28.43**), base metals (**Chapters 72 to 76** and **78 to 81**) and radioactive chemical elements and isotopes (**heading 28.44**) and stable isotopes (**heading 28.45**).

An alphabetical list of the various known elements, indicating the appropriate classification, is given below. Some elements, such as antimony, behave both as metals and as non-metals; attention is drawn to their classification in the Nomenclature.

Element	Symbol	Atomic Number	Classification
Actinium.....	Ac	89	Radioactive element (28.44).
Aluminium.....	Al	13	Base metal (Chapter 76).
Americium.....	Am	95	Radioactive element (28.44).
Antimony.....	Sb	51	Base metal (81.10).
Argon.....	Ar	18	Rare gas (28.04).
Arsenic.....	As	33	Non-metal (28.04).
Astatine.....	At	85	Radioactive element (28.44).
Barium.....	Ba	56	Alkaline-earth metal (28.05).
Berkelium.....	Bk	97	Radioactive element (28.44).
Beryllium.....	Be	4	Base metal (81.12).
Bismuth.....	Bi	83	Base metal (81.06).
Boron.....	B	5	Non-metal (28.04).
Bromine.....	Br	35	Non-metal (28.01).
Cadmium.....	Cd	48	Base metal (81.07).
Caesium.....	Cs	55	Alkali metal (28.05).
Calcium.....	Ca	20	Alkaline-earth metal (28.05).
Californium.....	Cf	98	Radioactive element (28.44).
Carbon.....	C	6	Non-metal (28.03). (But see 38.01 for artificial graphite.)
Cerium.....	Ce	58	Rare-earth metal (28.05).
Chlorine.....	Cl	17	Non-metal (28.01).
Chromium.....	Cr	24	Base metal (81.12).
Cobalt.....	Co	27	Base metal (81.05).
Copper.....	Cu	29	Base metal (Chapter 74).
Curium.....	Cm	96	Radioactive element (28.44).
Dysprosium.....	Dy	66	Rare-earth metal (28.05).
Einsteinium.....	Es	99	Radioactive element (28.44).
Erbium.....	Er	68	Rare-earth metal (28.05).
Europium.....	Eu	63	Rare-earth metal (28.05).
Fermium.....	Fm	100	Radioactive element (28.44).
Fluorine.....	F	9	Non-metal (28.01).
Francium.....	Fr	87	Radioactive element (28.44).
Gadolinium.....	Gd	64	Rare-earth metal (28.05).
Gallium.....	Ga	31	Base metal (81.12).
Germanium.....	Ge	32	Base metal (81.12).
Gold.....	Au	79	Precious metal (71.08).
Hafnium.....	Hf	72	Base metal (81.12).
Helium.....	He	2	Rare gas (28.04).

Element	Symbol	Atomic Number	Classification
Holmium	Ho	67	Rare-earth metal (28.05).
Hydrogen.....	H	1	Non-metal (28.04).
Indium.....	In	49	Base metal (81.12)
Iodine.....	I	53	Non-metal (28.01).
Iridium.....	Ir	77	Precious metal (71.10).
Iron.....	Fe	26	Base metal (Chapter 72).
Krypton.....	Kr	36	Rare gas (28.04).
Lanthanum.....	La	57	Rare-earth metal (28.05).
Lawrencium.....	Lr	103	Radioactive element (28.44).
Lead.....	Pb	82	Base metal (Chapter 78).
Lithium.....	Li	3	Alkali metal (28.05).
Lutetium.....	Lu	71	Rare-earth metal (28.05).
Magnesium.....	Mg	12	Base metal (81.04).
Manganese.....	Mn	25	Base metal (81.11).
Mendelevium.....	Md	101	Radioactive element (28.44).
Mercury.....	Hg	80	Metal (28.05).
Molybdenum.....	Mo	42	Base metal (81.02).
Neodymium.....	Nd	60	Rare-earth metal (28.05).
Neon.....	Ne	10	Rare gas (28.04).
Neptunium.....	Np	93	Radioactive element (28.44).
Nickel.....	Ni	28	Base metal (Chapter 75).
Niobium.....	Nb	41	Base metal (81.12).
Nitrogen.....	N	7	Non-metal (28.04).
Nobelium.....	No	102	Radioactive element (28.44).
Osmium.....	Os	76	Precious metal (71.10).
Oxygen.....	O	8	Non-metal (28.04).
Palladium.....	Pd	46	Precious metal (71.10).
Phosphorus.....	P	15	Non-metal (28.04).
Platinum.....	Pt	78	Precious metal (71.10).
Plutonium.....	Pu	94	Radioactive element (28.44).
Polonium.....	Po	84	Radioactive element (28.44).
Potassium.....	K	19	Alkali metal (28.05).
Praseodymium.....	Pr	59	Rare-earth metal (28.05).
Promethium.....	Pm	61	Radioactive element (28.44).
Protactinium.....	Pa	91	Radioactive element (28.44).
Radium.....	Ra	88	Radioactive element (28.44).
Radon.....	Rn	86	Radioactive element (28.44).
Rhenium.....	Re	75	Base metal (81.12).
Rhodium.....	Rh	45	Precious metal (71.10).
Rubidium.....	Rb	37	Alkali metal (28.05).
Ruthenium.....	Ru	44	Precious metal (71.10).
Samarium.....	Sm	62	Rare-earth metal (28.05).
Scandium.....	Sc	21	Classified with the rare-earth metals (28.05).
Selenium.....	Se	34	Non-metal (28.04).
Silicon.....	Si	14	Non-metal (28.04).
Silver.....	Ag	47	Precious metal (71.06).
Sodium.....	Na	11	Alkali metal (28.05).
Strontium.....	Sr	38	Alkaline-earth metal (28.05).
Sulphur.....	S	16	Non-metal (28.02). (But see 25.03 for crude sulphur).
Tantalum.....	Ta	73	Base metal (81.03).
Technetium.....	Tc	43	Radioactive element (28.44).
Tellurium.....	Te	52	Non-metal (28.04).
Terbium.....	Tb	65	Rare-earth metal (28.05).
Thallium.....	Tl	81	Base metal (81.12).
Thorium.....	Th	90	Radioactive element (28.44).
Thulium.....	Tm	69	Rare-earth metal (28.05).
Tin.....	Sn	50	Base metal (Chapter 80).
Titanium.....	Ti	22	Base metal (81.08).
Tungsten.....	W	74	Base metal (81.01).
Uranium.....	U	92	Radioactive element (28.44).
Vanadium.....	V	23	Base metal (81.12).
Xenon.....	Xe	54	Rare gas (28.04).
Ytterbium.....	Yb	70	Rare-earth metal (28.05).
Yttrium.....	Y	39	Classified with the rare-earth metals (28.05).
Zinc	Zn	30	Base metal (Chapter 79).
Zirconium.....	Zr	40	Base metal (81.09).

28.01 - Fluorine, chlorine, bromine and iodine.

2801.10 - Chlorine

2801.20 - Iodine

2801.30 - Fluorine; bromine

This heading covers the non-metals known as halogens, with the **exception** of astatine (**heading 28.44**).

(A) FLUORINE

Fluorine is a faintly greenish-yellow gas with a pungent odour; it is dangerous to inhale as it irritates the mucous membranes and is corrosive. It is presented under pressure in steel containers; it is a very active element which ignites organic matter - in particular wood, fats and textiles.

Fluorine is used for the preparation of certain fluorides and organo-fluorine derivatives.

(B) CHLORINE

Chlorine is usually obtained by electrolysis of alkali chlorides, especially sodium chloride.

Chlorine is a greenish-yellow gas, suffocating, corrosive, two and a half times as dense as air, slightly soluble in water and readily liquefied. It is usually transported in steel cylinders, tanks, railway tank wagons or barges.

Chlorine destroys colouring and organic matter. It is used for bleaching vegetable (but not animal) fibres, and in the preparation of wood pulp. Because of its disinfecting and antiseptic properties, it is also used for sterilising (chlorinating) water. It is used in gold, tin and cadmium metallurgy, in the manufacture of hypochlorites, metal chlorides and carbonyl chloride, in organic syntheses (e.g., synthetic dyes, artificial waxes, chlorinated rubber).

(C) BROMINE

Bromine can be obtained by the action of chlorine on the alkaline bromides contained in saline mother-liquors, or by electrolysing bromides.

It is a very dense (3.18 at 0 °C), corrosive, reddish or dark brown liquid which, even when cold, gives off suffocating red fumes irritating to the eyes. It inflames the skin, turning it yellow, and ignites organic substances such as sawdust. It is presented in glass or pottery containers. It is slightly soluble in water. The heading **excludes** solutions of bromine in acetic acid (**heading 38.24**).

It is used in the manufacture of medicaments (e.g., sedatives), dyes (e.g., eosins, brominated derivatives of indigo), photographic chemicals (silver bromide), lachrymatory products (bromo-acetone), in metallurgy, etc.

(D) IODINE

Iodine is extracted either from the mother-liquors of natural sodium nitrates by treatment with sulphur dioxide or sodium hydrogen sulphite, or from marine algae by drying, incinerating and chemical treatment of the ash.

It is a very dense solid (specific gravity 4.95 at 0 °C), with an odour reminiscent of both chlorine and bromine; it is dangerous to inhale. It sublimes at room temperature and turns starch-paste blue. When impure, it occurs in specks or as a coarse powder. When purified by sublimation, it takes the form of brilliant, greyish flakes or crystals with a metallic glint; it is then usually put up in glass.

It is used in medicine, and also in the manufacture of photographic chemicals (sodium iodide), dyes (e.g., erythrosines) and medicaments, as a catalyst in organic synthesis, as a reagent, etc.

28.02 - Sulphur, sublimed or precipitated; colloidal sulphur.

(A) SUBLIMED OR PRECIPITATED SULPHUR

The sulphur in these two categories is usually about 99.5 % pure.

Sublimed sulphur, or **flowers of sulphur**, is obtained by slow distillation of crude or impure sulphur, followed by condensation **in the solid form** (or sublimation) as fine, very light particles. It is chiefly used in viticulture, in the chemical industry or for vulcanising high-grade rubber.

This heading also includes “ washed sublimed sulphur ”, treated with ammonia solution to eliminate the sulphur dioxide; this product is used in medicine.

The **precipitated sulphur** classified here is always obtained by precipitating a solution of a sulphide, or of an alkaline or alkaline-earth polysulphide, with hydrochloric acid. It is more finely divided and paler yellow than sublimed sulphur; its odour is somewhat similar to that of hydrogen sulphide and it deteriorates with age. Its uses are almost entirely medicinal.

The precipitated sulphur of this heading must not be confused with certain “ recovered ” (triturated or micronised) sulphurs sometimes described as “ precipitated ” but classified in **heading 25.03**.

(B) COLLOIDAL SULPHUR

Colloidal sulphur is obtained by the action of hydrogen sulphide on a solution of sulphur dioxide containing gelatin. It may also be obtained by the action of mineral acid on sodium thiosulphate, or by cathodic pulverisation. Colloidal sulphur is a white powder which forms an emulsion with water; however it can be preserved in this state only if a protective colloid (albumin or gelatin) is added, and even then it can be kept for only a limited time. The heading includes this prepared colloidal solution. Like all colloidal dispersions, sulphur dispersions have a large surface for adsorption and can take up colouring matter; they are also very active antiseptics used internally in medicine.

The heading **excludes** unrefined sulphur as obtained by the Frasch process and refined sulphur, even though they are often very pure (**heading 25.03**).

28.03 - Carbon (carbon blacks and other forms of carbon not elsewhere specified or included).

Carbon is a solid non-metal.

This heading covers the following categories of carbon.

Carbon black results from the incomplete combustion or cracking (by heating, by electric arc or by electric sparks) of organic substances rich in carbon, such as :

- (1) Natural gases such as methane, anthracenic gases (i.e., gases carburetted with anthracene) and acetylene. Acetylene black, a very fine and pure product, is obtained by the sudden decomposition, initiated by an electric spark, of compressed acetylene.
- (2) Naphthalene, resins, oils (lamp black).

Carbon black may also be described as channel black or furnace black, according to the method of production.

Carbon black may contain oily impurities.

Carbon black is used as a pigment for the manufacture of paint, printing ink, shoe-polish, etc., in making carbon paper, and as a reinforcing agent in the rubber industry.

This heading **excludes** :

- (a) Natural graphite (**heading 25.04**).
- (b) Natural carbons in the form of solid fuels (anthracite, coal, lignite); coke, agglomerated fuels and gas carbon (**Chapter 27**).
- (c) Certain black mineral colouring matter of **heading 32.06** (e.g., alu black, shale black, silica black).
- (d) Artificial graphite; colloidal or semi-colloidal graphite (e.g., **heading 38.01**).
- (e) Activated carbon and animal black (**heading 38.02**).
- (f) Wood charcoal (**heading 44.02**).
- (g) Crystalline carbon in the form of diamonds (**headings 71.02 and 71.04**).

28.04 - Hydrogen, rare gases and other non-metals.

2804.10 - Hydrogen

- Rare gases :

2804.21 -- Argon

2804.29 -- Other

2804.30 - Nitrogen

2804.40 - Oxygen

2804.50 - Boron; tellurium

- Silicon :

2804.61 -- Containing by weight not less than 99.99 % of silicon

2804.69 -- Other

2804.70 - Phosphorus

2804.80 - Arsenic

2804.90 - Selenium

(A) HYDROGEN

Hydrogen is obtained by electrolysing water, or from water-gas, coke-oven gas or hydrocarbons.

It is generally regarded as a non-metal. It is presented under pressure in thick steel cylinders.

It is used for hydrogenating oils (preparation of solid fats), for cracking petroleum products, in the synthesis of ammonia, for cutting or welding metals (oxy-hydrogen blow lamps), etc.

The heading **excludes** deuterium (stable hydrogen isotope) which falls in **heading 28.45**, and tritium (radioactive hydrogen isotope) which falls in **heading 28.44**.

(B) RARE GASES

The term " rare gases " (inert gases) applies to the elements listed below. They are remarkable for their lack of chemical affinity and for their electrical properties - particularly that of emitting coloured rays (used, for example, in neon signs) under the action of high voltage discharges.

- (1) **Helium** (non-inflammable, used, e.g., for inflating balloons).
- (2) **Neon** (gives a rosy orange-yellow light or, combined with mercury vapour, " daylight " lighting).
- (3) **Argon** (a colourless and odourless gas used to provide an inert atmosphere in electric lamp bulbs).
- (4) **Krypton** (same use as argon, or to give a pale violet light).

(5) **Xenon** (gives a blue light).

Rare gases are obtained by fractionating liquid air, or also (in the case of helium) from certain natural gases. They are presented under pressure.

Radon is a radioactive inert gas of **heading 28.44** formed by the radioactive decay of radium.

(C) OTHER NON-METALS

The other non-metals covered by this heading are :

(1) **Nitrogen.**

Nitrogen is a gas which neither burns nor supports combustion, but extinguishes flames. It is obtained by fractional distillation of liquid air, and is presented under pressure in steel cylinders.

Nitrogen is chiefly used for the manufacture of ammonia and calcium cyanamide, but is also used to provide an inert atmosphere in electric lamp bulbs, etc.

(2) **Oxygen.**

This is a combustion-supporting gas, chiefly obtained by fractional distillation of liquid air.

It is presented under pressure in steel cylinders, or sometimes as a liquid in double-walled containers.

Compressed oxygen is used in oxyhydrogen and oxyacetylene blow lamps for welding (autogenous welding) or cutting metals such as iron. It is also used in iron or steel metallurgy and in medicine (inhalations).

This heading also includes **ozone**, an allotropic form of oxygen obtained by the action of electric sparks or discharges. It is used for sterilising water (ozonisation), for the oxidation of drying oils, for bleaching cotton, as an antiseptic and for therapeutic purposes.

(3) **Boron.**

Boron is a chestnut-coloured solid generally in powder form. It is used in metallurgy, and for the manufacture of heat regulators and highly sensitive thermometers.

Because of its very high rate of absorption of slow neutrons, boron is also used, pure or alloyed with steel, for the manufacture of mobile control rods for nuclear reactors.

(4) **Tellurium.**

A solid (specific gravity 6.2), amorphous or crystalline. It is a relatively good conductor of heat and electricity, and has certain metallic properties. It is used in certain alloys (e.g., tellurium-lead alloys), and also as a vulcanising agent.

(5) **Silicon.**

Silicon is obtained almost exclusively by carbothermal reduction of silicon dioxide using electric arc-furnaces. It is a poor conductor of heat and electricity, is harder than glass, and is put up as a chestnut-coloured powder or, more often, in shapeless lumps. It crystallises as grey needles with a metallic lustre.

Silicon is one of the most important materials used in electronics. Very pure silicon, obtained by, for example, crystal pulling, may be in forms unworked as drawn, or in the form of cylinders or rods; when doped with boron, phosphorus, etc., it is used for the manufacture of, for example, diodes, transistors and other semi-conductor devices and solar cells.

Silicon is also used in metallurgical industries (e.g., ferrous or aluminium alloys), and in chemistry for the preparation of silicon compounds (e.g., silicon tetrachloride).

(6) **Phosphorus.**

Phosphorus is a soft flexible solid obtained by treating mineral phosphates mixed with sand and carbon in an electric furnace.

There are two main varieties of phosphorus :

- (a) **“ White ” phosphorus**, transparent and yellowish, toxic, dangerous to handle, highly inflammable. This is put up as moulded rods packed in water-filled containers of black glass, stoneware or, more often, metal; these containers should not be exposed to frost.
- (b) **Red phosphorus**, known as “ amorphous ”, but which can actually be crystallised. This is an opaque solid, non-toxic, non-phosphorescent, denser and less active than white phosphorus. Red phosphorus is used for the manufacture of match compounds, in pyrotechnics, or as a catalyst (e.g., in the chlorination of acyclic acids).

Certain medicaments contain phosphorus (e.g., phosphorised cod liver oil). It is also used as rat poison, or in the preparation of phosphoric acids, phosphinates (hypophosphites), calcium phosphide, etc.

(7) **Arsenic.**

Arsenic (regulus of arsenic) is a solid extracted from natural arsenical pyrites.

It exists in two main forms :

- (a) Common, so-called “ metallic ” arsenic, in brilliant, steelgrey crystals, brittle, insoluble in water.
- (b) Yellow arsenic, crystalline, rather unstable.

Arsenic is used in the manufacture of arsenic disulphide, buck-shot, hard bronzes and various other alloys (of tin, copper, etc.).

(8) **Selenium.**

Selenium, which is rather similar to sulphur, exists in several forms :

- (a) Amorphous selenium, in reddish flakes (flowers of selenium).
- (b) Vitreous selenium, a poor conductor of heat and electricity. It has a brilliant fracture, brown or reddish.
- (c) Crystallised selenium, grey or red crystals. It is a relatively good conductor of heat and electricity, especially when exposed to light. It is used in the manufacture of photoelectric cells and, when doped, of semi-conductor devices, in photography, in powder form (red selenium), for the manufacture of rubber, of special lenses, etc.

The heading **excludes** selenium in colloidal suspension (used in medicine) (**Chapter 30**).

In the Nomenclature, antimony is classified as a metal (**heading 81.10**).

Some of the non-metals in this group (for example, silicon and selenium) may be doped with elements such as boron, phosphorus, etc., in a proportion generally of the order of one part per million, with a view to their use in electronics. They are classified in this heading **provided** that they are in forms unworked as drawn, or in the form of cylinders or rods. When cut in the form of discs, wafers or similar forms, they are classified in **heading 38.18**.

28.05 - Alkali or alkaline-earth metals; rare-earth metals, scandium and yttrium, whether or not intermixed or interalloyed; mercury.

- Alkali or alkaline-earth metals :

2805.11 -- Sodium

2805.12 -- Calcium

2805.19 -- Other

2805.30 - Rare-earth metals, scandium and yttrium whether or not intermixed or interalloyed

2805.40 - Mercury

(A) ALKALI METALS

The five alkali metals are soft and rather light. They decompose cold water; they deteriorate in air, forming hydroxides.

(1) Lithium.

This is the lightest (specific gravity 0.54) and hardest of the group. It is kept in mineral oil or inert gases.

Lithium helps to improve the qualities of metals, and is used in various alloys (e.g., anti-friction alloys). Because of its great affinity for other elements, it is also used, *inter alia*, to obtain other metals in the pure state.

(2) Sodium.

A solid (specific gravity 0.97) with a metallic lustre, readily tarnishing after cutting. It is preserved in mineral oil or in airtight welded tins.

Sodium is obtained by electrolysing molten sodium chloride or sodium hydroxide.

It is used in the manufacture of sodium peroxide ("dioxide"), sodium cyanide, sodamide, etc., the indigo industry, the manufacture of explosives (chemical primers and fuses), the polymerisation of butadiene, anti-friction alloys, or titanium or zirconium metallurgy.

The heading **excludes** sodium amalgam (**heading 28.53**).

(3) Potassium.

A silvery-white metal (specific gravity 0.85), which can be cut with an ordinary knife. It is preserved in mineral oil or in sealed ampoules.

Potassium is used for the preparation of certain photoelectric cells, and in anti-friction alloys.

(4) Rubidium.

A silvery-white solid (specific gravity 1.5), more fusible than sodium. It is preserved in sealed ampoules or in mineral oil.

Like sodium, it is employed in anti-friction alloys.

(5) Caesium.

A silvery-white or yellowish metal (specific gravity 1.9), which ignites on contact with air; the most readily oxidising metal; presented in sealed ampoules or in mineral oil.

The radioactive alkali metal francium is excluded (**heading 28.44**).

(B) ALKALINE-EARTH METALS

The three alkaline-earth metals are malleable and decompose cold water fairly readily; they deteriorate in damp air.

(1) Calcium.

Obtained by the alumino thermal reduction of calcium oxide or by electrolysing molten calcium chloride. It is a white metal (specific gravity 1.57), used in the purification of argon, the refining of copper or steel, the manufacture of zirconium, calcium hydride (hydrolith), anti-friction alloys, etc.

(2) Strontium.

White or pale yellow metal, ductile (specific gravity 2.5).

(3) Barium.

White metal (specific gravity 4.2); used in certain anti-friction alloys and in the preparation of getters for vacuum tubes (**heading 38.24**).

This heading **does not include** radium, a radioactive element (**heading 28.44**), magnesium (**heading 81.04**), or beryllium (**heading 81.12**); these all resemble alkaline-earth metals in certain respects.

(C) RARE-EARTH METALS; SCANDIUM AND YTTRIUM, WHETHER OR NOT INTERMIXED OR INTERALLOYED

Rare-earth metals (the term "rare-earth" applies to their oxides) or lanthanons comprise the elements with atomic numbers (*) from 57 to 71 in the periodic system, i.e.:

Cerium group	Terbium group	Erbium group
57 Lanthanum	63 Europium	66 Dysprosium
58 Cerium	64 Gadolinium	67 Holmium
59 Praseodymium	65 Terbium	68 Erbium
60 Neodymium		69 Thulium
62 Samarium		70 Ytterbium
		71 Lutetium

Promethium (element 61), which is radioactive, is classified in **heading 28.44**.

The rare-earth metals are generally greyish or yellowish, and ductile or malleable.

(*) The atomic number of an element is the total number of orbital electrons contained in an atom of that element.

Cerium, the most important of the group, is obtained from monazite (rare-earth phosphate) or thorite (rare-earth silicate), after the removal of thorium. Cerium is obtained by metallothermic reduction of the halides using calcium or lithium as the reductant or by electrolysis of the fused chloride. It is a grey ductile metal, a little harder than lead, and gives off sparks when rubbed on rough surfaces.

Lanthanum, which exists in the impure state in ceric salts, is used in the manufacture of blue glass.

This heading also covers **scandium** and **yttrium** which resemble the rare-earth metals quite closely - **scandium** in addition resembles the metals of the iron group. These two metals are extracted from the ore thortveitite, a silicate of scandium containing yttrium and other elements.

These elements remain classified here whether or not intermixed or interalloyed. For instance, the heading covers " Mischmetal ", which is an alloy containing 45 to 55 % cerium, 22 to 27 % lanthanum, other lanthanons, yttrium and various impurities (up to 5 % iron, traces of silicon, calcium, aluminium). " Mischmetal " is used mainly in metallurgy and for the manufacture of lighter flints. When alloyed with more than 5 % iron or with magnesium or other metals it falls elsewhere (e.g., if it has the character of a pyrophoric alloy, in **heading 36.06**).

The heading **excludes** the salts and compounds of rare-earth metals, of yttrium and of scandium (**heading 28.46**).

(D) MERCURY

Mercury (quicksilver) is the only metal which is liquid at room temperature.

It is obtained by roasting natural mercury sulphide (cinnabar) and is separated from the other metals contained in the ore (lead, zinc, tin, bismuth) by filtration, distillation in a vacuum, and treatment with dilute nitric acid.

Mercury is a very brilliant silver-coloured liquid, heavy (specific gravity 13.59), toxic and liable to attack precious metals. At room temperature, pure mercury is unaffected by exposure to air, but the impure metal takes on a coating of brownish mercuric oxide. Mercury is presented in special iron containers (" flasks ").

Mercury is used for preparing the amalgams of heading 28.43 or 28.53. It is used in gold or silver metallurgy, in the gold- or silver-plating industries, and in the manufacture of chlorine, sodium hydroxide, mercury salts, vermillion or fulminates. It is also used for making mercury vapour lamps and in various physical instruments, in medicine, etc.

Sub-Chapter II

INORGANIC ACIDS AND INORGANIC OXYGEN COMPOUNDS OF NON-METALS

GENERAL

Acids contain hydrogen which can be wholly or partly replaced by metals (or by ions with analogous properties, e.g., the ammonium ion (NH_4^+)) as a result salts are formed. Acids react with bases to form salts, and with alcohols to form esters. In the liquid state or in solution, they are electrolytes which produce hydrogen at the cathode. When one or more molecules of water are eliminated from those acids containing oxygen, anhydrides are obtained. Most oxides of non-metals are anhydrides.

This sub-Chapter covers **inorganic oxygen compounds of non-metals** (anhydrides and other), and also **inorganic acids, the anode radical of which is a non-metal**.

On the other hand it **excludes** anhydrides and acids formed, respectively, by metal oxides or hydroxides; these generally fall in **sub-Chapter IV** (e.g., metal oxides, hydroxides and peroxides, such as acids or anhydrides of chromium, molybdenum, tungsten and vanadium). In certain cases, however, they fall elsewhere, e.g., in **heading 28.43** (compounds of precious metals), **heading 28.44** or **28.45** (compounds of radioactive elements and isotopes) or **heading 28.46** (compounds of rare-earth metals, of scandium or yttrium).

Oxygen compounds of hydrogen are also **excluded** and are classified under **heading 22.01** (water), **heading 28.45** (heavy water), **heading 28.47** (hydrogen peroxide) or **heading 28.53** (distilled and conductivity water and water of similar purity, including water treated with ion-exchange media).

28.06 - Hydrogen chloride (hydrochloric acid); chlorosulphuric acid.

2806.10 - Hydrogen chloride (hydrochloric acid)

2806.20 - Chlorosulphuric acid

(A) HYDROGEN CHLORIDE (HYDROCHLORIC ACID)

Hydrogen chloride (HCl) is a colourless fuming gas with a suffocating odour, obtained by the action of hydrogen (or of water and coke) on chlorine, or by the action of sulphuric acid on sodium chloride.

It is easily liquefied under pressure and very soluble in water. It is presented under pressure in liquid form in steel cylinders. It is also presented in concentrated aqueous solutions (usually 28 to 38 %) (hydrochloric acid, muriatic acid, spirits of salt) in glass or earthenware containers or in rubber-lined tank wagons or tank trucks. These pungent-smelling solutions are yellowish if the product contains impurities (ferric chloride, arsenic, sulphur dioxide, sulphuric acid), and colourless if pure. The concentrated solutions give off white fumes in damp air.

Hydrochloric acid has many uses, e.g., pickling iron, zinc or other metals, extracting gelatin from bones, purifying animal black, preparing metal chlorides, etc. Hydrogen chloride gas is often employed in organic syntheses (e.g., in the manufacture of chloroprene, vinyl chloride, artificial camphor, rubber hydrochloride).

(B) CHLOROSULPHURIC ACID (CHLOROSULPHONIC ACID)

Chlorosulphuric acid, commercially designated as chlorosulphonic acid ("sulphuric chlorohydrin") and having the chemical formula ClSO_2OH , results from the dry combination of hydrogen chloride with sulphur trioxide or oleum.

It is a highly corrosive, colourless or brownish liquid with an irritating odour; it fumes in a humid atmosphere and decomposes on contact with water or if heated.

It is used in organic syntheses (manufacture of saccharin, thioindigo, indigosols, etc.).

The heading **excludes** hypochlorous, chloric or perchloric acids (**heading 28.11**). The heading also excludes sulphur dichloride dioxide (sulphuryl chloride) (**heading 28.12**), which is sometimes erroneously referred to as "chlorosulphuric acid".

28.07 - Sulphuric acid; oleum.

(A) SULPHURIC ACID

Sulphuric acid (H_2SO_4) is mainly obtained by passing oxygen and sulphur dioxide over a catalyst (platinum, ferric oxide, vanadium pentoxide, etc.). It is freed from impurities (nitrogen compounds, arsenical or seleniferous products, lead sulphate) by treatment with hydrogen sulphide or ammonium sulphide.

Sulphuric acid is a very strong corrosive. It is a dense, oily liquid, colourless (if it does not contain impurities) or yellow or brown (in other cases). It reacts violently on contact with water and destroys the skin and most organic substances by carbonising them.

Commercial sulphuric acid contains between 77 and 100 % H_2SO_4 . It is presented in containers or carboys of glass, in steel drums, tank trucks, railway tank wagons or tank ships.

This acid is used in a great number of industries : it is used in particular in the preparation of fertilisers, explosives and inorganic pigments and, *inter alia*, in the petroleum and steel industries.

(B) OLEUM

Oleum (fuming sulphuric acid) is sulphuric acid charged with an excess (up to 80 %) of sulphur trioxide. Oleums can be liquid or solid, very brown in colour; they react violently with water, attack the skin and clothing, give off dangerous fumes (in particular, free sulphur trioxide). They are presented in glass, earthenware or sheet iron containers.

Oleum is largely used in sulphonation reactions in organic chemistry (preparation of naphthalenesulphonic acid, hydroxyanthraquinone, thioindigo, alizarin derivatives, etc.).

The heading **does not include** :

- (a) Chlorosulphuric acid ("sulphuric chlorhydrin") and sulphonitric acid (**headings 28.06 and 28.08**, respectively).
- (b) Sulphur trioxide, hydrogen sulphide, peroxosulphuric (persulphuric) acids, sulphamic acid and the mineral acids of the thionic series (polythionic acids) (**heading 28.11**).
- (c) Thionyl or sulphuryl chlorides (**heading 28.12**).

28.08 - Nitric acid; sulphonitric acids.

(A) NITRIC ACID

Nitric acid (HNO_3) is mainly obtained by oxidising ammonia in the presence of a catalyst (platinum, iron, chromium, bismuth or manganese oxides, etc.). Alternatively, nitrogen and oxygen may be directly combined in an electric-arc furnace and the resulting nitric oxide oxidised. It can also be prepared by the action of sulphuric acid (alone or associated with sodium disulphate) on natural sodium nitrate; the impurities (sulphuric or hydrochloric acids, nitrous fumes) are eliminated by distillation and hot air.

Nitric acid is a colourless or yellowish toxic liquid. In concentrated form (fuming nitric acid), it gives off clouds of yellowish nitrous fumes. It attacks the skin and destroys organic matter; it is a powerful oxidising agent. It is presented in glass or earthenware carboys or aluminium containers.

Its uses include the manufacture of nitrates (of silver, mercury, lead, copper, etc.), organic dyes, explosives (nitroglycerol, collodion cotton, trinitrotoluene, picric acid, mercury fulminate, etc.); the pickling of metals (especially for pickling cast iron); copperplate engraving; gold or silver refining.

(B) SULPHONITRIC ACIDS

Sulphonitric acids are mixtures in definite proportions (e.g., equal parts) of concentrated nitric and sulphuric acids. They are highly corrosive, viscous liquids, generally presented in sheet-iron drums.

They are used, in particular, for nitrating organic compounds in the synthetic dyestuffs industry, and in the manufacture of nitrocellulose and explosives.

The heading **does not cover** :

- (a) Aminosulphonic acid (sulphamic acid) (**heading 28.11**) (not to be confused with the sulphonitric acids above).
- (b) Hydrogen azide, nitrous acid and the various oxides of nitrogen (also **heading 28.11**).

28.09 - Diphosphorus pentaoxide; phosphoric acid; polyphosphoric acids, whether or not chemically defined.

2809.10 - Diphosphorus pentaoxide

2809.20 - Phosphoric acid and polyphosphoric acids

This heading covers diphosphorus pentaoxide, phosphoric acid (orthophosphoric acid or common phosphoric acid), pyrophosphoric (diphosphoric) acid, metaphosphoric and other polyphosphoric acids.

(A) DIPHOSPHORUS PENTAOXIDE

Diphosphorus pentaoxide (phosphorus (V) oxide, phosphorus pentoxide, phosphoric anhydride) (P_2O_5) is obtained by combustion, in dry air, of phosphorus extracted from natural phosphates. It is a very corrosive white powder, absorbs water avidly, and is transported in airtight packings. It is used for drying gases, and in organic synthesis.

Diphosphorus pentaoxide exists in crystalline, amorphous or vitreous form. These three varieties mixed together give "phosphoric snow", classified here.

(B) PHOSPHORIC ACID

Phosphoric acid (orthophosphoric acid or common phosphoric acid) (H_3PO_4) is obtained by the action of sulphuric acid on natural tricalcium phosphate. The commercial acid thus prepared contains as impurities diphosphorus pentaoxide, calcium dihydrogenorthophosphate, sulphur trioxide, sulphuric acid, fluorosilicic acid, etc. Pure phosphoric acid is obtained by controlled hydration of diphosphorus pentaoxide.

Phosphoric acid may be in the form of deliquescent prismatic crystals, but, as it is difficult to preserve in the solid state, it is usually put up in aqueous solutions (e.g., 65 %, 90 %). The concentrated solution, which remains supersaturated at room temperature, is sometimes known as "syrupy phosphoric acid".

Phosphoric acid is used to prepare concentrated (triple) superphosphates; it is also employed in the textile industries and as a pickling (rust-removing) agent.

Phosphoric acid by condensation at high temperature gives rise to several polymeric acids : pyrophosphoric (diphosphoric) acid, metaphosphoric acids and other polyphosphoric acids.

(C) POLYPHOSPHORIC ACIDS

(I) Acids characterised by alternating P-O-P atoms are classified here.

They may be derived formally by condensing two or more molecules of orthophosphoric acid with elimination of the elements of water. In this way, a series of linear acids of general formula $H_{n+2}P_nO_{3n+1}$, where n is 2 or more, and a cyclic series of general formula $(HPO_3)_n$, where n is 3 or more, can be generated.

- (1) Pyrophosphoric acid (diphosphoric acid, $H_4P_2O_7$) is formed by controlled heating of orthophosphoric acid. It is unstable in moist air and readily reconverts to the orthoacid.

- (2) Metaphosphoric acids. These are the cyclic acids exemplified by **cyclo**-triphosphoric acid ($\text{HPO}_3)_3$ and **cyclo**-tetraphosphoric acid ($\text{HPO}_3)_4$, which occur as minor components of mixed polyphosphoric acids containing more than 86 % P_2O_5 . Glacial polyphosphoric acid (commercial metaphosphoric acid) is a non-chemically defined mixture of polyphosphoric acids (mainly linear), which may also contain sodium salts thereof. Such mixtures, which are classified here, occur as vitreous masses, volatilising at red heat and are uncrySTALLisable.

They are highly absorbent of water and are used for drying gases.

- (3) Other polyphosphoric acids of the P-O-P type. These are normally mixtures, marketed under the names "polyphosphoric" or "superphosphoric" acids, which contain higher members of the series such as triphosphoric acid ($\text{H}_5\text{P}_3\text{O}_{10}$) and tetraphosphoric acid ($\text{H}_6\text{P}_4\text{O}_{13}$). These mixtures are also classified here.

(II) Other polyphosphoric acids.

This part includes, *inter alia*, hypophosphoric acid (diphosphoric (IV) acid) ($\text{H}_4\text{P}_2\text{O}_6$). This compound is in the form of a crystalline dihydrate which must be kept in a dry place. It is more stable in weak solutions.

The heading **does not include** :

- (a) Other phosphorus acids and anhydrides (phosphonic acid and its anhydrides, phosphinic acid) (**heading 28.11**).
- (b) Hydrogen phosphides (**heading 28.53**).

28.10 - Oxides of boron; boric acids.

(A) OXIDES OF BORON

Diboron trioxide (Boron sesquioxide) (B_2O_3) exists as transparent vitreous masses, crystals or white flakes.

It has been used for making synthetic precious or semi-precious stones (corundum, sapphire, etc.) by action on volatile metal fluorides.

The heading also includes all other oxides of boron.

(B) BORIC ACIDS

Boric acid (orthoboric acid) (H_3BO_3) is obtained either by acid decomposition of natural borates, or by physico-chemical treatment of crude boric acid.

It exists in the form of powder or small scales, micaceous flakes or vitrified lumps, with transparent edges, ash-grey or bluish (crystallised acid). It is odourless, greasy to the touch.

Its uses include : as an antiseptic (boracic water); for the manufacture of borosilicate glass (low coefficient of expansion), vitrifiable compounds, Guignet's green (hydrated chromic oxide), artificial borates (borax), hydroxy- and amino-anthraquinones; for impregnating candle wicks; for fire-proofing cloth.

Crude natural boric acid falls in **heading 25.28** when containing not more than 85 % of H_3BO_3 , calculated on the dry weight; when the H_3BO_3 content exceeds 85 %, the acid is classified in this heading. Metaboric acid (HBO_2)_n is also classified here.

The heading **does not include** :

- (a) Tetrafluoroboric acid (fluoroboric acid) (**heading 28.11**).
- (b) Glyceroboric acid (**heading 29.20**).

28.11 - Other inorganic acids and other inorganic oxygen compounds of non-metals.

- Other inorganic acids :

2811.11 -- Hydrogen fluoride (hydrofluoric acid)

2811.12 -- Hydrogen cyanide (hydrocyanic acid)

2811.19 -- Other

- Other inorganic oxygen compounds of non-metals :

2811.21 -- Carbon dioxide

2811.22 -- Silicon dioxide

2811.29 -- Other

This heading covers mineral acids and anhydrides and other oxides of non-metals. The most important are listed below according to their non-metal component (*) :

(A) COMPOUNDS OF FLUORINE

- (1) **Hydrogen fluoride** (HF). Obtained by the action of sulphuric acid on natural calcium fluoride (fluorite) or on cryolite. It is purified by treatment with potassium carbonate or by distillation (it sometimes contains small quantities of silicates and of fluorosilicic acid as impurities). In the anhydrous state, hydrogen fluoride is an extremely hygroscopic liquid (boiling point 18/20 °C); it fumes in a humid atmosphere. In the anhydrous state and in concentrated solution (hydrofluoric acid) it burns deeply into the skin and carbonises organic matter. It is presented in metal bottles lined with lead, gutta-percha or ceresine wax, or in rubber or plastic containers; the very pure acid is kept in silver flasks.

Its uses include etching on glass, manufacturing ashless filter paper, preparation of tantalum, of fluorides, scouring and pickling foundry pieces, in organic synthesis, or as a control in fermenting processes.

- (2) **Fluoroacids**. These include :

(a) **Tetrafluoroboric acid** (fluoroboric acid) (HBF_4).

(b) **Hexafluorosilicic acid** (fluorosilicic acid) (H_2SiF_6), e.g., in aqueous solutions obtained as by-products in the manufacture of superphosphates, or from silicon fluorides. It is used for the electrolytic refining of tin and lead, for preparing fluorosilicates, etc.

(B) COMPOUNDS OF CHLORINE

The most important of these compounds are powerful oxidising and chlorinating agents, used in bleaching and in organic synthesis. They are, as a rule, unstable. They include :

- (1) **Hypochlorous acid** (HClO). A product dangerous to inhale, exploding on contact with organic matter. The gas is presented in aqueous solutions, yellow or occasionally reddish.

(*) In the following order : fluorine, chlorine, bromine, iodine, sulphur, selenium, tellurium, nitrogen, phosphorus, arsenic, carbon, silicon.

- (2) **Chloric acid** (HClO_3). This acid exists only as colourless or yellowish aqueous solutions.
- (3) **Perchloric acid** (HClO_4). This product, more or less highly concentrated, gives various hydrates. It attacks the skin. Used in analyses.

(C) COMPOUNDS OF BROMINE

- (1) **Hydrogen bromide** (HBr). A colourless gas with a strong, pungent odour. It may be put up under pressure, or in the form of aqueous solutions (hydrobromic acid) which decompose slowly in the air (especially under the action of light). Hydrobromic acid is used to prepare bromides and in organic synthesis.
- (2) **Bromic acid** (HBrO_3). Exists only in aqueous solutions; used in organic synthesis.

(D) COMPOUNDS OF IODINE

- (1) **Hydrogen iodide** (HI). A colourless, suffocating gas, readily decomposed. It is presented in corrosive, aqueous solutions (hydriodic acid) which fume in damp air when concentrated. Used in organic synthesis as a reducing agent or as a medium for fixing iodine.
- (2) **Iodic acid** (HIO_3) and its anhydride (I_2O_5), prismatic crystals or in aqueous solutions. Used in medicine or as an absorbent agent in gas masks.
- (3) **Periodic acid** ($\text{HIO}_4 \cdot 2\text{H}_2\text{O}$). Similar properties to iodic acid.

(E) SULPHUR COMPOUNDS

- (1) **Hydrogen sulphide** (H_2S). A highly toxic, colourless gas with the foetid odour of rotten eggs. Presented under pressure in steel cylinders or in aqueous solution (hydrosulphuric acid). It is used in analysis, for purifying sulphuric or hydrochloric acids, for obtaining sulphur dioxide or regenerated sulphur, etc.
- (2) **Peroxosulphuric acids** (persulphuric acids), presented in crystalline form :
 - (a) Peroxodisulphuric acid ($\text{H}_2\text{S}_2\text{O}_8$) and its anhydride (S_2O_7).
 - (b) Peroxomonosulphuric acid (Caro's acid) (H_2SO_5), extremely hygroscopic; a powerful oxidising agent.
- (3) **Thionic acids**. These exist only in aqueous solution : dithionic acid ($\text{H}_2\text{S}_2\text{O}_6$); trithionic acid ($\text{H}_2\text{S}_3\text{O}_6$); tetrathionic acid ($\text{H}_2\text{S}_4\text{O}_6$); pentathionic acid ($\text{H}_2\text{S}_5\text{O}_6$).
- (4) **Aminosulphonic acid** (sulphamic acid) ($\text{SO}_2(\text{OH})\text{NH}_2$). Obtained by dissolving urea in sulphuric acid, sulphur trioxide or oleum; crystalline, slightly soluble in water but readily soluble in alcohol. Used for the manufacture of fire-proof textile dressings, in tanning and electroplating and in organic synthesis.
- (5) **Sulphur dioxide** (SO_2). Obtained by combustion of sulphur, by roasting natural sulphides (particularly iron pyrites), or by roasting natural calcium sulphate (e.g., anhydrite) with clay and coke. It is a colourless, suffocating gas.

Sulphur dioxide is presented either liquefied under pressure in steel bottles, or in aqueous solution; in the latter commercial form it is often wrongly called “ sulphurous acid ”.

A powerful reducing and bleaching agent, sulphur dioxide has many uses, e.g., bleaching animal textiles, straw, feathers or gelatin, the sulphite process in sugar refining, preservation of fruit or vegetables, the preparation of acid sulphites for the treatment of wood pulp, manufacture of sulphuric acid, or as a disinfectant (for wine mutage). Liquid sulphur dioxide, which lowers the temperature on evaporation, is used in refrigerating plant.

- (6) **Sulphur trioxide** (sulphuric anhydride) (SO_3). A white solid in needle-shaped crystals somewhat similar to asbestos in appearance. Fumes in damp air; absorbs and reacts violently with water. It is presented in airtight sheet-iron containers or in glass or stoneware carboys, which are fitted with a device containing inorganic absorbent matter. It is used for preparing oleums (heading 28.07) and alums (heading 28.33).
- (7) **Disulphur trioxide** (S_2O_3). Deliquescent green crystals, decomposed by water and soluble in alcohol; used as a reducing agent in the manufacture of synthetic dyes.

(F) SELENIUM COMPOUNDS

- (1) **Hydrogen selenide** (H_2Se). A nauseous gas, dangerous to inhale because it paralyses the olfactory nerve. Presented in unstable aqueous solutions.
- (2) **Selenious acid** (H_2SeO_3) **and its anhydride** (SeO_2). Hexagonal white crystals, deliquescent, very soluble in water; used in the enamel industry.
- (3) **Selenic acid** (H_2SeO_4). White crystals, anhydrous or hydrated.

(G) TELLURIUM COMPOUNDS

These are hydrogen telluride (H_2Te) (in aqueous solutions), tellurous acid (H_2TeO_3) and its anhydride (TeO_2) (white solids), and telluric acid (H_2TeO_4) (colourless crystals) and its anhydride (TeO_3) (orange-coloured solid).

(H) NITROGEN COMPOUNDS

- (1) **Hydrogen azide** (hydrazoic acid) (HN_3). Colourless, toxic liquid with a suffocating odour; very soluble in water; unstable, with explosive properties. Its salts (azides) fall in heading 28.50, and not in sub-Chapter V.
- (2) **Dinitrogen oxide** (nitrous oxide) (N_2O). Sweet-tasting gas, soluble in water and presented in liquid form. Used in the gaseous state as an anaesthetic, and in the liquid or solid state as a refrigerating agent.
- (3) **Nitrogen dioxide** (nitroxyl, nitrous vapours, “ nitrogen peroxide ”) (NO_2). Colourless liquid at 0 °C, orange-brown at higher temperatures; boiling point about 22 °C (when it gives off red fumes). This is the most stable nitrogen oxide. A powerful oxidising agent.

(IJ) PHOSPHORUS COMPOUNDS

- (1) **Phosphinic acid** (hypophosphorous acid) (H_3PO_2). Lamellar crystals, melting at about 25 °C, oxidising on exposure to air; a powerful reducing agent.

- (2) **Phosphonic acid** (phosphorous acid) (H_3PO_3). Deliquescent crystals melting at about $71^{\circ}C$, soluble in water. Also **its anhydride** (P_2O_3 or P_4O_6), crystals which melt at about $24^{\circ}C$, and turn first yellow then red when exposed to light, gradually decomposing.

(K) ARSENIC COMPOUNDS

- (1) **Diarsenic trioxide** (arsenic sesquioxide, arsenious oxide, white arsenic) (As_2O_3). Wrongly known as “arsenious acid”. Obtained by roasting arseniferous ores of nickel and silver, or arsenical pyrites. It may sometimes contain impurities (arsenic sulphide, sulphur, antimonous oxide, etc.).

Commercial arsenic (III) oxide is generally a crystalline white powder, odourless and highly poisonous (flowers of arsenic). The vitreous anhydride takes the form of transparent, amorphous masses; the porcelanic anhydride is in opaque, interlocking, octahedral crystals.

Its uses include preserving hides or zoological specimens (sometimes it is used mixed together with soap); as a rat poison; for the manufacture of fly-papers; preparation of certain opacifiers, vitrifiable enamels or mineral greens such as Scheele's green (copper arsenite) or Schweinfurt green (copper acetoarsenite); in small doses, as a medicament (in the treatment of dermatitis, malaria or asthma).

- (2) **Diarsenic pentaoxide** (As_2O_5). Obtained by the oxidation of arsenic trioxide or by the dehydration of arsenic acid; it is a highly poisonous white powder which dissolves slowly in water, giving arsenic acid. It is used for the manufacture of arsenic acid, as an oxidising agent, etc.
- (3) **Arsenic acids.** The name “arsenic acid” is given to ortho-arsenic acid ($H_3AsO_4 \cdot \frac{1}{2}H_2O$) and other hydrates of arsenic pentaoxide (pyro- or meta-arsenic acids, etc.). They crystallise in colourless needles and are deadly poisons.

Arsenic acid is used for the manufacture of synthetic dyes (fuchsine, etc.), arsenates and organic derivatives of arsenic used as medicaments or insecticides.

The heading **excludes** arsenic hydrides (e.g., AsH_3) (**heading 28.50**).

(L) CARBON COMPOUNDS

- (1) **Carbon monoxide** (CO). Toxic, colourless and tasteless gas; put up under pressure. Its reducing properties are utilized, *inter alia*, in metallurgy.
- (2) **Carbon dioxide** (CO_2). Incorrectly called “carbonic acid”. Obtained by the combustion of carbon, or by heating calcareous substances or treating them with acids.

It is a colourless gas, one and a half times heavier than air; it extinguishes flames. Carbon dioxide can be presented either as a liquid (compressed in steel cylinders), or as a solid (compressed cubes in insulated containers, “carbonic snow” or “carbonic ice”).

It is used in metallurgy, in sugar manufacture or for aerating beverages. Liquid CO_2 is used for raising beer, for the preparation of salicylic acid, in fire extinguishers, etc. Solid CO_2 is used as a coolant (down to $-80^{\circ}C$).

- (3) **Hydrogen cyanide** (hydrocyanic acid, prussic acid) (HCN). Obtained by the action of sulphuric acid on a cyanide, or by the action of catalysts on mixtures of ammonia and hydrocarbons.

It is a very toxic, colourless liquid with an odour of bitter almonds. Miscible with and less dense than water; it keeps badly when impure or in weak solution.

Hydrocyanic acid is used in organic synthesis (e.g., for the production of acrylonitrile by reaction with acetylene) and as a parasiticide.

- (4) **Isocyanic, thiocyanic or fulminic acids.**

(M) SILICON COMPOUNDS

Silicon dioxide (pure silica, silicic anhydride, etc.) (SiO_2). Obtained by treating silicate solutions with acids, or by decomposing silicon halides by the action of water and heat.

It can be either in amorphous form (as a white powder "silica white", "flowers of silica", "calcined silica"; as vitreous granules – "vitreous silica"; in gelatinous condition – "silica frost", "hydrated silica"), or in crystals (tridymite and cristobalite forms).

Silica resists the action of acids; fused silica is therefore used to make laboratory apparatus and industrial equipment which can be suddenly heated or cooled without breaking (see General Explanatory Note to Chapter 70). Finely powdered silica is used, e.g., as a filler for various types of natural and synthetic rubber and other elastomers, as a thickening or thixotropic agent for various plastics, printing ink, paints, coatings and adhesives. Fumed silica (made by combustion of silicon tetrachloride or trichlorosilane in hydrogen-oxygen furnaces) is also used in chemi-mechanical polishing of silicon wafers and as a free-flow or anti-settling agent for a variety of materials. Activated silica gel is employed to dry gases.

The heading **excludes** :

- Natural silica (**Chapter 25**, except varieties constituting precious or semi-precious stones - see the Explanatory Notes to **headings 71.03** and **71.05**).
- Colloidal suspensions of silica are generally classified in **heading 38.24** unless specially prepared for specific purposes (e.g., as textile dressings of **heading 38.09**).
- Silica gel with added cobalt salts (used as a humidity indicator) (**heading 38.24**).

(N) COMPLEX ACIDS

This heading also covers chemically defined complex acids consisting of two or more non-metal mineral acids (e.g., chloro-acids), or of a non-metal acid and a metal acid (e.g., tungstosilicic, tungstoboric acids), not specified or included in other headings of this Chapter.

Since antimony is deemed in the Nomenclature to be a metal, antimonic acid and antimony oxides fall in **heading 28.25**.

Sub-Chapter III

HALOGEN OR SULPHUR COMPOUNDS OF NON-METALS

GENERAL

This sub-Chapter covers products which, although known by names (chlorides, sulphides, etc.) similar to those of the metal salts of hydrides classified in sub-Chapter V, are actually **non-metal** combinations such as :

- (1) A halogen with a non-metal other than oxygen or hydrogen (**halogen compounds**).
- (2) The same compounds as under (1) above, combined with oxygen (**halide oxides**).
- or (3) Sulphur with a non-metal other than oxygen or hydrogen (**sulphur compounds**).

Sulphide oxides of non-metals (sulphur + oxygen + non-metal) are **excluded** from this sub-Chapter; they fall in **heading 28.53**.

Halides, halide oxides, and sulphides of metals (see the General Explanatory Note to sub-Chapter I) or of the ammonium ion (NH_4^+) fall in sub-Chapter V except in the case of compounds of precious metals (**heading 28.43**) and the compounds of **heading 28.44, 28.45, 28.46** or **28.52**.

28.12 - Halides and halide oxides of non-metals.

- Chlorides and chloride oxides :

- 2812.11 -- Carbonyl dichloride (phosgene)
- 2812.12 -- Phosphorus oxychloride
- 2812.13 -- Phosphorus trichloride
- 2812.14 -- Phosphorus pentachloride
- 2812.15 -- Sulphur monochloride
- 2812.16 -- Sulphur dichloride
- 2812.17 -- Thionyl chloride
- 2812.19 -- Other
- 2812.90 - Other
- 2812.90 - Other

(A) CHLORIDES OF NON-METALS

The most important of these binary compounds are :

- (1) **Iodine chlorides**.

- (a) **Iodine chloride** (ICl) results from direct action of chlorine on iodine. Dark brown liquid above 27°C ; below that temperature, reddish crystals. Specific gravity about 3. Decomposed by water; it burns the skin badly. Used in organic synthesis as an iodinating agent.
- (b) **Iodine trichloride** (ICl_3). Obtained by the same process as the monochloride, or from hydriodic acid. Yellow needles soluble in water. Specific gravity about 3. Used for the same purposes as the monochloride and also in medicine.

(2) **Sulphur chlorides.**

- (a) **Sulphur monochloride** (S_2Cl_2) (an alternative name is “disulphur dichloride”, the name implied by its structural formula $\text{Cl}-\text{S}-\text{S}-\text{Cl}$). Obtained by the action of chlorine on sulphur. This is the commercial sulphur chloride, a yellow or reddish liquid, giving off fumes of a suffocating odour when exposed to air; decomposed by water. Specific gravity about 1.7. A solvent for sulphur, it is used in the cold vulcanisation of rubber or of gutta-percha.
- (b) **Sulphur dichloride** (SCl_2). Prepared from monochloride. Reddish-brown liquid, also decomposed by water; rather unstable. Specific gravity about 1.6. Uses include: the cold vulcanisation of rubber, as a chlorinating agent in the manufacture of synthetic dyes (in particular thioindigo).

(3) **Phosphorus chlorides.**

- (a) **Phosphorus trichloride** (PCl_3). Obtained by the direct action of chlorine on phosphorus. Colourless liquid, specific gravity about 1.6; corrosive, with an irritating odour, lachrymatory. Fumes in a humid atmosphere and decomposes on contact with water. Mainly used as a chlorinating agent in organic synthesis (e.g., manufacture of acid chlorides, dyes, etc.); also used in the manufacture of ceramics to produce a lustrous effect.
- (b) **Phosphorus pentachloride** (PCl_5). Obtained from trichloride in the form of white or yellowish crystals. Specific gravity about 3.6. Like the trichloride, it fumes in a humid atmosphere; decomposes on contact with water and is lachrymatory. Used in organic chemistry as a chlorinating agent or a catalyst (e.g., to prepare isatin chloride).

Phosphonium chloride (PH_4Cl) is **excluded (heading 28.53)**.

(4) **Arsenic chlorides.**

Arsenic trichloride (AsCl_3). Obtained by the action of chlorine on arsenic or of hydrochloric acid on arsenic trioxide. Colourless liquid of oily appearance. Fumes in moist air; very toxic.

(5) **Silicon chlorides.**

Silicon tetrachloride (SiCl_4). Obtained by the action of chlorine gas on a mixture of silica and coal, or on silicon, silicon bronze or ferro-silicon. Colourless liquid, specific gravity of about 1.5. Liberates suffocating white fumes (hydrogen chloride (HCl)) in the presence of atmospheric moisture. Decomposes in water with formation of gelatinous silica and liberation of HCl fumes. Used for preparing silica and very pure silicon, silicones and smoke screens.

Substitution products of hydrogen silicides, such as trichlorosilane (SiHCl_3) are **excluded (heading 28.53)**.

The heading **does not include** carbon tetrachloride (tetrachloromethane) (CCl_4) hexachloroethane (carbon hexachloride) (C_2Cl_6), hexachlorobenzene (ISO) (C_6Cl_6), octachloronaphthalene (C_{10}Cl_8) and similar carbon chlorides; these are chlorinated derivatives of hydrocarbons (**heading 29.03**).

(B) CHLORIDE OXIDES OF NON-METALS

These ternary combinations include, *inter alia* :

(1) **Sulphur chloride oxides.**

- (a) **Thionyl chloride** (sulphur dichloride oxide, sulphanyl chloride) (SOCl_2). Obtained by the oxidation of sulphur dichloride with either sulphur trioxide or sulphuryl chloride. Colourless liquid; specific gravity about 1.7. Gives off suffocating vapours; decomposed by water. Used in the manufacture of organic chlorides.
- (b) **Sulphur dichloride dioxide** (sulphonyl chloride, sulphuryl chloride) ("dichlorosulphonic acid") (SO_2Cl_2). Obtained by the action of chlorine on sulphur dioxide either on exposure to sunlight or in the presence of a catalyst (camphor or activated carbon). Colourless liquid, specific gravity about 1.7. Fumes in the air; decomposed by water; corrosive. Used as a chlorinating and sulphonating agent in organic synthesis, e.g., in the manufacture of acid chlorides.

The heading **excludes** chlorosulphuric acid ("sulphuric chlorohydrin") (ClSO_2OH) (**heading 28.06**).

(2) **Selenium dichloride oxide.**

Selenium dichloride oxide, generally called "selenyl chloride" (SeOCl_2) is similar to thionyl chloride. Produced by the action of selenium tetrachloride on selenium dioxide. Above 10 °C it is a yellow liquid, fuming in the air; below that temperature it forms colourless crystals; specific gravity is about 2.4. Decomposed by water. Used in organic synthesis or for decarbonising the cylinders of internal combustion engines.

(3) **Nitrosyl chloride** (nitrogen chloride oxide) (NOCl).

Orange yellow gas with a suffocating smell; toxic; used as an oxidising agent.

(4) **Phosphorus oxychloride** (phosphorus trichloride oxide, phosphoryl chloride) (POCl_3).

Obtained from phosphorus trichloride treated with potassium chlorate, from phosphorus pentachloride treated with boric acid, or by the action of carbonyl chloride on tricalcium phosphate. Colourless liquid, specific gravity about 1.7. It has an irritating odour, fumes in a humid atmosphere and is decomposed by water. Used as a chlorinating agent in organic synthesis and also in the manufacture of acetic anhydride or chlorosulphonic acid.

(5) **Carbonyl dichloride** (phosgene, carbon chloride oxide, carbonyl chloride) (COCl_2).

Produced by the action of chlorine on carbon monoxide in the presence of animal black or charcoal, or by the action of oleum on carbon tetrachloride. Colourless product, liquid up to 8 °C and gaseous above that temperature; it is presented liquefied or under pressure in heavy steel containers. When dissolved in toluene or benzene, it is classified in **heading 38.24**.

A lachrymatory and very toxic product. It is a chlorinating agent, widely used in organic synthesis (e.g., in the manufacture of acid chlorides, amino derivatives, Michler's ketone and of intermediates in the organic dyestuff industry).

(C) OTHER HALIDES AND HALIDE OXIDES OF NON-METALS

This group includes all other halides of non-metals (fluorides, bromides and iodides).

(1) Fluorides.

- (a) **Iodine pentafluoride** (IF_5), a fuming liquid.
- (b) **Phosphorus fluorides and silicon fluorides.**
- (c) **Boron trifluoride** (BF_3). Obtained by heating natural calcium fluoride and powdered boric oxide in the presence of sulphuric acid. Colourless gas. Fumes in moist air; carbonises organic products. Highly absorbent of water forming fluoroboric acid. Used as a dehydrating agent and as a catalyst in organic synthesis. It forms complex compounds with organic compounds (e.g., diethyl ether, acetic acid or phenol); these compounds, which are also used as catalysts, fall in **heading 29.42**.

(2) Bromides.

- (a) **Iodine bromide** (monobromide) (IBr). Prepared by combining the constituent elements. Blackish-red crystalline mass, resembling iodine. Soluble in water. Used in organic synthesis.
- (b) **Phosphorus bromides.**

Phosphorus tribromide (PBr_3). Obtained by the action of bromine on phosphorus dissolved in carbon disulphide. Colourless liquid. Fumes in moist air; decomposes in water. Specific gravity about 2.8. Used in organic synthesis.

The heading **excludes** phosphonium bromide (PH_4Br) (**heading 28.53**) and carbon bromides (**heading 29.03**).

(3) Iodides.

(a) **Phosphorus iodides.**

Phosphorus di-iodide (P_2I_4). Results from the action of iodine on phosphorus dissolved in carbon disulphide. Orange-coloured crystals, giving off coloured vapour.

Phosphorus tri-iodide (PI_3). Obtained by a similar method; crystallises into dark red tablets.

Phosphonium iodide (PH_4I) falls in **heading 28.53**.

(b) **Arsenic iodides.**

Arsenic tri-iodide (AsI_3). Red crystals; obtained from the constituent elements. Toxic and volatile. Used in medicine or as a reagent in laboratories.

(c) **Combinations of iodine with other halogens.** See paragraphs A (1), C (1) (a), C (2) (a) above.

(4) Halide oxides other than chloride oxides.

(a) **Fluoride oxides**, e.g., phosphorus trifluoride oxide (phosphoryl fluoride) (POF_3).

(b) **Bromide oxides**, e.g., sulphur dibromide oxide (thionyl bromide) (SOBr_2), an orange-coloured liquid, and phosphorus tribromide oxide (phosphoryl bromide) (POBr_3) in lamellar crystals.

(c) **Iodide oxides**.

28.13 - Sulphides of non-metals; commercial phosphorus trisulphide.

2813.10 - Carbon disulphide

2813.90 - Other

The most important of these binary compounds are :

(1) **Carbon disulphide (CS₂).**

Results from the action of sulphur vapours on burning carbon. Colourless, toxic liquid (specific gravity about 1.3). Not miscible with water. Smells of rotten eggs when impure. Very volatile and highly inflammable, it is dangerous to inhale and to handle. It is presented in stoneware, metal or glass containers encased in straw or osier, and very tightly stoppered.

It is used as a solvent for numerous purposes, e.g., for extracting oils, fats or essential oils, for defatting bones, in medicine, or in the man-made textile or rubber industries. It is also used in agriculture where it is injected into the soil for destroying insects, phylloxera, etc. For the latter use, the derived product potassium thiocarbonate (**heading 28.42**) is sometimes used. (See the Explanatory Note to heading 38.08.)

(2) **Silicon disulphide (SiS₂).**

Obtained by the action of sulphur vapour on strongly heated silicon. White solid; crystallises in volatile needles. Decomposes water with formation of gelatinous silica.

(3) **Arsenic sulphides.**

This heading covers artificial sulphides obtained either from natural sulphides, or from arsenic or arsenous oxide by treatment with sulphur or hydrogen sulphide.

(a) **Diarsenic disulphide** (artificial realgar, false realgar, red sulphide) (As₂S₂ or As₄S₄). Toxic product, occurring in vitreous red or orange-coloured crystals, specific gravity about 3.5. Volatilises without melting. Used for the manufacture of fireworks (mixed with potassium nitrate and sulphur), in paints (ruby arsenic), or in leather dressing for dehauling hides.

(b) **Diarsenic trisulphide** (artificial orpiment, false auripigment, yellow sulphide) (As₂S₃). Toxic yellow powder, specific gravity about 2.7; odourless and insoluble in water. Similar uses to the disulphide, and also as a pigment for leather or rubber, as a parasiticide or in medicine (because it destroys morbid growths). With alkali sulphides, it forms thioarsenites of **heading 28.42**.

(c) **Diarsenic pentasulphide** (As₂S₅). This product, which does not occur in nature, is a light yellow amorphous solid, insoluble in water. Used as a pigment. With alkali sulphides, it also forms thioarsenates of **heading 28.42**.

The heading **excludes** natural arsenic sulphides (disulphide or realgar, trisulphide or orpiment) (**heading 25.30**).

(4) **Phosphorus sulphides.**

- (a) **Tetraphosphorus trisulphide** (P_4S_3). Obtained from the constituent elements. Grey or yellow solid. Specific gravity of about 2.1. Occurs either as an amorphous mass or in crystals. Smells of garlic and is not very toxic, though the dust is rather dangerous to inhale. It is decomposed by boiling water, but is not affected by air. It is the most stable phosphorus sulphide. Used in the manufacture of the pentasulphide, and in place of phosphorus in the manufacture of safety matches; also in organic synthesis.
- (b) **Diphosphorus pentasulphide** (P_2S_5 or P_4S_{10}). Occurs in yellow crystals; specific gravity 2.03 to 2.09. Used for the same purposes as tetraphosphorus trisulphide or for the preparation of flotation agents for ores.
- (c) **Commercial phosphorus trisulphide**. The product known as phosphorus trisulphide is a mixture whose formula approximates to P_2S_3 ; it occurs in yellowish grey crystalline masses, decomposed by water. Used in organic synthesis.

The heading **excludes** :

- (a) The binary combinations of sulphur with halogens (e.g., sulphur chlorides) (**heading 28.12**).
 - (b) Oxysulphides (e.g., of arsenic, carbon and silicon), and the thiohalides of non-metals (e.g., phosphorus chlorosulphide and thiocarbonyl chloride) (**heading 28.53**).
-

Sub-Chapter IV

INORGANIC BASES AND OXIDES, HYDROXIDES AND PEROXIDES OF METAL

GENERAL

Bases are compounds characterised by a hydroxyl radical (OH) and which react with acids to form salts. In the liquid state or in solution, they are electrolytes giving a metal or an analogous ion (NH_4^+) at the cathode.

Metal oxides are compounds of a metal with oxygen. Many can combine with one or more molecules of water to form hydroxides.

Most oxides are **basic** since their hydroxides act as bases. Certain oxides (anhydride oxides), however, react only with alkaline or other bases to form salts, while another more common class (amphoteric oxides) can behave both as anhydride oxides or as bases. These classes of oxides must be regarded as **anhydrides** of acids, real or hypothetical, corresponding to their hydroxides.

Certain oxides (**saline oxides**) may be regarded as resulting from the combination of a basic oxide with an anhydride oxide.

This sub-Chapter covers :

- (1) Oxides, hydroxides and peroxides of metal, whether basic, acidic, amphoteric or saline.
- (2) Other inorganic bases containing no oxygen, such as ammonia (heading 28.14), or hydrazine (heading 28.25), and those containing no metal, such as hydroxylamine (heading 28.25).

The sub-Chapter **excludes** :

- (a) The oxides and hydroxides of **Chapter 25**, particularly magnesia (magnesium oxide), whether or not pure, and quicklime and slaked lime (crude calcium oxide and hydroxide).
- (b) Oxides and hydroxides constituting ores (**headings 26.01 to 26.17**), scalings, ash, slag, dross, scum or other metalliferous residues (**headings 26.18 to 26.20**).
- (c) Oxides, peroxides and hydroxides of precious metals (**heading 28.43**), of radioactive elements (**heading 28.44**), of rare-earth metals, of yttrium or of scandium or of mixtures of these metals (**heading 28.46**), or of mercury (**heading 28.52**).
- (d) Oxygen compounds of hydrogen of **heading 22.01** (water), **heading 28.45** (heavy water), **heading 28.47** (hydrogen peroxide), or **heading 28.53** (distilled and conductivity water and water of similar purity, including water treated with ion-exchange media).
- (e) Colouring matter with a basis of metal oxides (**heading 32.06**), prepared pigments, prepared opacifiers and prepared colours, vitrifiable enamels and glazes and similar products of the kind used in the ceramic, enamelling or glass industries (**heading 32.07**), and other preparations of **Chapter 32**, constituted by oxides, hydroxides or bases mixed with other products.
- (f) Opacifying preparations for de-lustering man-made fibres (**heading 38.09**) and pickling preparations for metal surfaces (**heading 38.10**).
- (g) Natural or synthetic precious or semi-precious stones (**headings 71.02 to 71.05**).

28.14 - Ammonia, anhydrous or in aqueous solution.

2814.10 - Anhydrous ammonia

2814.20 - Ammonia in aqueous solution

Ammonia is obtained either from impure ammoniacal gas liquors produced in coal gas purification or coke works (see Explanatory Note to heading 38.25, Item (A) (3)), or by synthesis from hydrogen and nitrogen.

This heading includes :

- (1) **Anhydrous ammonia** (NH_3), a colourless gas. It is less dense than air and easily liquefied by pressure. Presented in metal cylinders.
- (2) **Ammonia in aqueous solution** (NH_4OH), hydroxide of a hypothetical “element” ammonium (NH_4). These solutions (generally containing 20, 27 or 34 % of NH_3) are colourless or yellowish liquids presented in tightly-stoppered containers. Alcoholic solutions of ammonia are **excluded (heading 38.24)**.

Ammonia has many uses, for example, in the manufacture of nitric acid and nitrates, ammonium sulphate, other ammonium salts and nitrogenous fertilisers, sodium carbonate, cyanides, amines (e.g., naphthylamine). It emulsifies fatty matter and resins, and it acts as a detergent for removing stains, preparing polishing compounds, treating latex, removing varnish, etc. Liquefied ammonia is used in refrigerating plant.

28.15 - Sodium hydroxide (caustic soda); potassium hydroxide (caustic potash); peroxides of sodium or potassium.

- Sodium hydroxide (caustic soda) :

2815.11 -- Solid

2815.12 -- In aqueous solution (soda lye or liquid soda)

2815.20 - Potassium hydroxide (caustic potash)

2815.30 - Peroxides of sodium or potassium

(A) SODIUM HYDROXIDE (CAUSTIC SODA)

Sodium hydroxide (caustic soda) (NaOH) should not be confused with commercial soda, which is sodium carbonate (**heading 28.36**).

Sodium hydroxide is obtained, for example, by causticising sodium carbonate with milk of lime or by electrolysing sodium chloride. It may be presented as an aqueous solution or an anhydrous solid. Evaporation of the sodium hydroxide aqueous solution produces solid sodium hydroxide in the form of flakes or lumps. The pure product is presented in pellets or cubes in glass jars.

Solid sodium hydroxide attacks the skin and destroys the mucous membranes. It is deliquescent and very soluble in water; it must therefore be kept in well-sealed steel containers.

It is a powerful base with many industrial uses : preparation of certain chemical wood pulps by elimination of the lignin, manufacture of regenerated cellulose, mercerising of cotton, tantalum or niobium metallurgy, production of hard soaps, manufacture of many chemical products, including phenolic compounds (phenol, resorcinol, alizarin, etc.).

The heading **excludes** residual lyes (soda lyes) obtained as residual products from the manufacture of wood pulp by the alkali or sulphate processes (**heading 38.04**); from these lyes the tall oil of **heading 38.03** can be obtained and sodium hydroxide regenerated.

The heading also **excludes** the mixtures of sodium hydroxide and lime known as "soda lime" (**heading 38.24**).

(B) POTASSIUM HYDROXIDE (CAUSTIC POTASH)

Potassium hydroxide (caustic potash) (KOH) is very similar to the sodium hydroxide described above. It must be distinguished from potassium carbonate (**heading 28.36**) or commercial potash (a name applied loosely in certain countries to any potassium salt, particularly the chloride).

It is usually obtained by electrolysing solutions of natural potassium chloride (heading 31.04), but can also be obtained from potassium carbonate by causticising with milk of lime (giving "lime potash"). Pure potassium hydroxide is obtained by treatment with alcohol, or by double decomposition of barium hydroxide and potassium sulphate.

Potassium hydroxide may be presented as an aqueous solution (potash lye), more or less highly concentrated (usually around 50 %), or as a solid containing (amongst other impurities) potassium chloride. It is stored in the same way as sodium hydroxide and has similar properties.

It is used in the manufacture of soft soaps, for pickling of parts to be metallised or repainted, for bleaching, in the manufacture of potassium permanganate, etc. It is also used in medicine as a cauterising agent (in sticks), for this purpose it is sometimes mixed with lime and is then classified in **heading 30.03** or **30.04**.

(C) SODIUM PEROXIDE

Sodium peroxide (disodium dioxide) (Na_2O_2), obtained by combustion of sodium, is a very deliquescent white or yellowish powder, specific gravity about 2.8. It is decomposed by water, generating heat and forming hydrogen peroxide. It is also presented in the form of cakes packed in welded metal containers.

It is used in soap manufacture, for bleaching fabrics, as an oxidising agent in organic synthesis, or for purifying confined air (e.g., in submarines). When mixed with catalysts (traces of copper or nickel salts, etc.) for rapid production of hydrogen peroxide, it constitutes a preparation of **heading 38.24**.

(D) POTASSIUM PEROXIDE

Potassium peroxide (dipotassium dioxide) (K_2O_2) is very similar to sodium peroxide as regards manufacturing processes, properties and uses.

28.16 - Hydroxide and peroxide of magnesium; oxides, hydroxides and peroxides, of strontium or barium.

2816.10 - Hydroxide and peroxide of magnesium

2816.40 - Oxides, hydroxides and peroxides, of strontium or barium

(A) MAGNESIUM HYDROXIDE AND PEROXIDE

- (1) **Magnesium hydroxide** ($Mg(OH)_2$). White powder, heavier than magnesium oxide; stable but forming the carbonate slowly when exposed to air. Used in pharmacy.
- (2) **Magnesium peroxide** (MgO_2). Prepared by the action of hydrogen peroxide on magnesium hydroxide. White powder, containing oxide as impurity; almost insoluble in water. Used for bleaching feathers, in preparing dentifrices or as a gastro-intestinal antiseptic.

Magnesium oxide is **excluded** (**heading 25.19** or if in the form of cultured crystals weighing not less than 2.5 g each, **heading 38.24**).

(B) STRONTIUM OXIDE, HYDROXIDE AND PEROXIDE

- (1) **Strontium oxide** (anhydrous or caustic strontia) (SrO). Prepared by calcining precipitated strontium carbonate. Porous white, hygroscopic powder, soluble in water. Forms the carbonate when exposed to air. Used in pyrotechnics or medicine and for preparing strontium hydroxide and pigments.
- (2) **Strontium hydroxide** ($Sr(OH)_2$). Exists in the anhydrous amorphous state or crystallised with 8 H_2O ; forms the carbonate when exposed to air. Used in glass manufacture, and for the preparation of strontium salts and luminous pigments.
- (3) **Strontium peroxide** (SrO_2). Prepared by the action of oxygen on strontium oxide. White powder, decomposed by hot water. Used in pyrotechnics.

(C) BARIUM OXIDE, HYDROXIDE AND PEROXIDE

- (1) **Barium oxide** (anhydrous baryta) (BaO). This product must not be confused with natural barium sulphate, sometimes known as barytes. It is obtained by calcining precipitated barium nitrate or precipitated barium carbonate, or by hydrolysing barium silicate. Barium oxide resembles strontium oxide in appearance, but is heavier (specific gravity about 5.5) and can crystallise. Used for preparing barium hydroxide and peroxide and barium metal.

The heading **excludes** the crude product obtained by merely calcining witherite (**heading 25.11**).

- (2) **Barium hydroxide** ($Ba(OH)_2$). Usually in the form of whitish and efflorescent lamellar crystals (with 8 H_2O) or as an aqueous solution (baryta water). Used in : the glass industry; for producing glass X-ray shields; in pottery; for purifying water; manufacture of potassium hydroxide and of various barium compounds.
- (3) **Barium peroxide** (BaO_2). Prepared by heating barium oxide in air freed of carbon dioxide. White powder or insoluble greyish lumps (specific gravity about 5). When decomposed by water it produces hydrogen peroxide; used for the manufacture of the latter.

28.17 - Zinc oxide; zinc peroxide.

(A) ZINC OXIDE

"**Zinc oxide** (zinc white) (ZnO) is obtained by burning zinc vapour with oxygen from air. The zinc vapour is obtained by vaporising metallic zinc (indirect or French process) or by the reduction of oxidic zinc raw materials like zinc ores (roasted blende, calamine – **heading 26.08**) with carbon (direct or American process). In these processes, the oxide is collected in bag houses or chambers forming deposits of increasingly pure oxides.

In the wet process, zinc is leached from zinc containing raw materials and then precipitated as zinc hydroxide or carbonate. The precipitate is filtered, washed, dried and calcinated to ZnO . Zinc oxide is a fine white powder which turns yellow on heating. It is of amphoteric nature, soluble in acids and alkalis.

Zinc oxide is mainly used in industrial paints. It is also used in the rubber industry, ceramic, glass manufacturing, electronics and pharmaceuticals. Zinc oxide is also a precursor of a wide variety of inorganic or organic salts used in the manufacture of plastics.

The zincates of heading 28.41 correspond to this amphoteric oxide.

(B) ZINC PEROXIDE

Zinc peroxide (ZnO_2) White powder, insoluble in water. Used in medicine, either pure or with zinc oxide as impurity, and also for preparing cosmetics.

This heading **does not include** :

- (a) Natural zinc oxide or zincite (**heading 26.08**).
- (b) Residues of zinc metallurgy known as zinc scurf, skimmings or dross, which also consist of impure oxides (**heading 26.20**).
- (c) Zinc hydroxide ($\text{Zn}(\text{OH})_2$) or gelatinous white, or the hydroperoxide (**heading 28.25**).
- (d) The impure zinc oxide, sometimes known as zinc grey (**heading 32.06**).

28.18 - Artificial corundum, whether or not chemically defined; aluminium oxide; aluminium hydroxide.

2818.10 - Artificial corundum, whether or not chemically defined

2818.20 - Aluminium oxide, other than artificial corundum

2818.30 - Aluminium hydroxide

(A) ARTIFICIAL CORUNDUM, WHETHER OR NOT CHEMICALLY DEFINED

Artificial corundum is formed by fusing aluminium oxide in an electric furnace. The aluminium oxide may contain small proportions of other oxides (e.g., titanium oxide, chromium oxide) either deriving from the natural starting material (bauxites) or added to improve, for example, the hardness of the fused grain or to modify the colour. However, mechanical mixtures of artificial corundum and other substances, such as zirconium dioxide, are excluded (heading 38.24).

Artificial corundum is put up in small pieces or masses, crushed or in grains; it is more resistant than ordinary aluminium oxide to the action of air and acids, and is very hard. It is used, e.g., as an abrasive, in the manufacture of refractory conglomerates (such as mullite and sillimanite, mixtures of corundum with pure refractory clay and with anhydrous aluminium silicates, respectively) or of laboratory utensils and in the electrical industry.

(B) ALUMINIUM OXIDE, OTHER THAN ARTIFICIAL CORUNDUM

Aluminium oxide (anhydrous or calcined alumina) (Al_2O_3) is obtained by calcining the aluminium hydroxide described below, or from ammonium alum. It is a light white powder, insoluble in water, specific gravity about 3.7.

Uses include, e.g., in aluminium metallurgy, as a filler for paints, in the manufacture of abrasives and synthetic precious or semi-precious stones (rubies, sapphires, emeralds, amethysts, aquamarines, etc.), as a dehydrating agent (for drying gases), or as a catalyst (manufacture of acetone and acetic acid, cracking operations, etc.).

(C) ALUMINIUM HYDROXIDE

Aluminium hydroxide (hydrated alumina) ($\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$) is obtained from bauxite (a mixture containing aluminium hydroxide) during aluminium metallurgy (see the General Explanatory Note to Chapter 76).

The dry hydroxide is an amorphous, friable white powder, insoluble in water; when damp it is in gelatinous masses (alumina gel, gelatinous alumina).

Aluminium hydroxide is used for the manufacture of ceramic glazes, printing inks, medicinal products, alums, the artificial corundum described above and for clarifying liquids; it is mixed with carbon for the manufacture of anti-rust paints and is also used, due to its affinity for organic colouring matter, for preparing the colour lakes of heading 32.05 and textile mordants.

The aluminates of heading 28.41 correspond to this amphoteric hydroxide.

This heading also covers activated alumina, obtained by controlled heat treatment of hydrated alumina, in which process the latter loses most of its constitutional water; activated alumina is used primarily as an adsorption agent or as a catalyst.

This heading **does not include** :

- (a) Natural corundum (native aluminium oxide) and emery (aluminium oxide containing iron oxide) (**heading 25.13**).
- (b) Bauxite, whether or not washed and calcined, but not chemically purified (e.g., by treatment with soda) for use as an electrolyte (**heading 26.06**).
- (c) Activated bauxite (**heading 38.02**).
- (d) Colloidal solutions of aluminium hydroxide (soluble alumina) (**heading 38.24**).
- (e) Artificial corundum on a backing of paper, paperboard or other materials (**heading 68.05**) or agglomerated as grinding wheels, whetstones, hones or other goods of **heading 68.04**.
- (f) Natural precious or semi-precious stones with a basis of aluminium oxide (**heading 71.03** or **71.05**).
- (g) Synthetic precious or semi-precious stones with a basis of aluminium oxide (e.g., artificial rubies) (**heading 71.04** or **71.05**).

28.19 - Chromium oxides and hydroxides.

2819.10 - Chromium trioxide

2819.90 - Other

(A) CHROMIUM OXIDES

- (1) **Chromium trioxide** (chromium (VI) oxide) or chromic anhydride (CrO_3) (wrongly known as "chromic acid", because it can give the chromates of heading 28.41). Orange or red slabs or needles; deliquescent; very soluble in water; specific gravity about 2.8. When combined with alcohol it gives explosive mixtures. An oxidising agent in organic chemistry (manufacture of isatin, indigo dyes, etc.); also used in medicine and, when mixed with kieselguhr ("epurite"), for purifying acetylene.
- (2) **Dichromium trioxide**, chromium (III) oxide (chromium sesquioxide) (Cr_2O_3). Obtained by calcining chromates with an ammonium salt or by reducing dichromates. A very hard, olive green product, in powder or in crystals; insoluble in water; specific gravity about 5. The pure oxide is used as a pigment known as "chromium oxide green", not to be confused with mixtures of lead chromate and iron blues known as "chrome green". It is also used for the preparation of paints and printing inks, and in the porcelain, glass (coloured optical glass) or rubber industries. Because of its hardness and its resistance to heat, it serves for the preparation of abrasive compounds and refractory bricks for metal furnaces. It is also used for obtaining anti-rust products, and in chromium metallurgy.

Chromite, natural chromium oxide containing iron (chrome iron ore, iron chromite) is **excluded (heading 26.10)**.

(B) CHROMIUM HYDROXIDES

The term "chromium hydroxide" applies to the various hydrates of the oxides described above and, in particular, the green hydrate of chromic oxide ($\text{Cr}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$), obtained by treating potassium dichromate with boric acid; this is used as colouring matter under the name of "chrome green" or in the manufacture of Guignet's green. There is also a violet chromium hydroxide.

28.20 - Manganese oxides.

2820.10 - Manganese dioxide

2820.90 - Other

- (1) **Manganese dioxide** (manganous anhydride) (MnO_2). The most important manganese oxide. Prepared by the action of a slightly nitric solution of potassium permanganate on a manganous salt (e.g., the sulphate). Brown or blackish masses or powder (specific gravity about 5), insoluble in water.

A very powerful oxidising agent. Uses include pyrotechnics, organic synthesis (preparation of hydroxyanthraquinones, aminoanthraquinones, etc.), in gas-masks, as a depolarising agent in batteries, in the ceramics industry, in the manufacture of driers, printers' ink (manganese black), colours (brown pigments known as mineral bistre, manganese bitumen), certain mastics, and synthetic semi-precious stones (artificial garnet). It is also used in the glass industry (glassmakers' soap) generally to correct the yellow tint of glass.

This oxide has the character of an anhydride from which the manganites of heading 28.41 are derived.

This heading **does not include** the anhydrous natural manganese dioxide (pyrolusite) and hydrated natural manganese dioxide (psilomelane) (**heading 26.02**).

- (2) **Manganese oxide** (MnO). Greyish or greenish powder, insoluble in water. Specific gravity about 5.1. Used in textile printing.

Manganous hydroxide is **excluded (heading 28.25)**.

- (3) **Dimanganese trioxide** (manganese sesquioxide, manganic oxide) (Mn_2O_3). This oxide is basic. Brown or black powder (specific gravity about 4.8), insoluble in water. Uses include : in textile printing, as a ceramic colour, in the glass industry, the manufacture of driers (manganese linoleate), as a catalyst in chemistry, inorganic (manufacture of nitric acid) or organic.

The heading **does not include** natural manganic oxide (braunite - **heading 26.02**), nor manganic hydroxide (**heading 28.25**).

- (4) **Manganomanganic oxide** (manganese saline oxide) (Mn_3O_4). Resembles saline iron oxide in some respects.

Natural saline oxide of manganese (hausmannite) is **excluded (heading 26.02)**.

- (5) **Permanganic anhydride** (Mn_2O_7). Dark brown liquid which absorbs moisture and detonates towards 40 °C.

This anhydride gives the permanganates of heading 28.41.

Permanganic acid is **excluded (heading 28.25)**.

28.21 - Iron oxides and hydroxides; earth colours containing 70 % or more by weight of combined iron evaluated as Fe₂O₃.

2821.10 - Iron oxides and hydroxides

2821.20 - Earth colours

Earth colours with a basis of **natural** iron oxides, **containing 70 % or more** by weight of combined iron calculated as Fe₂O₃, fall in this heading. For the purposes of assessing whether the 70 % limit has been reached, account must be taken of the total iron content expressed as ferric oxide; thus a natural ferrous earth colour containing 84 % of ferric oxide (representing 58.8 % of pure iron) remains classified in the heading.

The heading also includes the following **artificial** oxides and hydroxides :

(A) IRON OXIDES

Ferric oxide (Fe₂O₃). Obtained from dehydrated ferrous sulphate or natural iron oxide. Finely divided powder, usually red but sometimes violet, yellowish or black (violet, yellow or black oxide). Used as a pigment (iron minium, jewellers' rouge or colcothar), either in the pure state (in which case it is classified in this heading), or mixed with clay, calcium sulphate (Venetian red), etc. (it then falls in **Chapter 32**). It is used for making ordinary or anti-rust paints, compounds for burnishing metal or polishing glass, and vitrifiable compounds used to render the mass fusible in the manufacture of bottle-glass. It also serves for preparing thermite (mixed with aluminium powder), and for purifying coal gas, etc.

(B) IRON HYDROXIDES

- (1) **Ferrous hydroxide** (Fe(OH)₂). Obtained by the action of an alkali base on a ferrous salt. White solid which discolours in the presence of oxygen, turning into ferric hydroxide.
- (2) **Ferric hydroxide** (brown oxide) (Fe(OH)₃). Prepared by the action of an alkali base on a ferric salt. A rust-coloured, reddish brown or violet-glinting product used as a pigment, either alone - in which case it is classified here - or mixed with carbon, Prussian brown, etc. (saffron or Mars yellow), when it falls in **heading 32.06**. Ferric hydroxide is used in the manufacture of complex colours (Van Dyck brown, Van Dyck red, "English brown", "Swedish brown"). It is used in the pure state as an antidote to arsenic poisoning.

It is an amphoteric hydroxide which, after oxygenation, gives the ferrates of heading 28.41.

This heading **excludes** :

- (a) Ferrous earth colours containing less than 70 % by weight of combined iron calculated as Fe₂O₃, or mixed together with other earth colours; micaceous iron oxide (**heading 25.30**).
- (b) Iron ores of **heading 26.01**, e.g., red haematite (including the oxides specular iron ore and martite), brown haematite (*minettes*, the hydrated oxide containing iron and calcium carbonates), limonite (hydrated oxide), magnetite (magnetic oxide).

- (c) Iron scalings, crude oxides which become detached from the surface of iron brought to red heat or hammered (**heading 26.19**).
- (d) Alkaline iron oxide for the purification of gas (**heading 38.25**).
- (e) Iron oxide (haematite) in the form of semi-precious stones (**heading 71.03 or 71.05**).

28.22 - Cobalt oxides and hydroxides; commercial cobalt oxides.

(A) COBALT OXIDES

- (1) **Cobalt oxide** (cobalt monoxide, cobaltous oxide, grey oxide) (CoO). A grey, brown or greenish powder.
- (2) **Dicobalt trioxide** (cobalt sesquioxide, cobaltic oxide) (Co_2O_3). Black powder.
- (3) **Tricobalt tetraoxide** (cobalt saline oxide) (Co_3O_4). Black powder.
- (4) **Commercial cobalt oxides.** Generally greyish or black powder consisting of cobalt monoxide and cobalt saline oxide in various ratios.

These products serve in enamel works for preparing brilliant blue colours, and in the glass industry for colouring optical glass. They are converted into silicates (e.g., cobalt potassium silicates) for the manufacture of the vitrifiable colours of heading 32.07; these compounds are known as smalt, opaque glass, azure, enamel blue and Sèvres blue. The term "smalt" is applied indiscriminately to the oxides and to their silicates, both being obtained from a natural cobalt arsenide, smaltite, an ore classified in heading 26.05. A certain number of blue, green and violet artists' paints are composed of cobalt oxides, aluminates, zincates and phosphates (sky blue, cerulean blue, cobalt green, cobalt violet).

The heading **excludes** crude cobalt oxides obtained from the treatment of argentiferous ores (**heading 26.20**).

(B) COBALT HYDROXIDES

The term "cobalt hydroxide" covers not only cobaltous hydroxide (Co(OH)_2), used for the preparation of driers, and cobaltic hydroxide (e.g., Co(OH)_3), obtained in cobalt metallurgy, but also saline oxide hydrates. They are used for similar purposes to cobalt oxides.

Natural hydrated oxide of cobalt (heterogenite) is **excluded (heading 26.05)**.

28.23 - Titanium oxides.

The only titanium oxide of commercial interest is titanium dioxide or titanic anhydride (TiO_2), which gives the titanates of heading 28.41.

It is an amorphous powder, specific gravity about 4; white but turns yellow when heated.

This heading covers titanium dioxide that is not mixed or surface-treated, but it **excludes** titanium dioxide to which compounds have been intentionally added during the production process in order to obtain certain physical properties rendering it suitable for use as a pigment (**heading 32.06**) or for other purposes (e.g., **headings 38.15, 38.24**).

The heading further **excludes** :

- (a) Natural titanium dioxide (rutile, anatase, brookite), an ore (**heading 26.14**).
- (b) Orthotitanic acid (Ti(OH)_4) and metatitanic acid (TiO(OH)_2) (**heading 28.25**).

28.24 - Lead oxides; red lead and orange lead.

2824.10 - Lead monoxide (litharge, massicot)

2824.90 - Other

- (1) **Lead oxide** (Lead monoxide, litharge, massicot) (PbO). Lead or cerussite (lead hydrocarbonate) oxidised by heating in air produces first unmelted lead oxide or massicot, in the form of a pale yellow powder, and then, when the temperature passes the blood-red heat point, the fused oxide, in orange-yellow or reddish powder or scales. The term "litharge" covers both these products, but is applied more particularly to the latter. They are also obtained as by-products of the extraction of silver from argentiferous lead. Lead oxide is used in the glass industry (manufacture of lead and crystal glass), in the enamel industry, and in the manufacture of matches, colours, driers, etc.
- (2) **Trilead tetraoxide** (Lead saline oxide, red lead, minium) (approximate formula Pb_3O_4). Obtained from unmelted lead monoxide (massicot). A toxic, orange-red powder (specific gravity 8 to 9). The term **orange lead** is applied either to a very pure saline oxide, more highly coloured and less dense than the common variety, or to lead oxides still containing lead carbonate from the cerussite used in their preparation. **Red lead** is used for extending other colours (Saturn red), for preparing anti-rust paints or mastics and for colouring sealing-wax. It is also used as a pottery glaze. It is employed in the manufacture of crystal glass and optical glass even more widely than the monoxide, because it gives a fusible glass of remarkable brilliance arising from a high refractive index.
- (3) **Lead dioxide** (puce oxide, plumbic anhydride) (PbO_2). Prepared by treating the lead saline oxide with nitric acid or by electrolysing lead nitrate. A brown powder, insoluble in water, capable of igniting organic matter on contact. It is an oxidising agent used in pyrotechnics; also for manufacturing matches or accumulator plates, and as a mordant in the textile industry.

This amphoteric oxide gives the plumbates of heading 28.41.

28.25 - Hydrazine and hydroxylamine and their inorganic salts; other inorganic bases; other metal oxides, hydroxides and peroxides.

- 2825.10 - Hydrazine and hydroxylamine and their inorganic salts
- 2825.20 - Lithium oxide and hydroxide
- 2825.30 - Vanadium oxides and hydroxides
- 2825.40 - Nickel oxides and hydroxides
- 2825.50 - Copper oxides and hydroxides
- 2825.60 - Germanium oxides and zirconium dioxide
- 2825.70 - Molybdenum oxides and hydroxides
- 2825.80 - Antimony oxides
- 2825.90 - Other

This heading covers :

- (A) **Hydrazine and hydroxylamine and their inorganic salts.**
- (B) **The metal oxides, hydroxides and peroxides of this Chapter not included in preceding headings.**

The most important products are :

(1) **Hydrazine and its inorganic salts.**

Hydrazine (NH_2NH_2), a basic product prepared by the oxidation of ammonia with sodium hypochlorite. Also exists as the hydrate ($\text{NH}_2\text{NH}_2\text{H}_2\text{O}$). Colourless, lachrymatory liquid which fumes in the air. A powerful reducing agent, used in the manufacture of a priming explosive or in chemical synthesis.

Inorganic salts of hydrazine, obtained by reaction with mineral acids, are also classified here. The most important is **hydrazine sulphate**, colourless crystals which are slightly soluble in cold water and decompose violently when heated; this sulphate is used as a reagent in analysis, and in metallurgy (to separate polonium from tellurium).

Organic derivatives of hydrazine are **excluded (heading 29.28)**.

(2) **Hydroxylamine and its inorganic salts.**

Hydroxylamine (NH_2OH) is a basic product obtained by hydrolysis of nitromethane; colourless, deliquescent crystals, very soluble in water, melting at 33 °C, decomposing violently at 130 °C.

Inorganic salts of hydroxylamine, obtained by reaction with mineral acids, also fall in this heading. The most important are hydroxyammonium **chloride**, **sulphates** and nitrate, white or colourless crystals soluble in water. They are used as reducing agents in organic synthesis, as anti-oxidants for fatty acids, in the bleaching, dyeing or printing of textiles, and as reagents, etc.

Organic derivatives of hydroxylamine are excluded (**heading 29.28**).

- (3) **Lithium oxide and hydroxide.** The oxide (Li_2O) and its hydroxide (LiOH) are obtained from lithium nitrate. They are white powders, soluble in water, used in photography and for the preparation of lithium salts.
- (4) **Vanadium oxides and hydroxides.** The most important vanadium oxide is divanadium ptaoxide (vanadium anhydride) (V_2O_5), obtained from the natural vanadates, vanadinite (heading 26.15) and carnotite (heading 26.12). It may be either amorphous or crystalline, in lumps or in powder. Colour ranges from yellow to reddish-brown; it turns red when exposed to heat and is almost insoluble in water. Used for preparing vanadium salts, certain inks, and as a catalyst (manufacture of sulphuric acid, phthalic anhydride or synthetic ethanol).

There are several hydroxides, constituting acids, from which the various vanadates of heading 28.41 are derived.

(5) **Nickel oxides and hydroxides.**

- (a) **Nickelous oxide** (NiO) is obtained by thoroughly calcining the nitrate or the carbonate. A greenish-grey powder, the density and shade of which vary with the method of preparation. It is used in the enamel industry, in the glass industry as colouring matter and in organic synthesis as a catalyst. It is a basic oxide.
- (b) **Nickelic oxide** (sesquioxide) (Ni_2O_3). A black powder used as colouring matter in the enamel industry and for the manufacture of alkaline accumulator grid plates.
- (c) **Nickelous hydroxide** ($\text{Ni}(\text{OH})_2$). A fine green powder used in electroplating, as a constituent of plates in alkaline accumulators and in the manufacture of nickel catalysts.

The heading excludes :

- (a) Natural nickel oxide (bunsenite) (**heading 25.30**).
- (b) Impure nickel oxides, e.g., nickel oxide sinters, nickel oxide in granular form ("green nickel oxide") (**heading 75.01**).

(6) **Copper oxides and hydroxides.**

- (a) **Cuprous oxide** (red copper oxide) (Cu_2O). Obtained from copper acetate or sulphate; a crystalline red powder, insoluble in water. Used for colouring glass red (glass for signals), manufacturing antifouling paints or synthetic precious stones (artificial emeralds), and as a fungicide in agriculture.
- (b) **Cupric oxide** (black copper oxide) (CuO). Prepared from copper nitrate or carbonate or by oxidising the metal. Black powder or grains with chestnut sheen, insoluble in water. Pigment used in the enamel, glass (green glass) or ceramic industries and in the preparation of paints. Also used for depolarising electric batteries and as an oxidising agent or catalyst in organic chemistry.

- (c) **Copper hydroxides.** The most common of these is cupric hydroxide ($\text{Cu}(\text{OH})_2$). Blue solid which, alone or mixed, constitutes a pigment (Bremen blue). It is also used in the manufacture of pigments (e.g., Peligot blue, permanent in artificial light) and of the ammoniacal solution known as "Schweitzer's reagent", a solvent in the cuprammonium process of rayon manufacture.

Natural cuprous oxide (cuprite) and natural cupric oxide (tenorite) are **excluded (heading 26.03)**.

- (7) **Germanium oxides.** The most important germanium oxide is the dioxide (GeO_2) obtained in the metallurgy of the metal from natural copper germano-sulphide (germanite) (heading 26.17), or by hydrolysing the chloride. It is a white powder, slightly soluble in water. It is used for preparing germanium metal (for transistors, etc.), in medicine and in the manufacture of special glass.
- (8) **Molybdenum oxides and hydroxides.** The most important molybdenum oxide is the trioxide (MoO_3), obtained from the natural sulphide, molybdenite (heading 26.13). It is a white crystalline product which turns yellow on heating; practically insoluble in water. Used as a catalyst in organic synthesis (manufacture of phthalic anhydride).

There are also blue oxides which are still used as such or in mixture (in the latter case, they fall in **Chapter 32**) by artists, under the names of molybdenum blue and mineral indigo.

Hydroxides include molybdic acid (H_2MoO_4), a white or yellowish powder, slightly soluble in water, used in the ceramic industry (glazes) or as a catalyst. The molybdates of heading 28.41 are derived from these hydroxides.

Natural molybdenum oxide (molybdenum ochre, molybdite) is **excluded (heading 25.30)**.

(9) **Antimony oxides.**

- (a) **Trioxide or antimonous anhydride** (Sb_2O_3). Obtained by oxidising the metal or from the natural sulphide (stibnite). White powder or needle-shaped crystals; practically insoluble in water. The term "antimony white" is used in reference both to the pure oxide of this heading, and to a mixture of that oxide with zinc oxide, which is classified in **Chapter 32**. Antimony trioxide is used in paints, as an opacifier in the enamel industry (enamelling of iron) and pottery industry (glazes), in the manufacture of glass with a low coefficient of expansion (lamp glass), and for producing synthetic precious or semi-precious stones (artificial rubies, topazes, garnets). It gives the antimonites of heading 28.41.
- (b) **Pentaoxide or antimonic anhydride** (Sb_2O_5). Obtained by oxidising the metal or calcining the nitrate. A yellow powder, also used as an opacifier in the enamel industry. Gives the antimonates of heading 28.41.
- (c) **Tetraoxide** (Sb_2O_4). White powder obtained by heating the pentaoxide.

The heading **excludes** ores, i.e., natural antimony trioxides (senarmontite and valentinite) and natural tetraoxide (cervantite) (**heading 26.17**).

(10) **Beryllium oxide and hydroxide.**

- (a) **Oxide** (BeO). Prepared from beryllium nitrate or sulphate. White powder, insoluble in water; can be crystallised. Used for making beryllium salts, synthetic precious or semi-precious stones and as a catalyst.
 - (b) **Hydroxide** (Be(OH)_2). White powder resembling alumina in appearance.
- (11) **Calcium oxide, hydroxide and peroxide.** This heading covers only the oxide (CaO) and the hydroxide (Ca(OH)_2), in the pure state (i.e., containing practically no clay, iron oxide, manganese oxide, etc.), such as the product obtained by calcining precipitated calcium carbonate.

The heading also covers fused lime obtained by fusing ordinary quicklime in an electric furnace. This product has a high degree of purity (approximately 98 % calcium oxide); it is crystalline and generally colourless. It is used, in particular, for refractory linings for furnaces, in the manufacture of crucibles and for addition to concrete, in small pieces, to increase its resistance to wear.

Calcium peroxide (CaO_2) is a white or yellowish powder, hydrated (usually with 8 H_2O), sparingly soluble in water. Used as a bactericide and as a detergent, in medicine and in the preparation of cosmetics.

Quicklime (calcium oxide) and slaked lime (calcium hydroxide) are **excluded** (**heading 25.22**).

(12) **Manganese hydroxides.**

- (a) **Manganous hydroxide** (Mn(OH)_2). A whitish powder, insoluble in water.
- (b) **Manganic hydroxide** (Mn(OH)_3). Derived from manganic oxyde (Mn_2O_3). A brown powder used for preparing colours (manganese brown) and manganese linoleate.
- (c) **Manganese saline hydroxide.** Derived from the saline oxyde Mn_3O_4 .

The heading **excludes** natural hydrated manganese oxide (natural manganic hydroxide (manganite) which is an ore of **heading 26.02** and non-hydrated manganese oxides (**heading 28.20**)).

(13) **Zirconium dioxide** (zirconia) (ZrO_2), not to be confused with zircon (**heading 26.15** or **71.03**), which is a crystallised natural zirconium silicate.

The artificial oxide is obtained from the above-mentioned ore or from zirconium salts. It is a refractory whitish powder with a melting point of about 2,600 °C. Zirconia is used as a refractory product resistant to the action of chemical agents, a pigment and ceramic opacifier (zirconium white), an abrasive, a constituent of glass and a catalyst.

Natural zirconium oxide or baddeleyite is an ore of **heading 26.15**.

(14) **Cadmium oxide and hydroxide.**

- (a) **Oxide** (CdO). Powder of a more or less brownish-yellow colour according to the calcination temperature during the preparation from the carbonate or the hydroxide. Used in the ceramic industry and as a catalyst.
- (b) **Hydroxide** ($\text{Cd}(\text{OH})_2$). White powder.

(15) **Tin oxides and hydroxides.**

- (a) **Stannous oxide** (brown oxide) (SnO). Insoluble in water. It may be grey or black crystals, or olive-brown powder with bluish, reddish or greenish glints, according to the process of preparation.

This oxide is amphoteric and gives the stannites of heading 28.41. It is used in organic synthesis as a reducing agent or catalyst.

- (b) **Stannic oxide** (stannic anhydride, dioxide) (SnO_2), also insoluble in water, is a powder, white (tin white) or grey (tin ash). The white oxide is used in the ceramic or glass industries as an opacifier, whereas the grey powder is used for polishing metal, mirrors, etc., and also for obtaining vitrifiable compounds. This oxide is sometimes known as “putty powder”, but this term also covers mixtures of this oxide with lead oxide, which fall in **heading 38.24**.

Stannic oxide is amphoteric and gives the stannates of heading 28.41.

- (c) **Stannic acid or stannic hydroxide** ($\text{Sn}(\text{OH})_4$). Obtained by the action of an alkali hydroxide on a stannic salt. A white powder which turns into meta-stannic acid.
- (d) **Meta-stannic acid**. Obtained from stannic acid; a powder, insoluble in water. Used as an opacifying colour in ceramics and an abrasive in the glass industry.

These stannic acids give the stannates of heading 28.41.

This heading **does not include** :

- (a) Natural tin oxide (cassiterite), an ore (**heading 26.09**).
- (b) Tin dross, a mixture of tin oxide and tin obtained during the melting of the metal (**heading 26.20**).

(16) **Tungsten oxides and hydroxides.** The most important tungsten oxide is tungstic oxide (tungstic anhydride, tungsten trioxide) (WO_3), obtained in the metallurgy of this metal by treating the natural tungstates (wolframite or scheelite) (heading 26.11). It is a lemon-yellow, crystalline product which turns orange on heating and is insoluble in water. Used for preparing the tungsten for electric bulb filaments and in ceramic paints.

There are several hydroxides, including tungstic acid (H_2WO_4) (yellow hydrate), which gives the normal tungstates of heading 28.41.

Natural tungsten oxide (tungsten ochre, tungstite) is **excluded** (**heading 25.30**).

(17) **Bismuth oxides and hydroxides.**

- (a) **Dibismuth trioxide** (Bi_2O_3). Prepared from bismuth nitrate or carbonate. Pale yellow powder, insoluble in water and turning red when heated. Used in the glass or ceramic industries.
- (b) **Dibismuth pentoxyde** (red oxide) (Bi_2O_5). Brownish-red powder.
- (c) **Bismuth hydroxide** ($\text{Bi}(\text{OH})_3$).

Natural bismuth ochre, which mainly consists of the trioxides, is **excluded (heading 26.17)**.

This heading **does not include** mercury oxides (**heading 28.52**).

Sub-Chapter V

SALTS AND PEROXYSALTS, OF INORGANIC ACIDS AND METALS

GENERAL

Metal salts are obtained by replacing the hydrogen element in an acid by a metal or by the ammonium ion (NH_4^+). In the liquid state or in solution, they are electrolytes giving a metal (or a metal ion) at the cathode.

In **neutral** salts all the hydrogen atoms are replaced by the metal, but **acid** salts still contain part of the hydrogen replaceable by metal; **basic** salts contain a greater quantity of basic oxide than is necessary to neutralise the acid (e.g., basic sulphate of cadmium ($\text{CdSO}_4 \cdot \text{CdO}$)).

Sub-Chapter V covers metal salts of the acids classified in sub-Chapter II (acids derived from non-metals) or in sub-Chapter IV (acid-function metal hydroxides).

Double or complex salts.

Certain double or complex salts are specifically referred to in headings 28.26 to 28.41; for example, fluorosilicates, fluoroborates and other complex fluorine salts (heading 28.26), alums (heading 28.33), complex cyanides (heading 28.37). As regards double or complex salts not so specified, see the Explanatory Note to heading 28.42.

This sub-Chapter **excludes**, *inter alia* :

- (a) Salts of **Chapter 25** (e.g., sodium chloride).
- (b) Salts constituting ores or other products of **Chapter 26**.
- (c) Compounds of precious metals (**heading 28.43**), of radioactive elements (**heading 28.44**), of rare-earth metals, of yttrium or of scandium or of mixtures of these metals (**heading 28.46**), or of mercury (**heading 28.52**).
- (d) Phosphides, carbides, hydrides, nitrides, azides, silicides and borides (**headings 28.49, 28.50 and 28.53**) and ferrophosphorus (**Section XV**).
- (e) Salts of **Chapter 31**.
- (f) Pigments, colours, opacifiers, enamels and other preparations included in **Chapter 32**. This sub-Chapter covers **unmixed** metal salts (except luminophores), suitable for direct use as pigments; when mixed either together or with other products to form pigments, such salts fall in **Chapter 32**. Luminophores, mixed or not, fall in **heading 32.06**.
- (g) Disinfectants, insecticides, fungicides, weed killers, etc., of **heading 38.08**.
- (h) Fluxes and other auxiliary preparations for soldering, etc. (**heading 38.10**).
- (ij) Cultured crystals (other than optical elements) weighing not less than 2.5 g each, of the halides of the alkali or alkaline-earth metals (**heading 38.24**); when they are in the form of optical elements they are classified in **heading 90.01**.
- (k) Precious or semi-precious stones, natural or synthetic (**headings 71.02 to 71.05**).

28.26 - Fluorides; fluorosilicates, fluoroaluminates and other complex fluorine salts.

- Fluorides :

2826.12 -- Of aluminium

2826.19 -- Other

2826.30 - Sodium hexafluoroaluminate (synthetic cryolite)

2826.90 - Other

(A) FLUORIDES

Subject to the **exclusions** specified in the introduction to this Sub-Chapter, this heading covers the fluorides (i.e., the metal salts of hydrofluoric acid of heading 28.11).
The most important fluorides are :

- (1) **Ammonium fluorides** : the neutral fluoride (NH_4F) and the acid fluoride ($\text{NH}_4\text{F.HF}$). These occur in deliquescent, colourless, toxic crystals, soluble in water. Uses include : as antiseptics (for preserving hides or wood); to control fermentations, (in lieu of hydrofluoric acid); in dyeing (mordants); for etching glass (mainly acid fluoride); for scouring copper; in metallurgy (to disintegrate ores, to prepare platinum), etc.
- (2) **Sodium fluorides** : the neutral fluoride (NaF) and the acid fluoride (NaF.HF). Obtained by calcining natural calcium fluoride of heading 25.29 (fluorspar or fluorite) with a sodium salt. Colourless crystals, not very soluble in water, toxic. Like ammonium fluorides, they are used as antiseptics (for preserving hides, wood, eggs), to control fermentations, and for etching or frosting glass. They are also used in the manufacture of vitrifiable enamels or of parasiticides.
- (3) **Aluminium fluoride** (AlF_3). Prepared from bauxite and hydrofluoric acid. Colourless crystals, insoluble in water. It is used as a flux in the enamel or ceramic industries and for purifying hydrogen peroxide.
- (4) **Potassium fluorides**. Neutral potassium fluoride ($\text{KF.2H}_2\text{O}$) occurs in colourless, deliquescent, toxic crystals, very soluble in water. Also an acid fluoride (KF.HF). Same uses as sodium fluorides. In addition, the acid fluoride is used in the metallurgy of zirconium or of tantalum.
- (5) **Calcium fluoride** (CaF_2). Prepared from the natural calcium fluoride (fluorite, fluorspar) of **heading 25.29**. Colourless crystals, insoluble in water; or may be in the gelatinous state. Used as a flux in metallurgy (particularly in the electrolytic preparation of magnesium from carnallite), and in the manufacture of glass or of ceramics.
- (6) **Chromium trifluoride** ($\text{CrF}_3.4\text{H}_2\text{O}$). Dark green powder, soluble in water. In aqueous solution it attacks glass. Used as a mordant in dyeing.

- (7) **Zinc fluoride** (ZnF_2). White powder, insoluble in water. Used for impregnating wood, in the preparation of enamels and in galvanising.
- (8) **Antimony fluorides**. The action of hydrofluoric acid on antimony oxides gives antimony trifluoride (SbF_3), crystallising in deliquescent white needles, soluble in water, and antimony pentafluoride (SbF_5), a viscous liquid which dissolves in water with a hissing sound to form a hydrate (with $2 H_2O$). These salts are used in ceramics, as mordants in dyeing or textile printing.
- (9) **Barium fluoride** (BaF_2). Prepared from hydrofluoric acid and barium oxide, sulphide or carbonate. A white powder, sparingly soluble in water; toxic. Used as a pigment in ceramics or enamels, as an antiseptic in embalming, as an insecticide, etc.

This heading **excludes** non-metal fluorides (**heading 28.12**).

(B) FLUOROSILICATES

Fluorosilicates are the salts of the hexafluorosilicic acid (H_2SiF_6) of heading 28.11.

- (1) **Disodium hexafluorosilicate** (sodium fluorosilicate) (Na_2SiF_6). Prepared from silicon fluoride, a by-product of the manufacture of superphosphates. White powder, only sparingly soluble in cold water. Uses include the manufacture of opaque glass and enamels, synthetic stones, anti-acid cements, rat poisons, insecticides; the extraction of beryllium metal (electrolytic); the refining of tin by electrolysis; coagulating latex; as an antiseptic.
- (2) **Dipotassium hexafluorosilicate** (potassium fluorosilicate) (K_2SiF_6). White, odourless, crystalline powder, slightly soluble in water, soluble in hydrochloric acid. Uses include the manufacture of vitreous enamel frits, ceramics, insecticides, synthetic mica; in metallurgy of aluminium and magnesium.
- (3) **Calcium hexafluorosilicate** (calcium fluorosilicate) ($CaSiF_6$). White, crystalline powder; very slightly soluble in water; used as white pigment in ceramics.
- (4) **Copper hexafluorosilicate** (copper fluorosilicate) ($CuSiF_6 \cdot 6H_2O$). Blue, crystalline powder, soluble in water and toxic. Used for the production of mottled effects or as a fungicide.
- (5) **Zinc hexafluorosilicate** (zinc fluorosilicate) ($ZnSiF_6 \cdot 6H_2O$). Crystalline powder, soluble in water; reacts with calcium compounds to give a coating of calcium fluorides. Used for hardening concrete, for zinc electroplating, as an antiseptic or fungicide (wood infections).
- (6) **Barium hexafluorosilicate** (barium fluorosilicate) ($BaSiF_6$). White powder used against the Colorado beetle and other insects, and to exterminate noxious animals.

Other fluorosilicates. Magnesium fluorosilicate and aluminium fluorosilicate; like zinc fluorosilicate, these are used for hardening concrete. Chromium fluorosilicate and iron fluorosilicate are used in the dyestuff industry.

The heading **does not include** topaz, a natural aluminium fluorosilicate (**Chapter 71**).

(C) FLUOROALUMINATES AND OTHER COMPLEX FLUORINE SALTS

- (1) **Trisodium hexafluoroaluminate** (sodium hexafluoroaluminate) (Na_3AlF_6), synthetic cryolite, obtained as a precipitate on mixing aluminium oxide dissolved in hydrofluoric acid with sodium chloride, or by fusion of aluminium sulphate together with sodium fluoride. Occurs in whitish crystalline masses. It is used as a substitute for natural cryolite (**heading 25.30**) in the metallurgy of aluminium, in pyrotechnics, in enamels, in glass-making or as an insecticide.
- (2) **Fluoroborates.** Sodium fluoroborate (disinfectant), potassium fluoroborate (used in enamels), chromium fluoroborate and nickel fluoroborate (used in electro-plating), etc.
- (3) **Fluorosulphates.** In particular ammonium antimony fluorosulphate ($(\text{NH}_4)_2\text{SO}_4\text{SbF}_3$) or "Haen salt"; soluble crystals which corrode glass and metal. Used as a mordant in dyeing.
- (4) **Fluorophosphates**, for example, those obtained from natural magnesium fluorophosphate (wagnerite) (**heading 25.30**) or aluminium lithium fluorophosphate (amblygonite) (**heading 25.30**).
- (5) **Fluorotantalates** (obtained in the metallurgy of tantalum); **fluorotitanates**, **fluorogermanates**, **fluoroniobates**, **fluorozirconates** (obtained in the metallurgy of zirconium), **fluorostannates**, etc.

This heading includes metal fluoride oxides (of beryllium, etc.) and complex fluoride oxide salts but it **excludes** fluoride oxides of non-metals (**heading 28.12**).

Fluoroformates, fluoroacetates or other organic complex fluorine salts are **excluded** (**Chapter 29**).

28.27 - Chlorides, chloride oxides and chloride hydroxides; bromides and bromide oxides; iodides and iodide oxides.

2827.10 - Ammonium chloride

2827.20 - Calcium chloride

- Other chlorides :

2827.31 -- Of magnesium

2827.32 -- Of aluminium

2827.35 -- Of nickel

2827.39 -- Other

- Chloride oxides and chloride hydroxides :

2827.41 -- Of copper

2827.49 -- Other

- Bromides and bromide oxides :

2827.51 -- Bromides of sodium or of potassium

2827.59 -- Other

2827.60 - Iodides and iodide oxides

Subject to the **exclusions** specified in the introduction to this sub-Chapter, this heading covers chlorides, chloride oxides (oxychlorides), chloride hydroxides (hydroxychlorides), bromides, bromide oxides (oxybromides), iodides and iodide oxides (oxyiodides) of metals or of the ammonium ion (NH_4^+). Halides and halide oxides of non-metals are excluded (heading 28.12).

(A) CHLORIDES

This group covers the salts of hydrogen chloride (heading 28.06).

The main chlorides included here are :

- (1) **Ammonium chloride** (sal ammoniac, ammonium muriate) (NH_4Cl). Results from the neutralisation of hydrogen chloride with ammonia. It may be in crystalline masses or in powder, flowers or cakes obtained by sublimation. Colourless when pure, otherwise yellowish; soluble in water. Its uses include the pickling of metals, in the textile dyeing or printing industry, in tanning, as a fertiliser, in the manufacture of Leclanché cells, for hardening varnishes or glues, in electroplating, in photography (fixing solutions), etc.

See Explanatory Note to heading 31.02 regarding fertilisers containing ammonium chloride.

(2) **Calcium chloride** (CaCl_2). This compound is either extracted from natural Stassfurt salts, or obtained as a by-product of the manufacture of sodium carbonate. It is white, yellowish or brown in colour, according to the degree of purity. A hygroscopic product, it may be in cast or melted form, in porous masses or in flakes, or may be hydrated with 6 H_2O (crystalline or granulated). It is used in refrigerating mixtures, for cold weather concrete work, as an anti-dust dressing for roads or for hard-earth floorings, as a catalyst, as a dehydrating or condensation agent in organic synthesis (e.g., preparation of amines from phenol) and for drying gases. It is also used in medicine.

(3) **Magnesium chloride** (MgCl_2). A by-product of the extraction of potassium salts. Occurs either in anhydrous translucent masses, cylinders, tablets or prisms, or hydrated in colourless needles. Soluble in water. Used in the manufacture of very hard cement (e.g., for floor coverings cast in one piece), of cotton or other textile dressings, as a disinfectant or antiseptic in medicine and for fire-proofing wood.

The heading excludes natural magnesium chloride (bischofite) (**heading 25.30**).

(4) **Aluminium chloride** (AlCl_3). Obtained by the action of chlorine on aluminium, or of hydrogen chloride on aluminium oxide. Anhydrous or crystalline; or in aqueous solutions of syrupy consistency. The anhydrous salt fumes on exposure to air. The solid chloride is used in organic synthesis, as a mordant in dyeing, etc. In aqueous solutions it is used for preserving wood, pickling wool, as a disinfectant, etc.

(5) **Iron chlorides.**

(a) **Ferrous chloride** (FeCl_2). Anhydrous (scales, flakes or greenish-yellow powder) or hydrated with, for example, 4 H_2O (green or bluish crystals); or may be in green aqueous solutions. Oxidises in the air and becomes yellow. Usually presented in carefully stoppered bottles with a few drops of alcohol added to prevent oxidation. A reducing agent and a mordant.

(b) **Ferric chloride** (FeCl_3). Prepared by dissolving iron oxide or carbonate or iron metal in hydrochloric acid or in *aqua regia*, or by passing gaseous chlorine over red-hot iron. Anhydrous, in yellow, brown or garnet-coloured masses, deliquescent and soluble in water, or hydrated (with 5 or 12 H_2O) in orange-coloured, red or purple crystals; the liquid iron chloride on the market is a dark red aqueous solution. More widely employed than ferrous chloride, e.g., for purifying industrial water, as a mordant, in photography and photo-engraving, to give a patina to iron, in medicine (haemostatic or vasoconstrictive preparations), and, principally, as an oxidising agent.

(6) **Cobalt dichloride** (cobaltous chloride) ($\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$). In pink, red or purple crystals turning blue when heated; soluble in water. Used in the manufacture of hygrometers, as a sympathetic ink or as an absorbent in gas masks.

(7) **Nickel dichloride** (NiCl_2). Anhydrous, in yellow scales or flakes, or hydrated (with 6 H_2O) in deliquescent green crystals; very soluble in water. Used as a mordant in dyeing, in electrolysis (nickel-plating baths) or as an absorbent in gas masks.

(8) **Zinc chloride** (ZnCl_2). Zinc chloride is obtained by passing hydrogen chloride over roasted zinc ores (blende or calamine) (heading 26.08); or it can be extracted from the ashes and residues classified in heading 26.20. White crystalline masses (butter of zinc), fused or granulated. It is highly deliquescent, soluble in water, caustic and very toxic. Used as an antiseptic, fungicide, dehydrating agent, for fire-proofing wood, preserving hides, hardening cellulose (preparation of vulcanised fibre), and in organic synthesis. Also used as a flux in soldering, as a mordant in dyeing or printing, for purifying oils, and in the manufacture of dental cements or of medicaments (cauterising antiseptics).

(9) **Tin chlorides.**

- (a) **Stannous chloride** (tin dichloride) (SnCl_2). Masses with a resinous fracture, or in white or yellowish crystals (with 2 H_2O). Also in solutions of the same colours. Corrosive; deteriorates in the air. Used as a reducing agent or mordant in textile dyeing, in vat dyes (dyers' tin salt), as tin size for silk or in electrolytic tin-plating.
- (b) **Stannic chloride** (tin tetrachloride) (SnCl_4). In the anhydrous state this is a colourless or yellowish liquid, giving off white fumes in a humid atmosphere. Hydrated it gives colourless crystals; it also occurs in gelatinous masses (butter of tin). Used as a textile mordant or size (tin size for silk), or, mixed with stannous chloride and gold salts, in the preparation of purple of Cassius for decorating porcelain.

(10) **Barium chloride** (BaCl_2). Prepared from natural barium carbonate (witherite) or sulphate (barytes). Soluble in water; may be anhydrous or fused (yellow powder), or hydrated with 2 H_2O (in lamellar crystals or tablets). Used in dyeing, in ceramics, as a parasiticide or rat-poison, for purifying industrial water, etc.

(11) **Titanium chlorides.** The most important is titanium tetrachloride (TiCl_4) obtained in the metallurgy of titanium by the action of chlorine on a mixture of carbon and native titanium dioxide (rutile, brookite, anatase). Colourless or yellowish liquid with a pungent odour; fumes in moist air; absorbs and is hydrolysed by water. Used in the manufacture of mordants for dyeing (titanium mordants), for giving ceramics an iridescent appearance, for making smoke-screens or in organic synthesis.

(12) **Chromium chlorides.**

- (a) **Chromous chloride** (CrCl_2). Needle-shaped crystals or azure-blue solutions. Reducing agent.
- (b) **Chromic chloride** (CrCl_3). Pink or orange crystalline scales, or hydrated (with 6 or 12 H_2O) in green or purple crystals. Used as a mordant in textile dyeing, in tanning, in electrolytic chromium plating, in organic synthesis and for preparing sintered chromium.

(13) **Manganese dichloride** (MnCl_2). Obtained by treating the natural carbonate, rhodocrosite or dialogite (heading 26.02) with hydrogen chloride. Rose-coloured, crystalline masses when anhydrous; or hydrated (e.g., with 4 H_2O) in rose-coloured crystals, deliquescent and soluble in water. Used in the manufacture of brown colouring agents or of certain medicaments, as a catalyst and in textile printing.

(14) **Copper chlorides.**

- (a) **Cuprous chloride** (copper monochloride) (CuCl). Crystalline powder or colourless crystals, practically insoluble in water, oxidising in the air. Used in the metallurgy of nickel and silver, or as a catalyst.

(b) **Cupric chloride** ($\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$). Deliquescent green crystals, soluble in water. Used in textile printing, photography or electrolysis; as a catalyst, an antiseptic, disinfectant or insecticide; in the dyestuff industry and in pyrotechnics (Bengal fires).

Nantokite, natural copper chloride, falls in **heading 25.30**.

(15) **Antimony chlorides.**

- (a) **Antimony trichloride** (butter of antimony) (SbCl_3). Prepared by treating natural sulphide (stibnite) (heading 26.17) with hydrogen chloride. Occurs in colourless, translucent lumps; absorbs atmospheric moisture to take on an unctuous appearance; it is caustic. Used for “ bronzing ” or pickling metals, as a mordant, for making lakes, for leather dressing, and in the preparation of antimony oxide or veterinary remedies.
- (b) **Antimony pentachloride** (SbCl_5). Colourless liquid, fuming in moist air; decomposed by water. Used as a chlorine carrier in organic synthesis and as a fumigant.

This group **excludes** sodium chloride and potassium chloride which, even in the pure state, fall in **headings 25.01** and **31.04** or **31.05**, respectively. The heading also **excludes** the compound wrongly known as “chloride of lime” which is commercial calcium hypochlorite (**heading 28.28**). Mercury chlorides (mercurous chloride and mercuric chloride) fall in **heading 28.52**.

(B) CHLORIDE OXIDES AND CHLORIDE HYDROXIDES

This group covers chloride oxides (oxychlorides) and chloride hydroxides (hydroxychlorides) of metals.

It includes :

- (1) **Copper chloride oxides and chloride hydroxides.** Crystalline, blue powders, used as insecticides, fungicides or pigments.
The heading **excludes** natural copper chloride hydroxide (atacamite) (**heading 26.03**).
- (2) **Aluminium chloride hydroxide** ($\text{Al}_2\text{Cl}(\text{OH})_5 \cdot x\text{H}_2\text{O}$). Yellowish-white powder. Used as anti-perspirant in cosmetics.
- (3) **Chromium chloride oxide** (chromyl chloride) (CrCl_2O_2). Red liquid with an irritating odour; fumes in moist air and decomposed by water. Used in tanning, as a mordant and as an oxidising agent.
- (4) **Tin chloride oxide.** Grey or white amorphous lumps, soluble in water. Used as a mordant.
- (5) **Antimony chloride oxide** (SbClO). A white powder used in the manufacture of smokes, pigments, medicaments.
- (6) **Lead chloride oxides and chloride hydroxides.** White powders obtained by treating lead oxide (litharge) with an alkaline chloride. Used for preparing lead chromates, as pigments (Cassel yellow) for water paints, oil paints or distempers, and in the preparation of other more complex pigments.

- (7) **Bismuth chloride oxide** (bismuthyl chloride) (BiClO). White powder used as a pigment ("pearl white") in the manufacture of artificial pearls.

(C) BROMIDES AND BROMIDE OXIDES

This group covers the salts of hydrogen bromide (heading 28.11) and bromide oxides (oxybromides).

- (1) **Sodium bromide** (NaBr). Prepared in a similar way to ammonium bromide, or by treating with a sodium salt the iron bromide obtained by direct action of bromine on iron turnings. It can be obtained in the rather unstable anhydrous state by crystallisation above 51 °C. When crystallised below that temperature it is hydrated (with 2 H_2O), in large cubic crystals. Colourless, hygroscopic, soluble in water. Used in medicine and in photography.
- (2) **Potassium bromide** (KBr). Similar manufacturing processes and same uses as sodium bromide. Anhydrous, in large crystals.
- (3) **Ammonium bromide** (NH_4Br). Produced by the action of hydrogen bromide on ammonia. Colourless crystals, soluble in water, turning yellow and slowly disintegrating when exposed to air, and volatilised by heat. Used in medicine as a sedative, in photography (as a restrainer in developing solutions), and as a fire-proofing material.
- (4) **Calcium bromide** ($\text{CaBr}_2 \cdot 6\text{H}_2\text{O}$). Prepared from calcium carbonate and hydrogen bromide; deliquescent colourless crystals, very soluble in water. Used in medicine and in photography.
- (5) **Copper bromides.**
 - (a) **Cuprous bromide** (CuBr). Obtained by reduction of cupric bromide; colourless crystals, insoluble in water. Used in organic synthesis.
 - (b) **Cupric bromide** (CuBr_2). Prepared by direct action of bromine on copper. Deliquescent crystals, soluble in water. Used in organic synthesis and in photography.
- (6) **Other bromides and bromide oxides.** These include strontium bromide (used in medicine), and barium bromide.

(D) IODIDES AND IODIDE OXIDES

This group covers the salts of hydrogen iodide (heading 28.11) and iodide oxides (oxyiodides).

- (1) **Ammonium iodide** (NH_4I). Obtained by the action of hydrogen iodide on ammonia or ammonium carbonate. White, crystalline, hygroscopic powder, very soluble in water. Used in medicine (for circulatory ailments or emphysema) and in photography.
- (2) **Sodium iodide** (NaI). Obtained by the action of hydrogen iodide on sodium hydroxide or carbonate, or by treating with a sodium salt the iron iodide obtained by the direct action of iodine on iron filings; also prepared by calcining iodates. Crystalline, anhydrous. Deliquescent and very soluble in water, decomposing on exposure to air and light. Used in medicine, to iodise table or kitchen salt and in photography.

- (3) **Potassium iodide** (KI). Similar manufacturing processes and similar uses, but keeps better than sodium iodide. Anhydrous, colourless or opaque crystals.
- (4) **Calcium iodide** (CaI₂). Prepared from calcium carbonate and hydrogen iodide. Colourless shiny crystals or pearly white scales. Soluble in water and turns yellow in the air. Used in photography.
- (5) **Other iodides and iodide oxides.** These include :
 - (a) Iodides of lithium (used in medicine), of strontium, of antimony, of zinc or of iron (both used in medicine and as antiseptics), of lead (with a metallic glint, used in the preparation of rubber colours), of bismuth (reagent).
 - (b) Antimony iodide oxide, copper iodide oxide and lead iodide oxide.

Mercury iodides (mercurous iodide and mercuric iodide) are **excluded (heading 28.52)**.

28.28 - Hypochlorites; commercial calcium hypochlorite; chlorites; hypobromites.

2828.10 - Commercial calcium hypochlorite and other calcium hypochlorites

2828.90 - Other

Subject to the **exclusions** specified in the introduction to this sub-Chapter, this heading covers hypochlorites, chlorites and hypobromites of metals and commercial calcium hypochlorite.

(A) HYPOCHLORITES

These are the most important; they are mainly used for bleaching ("bleaching chlorites"). They are unstable salts, which deteriorate in the air; they give hypochlorous acid on contact even with weak acids. Hypochlorous acid, readily giving off chlorine, is a very powerful oxidising and bleaching agent.

- (1) **Sodium hypochlorite** ($\text{NaClO} \cdot 6\text{H}_2\text{O}$). Put up in aqueous solutions, is nowadays commercially known as "eau de Javel". It is prepared by electrolysing an aqueous solution of sodium chloride, or by the action of sodium sulphate or sodium carbonate on calcium hypochlorite, or by treating sodium hydroxide (caustic soda) with chlorine. This salt, very soluble in water, does not exist in the anhydrous state; it is rather unstable and sensitive to heat and light. Aqueous solutions of sodium hypochlorite are colourless or yellowish, smelling of chlorine. They generally contain as impurities a small quantity of sodium chloride. Used for bleaching vegetable fibres or wood pulp, disinfecting premises, purifying water or preparing hydrazine. It is also used in photography as a rapid developer for antihalation plates, and in medicine as an antiseptic (mixed with boric acid, it is known as Dakin's solution).
- (2) **Potassium hypochlorite** ($\text{KClO} \cdot 6\text{H}_2\text{O}$). The aqueous solution of this salt was previously known as "eau de Javel"; it is similar in all respects to the sodium compound.
- (3) **Other hypochlorites.** These include hypochlorites of ammonium (a disinfectant more powerful than calcium hypochlorite), of barium, of magnesium or of zinc; all are bleaching agents or disinfectants.

(B) COMMERCIAL CALCIUM HYPOCHLORITE

Calcium hypochlorite. The product, improperly known in commerce as "chloride of lime", consists mainly of impure calcium hypochlorite and calcium chloride and, sometimes, calcium oxide or hydroxide. It is obtained by saturating calcium hydroxide with chlorine. It is a white, amorphous, powdery substance, hygroscopic when containing calcium chloride, soluble in water, and sensitive to the action of light, heat and carbon dioxide. It affects animal fibres and organic matter, and destroys colouring matter. It is used for bleaching vegetable textiles or wood pulp, as a disinfectant or antiseptic (to purify water by "javellisation"), for spreading over ground contaminated by lethal gases. Pure calcium hypochlorite occurs in crystalline masses or in solutions smelling of chlorine; it is slightly more stable than the impure product.

Calcium chloride (CaCl_2) is **excluded (heading 28.27)**.

(C) CHLORITES

This group covers the salts of chlorous acid (HClO_2) :

- (1) **Sodium chlorite** (NaClO_2). Anhydrous or hydrated (with 3 H_2O) masses, or aqueous solutions. Stable up to 100 °C. Powerful oxidising agent, very corrosive. Used in dyeing or bleaching.
- (2) **Aluminium chlorite**. Same uses as sodium chlorite.

(D) HYPOBROMITES

This group covers the salts of hypobromous acid (HBrO) (heading 28.11).

Potassium hypobromite is used for measuring the nitrogen content of certain organic compounds.

28.29 - Chlorates and perchlorates; bromates and perbromates; iodates and periodates.

- Chlorates :

2829.11 -- Of sodium

2829.19 -- Other

2829.90 - Other

Subject to the **exclusions** specified in the introduction to this sub-Chapter, this heading covers chlorates and perchlorates, bromates and perbromates, and iodates and periodates of metals.

(A) CHLORATES

This group covers the salts of chloric acid (HClO_3) (heading 28.11).

- (1) **Sodium chlorate** (NaClO_3). Obtained by electrolysing an aqueous solution of sodium chloride. Shiny colourless crystals (tablets); very soluble in water; readily gives off its oxygen. Often contains impurities (e.g., chlorides of the alkali metals). Used as an oxidising agent, in organic synthesis, in textile printing (aniline black dyes), for the manufacture of fulminating primers and preparations for match heads, as a weed-killer, etc.
- (2) **Potassium chlorate** (KClO_3). Prepared in a similar manner to sodium chlorate. Colourless crystals, sparingly soluble in water. Its other properties are similar to those of sodium chlorate. It is also used in medicine and in the manufacture of blasting explosives (e.g., cheddite).
- (3) **Barium chlorate** ($\text{Ba}(\text{ClO}_3)_2$). Obtained by electrolysing a solution of barium chloride; colourless crystals, soluble in water. Used as green colouring matter in pyrotechnics and in the manufacture of explosives and certain other chlorates.
- (4) **Other chlorates**. These include ammonium chlorate, used in the manufacture of explosives; strontium chlorate, used in the manufacture of explosives and in pyrotechnics to produce red lights; chromium chlorate, used as a mordant in dyeing; copper chlorate, green crystals used in dyeing, in the manufacture of explosives and in pyrotechnics to produce green lights.

(B) PERCHLORATES

This group covers the salts of perchloric acid (HClO_4) (heading 28.11). These powerful oxidising agents are used in pyrotechnics and in the manufacture of explosives.

- (1) **Ammonium perchlorate** (NH_4ClO_4). Prepared from sodium perchlorate. Colourless crystals, soluble in water especially when hot; decomposed by heat, sometimes explosively.
- (2) **Sodium perchlorate** (NaClO_4). Obtained by electrolysing cold solutions of sodium chlorate; deliquescent, colourless crystals.
- (3) **Potassium perchlorate** (KClO_4). Obtained from sodium perchlorate. Colourless crystalline powder of comparatively low solubility, exploding on shock. Used in the chemical industry as an oxidising agent more powerful than chlorates.

- (4) **Other perchlorates.** These include : barium perchlorate (hydrated powder) and lead perchlorate; the saturated solution of the latter is a heavy liquid (specific gravity 2.6) used in the flotation process.

(C) BROMATES AND PERBROMATES

This group covers the salts of bromic acid (HBrO_3) (heading 28.11), for example potassium bromate (KBrO_3), and the salts of perbromic acid (HBrO_4).

(D) IODATES AND PERIODATES

This group covers the salts of iodic acid (HIO_3) (heading 28.11) and the salts of periodic acid (heading 28.11).

Sodium iodate (NaIO_3), potassium iodate (KIO_3) and potassium hydrogen di-iodate ($\text{KH}(\text{IO}_3)_2$) are employed in medicine and as reagents in chemical analysis. Barium iodate, in crystals, is used for manufacturing iodic acid.

Sodium periodates (monosodium and disodium) are obtained by the action of chlorine on an alkaline solution of sodium iodate.

28.30 - Sulphides; polysulphides, whether or not chemically defined.

2830.10 - Sodium sulphides

2830.90 - Other

Subject to the **exclusions** mentioned in the introduction of this sub-Chapter, this heading covers metal sulphides (salts of hydrogen sulphide (H_2S) of heading 28.11). The old name "sulphydrates" (hydrosulphides) is sometimes applied to the acid sulphides. Sulphides of non-metals are **excluded (heading 28.13)**.

(1) Sodium sulphides.

- (a) **Sodium sulphide** (Na_2S). Prepared by reducing sodium sulphate by means of coal. Either anhydrous, in whitish masses or plates (concentrated or melted sulphide), soluble in water, sulphating in the air, or in hydrated crystals (with 9 H_2O), colourless or greenish, according to their degree of purity. Mild reducing agent used in the preparation of organic compounds. In flotation processes, this sulphide promotes the absorption of oil on the surface of ores by sulphiding. Also used as a hair-remover (in tanning or in toilet preparations), and as a parasiticide.
- (b) **Sodium hydrogen sulphide** (hydrosulphide) ($NaHS$). Obtained by the action of hydrogen sulphide on the neutral sulphide. Colourless crystals, soluble in water. Used as a de-hairing agent in tanning, in dyeing, as a copper absorbent in nickel refining, as a reducing agent in organic synthesis, etc.
- (2) **Zinc sulphide** (ZnS). Artificial zinc sulphide is obtained in the hydrated form by precipitating an alkali zincate by means of sodium sulphide. White paste or powder often containing zinc oxide or other impurities. It is used, either pure or mixed with magnesia, as a pigment in the rubber industry. Co-precipitated with barium sulphate it forms lithopone (**heading 32.06**). Activated with silver, copper, etc., it gives a luminophore of **heading 32.06**. It should, however, be noted that zinc sulphide is classified in this heading **only when unmixed and non-activated**.

The heading **excludes** zinc blende (a natural zinc sulphide) (**heading 26.08**), and wurzite (also a natural zinc sulphide) (**heading 25.30**).

- (3) **Cadmium sulphide** (CdS). The artificial sulphide is obtained by precipitation from a cadmium salt (e.g., sulphate) solution by hydrogen sulphide or an alkali sulphide. Yellow pigment (cadmium yellow) used by artists and in the manufacture of anti-glare glass; co-precipitated with barium sulphate, it forms the bright yellow colouring matter employed in paints or ceramics (**heading 32.06**).

The heading **excludes** natural cadmium sulphide (greenockite) (**heading 25.30**).

- (4) **Ammonium hydrogen sulphide** (ammonium hydrosulphide) (NH_4HS). Crystalline flakes or needles; very volatile. Used in photography and in organic synthesis.
- (5) **Calcium sulphide** (CaS). Obtained by calcining a mixture of calcium sulphate and carbon. Greyish or yellowish masses, sometimes luminescent, almost insoluble in water. Often contains sulphate or other impurities. Used either alone, or treated with arsenous oxide or with lime for de-hairing hides. Used also as a hair-remover in toilet preparations, as a microbicide in medicine, in metallurgy and in the preparation of luminescent paints.

- (6) **Iron sulphides.** The most important artificial iron sulphide is the ferrous sulphide (FeS) obtained by fusion of a mixture of sulphur and iron filings. Blackish plates, sticks or lumps, with a metallic glint. Used in the manufacture of hydrogen sulphide and in ceramics.

Natural iron sulphides are **excluded** - see **heading 25.02** (unroasted pyrites), or **71.03** or **71.05** (marcasite). Natural double sulphides of iron with arsenic (mispickel) or copper (bornite, chalcopyrite) fall in **headings 25.30** and **26.03**, respectively.

- (7) **Strontium sulphide** (SrS). Greyish product, turning yellow on contact with air. Used as a hair-remover in the tanning industry, in cosmetic products and in the preparation of luminescent paints.
- (8) **Tin sulphides.** Artificial stannic sulphide (tin disulphide) (SnS_2) is obtained by heating a mixture of sulphur and ammonium chloride with a tin oxide or amalgam. Golden yellow flakes or powder, insoluble in water and subliming when heated. Used for bronzing wood, plaster, etc.

(9) **Antimony sulphides.**

- (a) **Artificial trisulphide** (Sb_2S_3). The action of an acid on the natural sulphide dissolved in sodium hydroxide gives a red or orange-coloured powder (precipitated trisulphide). Used either alone or mixed with pentasulphide or other products as a pigment in the rubber industry (antimony vermillion, antimony crimson). Melted natural sulphide gives black trisulphide, employed in pyrotechnics, in the manufacture of match head mixtures, of fulminating primers or caps (with potassium chlorate), of flashlight powder for photography (with potassium chromate), etc. Hot treatment with sodium carbonate gives "kermes mineral", consisting essentially of antimony trisulphide and sodium pyro-antimonate and used in medicine (**heading 38.24**).
- (b) **Pentasulphide** (golden antimony sulphide) (Sb_2S_5). Prepared by acidifying a solution of antimony sodium sulphide (Schlippe's salt). Orange-coloured powder, decomposing in course of time, even in the dark. Used for manufacturing primers, for vulcanising or colouring rubber, and in medicaments for human (expectorant) or veterinary uses.

Natural antimony sulphide (stibnite) and oxysulphide (kermesite) are **excluded** (**heading 26.17**).

- (10) **Barium sulphide** (BaS). Obtained by reducing the natural sulphate (barytes, heading 25.11) by means of coal. White powder or lumps when pure, greyish or yellowish when impure. Toxic. Similar uses to strontium sulphide.

(11) **Other sulphides.** These include :

- (a) **Potassium sulphides (neutral and acid).** Potassium hydrogen sulphide is used in the manufacture of mercaptans.
- (b) **Copper sulphides**, used in the preparation of electrodes or of paints resisting the action of sea water; natural copper sulphide (covellite, chalcocite) is **excluded** (**heading 26.03**).
- (c) **Lead sulphide**, used in ceramics; natural lead sulphide (galena) is **excluded** (**heading 26.07**).

Natural mercury sulphide (cinnabar, natural vermillion) and artificial mercury sulphides are **excluded** and fall in **headings 26.17** and **28.52**, respectively.

(12) **Polysulphides** which are also classified here, are mixtures of sulphides of the same metal.

- (a) **Sodium polysulphide** is obtained by heating sulphur with sodium carbonate or neutral sodium sulphide. Contains mainly sodium disulphide (Na_2S_2), trisulphide and tetrasulphide and impurities (sulphate, sulphite, etc.). It occurs in greenish plates, soluble, oxidising in the air and very hygroscopic; it is kept in well-stoppered containers. Used mainly as a reducing agent in organic synthesis (preparation of sulphur dyes); in flotation processes; in the preparation of ethylene polysulphides, of artificial mercury sulphide, sulphur baths or mixtures for the treatment of scabies.
- (b) **Potassium polysulphide** ("liver of sulphur") is used for the same purposes as sodium polysulphide and more particularly for sulphur baths.

The heading also **excludes** the following natural sulphides :

- (a) Nickel sulphide (millerite) (**heading 25.30**).
- (b) Molybdenum sulphide (molybdenite) (**heading 26.13**).
- (c) Vanadium sulphide (patronite) (**heading 26.15**).
- (d) Bismuth sulphide (bismuthinite) (**heading 26.17**).

28.31 - Dithionites and sulphonylates.

2831.10 - Of sodium

2831.90 - Other

Dithionites (hydrosulphites) are the salts of dithionous ("hydrosulphurous") acid ($H_2S_2O_4$) which has not been isolated in the free state. They are obtained by reducing (with zinc powder) solutions of hydrogen sulphites saturated with sulphur dioxide. They are reducing agents employed in the chemical, textile or sugar industries, mainly for bleaching.

The most important is **sodium dithionite** ($Na_2S_2O_4$), anhydrous white powder, soluble in water, or hydrated (with 2 H_2O) in colourless crystals. It is used in organic synthesis, in the dyeing industry and for paper-making. It deteriorates rather rapidly, even when crystallised. For certain uses (e.g., as a discharge in the textile industry), sodium dithionite must therefore be stabilised with formaldehyde, sometimes with the addition of zinc oxide or glycerol. It may also be stabilised with acetone.

Dithionites of potassium, calcium, magnesium and zinc, which may be stabilised by similar processes, are products similar to sodium dithionite, with similar properties and uses.

The heading **includes all these stabilised dithionites** and also formaldehyde sulphonylate which is a similar product.

Sulphites and thiosulphates are **excluded (heading 28.32)**.

28.32 - Sulphites; thiosulphates.

2832.10 - Sodium sulphites

2832.20 - Other sulphites

2832.30 - Thiosulphates

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers :

- (A) **Metal sulphites** - salts of sulphurous acid (H_2SO_3) (which exists only in aqueous solution and corresponds to the sulphur dioxide of heading 28.11).
- (B) **Metal thiosulphates** - salts of thiosulphuric acid ($H_2S_2O_3$) which does not exist in the pure state.

The heading **excludes** concentrated sulphite lye (**heading 38.04**), and the industrial products known as "hydrosulphites" stabilised by organic substances (**heading 28.31**).

(A) SULPHITES

This heading covers both neutral and acid sulphites.

- (1) **Sodium sulphites.** These include sodium hydrogen sulphite ($NaHSO_3$), disodium disulphite ($Na_2SO_3 \cdot SO_2$ or $Na_2S_2O_5$) or sodium sulphite (Na_2SO_3).
 - (a) **Sodium hydrogen sulphite** ("sodium bisulphite", sodium acid sulphite) results from the action of sulphur dioxide on an aqueous solution of sodium carbonate. Colourless powder or crystals, rather unstable, with a smell of sulphur dioxide and very soluble in water; also presented in concentrated solution, yellowish in colour. Used as a reducing agent in organic synthesis, in the manufacture of indigo, for bleaching wool or silk, as a vulcanising agent for the treatment of latex, in tanning, in oenology (as an antiseptic to preserve wine) and to reduce the buoyancy of minerals in flotation processes.
 - (b) **Disodium disulphite** (sodium metabisulphite, pyrosulphite, dry sulphite and, in some languages, incorrectly referred to as "sodium bisulphite crystals"). Obtained from the hydrogen sulphite; oxidises rather rapidly, especially in a humid atmosphere. Used for the same purposes as the acid sulphite and in viticulture and photography.
 - (c) **Sodium sulphite** (neutral sodium sulphite), prepared by neutralising a solution of the hydrogen sulphite by means of sodium carbonate. Anhydrous (in powder) or crystallised (with 7 H_2O) colourless, soluble in water. Used in photography, in breweries, for treating rosin, as an antiseptic or bleaching agent, in the manufacture of other sulphites or thiosulphates and of organic dyes, etc.
- (2) **Ammonium sulphite** ($(NH_4)_2SO_3 \cdot H_2O$). Results from the action of sulphur dioxide on ammonia. Colourless crystals, soluble in water, oxidising in the air. Used in organic synthesis.
- (3) **Potassium sulphites.** Appear in the same forms as sodium sulphites.
 - (a) **Potassium hydrogen sulphite**, crystalline, used in dyeing and in oenology.

- (b) **Dipotassium disulphite** (potassium metabisulphite), a white powder or in scales, used in photography, for the carotting of hair in the felt hat industry or as an antiseptic.
- (c) **Neutral sulphite**, crystallised (with 2 H₂O) used in textile printing.
- (4) **Calcium sulphites**, which include :
- (a) **Calcium dihydrogen bis(sulphite)** (calcium bisulphite) (Ca(HSO₃)₂), obtained by the action of sulphur dioxide on calcium hydroxide. Used to dissolve lignin in the preparation of chemical pulp, for bleaching (e.g., sponges), as an antichlor and to prevent cloudiness in beer.
- (b) **Neutral calcium sulphite** (CaSO₃), a white crystalline powder or hydrated needles (with 2 H₂O), sparingly soluble in water, efflorescing in the air. Used in medicine or in oenology.
- (5) **Other sulphites**. These include magnesium sulphites (same uses as calcium sulphites), zinc sulphite (antiseptic and mordant), or chromium hydrogen sulphite (mordant).

(B) THIOSULPHATES

- (1) **Ammonium thiosulphate** ((NH₄)₂S₂O₃). Prepared from sodium thiosulphate. Colourless crystals, deliquescent and soluble in water. Used for photographic fixing baths and as an antiseptic.
- (2) **Sodium thiosulphate** (Na₂S₂O₃.5H₂O). Results from the action of sulphur on a solution of sodium sulphite. In the form of colourless crystals, very soluble in water, unaffected by air. Used as a fixing agent in photography, as an antichlor in the bleaching of textiles or paper, in chrome tanning and in organic synthesis.
- (3) **Calcium thiosulphate** (CaS₂O₃.H₂O). Prepared by oxidation of calcium sulphide. White crystalline powder, soluble in water. Used in medicine and in the preparation of other thiosulphates.
- (4) **Other thiosulphates**. These include : barium thiosulphate (pigment with a pearly sheen); aluminium thiosulphate (used in organic synthesis); lead thiosulphate (used in the preparation of phosphorus-free matches).

28.33 - Sulphates; alums; peroxosulphates (persulphates).

- Sodium sulphates :

2833.11 -- Disodium sulphate

2833.19 -- Other

- Other sulphates :

2833.21 -- Of magnesium

2833.22 -- Of aluminium

2833.24 -- Of nickel

2833.25 -- Of copper

2833.27 -- Of barium

2833.29 -- Other

2833.30 - Alums

2833.40 - Peroxosulphates (persulphates)

(A) SULPHATES

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers the metal salts of sulphuric acid (H_2SO_4) (heading 28.07), but **excludes** mercury sulphates which fall in **heading 28.52**, ammonium sulphate which, even pure, falls in **heading 31.02** or **31.05** and potassium sulphate, which, whether or not pure, falls in **heading 31.04** or **31.05**.

(1) **Sodium sulphates** include :

(a) **Disodium sulphate** (neutral sulphate) (Na_2SO_4). Occurs in the anhydrous or hydrated state as a powder or in large transparent crystals, efflorescing in the air and dissolving in water with a fall in temperature. The decahydrate ($Na_2SO_4 \cdot 10H_2O$) is known as Glauber's salt. Impure forms of disodium sulphate (90 - 99 % purity), generally obtained as by-products of various manufacturing processes, are often described as "salt cake" and are classified in this heading. Disodium sulphate is used as an adjuvant in dyeing; as a flux in glass-making to obtain vitrifiable mixtures (manufacture of bottle glass, crystal and optical glass); in tanning for preserving hides; in paper-making (preparation of certain chemical pulps); as a sizing material in the textile industry; in medicine as a purgative, etc.

Natural sodium sulphates (glauberite, bloedite, reussin, astrakhanite) are **excluded** (**heading 25.30**).

(b) **Sodium hydrogen sulphate** (acid sulphate) ($NaHSO_4$). This residual salt of the manufacture of nitric acid occurs in deliquescent fused, white masses. Used instead of sulphuric acid, in particular for pickling metal, regenerating rubber, in the metallurgy of antimony or tantalum and as a weed-killer.

(c) **Disodium disulphate** (sodium pyrosulphate) ($Na_2S_2O_7$).

- (2) **Magnesium sulphate.** This heading covers artificial magnesium sulphate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) (Epsom salts, Seidlitz salts) obtained by purifying kieserite, or by the action of sulphuric acid on dolomite. Colourless crystals, slightly efflorescing in air, soluble in water. Used as a filler in sizing textiles, in tanning, for fire-proofing and as a purgative.

The heading **excludes** natural magnesium sulphate (kieserite) (**heading 25.30**).

- (3) **Aluminium sulphate** ($\text{Al}_2(\text{SO}_4)_3$). Obtained by treating bauxite, or natural aluminium silicates, with sulphuric acid; the impurities are mainly iron compounds. In the hydrated state (with 18 H_2O) it appears in white crystals, soluble in water, which can either be crumbly and easily scratched with a fingernail or hard and brittle, according to the degree of concentration of the solution employed; on gentle heating it melts in its water of crystallisation, giving finally the anhydrous sulphate. Used in dyeing as a mordant; in tanning for preserving hides and for alum tanning; in paper-making as a size for paper pulp; in the dyestuffs industry for making lakes, methylene blue or other thiazole dyestuffs. Used also for clarifying tallow, purifying industrial water, in fire extinguishers, etc.

Basic aluminium sulphate, used in dyeing, is also classified here.

- (4) **Chromium sulphates.** The best known is chromic sulphate ($\text{Cr}_2(\text{SO}_4)_3$), prepared from chromium nitrate and sulphuric acid. Crystalline powder, violet or green, in aqueous solution. Used as a mordant in dyeing (chrome mordanting) or in tanning (chrome tanning). The main products used for the latter purpose are rather unstable solutions of basic chromium sulphates derived from chromic sulphate or from chromous sulphate (CrSO_4). These sulphates are included here.

- (5) **Nickel sulphates.** The most common of these sulphates has the formula NiSO_4 . Anhydrous in yellow crystals, or hydrated in emerald green crystals (with 7 H_2O) or bluish crystals (with 6 H_2O); soluble in water. Used in electrolytic nickel-plating, as a mordant in dyeing, in the preparation of gas masks and as a catalyst.

(6) **Copper sulphates.**

- (a) **Cuprous sulphate** (Cu_2SO_4). Catalyst used in the preparation of synthetic ethanol.

- (b) **Cupric sulphate** ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$). By-product of electrolytic copper refining; also obtained by treating copper waste or scrap with a weak solution of sulphuric acid. Blue crystals or crystalline powder, soluble in water. It turns into a white anhydrous sulphate when calcinated, which absorbs water with avidity. Used as a fungicide in agriculture (see Explanatory Note to heading 38.08); for preparing spraying mixtures; to prepare cuprous oxide or inorganic copper colours; in dyeworks (for dyeing silk or wool black, purple or lilac); in electrolytic copper refining or copper-plating; as a flotation regulator (for restoring the natural buoyancy of ores); as an antiseptic, etc.

Natural hydrated copper sulphate (brochantite) is **excluded** (**heading 26.03**).

- (7) **Zinc sulphate** ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$). Obtained by the action of dilute sulphuric acid on zinc, zinc oxide, zinc carbonate or roasted blende. White vitreous masses or in needle-shaped crystals. Used for lessening the natural buoyancy of ores in flotation processes; as a mordant in dyeing; for zinc-plating by electrolysis; as an antiseptic; for preserving wood; in the manufacture of driers, of lithopone (**heading 32.06**), luminophores (zinc sulphate activated by copper) (**heading 32.06**) and of various other zinc compounds.
- (8) **Barium sulphate**. This heading covers artificial or precipitated barium sulphate (BaSO_4) obtained by precipitating a solution of barium chloride with sulphuric acid or an alkali sulphate. Occurs as a white powder, very heavy (specific gravity about 4.4) and insoluble in water, or in a thick paste. Used as a white pigment, as a filler for sizing textiles and in the preparation of rubber, coated paper, paperboard, lutings, lakes, colours, etc. It is impervious to X-rays and is therefore used (pure) in radiography.

Natural barium sulphate (barytes, heavy spar) is **excluded (heading 25.11)**.

(9) **Iron sulphates**.

- (a) **Ferrous sulphate** (FeSO_4). Obtained by treating iron shavings with dilute sulphuric acid or as a by-product from the manufacture of titanium dioxide; it often contains impurities such as copper and ferric sulphates and arsenic. Very soluble in water; occurs mainly in the hydrated state (generally with 7 H_2O) in light green crystals and turns brown on exposure to air; the action of heat transforms them into white anhydrous sulphate. Aqueous solutions are green but turn brownish on exposure to air. Ferrous sulphate is used for preparing inks (iron inks), colours (Prussian blue), and the mixture (with slaked lime and sawdust) used for purifying coal gas; in dyeing; as a disinfectant, an antiseptic and a herbicide.
- (b) **Ferric sulphate** ($\text{Fe}_2(\text{SO}_4)_3$). Prepared from ferrous sulphate. Powder or as brownish slabs. Very soluble in water, with which it forms a white hydrate (with 9 H_2O). Used for purifying natural waters or sewage, for coagulating blood in slaughterhouses, in iron-tanning and as a fungicide. As it lessens the buoyancy of ores, it is used as a flotation regulator. Used also as a mordant in dyeing and in the electrolytic production of copper or zinc.
- (10) **Cobalt sulphate** ($\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$). Prepared from cobaltous oxide and sulphuric acid; red crystals soluble in water. Used for electrolytic cobalt-plating, as a ceramic colour, as a catalyst and for preparing precipitated cobalt resinate (driers).
- (11) **Strontium sulphate**. Artificial strontium sulphate (SrSO_4) precipitated from chloride solution, is a white powder, sparingly soluble in water. Used in pyrotechnics, ceramics and the preparation of various strontium salts.
- Native strontium sulphate (celestine) is **excluded (heading 25.30)**.
- (12) **Cadmium sulphate** (CdSO_4). Colourless crystals, soluble in water, either anhydrous or in the hydrated state (with 8 H_2O). Used in the manufacture of cadmium yellow (cadmium sulphide) or other colouring matters, and of medicinal products; in standard electric cells (Weston cells); in electroplating and in dyeing.

(13) **Lead sulphates.**

- (a) **Artificial lead sulphate** (PbSO_4). Obtained from lead nitrate or acetate by precipitation with sulphuric acid; white powder or crystals, insoluble in water. Used in the manufacture of lead salts.
- (b) **Basic lead sulphate**. Prepared as greyish powder by heating together litharge, sodium chloride and sulphuric acid. May also be obtained by a metallurgical process, in which case it takes the form of a white powder. Used in the preparation of pigments, mastics and mixtures for the rubber industry.

Natural lead sulphate (anglesite) is excluded (heading 26.07).

(B) ALUMS

Alums are hydrated double sulphates containing a sulphate of a trivalent metal (aluminium, chromium, manganese, iron or indium) and a sulphate of a monovalent metal (alkali sulphate or ammonium sulphate). Used in dyeing, as antiseptics and in the preparation of chemicals, although there is a tendency to replace them by simple sulphates.

(1) **Aluminium alums.**

- (a) **Aluminium potassium sulphate** (ordinary alum or potassium alum) ($\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$). Obtained from natural alunite (alum stone) (heading 25.30), (i.e., basic aluminium-potassium sulphate mixed with aluminium hydroxide). Alum is also prepared from the two constituent sulphates. White crystalline solid, soluble in water. On calcination it gives a light white powder, anhydrous and crystalline (calcined alum). Used for the same purposes as aluminium sulphate, in particular in the preparation of lakes, in dyeing and in tanning (alum-tanning). Used also in photography, toilet preparations, etc.
- (b) **Aluminium ammonium sulphate** (ammonium alum) ($\text{Al}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$). Colourless crystals, soluble in water especially when hot. Used in the preparation of pure aluminium oxide and in medicine.
- (c) **Aluminium sodium sulphate** (sodium alum) ($\text{Al}_2(\text{SO}_4)_3 \cdot \text{Na}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$). Similar to potassium alum, occurs in efflorescent crystals, soluble in water. Used as a mordant in dyeing.

(2) **Chromium alums.**

- (a) **Chromium potassium sulphate** (chrome alum) ($\text{Cr}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$). Obtained by reducing a solution of potassium dichromate in sulphuric acid with sulphur dioxide. Forms purplish-red crystals, soluble in water and efflorescing in the air. Used in dyeing as a mordant, in tanning (chrome-tanning), in photography, etc.
 - (b) **Ammonium chromium sulphate** (chrome ammonium alum). Crystalline blue powder, used in tanning and in ceramics.
- (3) **Iron alums. Ammonium iron bis (sulphate)** ($(\text{NH}_4)_2\text{SO}_4 \cdot \text{Fe}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$), in purple crystals dehydrating and turning white in the air; **iron (III) potassium sulphate** also in purple crystals. Both are used in dyeing.

(C) PEROXOSULPHATES (PERSULPHATES)

The name peroxosulphates (persulphates) is reserved for the salts of the peroxosulphuric (persulphuric) acids of heading 28.11. They are fairly stable in the dry state but in aqueous solution they are decomposed on heating. Powerful oxidising agents.

- (1) **Diammonium peroxodisulphate** $((\text{NH}_4)_2\text{S}_2\text{O}_8)$. Prepared by electrolysing concentrated solutions of ammonium sulphate and sulphuric acid; colourless crystals, soluble in water, decomposed by moisture and heat. Used in photography; in textile bleaching or dyeing processes; in the preparation of soluble starches; in the preparation of other peroxodisulphates and of certain electrolytic baths; in organic synthesis, etc.
- (2) **Disodium peroxodisulphate** $(\text{Na}_2\text{S}_2\text{O}_8)$. Colourless crystals, very soluble in water. Used as a disinfectant, in bleaching, as a depolarising agent (batteries) and for engraving copper alloys.
- (3) **Dipotassium peroxodisulphate** $(\text{K}_2\text{S}_2\text{O}_8)$. Colourless crystals, very soluble in water. Used for bleaching, in soap-making, in photography, as an antiseptic, etc.

Natural calcium sulphates (gypsum, anhydrite, karstenite) are **excluded (heading 25.20)**.

28.34 - Nitrites; nitrates.

2834.10 - Nitrites

- Nitrates :

2834.21 -- Of potassium

2834.29 -- Other

(A) NITRITES

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading includes nitrites, metal salts of nitrous acid (HNO_2) (heading 28.11).

- (1) **Sodium nitrite** (NaNO_2). Obtained by reducing sodium nitrate with lead; also during the manufacture of litharge. Colourless crystals, hygroscopic and very soluble in water. Used as an oxidising agent in vat dyes; in organic synthesis; for pickling meat; in photography; as a rat-poison, etc.
- (2) **Potassium nitrite** (KNO_2). Prepared by the same method as sodium nitrite, or by the action of sulphur dioxide on a mixture of calcium oxide and potassium nitrate. A white crystalline powder or in yellowish sticks; often containing other salts as impurities. Soluble in water, very deliquescent and deteriorating in the air. Used for similar purposes to sodium nitrite.
- (3) **Barium nitrite** ($\text{Ba}(\text{NO}_2)_2$). Crystals used in pyrotechnics.
- (4) **Other nitrates**. These include ammonium nitrite, unstable and explosive; used in solution for the production of nitrogen in laboratories.

The heading **excludes** cobaltinitrites (heading 28.42).

(B) NITRATES

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers nitrates, metal salts of nitric acid (heading 28.08), **other than** ammonium nitrate and sodium nitrate, whether or not pure (heading 31.02 or 31.05). (See other exclusions below.)

Basic nitrates are also classified here.

- (1) **Potassium nitrate** (KNO_3) (also called saltpetre or nitre). Obtained from sodium nitrate and potassium chloride. Occurs in colourless crystals, in vitreous masses or as a white crystalline powder, soluble in water and hygroscopic when impure. Similar uses to sodium nitrate; also for preparing gunpowder, chemical primers, fireworks, matches and metallurgical fluxes.
- (2) **Bismuth nitrates**.
 - (a) **Neutral bismuth nitrate** ($\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$). Results from the action of nitric acid on bismuth; large crystals, colourless, deliquescent. Used for preparing bismuth oxides or salts and certain varnishes.

- (b) **Basic bismuth nitrate** ($\text{BiNO}_3(\text{OH})_2$). Obtained from the neutral bismuth nitrate; pearly white powder, insoluble in water. Used in medicine (for treating gastro-intestinal ailments); in ceramics (iridescent colours); in cosmetics; in the preparation of fulminate primers, etc.
- (3) **Magnesium nitrate** ($\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$). Colourless crystals, soluble in water. Used in pyrotechnics, in the preparation of refractory products (with magnesium oxide), of incandescent gas mantles, etc.
- (4) **Calcium nitrate** ($\text{Ca}(\text{NO}_3)_2$). Obtained by treating crushed limestone with nitric acid. White deliquescent mass, soluble in water, alcohol and acetone : used in pyrotechnics, in the manufacture of explosives, matches, fertilisers, etc.
- (5) **Ferric nitrate** ($\text{Fe}(\text{NO}_3)_3 \cdot 6$ or $9\text{ H}_2\text{O}$). Blue crystals. Used as a mordant in dyeing and in printing (alone or combined with the acetate). The pure aqueous solution is used in medicine.
- (6) **Cobalt nitrate** ($\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$). Purple, reddish or brownish crystals, soluble in water, deliquescent. Used in the preparation of cobalt blues or yellow and of sympathetic inks; in ceramic decoration; for electrolytic cobalt-plating, etc.
- (7) **Nickel nitrate** ($\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$). Water-soluble, deliquescent green crystals. Used in the ceramic industry (brown pigments); in dyeing (as a mordant); in electrolytic nickel-plating; for obtaining nickel oxide or for the preparation of the pure nickel catalyst.
- (8) **Cupric nitrate** ($\text{Cu}(\text{NO}_3)_2$). Copper dissolved in nitric acid gives, by crystallisation, copper nitrate (with 3 or $6\text{ H}_2\text{O}$) according to temperature). Blue or green crystals, soluble in water, hygroscopic, poisonous. Used in pyrotechnics; in the dyestuff industry; in textile dyeing or printing (mordant); in the preparation of cupric oxide and photographic papers; in electroplating, to give metals a patina, etc.
- (9) **Strontium nitrate** ($\text{Sr}(\text{NO}_3)_2$). The action of strontium oxide or sulphide on nitric acid gives the anhydrous salt in the warm, and the hydrated salt (with $4\text{ H}_2\text{O}$) in the cold. Colourless crystalline powder, deliquescent, soluble in water, decomposed by heat. Used in pyrotechnics for red lights; also in the preparation of matches.
- (10) **Cadmium nitrate** ($\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$). Prepared from the oxide. Colourless needles, soluble in water and deliquescent. Used as a colouring matter in ceramics or glass-making.
- (11) **Barium nitrate** ($\text{Ba}(\text{NO}_3)_2$). Prepared from natural carbonate (witherite) (heading 25.11). Colourless or white crystals or crystalline powder, soluble in water, poisonous. Used in pyrotechnics for green lights; in the manufacture of explosives, of optical glass, of ceramic glazes, of barium salts or of nitrates, etc.
- (12) **Lead nitrate** ($\text{Pb}(\text{NO}_3)_2$). Lead nitrate is obtained as a by-product of the preparation of lead dioxide by the action of nitric acid on red lead. Colourless crystals, soluble in water, poisonous. Used in pyrotechnics (yellow lights); in the manufacture of matches, of explosives and of certain colouring matters; in tanning; in photography and lithography; for preparing lead salts and as an oxidising agent in organic synthesis.

Apart from the **exclusions** mentioned previously, the following products are also **excluded** :

- (a) Mercury nitrates (**heading 28.52**).
- (b) Acetonitrates (**Chapter 29**) (e.g., iron acetonitrate, used as a mordant).
- (c) Double salts, whether or not pure, of ammonium sulphate and ammonium nitrate (**heading 31.02** or **31.05**).
- (d) Explosives consisting of mixtures of metal nitrates (**heading 36.02**).

28.35 - Phosphinates (hypophosphites), phosphonates (phosphites) and phosphates; polyphosphates, whether or not chemically defined.

2835.10 - Phosphinates (hypophosphites) and phosphonates (phosphites)

- Phosphates :

2835.22 -- Of mono- or disodium

2835.24 -- Of potassium

2835.25 -- Calcium hydrogenorthophosphate (" dicalcium phosphate ")

2835.26 -- Other phosphates of calcium

2835.29 -- Other

- Polyphosphates :

2835.31 -- Sodium triphosphate (sodium tripolyphosphate)

2835.39 -- Other

(A) PHOSPHINATES (HYPOPHOSPHITES)

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading includes phosphinates (hypophosphites), metal salts of phosphinic (hypophosphorous) acid (H_3PO_2) (heading 28.11).

These are soluble in water and decompose on heating with evolution of hydrogen phosphide which ignites spontaneously. Alkali phosphinates are reducing agents.

The most important are :

(I) **Sodium phosphinate (hypophosphite)** ($NaPH_2O_2$), in white tablets or crystalline powder, hygroscopic.

(II) **Calcium phosphinate (hypophosphite)** ($Ca(PH_2O_2)_2$), colourless crystals or a white powder (obtained by the action of white phosphorus on boiling milk of lime).

Both these products are used in medicine as tonics or restoratives.

(III) **Ammonium, iron or lead phosphinates (hypophosphites).**

(B) PHOSPHONATES (PHOSPHITES)

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading includes phosphonates (phosphites), metal salts (neutral or acid) of phosphonic (phosphorous) acid (H_3PO_3) (heading 28.11).

The most important phosphonates are those of ammonium, sodium, potassium or calcium, soluble in water and acting as reducing agents.

(C) PHOSPHATES AND POLYPHOSPHATES

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading includes metal phosphates and polyphosphates derived from the acids of heading 28.09, i.e. :

- (I) **Phosphates** - metal salts of phosphoric acid (H_3PO_4). These are the most important and are often called "phosphates" without further qualification. The salts formed by phosphoric acid with monovalent metals may be mono-, di- or tribasic (with monovalent metals they contain one, two or three metal atoms); there are, for example, three sodium phosphates : sodium dihydrogenorthophosphate (monobasic phosphate (NaH_2PO_4)), disodium hydrogenorthophosphate (dibasic phosphate (Na_2HPO_4)) and trisodiummorthophosphate (tribasic phosphate (Na_3PO_4)).
- (II) **Pyrophosphates** (diphosphates) - metal salts of pyrophosphoric acid ($H_4P_2O_7$).
- (III) **Metaphosphates** - metal salts of metaphosphoric acids (HPO_3)_n.
- (IV) **Other polyphosphates** - metal salts of polyphosphoric acids having a high degree of polymerisation.

The most important phosphates and polyphosphates are :

(1) **Ammonium phosphates and polyphosphates.**

- (a) **Triammonium orthophosphate** ($(NH_4)_3PO_4$), stable in aqueous solution only.
- (b) **Ammonium polyphosphates.** There are several ammonium polyphosphates having a degree of polymerisation ranging from a few units to a few thousand.

They occur as white crystalline powders, soluble or insoluble in water; they are used in the preparation of fertilisers, in fire-proofing additives for varnish or in fire-proofing preparations.

They remain in this heading even though their degree of polymerisation is not defined.

Ammonium dihydrogenorthophosphate (monoammonium phosphate) and diammonium hydrogenortho- phosphate (diammonium phosphate), whether or not pure, and intermixtures thereof, are **excluded** from this heading (**heading 31.05**).

(2) **Sodium phosphates and polyphosphates.**

- (a) **Sodium dihydrogenorthophosphate** (monobasic phosphate) ($NaH_2PO_4 \cdot 2H_2O$). Colourless crystals, soluble in water, which under the action of heat lose water (pulverised phosphate) to become pyrophosphate and, finally, metaphosphate. Used in medicine, in the man-made textiles industry, as a coagulant of protein substances, in electroplating, etc.
- (b) **Disodium hydrogenorthophosphate** (dibasic phosphate) (Na_2HPO_4), anhydrous (white powder) or crystallised (with 2, 7 or 12 H_2O). Soluble in water. Used as a size for silk (with tin chloride), for fire-proofing fabrics, wood or paper, as a textile mordant, in chrome-tanning, in the manufacture of optical glass, for glazing porcelain, in the preparation of baking powder, in the manufacture of colouring matters and soldering fluxes, in electro-plating, in medicine, etc.

- (c) **Trisodium orthophosphate** (tribasic phosphate) ($\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$). Colourless crystals, soluble in water, releasing part of their water of crystallisation on warming. Used as a flux for dissolving metal oxides, in photography, as a detergent, for softening industrial water and descaling boilers, to clarify sugar and spirits, in tanning, in medicine, etc.
- (d) **Sodium pyrophosphates** (sodium diphosphates). Tetrasodium pyrophosphate (neutral diphosphate) ($\text{Na}_4\text{P}_2\text{O}_7$). Non-hygroscopic white powder, soluble in water. Used in laundering, in the preparation of detergents, of mixtures to prevent the coagulation of blood, of refrigerating products and of disinfectants, in cheese manufacture, etc.

Disodium dihydrogenpyrophosphate (acid diphosphate) ($\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$), which has the same appearance, is used as a flux in enamelling, for precipitating the casein from milk, and in the preparation of baking powder, of certain malted milk powders, etc.

- (e) **Sodium triphosphate** ($\text{Na}_5\text{P}_3\text{O}_{10}$) (pentasodium triphosphate also known as sodium tripolyphosphate). White crystalline powder; used as a water-softener, as an emulsifier or to preserve foodstuffs.
- (f) **Sodium metaphosphates** (basic formula $(\text{NaPO}_3)_n$). Two metaphosphates meeting this description are sodium cyclo-triphosphate and sodium cyclo-tetraphosphate.
- (g) **Sodium polyphosphates** having a high degree of polymerisation. Some sodium polyphosphates are incorrectly called sodium metaphosphates. There are several linear sodium polyphosphates having a high degree of polymerisation ranging from a few dozen to a few hundred units. Although they generally occur as polymers having an unspecified degree of polymerisation, they remain in this heading.

These include :

The product incorrectly known as sodium hexametaphosphate (a polymeric mixture of formula $((\text{NaPO}_3)_n)$, also known as Graham's salt. Vitreous substance or white powder, soluble in water. In aqueous solution, this product sequesters the calcium and the magnesium contained in the water, hence its use as a water-softener. Also used in the preparation of detergents and casein glues, to emulsify essential oils, in photography, in the manufacture of processed cheese, etc.

- (3) **Potassium phosphates**. The best known is potassium dihydrogenorthophosphate (monopotassium phosphate) (KH_2PO_4). Obtained by treating phosphated chalk with orthophosphoric acid and potassium sulphate. Colourless crystals, soluble in water. Used as a yeast nutrient and as a fertiliser.

(4) **Calcium phosphates**.

- (a) **Calcium hydrogenorthophosphate** ("dicalcium phosphate") ($\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$). Obtained by the action of an acidulated calcium chloride solution on disodium hydrogenorthophosphate. White powder, insoluble in water. Used as a fertiliser; as a mineral supplement to animal fodder, and in the manufacture of glass, medicaments, etc.

Calcium hydrogenorthophosphate containing not less than 0.2 % by weight of fluorine calculated on the dry anhydrous product is excluded (heading 31.03 or 31.05).

- (b) **Calcium tetrahydrogenbis (orthophosphate)** (monocalcium phosphate) ($\text{CaH}_4(\text{PO}_4)_2$. 1 or 2 H_2O). Obtained by treating bones with sulphuric acid or hydrogen chloride. Occurs in thick solutions; releases its water of crystallisation under the action of heat. It is the only calcium phosphate soluble in water. Used in the preparation of baking powders, as a medicament, etc.
- (c) **Tricalcium bis(orthophosphate)** (neutral calcium phosphate) ($\text{Ca}_3(\text{PO}_4)_2$). The heading covers precipitated calcium phosphate (i.e., ordinary calcium phosphate). Obtained by treating the tricalcium phosphate contained in bones, first with hydrochloric acid and then with sodium hydroxide, or by precipitating a solution of trisodium orthophosphate by means of calcium chloride in presence of ammonia. Amorphous white powder, odourless and insoluble in water. Used as a mordant in dyeing; to clarify syrups; for pickling metals; in the manufacture of glass or pottery; in the preparation of phosphorus and medicaments (e.g., lactophosphates, glycerophosphates), etc.

Natural calcium phosphate is **excluded (heading 25.10)**.

- (5) **Aluminium phosphate**. Artificial aluminium orthophosphate (AlPO_4), prepared from trisodium orthophosphate and aluminium sulphate, occurs as a white, greyish or pinkish powder. Used as a flux in ceramics, for sizing silk (with tin oxide), and in the preparation of dental cements.
- Natural aluminium phosphate (wavellite) is **excluded (heading 25.30)**.
- (6) **Manganese phosphate** ($\text{Mn}_3(\text{PO}_4)_2 \cdot 7\text{H}_2\text{O}$). Obtained from manganous chloride and phosphoric acid. It is a purple powder which, alone or mixed with other products, constitutes Nuremberg violet, used by artists and in enamels. Associated with ammonium phosphate, it forms Burgundy violet.
- (7) **Cobalt phosphates**. Tricobalt bis (orthophosphate) ($\text{Co}_3(\text{PO}_4)_2 \cdot 2$ or 8 H_2O) is prepared from sodium orthophosphate and cobalt acetate. Amorphous pink powder, insoluble in water. When heated with aluminium oxide, gives Thenard's blue used in enamels. Associated with aluminium phosphate, it is used in the preparation of cobalt purple.
- (8) **Other phosphates**. These include phosphates of barium (opacifier), chromium (ceramic colours), zinc (ceramic colours, dental cements, fermentation control, medicine), iron (medicine) and copper (ceramic colours).

The heading also **excludes** certain phosphates, viz. :

- Natural calcium phosphates, apatite and natural aluminium calcium phosphates (**heading 25.10**).
- Other natural mineral phosphates of **Chapter 25 or 26**.
- Ammonium dihydrogenorthophosphate (monoammonium phosphate) and diammonium hydrogenorthophosphate (diammonium phosphate), whether or not pure (**heading 31.05**).
- Precious and semi-precious stones (**heading 71.03 or 71.05**).

28.36 - Carbonates; peroxocarbonates (percarbonates); commercial ammonium carbonate containing ammonium carbamate.

- 2836.20 - Disodium carbonate
- 2836.30 - Sodium hydrogencarbonate (sodium bicarbonate)
- 2836.40 - Potassium carbonates
- 2836.50 - Calcium carbonate
- 2836.60 - Barium carbonate
 - Other :
- 2836.91 -- Lithium carbonates
- 2836.92 -- Strontium carbonate
- 2836.99 -- Other

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers :

- (I) **Carbonates (neutral carbonates, hydrogencarbonates or bicarbonates, basic carbonates)** - metal salts of the non-isolated carbonic acid (H_2CO_3), whose anhydride (CO_2) falls in heading 28.11.
- (II) **Peroxocarbonates** (percarbonates), i.e., carbonates containing an excess of oxygen, such as (Na_2CO_4) (peroxomonocarbonates) or $(Na_2C_2O_6)$ (peroxodicarbonates); these result from the action of carbon dioxide on metal peroxides.

(A) CARBONATES

- (1) **Ammonium carbonates.** Obtained by heating a mixture of chalk and ammonium sulphate (or chloride), or by combining carbon dioxide with gaseous ammonia in presence of steam.

These processes give **commercial ammonium carbonate** which, in addition to various impurities (chlorides, sulphates, organic matter), contains ammonium hydrogen carbonate and ammonium carbamate (NH_2COONH_4). Commercial ammonium carbonate (included in this heading) occurs in white crystalline masses or in powder, soluble in hot water. It deteriorates in a humid atmosphere with superficial formation of the acid carbonate, but may still be used in this state.

Ammonium carbonate is used as a mordant in textile dyeing or printing; as a detergent for wool; an expectorant in medicine; in the manufacture of smelling salts or of baking powders; in tanning; in the rubber industry; in cadmium metallurgy; in organic synthesis, etc.

- (2) **Sodium carbonates.**

- (a) **Disodium carbonate** (neutral carbonate) (Na_2CO_3). Improperly called " carbonate of soda " or " commercial soda "; not to be confused with sodium hydroxide (caustic soda) of **heading 28.15**. May be obtained by heating a solution of sodium chloride and ammonia with carbon dioxide, and decomposing by heating the resulting acid sodium carbonate.

Occurs as an anhydrous (or dehydrated) powder, or in hydrated crystals (soda crystals, washing soda) with 10 H₂O, efflorescing in the air to give a monohydrate (with 1 H₂O). Used in numerous industries : as a flux in glass-making and in ceramics; in the textile industry; in the manufacture of washing preparations; in dyeing; in the tin-sizing of silk (with stannic chloride); as an anti-scaling product (see Explanatory Note to heading 38.24); in the preparation of sodium hydroxide, sodium salts and indigo; in the metallurgy of tungsten, bismuth antimony or vanadium; in photography; for purifying industrial water (lime soda process) and, mixed with lime, for purifying coal gas.

- (b) **Sodium hydrogencarbonate** (acid carbonate, sodium bicarbonate) (NaHCO₃). Usually a crystalline powder or white crystals, soluble in water, especially when hot, and liable to deteriorate in a humid atmosphere. Used in medicine (for treating gravel); for manufacturing digestive tablets and aerated beverages; in the preparation of baking powders; in the porcelain industry, etc.

Natural sodium carbonate (natron, etc.) is **excluded (heading 25.30)**.

(3) **Potassium carbonates.**

- (a) **Dipotassium carbonate** (neutral carbonate) (K₂CO₃). Improperly called "potash"; not to be confused with potassium hydroxide (caustic potash) of **heading 28.15**. Obtained from vegetable ashes, residual beetwash and suint but mainly from potassium chloride. White, crystalline masses, very deliquescent, soluble in water. Used in the manufacture of glass or ceramics; for bleaching linen or scouring textiles; to clean paintings; to prepare potassium salts, cyanides, Prussian blue; as an anti-scale preparation, etc.
- (b) **Potassium hydrogencarbonate** (acid carbonate, potassium bicarbonate) (KHCO₃). Prepared by the action of carbon dioxide on the neutral carbonate; white crystals, soluble in water, slightly deliquescent. Used in fire-extinguishers; in the preparation of baking powders; in medicine and in oenology (anti-acid).

(4) **Precipitated calcium carbonate.** Precipitated calcium carbonate (CaCO₃) included in this heading results from the treatment of solutions of calcium salts with carbon dioxide. Used as an extender, in the preparation of toothpastes and face-powder, in medicine (treatment of rickets), etc.

The heading **excludes** natural limestone (**Chapter 25**) and chalk (natural calcium carbonate), whether or not washed and ground (**heading 25.09**) and calcium carbonate in powder form, the particles of which are coated with a water-repellent film of fatty acids (e.g., stearic acid) (**heading 38.24**).

(5) **Precipitated barium carbonate.** Precipitated barium carbonate (BaCO₃) included in this heading is obtained from sodium carbonate and barium sulphide. White powder insoluble in water. Used for purifying industrial water; for manufacturing parasiticides, optical glass and pure barium oxide; as a pigment and flux in enamels; in the rubber, paper, soap or sugar industries; in pyrotechnics (green lights).

Natural barium carbonate (witherite) is **excluded (heading 25.11)**.

(6) **Lead carbonates.**

Artificial lead carbonates, included in this heading, are :

- (a) **Neutral lead carbonate** (PbCO_3). White powder, crystalline or amorphous, insoluble in water. Used in ceramics and in the manufacture of pigments, mastics and indigo.
- (b) **Basic lead carbonates** of the type $2 \text{PbCO}_3 \cdot \text{Pb}(\text{OH})_2$ in powder, cakes, scales or paste, are known as "white lead". White lead is obtained from lead acetate resulting from the action of acetic acid on sheet lead or litharge; a drying pigment. Used in the manufacture of oil paints, of fluxes, of special mastics (e.g., for steam-pipe joints) and of orange lead. White lead (used alone or mixed with barium sulphate, zinc oxide, gypsum or kaolin) gives Krems white, Venetian white, Hamburg white, etc.

Natural lead carbonate (cerussite) is **excluded (heading 26.07)**.

- (7) **Lithium carbonates**. Neutral lithium carbonate (Li_2CO_3), obtained by precipitating lithium sulphate with sodium carbonate; white crystalline powder, odourless, unaffected by air, sparingly soluble in water. Used in medicine (uric diathesis) and in the preparation of mixtures for artificial mineral waters.
- (8) **Precipitated strontium carbonate**. Precipitated strontium carbonate (SrCO_3) included in this heading is a very fine white powder, insoluble in water. Used in pyrotechnics (red lights) and in the preparation of iridescent glass, luminous paints, strontium oxide or strontium salts.

Natural strontium carbonate (strontianite) is **excluded (heading 25.30)**.

- (9) **Bismuth carbonate**. Artificial bismuth carbonate included in this heading is essentially basic bismuth carbonate (bismuthyl carbonate) ($(\text{BiO})_2\text{CO}_3$), white or yellowish amorphous powder, insoluble in water. Used in medicine and in the manufacture of cosmetics.

Natural bismuth hydrocarbonate (bismutite) is **excluded (heading 26.17)**.

- (10) **Precipitated magnesium carbonate**. Precipitated magnesium carbonate, included in this heading, is a basic, hydrated carbonate. Obtained by double decomposition of sodium carbonate and magnesium sulphate. Odourless white product, practically insoluble in water. Light carbonate is the pharmacists' white magnesia, a laxative often presented in cubes. Heavy carbonate is a granular white powder. Magnesium carbonate is used as a filler for paper or rubber; also used in cosmetics and as a heat-insulating material.

The heading **excludes** natural magnesium carbonate (magnesite) (**heading 25.19**).

- (11) **Manganese carbonates**. Artificial carbonate (MnCO_3), anhydrous or hydrated (with 1 H_2O included in this heading, is a fine powder, yellow, pinkish or brownish, insoluble in water. Used as a pigment in paints, rubber and ceramics; also in medicine.

Natural manganese carbonate (rhodocrosite or dialogite) is **excluded (heading 26.02)**.

- (12) **Iron carbonates.** Artificial carbonate (FeCO_3) anhydrous or hydrated (with 1 H_2O) included in this heading, is obtained by double decomposition of iron sulphate and sodium carbonate. Greyish crystals, insoluble in water, readily oxidised by air, especially when damp. Used in the preparation of iron salts and of medicaments.

Natural iron carbonate (siderite or chalybite) is **excluded (heading 26.01)**.

- (13) **Cobalt carbonates.** Cobalt carbonate (CoCO_3), anhydrous or hydrated (with 6 H_2O) is a crystalline powder, pink, red or greenish, and insoluble in water. Used as a pigment in enamels and for preparing cobalt oxides or salts.

- (14) **Nickel carbonates.** Normal artificial nickel carbonate (NiCO_3) is a light green powder, insoluble in water; used as a pigment in ceramics and in the preparation of nickel oxide. Hydrated basic carbonate, in greenish crystals, is used in ceramics, glass-making, electroplating, etc.

Natural basic nickel carbonate (zaratite) is **excluded (heading 25.30)**.

- (15) **Copper carbonates.** Artificial carbonates, also called artificial malachite or artificial azure copper, are greenish-blue powders, poisonous and insoluble in water, consisting of neutral carbonate (CuCO_3) or of basic carbonates of various kinds. Prepared from sodium carbonate and copper sulphate. Used as pigments, pure or mixed (blue or green copper carbonate, mountain blue or green); as insecticides or fungicides; in medicine (astringents and antidotes against phosphorus poisoning); in electroplating; in pyrotechnics, etc.

Natural copper carbonate, hydrated or not (malachite, azurite) is **excluded (heading 26.03)**.

- (16) **Precipitated zinc carbonate.** Precipitated zinc carbonate (ZnCO_3) included in this heading is obtained by double decomposition of sodium carbonate and zinc sulphate; white crystalline powder, practically insoluble in water. Used as a pigment in paints, rubber, ceramics and cosmetics.

Natural zinc carbonate (smithsonite) is **excluded (heading 26.08)**.

(B) PEROXOCARBONATES (PERCARBONATES)

- (1) **Sodium peroxocarbonates.** Prepared by treating sodium peroxide, hydrated or not, with liquid carbon dioxide. White powders, dissolving in water to form oxygen and neutral sodium carbonate. Used for bleaching, in the preparation of domestic detergents and in photography.
- (2) **Potassium peroxocarbonates.** Obtained by electrolysing at -10 °C or -15 °C a saturated solution of neutral potassium carbonate. White crystals, very hygroscopic, turning blue in a humid atmosphere and soluble in water. Strong oxidising agents sometimes used for bleaching.
- (3) **Other peroxocarbonates**, e.g., ammonium or barium peroxocarbonates.

28.37 - Cyanides, cyanide oxides and complex cyanides.

- Cyanides and cyanide oxides :

2837.11 -- Of sodium

2837.19 -- Other

2837.20 - Complex cyanides

Cyanides are the metal salts of hydrogen cyanide (hydrocyanic acid) (HCN) (heading 28.11). These salts are very poisonous.

(A) CYANIDES

Cyanides are the metal salts of hydrogen cyanide (HCN) (heading 28.11). These salts are very poisonous.

- (1) **Sodium cyanide** (NaCN). Obtained by the action of coke or hydrocarbon gases and atmospheric nitrogen on sodium carbonate, by treating calcium cyanamide (see heading 31.02) with charcoal or by the interaction of pulverised coal, sodium and gaseous ammonia. White powder, plates or paste, crystalline, hygroscopic, very soluble in water and with an odour of bitter almonds. When brought to the melting-point it absorbs oxygen; may also give hydrates. Is presented in sealed vessels. Used in the metallurgy of gold or silver, in gold- or silver-plating, in photography, in lithography, as a parasiticide or insecticide, etc. Also used in the preparation of hydrogen cyanide, other cyanides and indigo; in flotation processes (in particular for separating galena from blende and pyrites from chalcopyrite).
- (2) **Potassium cyanide** (KCN). Obtained by similar methods, has similar characteristics and uses to sodium cyanide.
- (3) **Calcium cyanide** (Ca(CN)₂). White or greyish powder according to its degree of purity, soluble in water. Used for destroying insects, fungus and noxious animals.
- (4) **Nickel cyanide** (Ni(CN)₂). Hydrated, greenish plates or powder; amorphous, a yellow powder. Used in metallurgy and in electroplating.
- (5) **Copper cyanides.**
 - (a) **Cuprous cyanide** (CuCN). White or greyish powder, insoluble in water. Used for the same purposes as cupric cyanide and in medicine.
 - (b) **Cupric cyanide** (Cu(CN)₂). Amorphous powder, insoluble in water, easily decomposed. Used for plating iron with copper and in organic synthesis.
- (6) **Zinc cyanide** (Zn(CN)₂). White powder, insoluble in water, used in electroplating.

The heading excludes cyanides of mercury (**heading 28.52**) and cyanides of non-metals, such as bromine cyanide (**heading 28.53**).

(B) HEXACYANOFERRATES (II) (FERROCYANIDES)

Hexacyanoferrates (II) (ferrocyanides) are the metal salts of hydrogen hexacyanoferrate (II) ($\text{H}_4\text{Fe}(\text{CN})_6$) (heading 28.11). Obtained from spent oxide treated with calcium hydroxide or from the action of ferrous hydroxide on cyanides. Decomposed by heat.

The most important are :

- (1) **Tetrammonium hexacyanoferrate** ($(\text{NH}_4)_4\text{Fe}(\text{CN})_6$). Crystals soluble in water. Used for "black nickel-plating" and as a catalyst in the synthesis of ammonia.
- (2) **Tetrasodium hexacyanoferrate** ($\text{Na}_4\text{Fe}(\text{CN})_6 \cdot 10\text{H}_2\text{O}$). Yellow crystals, unaffected by air, soluble in water, especially when hot. Used for preparing hydrogen cyanide and Prussian blue, thio-indigo, etc.; to case-harden steel; in photography; in dyeing (as a mordant or as a blue tint); in printing (as an oxidising agent in aniline black printing) and as a fungicide.
- (3) **Tetrapotassium hexacyanoferrate** ($\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$). Yellow crystals, efflorescent, soluble in water, especially when hot. Same uses as tetrasodium hexacyanoferrate.
- (4) **Dicopper hexacyanoferrate** ($\text{Cu}_2\text{Fe}(\text{CN})_6 \cdot x\text{H}_2\text{O}$). Purplish brown powder, insoluble in water. Used for preparing Florentine or Van Dyck brown for artists' paints.
- (5) **Double hexacyanoferrates** (e.g., dilithium dipotassium hexacyanoferrate $\text{Li}_2\text{K}_2(\text{Fe}(\text{CN})_6) \cdot 3\text{H}_2\text{O}$).

The heading **excludes** Prussian blue (Berlin blue) and other pigments based on hexacyanoferrates (heading 32.06).

(C) HEXACYANOFERRATES (III) (FERRICYANIDES)

Hexacyanoferrates (III) (ferricyanides) are the salts of hydrogen hexacyanoferrate (III) ($\text{H}_3\text{Fe}(\text{CN})_6$) (heading 28.11).

The most important are :

- (1) **Trisodium hexacyanoferrate** ($\text{Na}_3\text{Fe}(\text{CN})_6 \cdot \text{H}_2\text{O}$). Obtained by the action of chlorine on hexacyanoferrates (II); garnet-coloured crystals, deliquescent, soluble in water and toxic; in aqueous solution it is greenish and decomposed by light. Used in dyeing and printing; in photography; for case-hardening; in electroplating; and as an oxidising agent in organic synthesis.
- (2) **Tripotassium hexacyanoferrate** ($\text{K}_3\text{Fe}(\text{CN})_6$). Similar appearance to trisodium hexacyano-ferrates but less deliquescent. Same uses.

(D) OTHER COMPOUNDS

These include pentacyanonitrosylferrates (II), pentacyanonitrosylferrates (III), cyanocadmates, cyanochromates, cyanomanganates, cyanocobaltates, cyanoniccolates, cyanocuprates, etc., of inorganic bases.

This group includes, for example, **sodium pentacyanonitrosylferrate (III)** (sodium nitroprusside or sodium nitroferricyanide) ($\text{Na}_2\text{Fe}(\text{CN})_5\text{NO} \cdot 2\text{H}_2\text{O}$), used in chemical analysis.

Cyanomercurates are, however, **excluded (heading 28.52)**.

[28.38]

28.39 - Silicates; commercial alkali metal silicates.

- Of sodium :

2839.11 -- Sodium metasilicates

2839.19 -- Other

2839.90 - Other

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers silicates, metal salts of the various silicic acids, non-isolated in the free state and derived from silicon dioxide (heading 28.11).

- (1) **Sodium silicates.** Obtained by melting sand and sodium carbonate or sulphate. Their composition is very diverse (monosilicate, metasilicate, polysilicate, etc.), and their degree of hydration and their solubility vary with the method of manufacture and the degree of purity. Occur in colourless crystals or in powder, in vitreous masses (water-glass) or in more or less viscous aqueous solutions. They deflocculate the gangues of ores and are used as flotation regulators. Also employed as fillers for manufacturing silicate soaps; as binders or adhesives in the manufacture of paperboard or agglomerated coal; as fire-proofing materials; for preserving eggs; in the manufacture of non-putrefying adhesives; as hardening agents in the preparation of corrosion-resistant cements, of lutings or of artificial stones; for the manufacture of washing preparations; for pickling metals; as anti-scaling products (see Explanatory Note to heading 38.24).
- (2) **Potassium silicates.** Used for similar purposes to sodium silicates.
- (3) **Manganese silicate** (MnSiO_3). Orange-coloured powder, insoluble in water. Used as a ceramic colour and as a drier for paints or varnishes.
- (4) **Precipitated calcium silicates.** White powders obtained from sodium or potassium silicates. Used for manufacturing fire-proof *pisés*, and dental cements.
- (5) **Barium silicates.** White powders used for manufacturing barium oxide and optical glass.
- (6) **Lead silicates.** Occur as powder or in vitreous white masses; used as a glaze in ceramics.
- (7) **Other silicates**, including commercial alkali metal silicates other than those mentioned above. These include caesium silicate (yellow powder, used in ceramics), zinc silicate (coating of fluorescent tubes), aluminium silicate (manufacture of porcelain and refractory products).

Natural silicates are **excluded** from the heading, e.g. :

- (a) Wollastonite (calcium silicate), rhodonite (manganese silicate), phenacite (or phenakite) (beryllium silicate), and titanite (titanium silicate) (**heading 25.30**).
- (b) Ores such as copper silicates (chrysocolla, dioptase), zinc hydrosilicate (hemimorphite), and zirconium silicate (zircon) (**headings 26.03, 26.08 and 26.15**).
- (c) The precious stones of **Chapter 71**.

28.40 - Borates; peroxoborates (perborates).

- Disodium tetraborate (refined borax) :

2840.11 -- Anhydrous

2840.19 -- Other

2840.20 - Other borates

2840.30 - Peroxoborates (perborates)

(A) BORATES

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers borates, metal salts of the various boric acids, principally normal or orthoboric acid (H_3BO_3) (heading 28.10).

Borates obtained by crystallisation or by a chemical process are covered by this heading, as are also natural borates obtained by evaporating complex brines from certain salt lakes.

- (1) **Sodium borates.** The most important is the tetraborate (disodium tetraborate, refined borax) ($Na_2B_4O_7$). Obtained by crystallisation of solutions of natural borates, or by treating natural calcium borates or boric acid with sodium carbonate. Anhydrous or hydrated with 5 H_2O or 10 H_2O . Heated and then cooled down, it gives a vitreous mass (melted borax, borax glass, borax bead). Used for stiffening linen or paper; in soldering metals (flux for hard solder); as a flux for enamels; in the manufacture of vitrifiable colours, special glass (optical glass, glass for electric bulbs), glue or polish; for refining gold; and for preparing borates and anthraquinone dyes.

There are other sodium borates (metaborates, hydrogen diborate) for laboratory uses.

- (2) **Ammonium borates.** The most important of these is metaborate ($NH_4BO_2 \cdot 2H_2O$). Colourless crystals, very soluble in water, efflorescent. Decomposed by heat to give a fusible varnish of boric anhydride; hence its use as a fire-proofing material. Also used as a fixative in hair-lotions; as a component of electrolytes for electrolytic capacitors and in the coating of paper.
- (3) **Precipitated calcium borates.** Obtained by treating natural borates with calcium chloride; white powder used in fire retardant compositions, in anti-freezing preparations and in ceramic insulators. It can also be used as an antiseptic.
- (4) **Manganese borates.** Mainly tetraborate (MnB_4O_7), pinkish powder, sparingly soluble. Used as a drier in paints or varnishes.
- (5) **Nickel borate.** Pale green crystals, used as a catalyst.
- (6) **Copper borate.** Blue crystals, very hard, insoluble in water. Used as a pigment (ceramic colours) and as an antiseptic and insecticide.

- (7) **Lead borate.** Greyish powder, insoluble in water. It is used to prepare driers, in glass-making, as a pigment for porcelain and in electroplating.
- (8) **Other borates.** Cadmium borate is used as a coating for fluorescent tubes. Cobalt borate is used as a drier; zinc borate as an antiseptic, in fire-proofing textiles or as a flux in ceramics, zirconium borate as an opacifier.

Natural sodium borates (kernite, tincal), used to prepare the borates of this heading, and natural calcium borates, (pandermite, priceite), used in the manufacture of boric acid, are **excluded** (**heading 25.28**).

(B) PEROXOBORATES (PERBORATES)

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading covers metal peroxoborates, which are more oxygenated than borates and readily release their oxygen.

They are generally complex products the formula of which corresponds to several acids such as HBO_3 or HBO_4 .

The main peroxoborates are :

- (1) **Sodium peroxoborate** (perborax). Obtained by the action of sodium peroxide on an aqueous solution of boric acid, or by treating an aqueous solution of sodium borate with hydrogen peroxide. White amorphous powder or crystals (with 1 or 4 H_2O). Used for bleaching linen, textiles and straw; for preserving hides; in the manufacture of household washing preparations, detergents and antiseptics.
- (2) **Magnesium peroxoborate.** White powder, insoluble in water, used in medicine or in the manufacture of toothpastes.
- (3) **Potassium peroxoborate.** Similar characteristics and uses to sodium peroxoborate.
- (4) **Other peroxoborates.** Ammonium, aluminium, calcium or zinc peroxoborates, which occur as white powders, are used in medicine and in the manufacture of tooth-pastes.

28.41 - Salts of oxometallic or peroxometallic acids.

- 2841.30 - Sodium dichromate
- 2841.50 - Other chromates and dichromates; peroxochromates
 - Manganites, manganates and permanganates :
- 2841.61 -- Potassium permanganate
- 2841.69 -- Other
- 2841.70 - Molybdates
- 2841.80 - Tungstates (wolframates)
- 2841.90 - Other

This heading covers the salts of oxometallic and peroxometallic acids (corresponding to metal oxides which constitute anhydrides).

The main groups of compounds covered by this heading are :

- (1) **Aluminates.** Derivatives of aluminium hydroxide.
 - (a) **Sodium aluminate.** Obtained by treating bauxite with sodium hydroxide solution. Occurs as a white powder soluble in water, in aqueous solutions or in paste form. Used as a mordant in dyeing (alkaline mordant); in the preparation of lakes; for sizing paper; as a filler for soap; for hardening plaster; for manufacturing opaque glass; for purifying industrial water, etc.
 - (b) **Potassium aluminate.** Prepared by dissolving bauxite in potassium hydroxide. White, micro-crystalline masses, hygroscopic and soluble in water. Same uses as sodium aluminate.
 - (c) **Calcium aluminate.** Obtained by the fusion of bauxite and calcium oxide in an electric furnace; white powder, insoluble in water. Used in dyeing (mordant); for purifying industrial water (ion exchanger); in paper-making (sizing); in the manufacture of glass, soap, special cements, polishing preparations and other aluminates.
 - (d) **Chromium aluminate.** Obtained by heating a mixture of aluminium oxide, calcium fluoride and ammonium dichromate. Ceramic colour.
 - (e) **Cobalt aluminate.** Prepared from sodium aluminate and a cobalt salt. It constitutes, either pure or mixed with aluminium oxide, cobalt blue (Thenard's blue). Used in the preparation of cerulean blue (with zinc aluminate), azure blue, smalt blue, Saxony blue, Sèvres blue, etc.
 - (f) **Zinc aluminate.** White powder used for similar purposes to sodium aluminate.
 - (g) **Barium aluminate.** Prepared from bauxite, barytes and coal; white or brown masses. Used for purifying industrial water and as an anti-scale compound.

- (h) **Lead aluminate.** Obtained by heating a mixture of lead oxide and aluminium oxide. Solid, not easily melted, used as a white pigment and for manufacturing refractory bricks and linings.

The heading **excludes** natural beryllium aluminate (chrysoberyl) (**heading 25.30, 71.03 or 71.05** as the case may be).

- (2) **Chromates.** Neutral or acid chromates (dichromates), tri-, tetra- and perchromates derive from the various chromic acids, in particular the normal acid (H_2CrO_4) or from the dichromic acid ($H_2Cr_2O_7$) not isolated in the pure state.

The principal of these mostly toxic salts are :

- (a) **Zinc chromate.** The treatment of zinc salts with potassium dichromate gives hydrated or basic zinc chromate. Powder, insoluble in water. Pigment which, alone or in mixture, constitutes zinc yellow. Mixed with Prussian blue, it forms zinc green.

- (b) **Lead chromate.**

Neutral artificial lead chromate results from the action of lead acetate on sodium dichromate. Yellow or sometimes orange-coloured or red powder according to the method of precipitation. Alone or mixed, this pigment constitutes chrome yellow, used in enamelling, in ceramics, in the manufacture of paints or varnishes, etc.

Basic chromate, alone or mixed, constitutes chrome red or Persian red.

- (c) **Sodium chromates.** Sodium chromate ($Na_2CrO_4 \cdot 10H_2O$) is obtained during the manufacture of chromium by roasting natural iron chromium oxide (chromite) mixed with coal and sodium carbonate. Large yellow crystals, deliquescent and very soluble in water. Used in dyeing (mordant); in tanning; for preparing inks, pigments or other chromates or dichromates. Used in mixture with antimony sulphide for preparing photographic flashlight powders.

Sodium dichromate ($Na_2Cr_2O_7 \cdot 2H_2O$), prepared from sodium chromate, forms deliquescent red crystals, soluble in water. Transformed by heat into the anhydrous and less deliquescent dichromate (i.e., melted or cast chromate) often containing a small quantity of sodium sulphate. Used in tanning (chrome-tanning); in dyeing (mordant and oxidiser); as an oxidising agent in organic synthesis; in photography; in printing; in pyrotechnics; for purifying or decolourising fats; for preparing dichromate batteries and dichromate gelatins (which, under the influence of light, are converted into products insoluble in hot water); in flotation processes (to reduce buoyancy); in petroleum refineries; as an antiseptic.

- (d) **Potassium chromates.** Potassium chromate (K_2CrO_4) (yellow potassium chromate) is prepared from chromite. Yellow crystals, soluble in water and poisonous.

Potassium dichromate ($K_2Cr_2O_7$) (red potassium chromate) is also obtained from chromite. Orange-coloured crystals, soluble in water and very toxic. Dichromate dust and vapours attack the nasal bone and cartilages; its solutions infect scratches.

Potassium chromate and dichromate are used for similar purposes to sodium chromate and dichromate.

(e) **Ammonium chromates.** Ammonium chromate ($(\text{NH}_4)_2\text{CrO}_4$), prepared by saturating a solution of chromium trioxide with ammonia. Yellow crystals, soluble in water. Used in photography and in dyeing.

Ammonium dichromate ($(\text{NH}_4)_2\text{Cr}_2\text{O}_7$), obtained from natural iron chromium oxide (chromite); red crystals, soluble in water. Used in photography; in dyeing (mordant); in tanning; for purifying fats or oils; in organic synthesis, etc.

(f) **Calcium chromate** ($\text{CaCrO}_4 \cdot 2\text{H}_2\text{O}$). Prepared from sodium dichromate and chalk; becomes anhydrous and turns yellow when heated. Used in the preparation of yellow colours such as "yellow ultramarine", a name also applied to calcium chromate alone.

(g) **Manganese chromate.** Neutral chromate (MnCrO_4), prepared from manganese oxide and chromic anhydride. Brownish crystals, soluble in water. Used as a mordant in dyeing.

Basic chromate, brown powder, insoluble in water, is used in water paints.

(h) **Iron chromates.** Ferric chromate ($\text{Fe}_2(\text{CrO}_4)_3$), (prepared from solutions of ferric chloride and potassium chromate, is a yellow powder, insoluble in water.

There is also a basic iron chromate which, alone or as a mixture, is used in painting under the name of siderine yellow. Associated with Prussian blue it gives greens imitating zinc green. Also used in metallurgy.

(ij) **Strontium chromate** (SrCrO_4). Analogous to calcium chromate; alone or in mixture constitutes strontium yellow. Employed in the preparation of artists' paints.

(k) **Barium chromate** (BaCrO_4). Obtained by precipitating solutions of barium chloride and sodium chromate; bright yellow powder, insoluble in water and poisonous. Alone or mixed, it constitutes barium yellow which, like the similar product obtained from calcium chromate, is sometimes known as "yellow ultramarine". Used for artists' paints and in the enamel and glass industries; also in the manufacture of matches and as a mordant in dyeing.

This heading excludes :

(a) Natural lead chromate (crocoisite) (**heading 25.30**).

(b) Pigments prepared with chromates (**heading 32.06**).

(3) **Manganates, permanganates.** These salts correspond to manganic acid (H_2MnO_4) (not isolated), permanganic acid (HMnO_4) existing only in aqueous solution).

(a) **Manganates.** Sodium manganate (Na_2MnO_4), prepared by fusion of a mixture of natural manganese dioxide (heading 26.02 - pyrolusite) and sodium hydroxide; green crystals, soluble in cold water, decomposed by hot water; used in gold metallurgy.

Potassium manganate (K_2MnO_4), in small greenish-black crystals. Used for preparing the permanganate.

Barium manganate (BaMnO_4), obtained by heating manganese dioxide mixed with barium nitrate. Emerald green powder. Mixed with barium sulphate, it constitutes manganese blue. Used for artists' paints.

- (b) **Permanganates.** Sodium permanganate ($\text{NaMnO}_4 \cdot 3\text{H}_2\text{O}$), prepared from the manganate; reddish-black crystals, deliquescent and soluble in water. Used as a disinfectant, in organic synthesis and for bleaching wool.

Potassium permanganate (KMnO_4), prepared from the manganate, or by oxidising a mixture of manganese dioxide and potassium hydroxide. Purple crystals with a metallic sheen, soluble in water, colouring the skin; also in purplish-red aqueous solutions or in tablets. Powerful oxidising agent, used in chemistry as a reagent, in organic synthesis (manufacture of saccharin); in metallurgy (nickel refining); for bleaching fatty substances, resins, silk yarn or fabrics or straw; for purifying water; as an antiseptic; as a dye (for wool, wood and in hair-dyes); in gas masks; in medicine.

Calcium permanganate ($\text{Ca}(\text{MnO}_4)_2 \cdot 5\text{H}_2\text{O}$), prepared by electrolysing solutions of alkali manganates and calcium chloride; forms dark purple crystals, soluble in water. Oxidising agent and disinfectant, used in dyeing, in organic synthesis, for purifying water, for bleaching paper pulp.

- (4) **Molybdates.** Molybdates, paramolybdates and polymolybdates (di-, tri-, tetra-) are derived from normal molybdic acid (H_2MoO_4) or from the other molybdic acids. Similar in some respects to chromates.

The principal of these salts are :

- (a) **Ammonium molybdate.** Obtained in the metallurgy of molybdenum. Hydrated crystals, slightly tinted with green or yellow and decomposed by heat. Used as a chemical reagent, in the preparation of pigments or fire-proofing materials, in the glass industry, etc.
- (b) **Sodium molybdate.** Hydrated crystals, shiny and soluble in water. Used as a reagent, in the manufacture of pigments and in medicine.
- (c) **Calcium molybdate.** White powder, insoluble in water; used in metallurgy.
- (d) **Lead molybdate.** Artificial lead molybdate co-precipitated with lead chromate gives the scarlet chrome pigments.

Natural lead molybdate (wulfenite) is **excluded (heading 26.13)**.

- (5) **Tungstates (wolframates).** Tungstates, paratungstates and pertungstates are derived from the normal tungstic acid (H_2WO_4) and other tungstic acids.

The principal of these salts are :

- (a) **Ammonium tungstate.** Obtained by dissolving tungstic acid in ammonia; white crystalline powder, hydrated, soluble in water; used for fire-proofing fabrics and in the preparation of other tungstates.

- (b) **Sodium tungstate**. Obtained in tungsten metallurgy, from wolframite (heading 26.11) and sodium carbonate; white leaflets or crystals, hydrated, with a pearly sheen, soluble in water. Same uses as ammonium tungstate; also used as a mordant in textile printing, for preparing lakes and catalysts and in organic synthesis.
- (c) **Calcium tungstate**. White, glossy scales, insoluble in water; used for preparing X-ray screens or fluorescent tubes.
- (d) **Barium tungstate**. White powder, used in artists' paints, alone or mixed, under the name of tungsten white or tungstate white.
- (e) **Other tungstates**. These include tungstates of potassium (for fire-proofing fabrics), magnesium (for X-ray screens), chromium (green pigment), or lead (pigment).

The heading **excludes** :

- (a) Native calcium tungstate (scheelite), an ore (**heading 26.11**).
- (b) Natural tungstates of manganese (hubnerite) or of iron (ferberite) (**heading 26.11**).
- (c) Luminescent tungstates (e.g., of calcium or magnesium), classified as inorganic luminophores (**heading 32.06**).
- (6) **Titanates** (ortho-, meta- and peroxotitanates, neutral or acid) are derived from the various titanic acids and hydroxides, based on titanium dioxide (TiO_2).

Barium and lead titanates are white powders used as pigments.

The heading **excludes** natural iron titanate (ilmenite) (**heading 26.14**), and inorganic fluorotitanates (**heading 28.26**).

- (7) **Vanadates** (ortho-, meta-, pyro-, hypovanadates, neutral or acid) are obtained from the various vanadic acids derived from vanadium pentaoxide (V_2O_5) or from other vanadium oxides.
 - (a) **Ammonium vanadate** (metavanadate) (NH_4VO_3). Yellowish-white crystalline powder, sparingly soluble in cold water, very soluble in hot water and giving a yellow solution. Used as a catalyst; as a mordant in textile dyeing or printing; as a drier in paints or varnishes; as a colouring matter in pottery, and in the preparation of writing or printing inks, etc.
 - (b) **Sodium vanadates** (ortho- and meta-). Hydrated white powders, crystalline and soluble in water. Used in aniline-black dyeing and printing.
- (8) **Ferrates and ferrites**. Ferrates and ferrites are derived from ferric hydroxide ($Fe(OH)_3$) and from ferrous hydroxide ($Fe(OH)_2$), respectively. Potassium ferrate is a black powder, dissolving in water to give a red liquid.

The name "ferrates" is erroneously given to simple mixtures of iron oxides and other metal oxides constituting ceramic colours and classified in **heading 32.07**.

The heading also **excludes** ferrous ferrite which is in fact magnetic iron oxide (Fe_3O_4) (**heading 26.01**), and hammer scale (**heading 26.19**).

(9) **Zincates.** Compounds derived from amphoteric zinc hydroxide (Zn(OH)_2).

- (a) **Sodium zincate.** Results from the action of sodium carbonate on zinc oxide, or of sodium hydroxide on zinc. Used in the preparation of zinc sulphide employed in paints.
- (b) **Iron zincate.** Used as a ceramic colour.
- (c) **Cobalt zincate,** pure or mixed with cobalt oxide or other salts, constitutes cobalt green or Rinmann's green.
- (d) **Barium zincate.** Prepared by precipitating an aqueous solution of barium hydroxide with an ammoniacal solution of zinc sulphate; white powder, soluble in water. Used in the manufacture of zinc sulphide employed in paints.

(10) **Stannates** (ortho- and meta-) are derived from stannic acids.

- (a) **Sodium stannate** ($\text{Na}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$). Obtained by fusion of a mixture of tin, sodium hydroxide, chloride and nitrate; hard masses or irregular lumps, soluble in water, white or coloured according to the proportion of impurities (sodium or iron salts). Used in textile dyeing or printing (mordant); in the glass or ceramic industries; in the separation of lead from arsenic; in tin sizes for silk and in organic synthesis.
- (b) **Aluminium stannate.** Prepared by heating a mixture of tin sulphate and aluminium sulphate; white powder. Used as an opacifier in the enamel or ceramic industries.
- (c) **Chromium stannate.** Main component of pink colours for ceramics or artists' paints. Also used in tin sizes for silk.
- (d) **Cobalt stannate.** Alone or mixed, constitutes a sky-blue pigment, used in paints.
- (e) **Copper stannate,** alone or mixed, it is known as "tin green".

(11) **Antimonates.** Salts of the various acids corresponding to antimonic oxide (Sb_2O_5); somewhat similar to arsenates.

- (a) **Sodium meta-antimonate** (leuconine). Prepared from sodium hydroxide and antimony pentaoxide; a white crystalline powder, sparingly soluble in water. Opacifier for the enamel or glass industries; used in the preparation of sodium thioantimonate (Schlippe's salt) (**heading 28.42**).
- (b) **Potassium antimonates.** The most important is potassium hydrogen antimonate, prepared by calcining the metal mixed with potassium nitrate; a white, crystalline powder. Used in medicine (as a purgative) and as a ceramic pigment.
- (c) **Lead antimonate.** Obtained by the fusion of antimony pentaoxide with red lead; yellow powder, insoluble in water. Alone or mixed with lead oxychloride, it constitutes Naples yellow (antimony yellow), a pigment for ceramics, glass or artists' paints.

Antimonides are excluded (**heading 28.53**).

(12) **Plumbates.** Derived from amphoteric lead dioxide (PbO_2).

Sodium plumbate is used as a colouring matter. Plumbates of calcium (yellow), strontium (chestnut) or barium (black) are used in the manufacture of matches and in pyrotechnics.

(13) **Other salts of oxometallic acids or peroxometallic acids.** These include :

- (a) **Tantalates and niobates.**
- (b) **Germanates.**
- (c) **Rhenates and perrhenates.**
- (d) **Zirconates.**
- (e) **Bismuthates.**

The heading **excludes**, however, compounds of :

- (a) Precious metals (**heading 28.43**).
- (b) Radioactive chemical elements or radioactive isotopes (**heading 28.44**).
- (c) Yttrium, scandium or rare-earth metals (**heading 28.46**).
- (d) Mercury (**heading 28.52**).

Complex fluorine salts, such as fluorotitanates fall in **heading 28.26**.

28.42 - Other salts of inorganic acids or peroxyacids (including aluminosilicates whether or not chemically defined), other than azides.

2842.10 - Double or complex silicates, including aluminosilicates whether or not chemically defined

2842.90 - Other

Subject to the **exclusions** mentioned in the introduction to this sub-Chapter, this heading includes :

**(I) SALTS OF NON-METAL INORGANIC ACIDS
OR PEROXYACIDS NOT SPECIFIED ELSEWHERE**

Examples of these salts include :

(A) **Fulminates, cyanates, isocyanates and thiocyanates**, metal salts of the non-isolated cyanic acid ($\text{HO-C}\equiv\text{N}$) or of isocyanic acid (HN=C=O) or of fulminic acid ($\text{H-C}\equiv\text{N}^+-\text{O}^-$) another isomer of cyanic acid, or of thiocyanic acid ($\text{HS-C}\equiv\text{N}$).

- (1) **Fulminates.** Fulminates are compounds of more or less unknown composition, very unstable, exploding at a slight shock or under the action of heat (for example, a spark). They constitute priming explosives and are used in the manufacture of fulminating caps or detonators.
- (2) **Cyanates.** Ammonium, sodium or potassium cyanates are used for manufacturing various organic compounds. There are also cyanates of alkaline-earths.
- (3) **Thiocyanates.** Thiocyanates (sulphocyanides) are the metal salts of the non-isolated thiocyanic acid ($\text{HS-C}\equiv\text{N}$). The most important are :
 - (a) **Ammonium thiocyanate** (NH_4SCN). Colourless crystals, deliquescent, very soluble in water, turning red under the action of air and light, and decomposed by heat. Used in electroplating; in photography; in dyeing or printing (in particular to prevent the deterioration of sized silk fabrics); for preparing refrigerating mixtures, cyanides or hexacyanoferrates (II), thiourea, guanidine, plastics, adhesives, weed-killers, etc.
 - (b) **Sodium thiocyanate** (NaSCN). Same appearance as ammonium thiocyanate or as a powder. Poisonous. Used in photography; in dyeing and printing (mordant); in medicine; as a laboratory reagent; in electroplating; for preparing artificial mustard oil; in the rubber industry, etc.
 - (c) **Potassium thiocyanate** (KSCN). Having the same characteristics as sodium thiocyanate. Used in the textile industry; in photography; in organic synthesis (e.g., thiourea, artificial mustard oil and dyestuffs), in the preparation of thiocyanates, refrigerating mixtures, parasiticides, etc.

(d) **Calcium thiocyanate** ($\text{Ca}(\text{SCN})_2 \cdot 3\text{H}_2\text{O}$). Colourless crystals, deliquescent and soluble in water. Used as a mordant in dyeing or printing, and as a solvent for cellulose; for mercerising cotton; in medicine instead of potassium iodide (against arteriosclerosis); for preparing hexacyanoferates (II) or other thiocyanates; in the manufacture of parchment.

(e) **Copper thiocyanates.**

Cuprous thiocyanate (CuSCN), whitish, greyish or yellowish powder or paste, insoluble in water. Used as a mordant in textile printing, in the manufacture of marine paints and in organic synthesis.

Cupric thiocyanate ($\text{Cu}(\text{SCN})_2$), black powder, insoluble in water, readily turning into cuprous thiocyanate. Used in the manufacture of detonating caps and matches.

Mercury fulminate and mercuric thiocyanate **are excluded (heading 28.52)**.

(B) **Arsenites and arsenates.**

These are the metal salts of acids of arsenic; arsenites are the salts of arsenious acids, and arsenates are the salts of arsenic acids (heading 28.11). They are violently poisonous. Examples are :

- (1) **Sodium arsenite** (NaAsO_2). Prepared by the fusion of sodium carbonate with arsenious oxide. White or greyish slabs or powder, soluble in water. Used in viticulture (insecticide); for preserving hides; in medicine; in the manufacture of soap and antiseptics, etc.
- (2) **Calcium arsenite** (CaHAsO_3). White powder, insoluble in water. Used as an insecticide.
- (3) **Copper arsenite** (CuAsO_3). Obtained from sodium arsenite and copper sulphate. Green powder, insoluble in water. Used as an insecticide, as a colouring matter known as Scheele's green and for preparing certain green pigments (see Explanatory Note to heading 32.06).
- (4) **Zinc arsenite** ($\text{Zn}(\text{AsO}_2)_2$). Similar appearance and uses to calcium arsenite.
- (5) **Lead arsenite** ($\text{Pb}(\text{AsO}_2)_2$). White powder, only sparingly soluble in water. Used in viticulture (insecticide).
- (6) **Sodium arsenates** (ortho-, meta- and pyroarsenates). The most important are disodium hydrogen orthoarsenate (Na_2HAsO_4) (with 7 or 12 H_2O , according to the temperature of crystallisation) and trisodium orthoarsenate (anhydrous or with 12 H_2O). Prepared from arsenious oxide and sodium nitrate. Colourless crystals or greenish powder. Used in the preparation of medicaments (Pearson's solution), of antiseptics, insecticides, and of other arsenates; also used in textile printing.
- (7) **Potassium arsenates**. Mono- and dibasic potassium orthoarsenates, prepared by the same method as sodium arsenates. Colourless crystals, soluble in water. Used as antiseptics or insecticides; for tanning; for printing textiles, etc.

- (8) **Calcium arsenates.** Tricalcium diorthoarsenate ($\text{Ca}_3(\text{AsO}_4)_2$), often containing other calcium arsenates as impurities. Obtained by the interaction of calcium chloride and sodium arsenate. White powder, insoluble in water. Used in agriculture as an insecticide.
- (9) **Copper arsenates.** Cupric orthoarsenate ($\text{Cu}_3(\text{AsO}_4)_2$). Obtained from sodium orthoarsenate and copper sulphate (or chloride). Green powder, insoluble in water. Used as a parasiticide in viticulture and for preparing anti-fouling paints.
- (10) **Lead arsenates.** Trilead diorthoarsenate ($\text{Pb}_3(\text{AsO}_4)_2$), and the acid orthoarsenate. Only sparingly soluble in water. White powders, pastes or emulsions. Used in the preparation of insecticides.
- (11) **Other arsenates.** These include arsenates of aluminium (insecticide) or of cobalt (pink powder, used in ceramics).

The heading **does not cover :**

- (a) Natural nickel arsenates (e.g., annabergite, etc.) (**heading 25.30**).
- (b) Arsenides (**heading 28.53**).
- (c) Acetoarsenites (**Chapter 29**).

(C) The salts of selenium acids : selenides, selenites, selenates. These include :

- (1) **Cadmium selenide.** Used in the manufacture of anti-glare glass and of pigments.
- (2) **Sodium selenite.** Used for giving glass a red tint, or for masking its greenish hue.
- (3) **Ammonium and sodium selenates.** Used as insecticides; the sodium salt is also used in medicine.
- (4) **Potassium selenate.** Used in photography.

Zorgite, a natural copper lead selenide, is **excluded (heading 25.30)**.

(D) The salts of tellurium acids : tellurides, tellurites, tellurates. These include :

- (1) **Bismuth telluride.** A semi-conductor for thermopiles.
- (2) **Sodium or potassium tellurates.** Used in medicine.

(II) DOUBLE OR COMPLEX SALTS

This group covers double or complex salts **other than** those specifically included elsewhere.

The principal double or complex salts classified in this heading include :

(A) Double or complex chlorides (chlorosalts).

- (1) **Chloride of ammonium with :**
 - (a) **Magnesium.** Deliquescent crystals; used in soldering.

- (b) **Iron (ammonium ferrous chloride and ammonium ferric chloride).** In masses or hygroscopic crystals; used in plating and in medicine.
 - (c) **Nickel.** Yellow powder or, hydrated, green crystals. Used as a mordant and in galvanising.
 - (d) **Copper (ammonium copper chloride).** Blue or greenish crystals, soluble in water. Used as a colouring agent and in pyrotechnics.
 - (e) **Zinc (ammonium zinc chloride).** White crystalline powder, soluble in water. Used in soldering (“**soldering salts**”), in dry batteries, and in galvanising (electrolytic zinc-plating).
 - (f) **Tin.** In particular **ammonium chlorostannate**; white or pink crystals or in aqueous solution. Sometimes called “**pink salt**”; used in dyeing and as a size for silk.
- (2) **Chloride of sodium with aluminium.** White crystalline powder, hygroscopic. Used in tanning.
- (3) **Chloride of calcium with magnesium.** White deliquescent crystals. Used in the paper, textile, potato-starch or paint industries.
- (4) **Chlorosalts, e.g., chlorobromides, chloroiodides, chloroiodates, chlorophosphates, chlorochromates and chlorovanadates.**

These include **potassium chlorochromate (Peligot's salt)**. Red crystals, decomposing in water. It is an oxidising agent used in organic synthesis.

Pyromorphite (phosphate and chloride of lead) and vanadinite (vanadate and chloride of lead) are **excluded** since they are natural metallic ores of **headings 26.07 and 26.15**, respectively.

(B) Double or complex iodides (iodosalts).

- (1) **Bismuth sodium iodide.** Red crystals, decomposed by water. Used in medicine.
- (2) **Cadmium potassium iodide.** A white deliquescent powder which turns yellow on exposure to air. Also used in medicine.

(C) Double or complex salts containing sulphur (thiosalts).

- (1) **Sulphate of ammonium** with :
 - (a) **Iron (ammonium ferrous sulphate, Mohr's salt)** ($\text{FeSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$). Light green crystals, soluble in water. Used in metallurgy and in medicine.
 - (b) **Cobalt** ($\text{CoSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$). Red crystals, soluble in water. Used in cobalt-plating and in ceramics.
 - (c) **Nickel** ($\text{NiSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$). Green crystals, decomposed by heat; very soluble in water. Used mainly for electrolytic nickel-plating.
 - (d) **Copper.** Blue crystalline powder soluble in water, efflorescing in air. Used as a parasiticide, in textile printing and processing, in the preparation of copper arsenite, etc.

- (2) **Sodium zirconium sulphate.** White solid. Used in zinc metallurgy.
- (3) “**Thiosalts**” and other double or complex salts containing sulphur, e.g.: selenosulphides and selenosulphates, thiottellurates, thioarsenates, thioarsenites and arsenosulphides, thiocarbonates, germanosulphides, thioantimonates, thiomolybdates, thiostannates, reineckates.

This group includes :

- (a) **Potassium trithiocarbonate.** Yellow crystals, soluble in water. Used in agriculture (against phylloxera) and in chemical analysis.
- (b) **Alkali thiomolybdates.** Used as accelerating agents in metal phosphatising (parkerising) baths.
- (c) **Ammonium tetrathiocyanatodiamminochromate (ammonium diammine-tetrakisthiocyanatochromate, ammonium reinecke or reinecke salt)** ($\text{NH}_4[\text{Cr}(\text{NH}_3)_2(\text{SCN}_4)] \cdot \text{H}_2\text{O}$). Crystalline powder or dark red crystals. Used as a reagent.
- (d) **Ferrous potassium thiocyanate and ferric potassium thiocyanate.**

Cobaltite (sulphide and arsenide of cobalt) and germanite (copper germano-sulphide) are excluded from this heading since they are natural ores of headings 26.05 and 26.17, respectively.

(D) **Double or complex salts of selenium (selenocarbonates, selenocyanates, etc.).**

(E) **Double or complex salts of tellurium (tellurocarbonates, tellurocyanates, etc.).**

(F) **Cobaltinitrites (nitrocobaltates).**

Potassium cobaltinitrite (cobalt potassium nitrite, Fischer's yellow) ($\text{K}_3\text{Co}(\text{NO}_2)_6$). Microcrystalline powder, fairly soluble in water. A pigment which, alone or mixed, is known as **cobalt yellow**.

(G) **Double or complex nitrates (tetra- and hexa-amminonickel nitrates).**

Ammoniacal nickel nitrates. Blue or green water soluble crystals. Used as oxidants and for the preparation of the pure nickel catalyst.

(H) **Double or complex phosphates (phosphosalts).**

- (1) **Ammonium sodium orthophosphate** $\text{NaNH}_4\text{HPO}_4 \cdot \text{H}_2\text{O}$ (microcosmic salt). Colourless efflorescent crystals, soluble in water. Used as a flux for dissolving metal oxides.
- (2) **Ammonium magnesium orthophosphate.** White powder, only very slightly soluble in water. Used for fire-proofing textiles and in medicine.
- (3) **Complex salts containing phosphorus,** e.g., **molybdophosphates, silicophosphates, tungstophosphates, stannophosphates.**

This group includes :

- (a) **Molybdophosphates.** Used in microscopic research.
- (b) **Silicophosphates and stannophosphates.** Used for sizing silk.

(IJ) **Tungstoborates (borotungstates).**

Cadmium borotungstate. Yellow crystals or in aqueous solution. Used for separating minerals by density.

(K) **Double or complex cyanates.**

(L) **Double or complex silicates.**

This group includes **aluminosilicates**, whether or not they are separate chemically defined compounds. Aluminosilicates are used in the glass industry and as insulators, ion-exchangers, catalysts, molecular sieves, etc.

Included in this category are synthetic zeolites with the generic formula $M_{2/n}O \cdot Al_2O_3 \cdot ySiO_2 \cdot wH_2O$, where M is a cation of valency n (usually sodium, potassium, magnesium or calcium), y is two or more and w is the number of water molecules.

Aluminosilicates containing binders (e.g., zeolites containing silica-based clay) are, however, **excluded (heading 38.24)**. Particle size can usually be used to identify zeolites containing binders (usually above 5 microns).

(M) **Double or complex salts of metal oxides.**

These are salts such as **calcium potassium chromate**.

This heading **excludes** :

- (a) Complex fluorine salts (**heading 28.26**).
 - (b) Alums (**heading 28.33**).
 - (c) Complex cyanides (**heading 28.37**).
 - (d) Salts of hydrazoic acid (azides) (**heading 28.50**).
 - (e) Chloride of ammonium with mercury (ammonium mercuric chloride or ammonium chloromercurate) and copper mercury iodide (**heading 28.52**).
 - (f) Magnesium potassium sulphate, whether or not pure (**Chapter 31**).
-

Sub-Chapter VI

MISCELLANEOUS

28.43 - Colloidal precious metals; inorganic or organic compounds of precious metals, whether or not chemically defined; amalgams of precious metals.

2843.10 - Colloidal precious metals

- Silver compounds :

2843.21 -- Silver nitrate

2843.29 -- Other

2843.30 - Gold compounds

2843.90 - Other compounds; amalgams

(A) COLLOIDAL PRECIOUS METALS

This heading covers precious metals as listed in Chapter 71 (i.e., silver, gold, platinum, iridium, osmium, palladium, rhodium and ruthenium), provided they are in colloidal suspension. These precious metals are obtained in this state either by dispersion or cathodic pulverisation, or by reducing one of their inorganic salts.

Colloidal silver occurs in small grains or flakes, bluish, brownish or greenish-grey, with a metallic glint. It is used in medicine as an antiseptic.

Colloidal gold may be red, violet, blue or green, and is used for the same purposes as colloidal silver.

Colloidal platinum is in small grey particles and has remarkable catalysing properties.

These colloidal metals (e.g., gold) remain classified in this heading when put up in colloidal solutions containing protective colloids (such as gelatin, casein, fish glue).

(B) INORGANIC OR ORGANIC COMPOUNDS OF PRECIOUS METALS, WHETHER OR NOT CHEMICALLY DEFINED

These are :

- (I) **Oxides, peroxides and hydroxides of precious metals**, analogous to the compounds of sub-Chapter IV.
- (II) **Inorganic salts of precious metals**, analogous to the compounds of sub-Chapter V.
- (III) **Phosphides, carbides, hydrides, nitrides, silicides and borides**, analogous to the compounds of headings 28.49, 28.50 and 28.53 (such as platinum phosphide, palladium hydride, silver nitride, platinum silicide).

(IV) **Organic compounds of precious metals**, analogous to the compounds of Chapter 29.

Compounds containing **both** precious metals and other metals (e.g., double salts of a base metal and a precious metal, complex esters containing precious metals) are also covered by this heading.

The most common compounds of each of the precious metals are listed below :

(1) **Silver compounds.**

- (a) **Silver oxides.** Disilver oxide (Ag_2O) is a brownish-black powder slightly soluble in water, turning black on exposure to light.

Silver oxide (AgO) is a greyish-black powder.

Silver oxides are used, *inter alia*, in the manufacture of batteries.

- (b) **Silver halides.** Silver chloride (AgCl) is a white mass or dense powder, insoluble in water, darkening when exposed to light; it is packed in dark-coloured opaque containers. Used in photography, in the manufacture of ceramics, in medicine and in silvering.

Cerargyrites (or horn silver), natural silver chlorides and iodides, are **excluded (heading 26.16)**.

Silver bromide (yellowish), silver iodide (yellow), and silver fluoride are used for similar purposes to the chloride.

- (c) **Silver sulphide.** Artificial silver sulphide (Ag_2S) is a heavy grey-black powder, insoluble in water, used for glass-making.

Natural silver sulphide (argentite), natural sulphide of silver and antimony (pyrargyrite, stephanite, polybasite) and natural sulphide of silver and arsenic (proustite) are **excluded (heading 26.16)**.

- (d) **Silver nitrate** (AgNO_3) white crystals, soluble in water, toxic, damages the skin. Used for silvering glass or metals; for dyeing silk or horn; in photography; for the manufacture of indelible ink; and as an antiseptic or a parasiticide. Sometimes called “lunar caustic”, though this name is also applied to silver nitrate melted with a small quantity of sodium or potassium nitrate, and sometimes with a little silver chloride, to form a cauteriser of **Chapter 30**.

(e) **Other salts and inorganic compounds.**

Silver sulphate (Ag_2SO_4) crystals.

Silver phosphate (Ag_3PO_4), yellowish crystals not very soluble in water; used in medicine, photography and optics.

Silver cyanide (AgCN), a white powder darkening on exposure to light, insoluble in water; used in medicine and for silver-plating. Silver thiocyanate (AgSCN) has a similar appearance and is used as an intensifier in photography.

Complex cyanide salts of silver and potassium ($\text{KAg}(\text{CN})_2$) or silver and sodium ($\text{NaAg}(\text{CN})_2$) are soluble white salts, used in electroplating.

Silver fulminate, white crystals, exploding at the slightest shock, dangerous to handle; used for the manufacture of detonating caps.

Silver dichromate ($\text{Ag}_2\text{Cr}_2\text{O}_7$) a crystalline ruby-red powder, slightly soluble in water; used for painting miniatures (silver red, purple red).

Silver permanganate, a crystalline deep violet powder, soluble in water; used in gas masks.

Silver azide, an explosive.

(f) **Organic compounds.** These include :

- (i) Silver lactate (white powder) and silver citrate (yellowish powder); used in photography and as antiseptics.
- (ii) Silver oxalate, which decomposes and explodes when heated.
- (iii) Silver acetate, benzoate, butyrate, cinnamate, picrate, salicylate, tartrate and valerate.
- (iv) Proteinates, nucleates, nucleinates, albuminates, peptonates, vitellinates and tannates of silver.

(2) **Gold compounds.**

- (a) **Oxides.** Aurous oxide (Au_2O). An insoluble, dark violet powder. Auric oxide (Au_2O_3) (auric anhydride) is a brown powder; the corresponding acid is auric hydroxide or acid ($\text{Au}(\text{OH})_3$), a black product, decomposed on exposure to light, from which alkali aurates are derived.
- (b) **Chlorides.** Aurous chloride (AuCl), a yellowish or reddish crystalline powder. Gold trichloride (AuCl_3) (auric chloride, brown chloride), a reddish-brown powder or crystalline mass, very hygroscopic, often presented in sealed flasks or tubes. Tetrachloroauric (III) acid ($\text{AuCl}_3 \cdot \text{HCl} \cdot 4\text{H}_2\text{O}$) (yellow chloride) yellow crystals, hydrated, and alkali chloroaurates, reddish-yellow crystals, are also classified in this heading. These products are used in photography (preparation of toning baths), in the ceramic or glass industries and in medicine.

The heading **excludes** purple of Cassius, a mixture of stannic hydroxide and colloidal gold (**Chapter 32**); this is used in the manufacture of paints or varnishes, and especially for colouring porcelain.

- (c) **Other compounds.** Gold sulphide (Au_2S_3) a blackish substance which, in combination with alkali sulphides, forms thioaurates.

Double sulphites of gold and sodium ($\text{NaAu}(\text{SO}_3)$) and of gold and ammonium ($\text{NH}_4\text{Au}(\text{SO}_3)$) marketed as colourless solutions, are used in electroplating.

Sodium aurothiosulphate is used in medicine.

Gold cyanide (AuCN), a crystalline yellow powder decomposable if exposed to heat, is used for electrolytic gilding and in medicine. Reacts with alkali cyanides to give cyanoaurates, such as potassium tetracyanoaurate ($\text{KAu}(\text{CN})_4$), which is a soluble white salt used in electroplating.

Sodium aurothiocyanate, crystallising in orange-coloured needles; used in medicine and in photography (toning baths).

- (3) **Ruthenium compounds.** Ruthenium dioxide (RuO_2) is a blue product, while ruthenium tetraoxide (RuO_4) is orange coloured. Ruthenium trichloride (RuCl_3) and ruthenium tetrachloride (RuCl_4), give double chlorides with alkali chlorides and ammino or nitroso complexes. There are also double nitrates of ruthenium or alkali metals.
- (4) **Rhodium compounds.** The rhodium hydroxide (Rh(OH)_3), corresponds to rhodium oxide (Rh_2O_3) a black powder. The rhodium trichloride (RhCl_3), gives chlororhodites with alkali chlorides, and there are, a sulphate with its complex alums or phosphates, a nitrate and complex nitrates; also cyanorhodites and complex ammino or oxalic derivatives.
- (5) **Palladium compounds.** The most stable oxide is palladous oxide (PdO), the only basic one. It is a black powder decomposed by heat.

Palladous chloride (PdCl_2), a brown deliquescent powder, soluble in water and crystallising with $2 \text{ H}_2\text{O}$, is used in the ceramic industry, in photography and in electroplating.

Potassium chloropalladite (K_2PdCl_4), a brown salt, fairly soluble, used as a detector of carbon monoxide, is also classified here. There also exist chloropalladates, ammino compounds (palladium diammines), thiopalladates, palladonitrites, cyanopalladites, pallado-oxalates and palladous sulphate.

- (6) **Osmium compounds.** Osmium dioxide (OsO_2) is a dark brown powder. Osmium tetraoxide (OsO_4) is a volatile solid, crystallising in white needles; it attacks the eyes and lungs; used in histology and micrography. This tetraoxide gives osmates such as potassium osmate (red crystals), and, by treatment with ammonia and alkali hydroxides, osmiamates such as osmiamates of potassium or sodium, yellow crystals.

Osmium tetrachloride (OsCl_4) and trichloride (OsCl_3) give alkali chloro-osmates and chloro-osmites.

- (7) **Iridium compounds.** In addition to iridium oxide there are an iridium tetrahydroxide (Ir(OH)_4), blue solid, a chloride, chloroiridates and chloroiridites, double sulphates and ammino compounds.

(8) **Platinum compounds.**

- (a) **Oxides.** Platinous oxide (PtO) is a violet or blackish powder. Platinic oxide (PtO_2) forms several hydrates of which one, the tetrahydrate ($\text{H}_2\text{Pt}(\text{OH})_6$) is a complex acid (hexahydroxyplatinic acid) to which correspond salts such as alkali hexahydroxyplatinates. There are also corresponding ammino complexes.
- (b) **Other compounds.** Platinic chloride (PtCl_4) occurs in the form of a brown powder or a yellow solution; it is used as a reagent. Commercial platinum chloride (chloroplatinic acid) (H_2PtCl_6), deliquescent prisms, brownish-red in colour, soluble in water; used in photography (platinum toning), in platinum-plating, for ceramic glazing or for obtaining platinum sponge. There are corresponding platinum ammino complexes.

There are also ammino complexes corresponding to chloroplatinous acid (H_2PtCl_4), itself a red solid. Cyanoplatinites of potassium or barium are used for obtaining fluorescent screens for radiography.

(C) AMALGAMS OF PRECIOUS METALS

These are alloys of precious metals with mercury. Amalgams of gold or silver, which are the most common, are used as intermediate products for obtaining these precious metals.

The heading includes amalgams containing **both** precious metals and base metals (e.g., certain amalgams used in dentistry); but it **excludes** amalgams **wholly** of base metal (**heading 28.53**).

Mercury compounds, whether or not chemically defined, other than amalgams are **excluded** (**heading 28.52**).

28.44 - Radioactive chemical elements and radioactive isotopes (including the fissile or fertile chemical elements and isotopes) and their compounds; mixtures and residues containing these products.

- 2844.10 - Natural uranium and its compounds; alloys, dispersions (including cermets), ceramic products and mixtures containing natural uranium or natural uranium compounds
- 2844.20 - Uranium enriched in U 235 and its compounds; plutonium and its compounds; alloys, dispersions (including cermets), ceramic products and mixtures containing uranium enriched in U 235, plutonium or compounds of these products
- 2844.30 - Uranium depleted in U 235 and its compounds; thorium and its compounds; alloys, dispersions (including cermets), ceramic products and mixtures containing uranium depleted in U 235, thorium or compounds of these products
- 2844.40 - Radioactive elements and isotopes and compounds other than those of subheading 2844.10, 2844.20 or 2844.30; alloys, dispersions (including cermets), ceramic products and mixtures containing these elements, isotopes or compounds; radioactive residues
- 2844.50 - Spent (irradiated) fuel elements (cartridges) of nuclear reactors

(I) ISOTOPES

The nuclei of an element, defined by its atomic number, always contain the same number of protons, but they may have different numbers of neutrons and, consequently, will be of different mass (different mass number).

Nuclides which differ only in the mass number and not in the atomic number, are called isotopes of the element. For example, there are several nuclides with the same atomic number 92 which are all called uranium, but their mass number ranges from 227 to 240; they are designated, for example, as uranium 233, uranium 235, uranium 238, etc. Analogously, hydrogen 1, hydrogen 2 or deuterium (classified in **heading 28.45**) and hydrogen 3 or tritium are isotopes of hydrogen.

The important factor in the chemical behaviour of an element is linked to the amount of the positive electric charge on the nucleus (number of protons); this determines the number of orbital electrons which actually affect the chemical properties.

Because of this, different isotopes of an element whose nuclei have the same electrical charge but different masses, will have the same chemical properties but their physical properties will vary from one isotope to another.

Chemical elements are composed either of a single nuclide (monoisotopic elements) or of a mixture of two or more isotopes in known unvarying proportions. For example, natural chlorine, in both the free and combined states, is always made up of a mixture of 75.4 % chlorine 35 and 24.6 % chlorine 37 (which gives it its atomic weight of 35.457).

When an element is composed of a mixture of isotopes, its constituent parts can be separated for example by diffusion through porous tubes, by electro-magnetic separation or by fractional electrolysis. Isotopes can also be made by bombarding natural elements with neutrons or charged particles of high kinetic energy.

For the purposes of Note 6 to this Chapter and of headings 28.44 and 28.45, the term **isotopes** covers not only isotopes in their pure state but also chemical elements whose natural isotopic composition has been artificially modified by enriching the elements in some of their isotopes (which is the same as depleting them in some others), or by converting, through a nuclear reaction, some isotopes into other, artificial isotopes. For example, chlorine of atomic weight 35.30 obtained by enriching this element to contain 85 % of chlorine 35 (and consequently by depleting it to contain 15 % of chlorine 37) is considered as an isotope.

It should be noted that elements existing in nature in the monoisotopic state, e.g., beryllium 9, fluorine 19, aluminium 27, phosphorus 31, manganese 55, etc., are not to be considered as isotopes, but are to be classified, in either the free or the combined state, according to the case, in the more specific headings relating to chemical elements or to their compounds.

Radioactive isotopes of these same elements obtained artificially (e.g. Be 10, F 18, Al 29, P 32, Mn 54) are, however, to be considered as isotopes.

Since artificial chemical elements (generally with an atomic number greater than 92, or transuranic elements) do not have a fixed isotopic composition but one which varies according to the method of obtaining the element, it is impossible in these cases to distinguish between the chemical element and its isotopes for the purposes of Note 6.

This heading covers only those isotopes which possess the phenomenon of **radioactivity** (described below); stable isotopes, on the other hand, are classified in **heading 28.45**.

(II) **RADIOACTIVITY**

Certain nuclides, whose nuclei are unstable, whether in the pure state or in the form of compounds, emit complex radiations producing physical or chemical effects such as :

- (1) Ionisation of gases.
- (2) Fluorescence.
- (3) Fogging of photographic plates.

These effects make it possible to detect these radiations and to measure their intensity by using, for example, Geiger-Müller counters, proportional counters, ionisation chambers, Wilson chambers, bubble flow counters, scintillation counters, and sensitised films or plates.

This is the phenomenon of **radioactivity**; chemical elements, isotopes, compounds and, in general, substances that display it are called **radioactive**.

(III) **RADIOACTIVE CHEMICAL ELEMENTS, RADIOACTIVE ISOTOPES AND THEIR COMPOUNDS; MIXTURES AND RESIDUES CONTAINING THESE PRODUCTS**

(A) **Radioactive elements.**

Within this heading fall the radioactive chemical elements referred to in Note 6 (a) to this Chapter, namely : technetium, promethium, polonium and all elements of greater atomic number, such as astatine, radon, francium, radium, actinium, thorium, protactinium, uranium, neptunium, plutonium, americium, curium, berkelium, californium, einsteinium, fermium, mendelevium, nobelium and lawrencium.

These are elements generally composed of several isotopes which are all radioactive.

On the other hand, there are elements composed of mixtures of stable and radioactive isotopes, such as potassium, rubidium, samarium and lutetium (**heading 28.05**), which, because the radioactive isotopes have a low level of radioactivity and constitute a relatively low percentage of the mixture, can be considered as practically stable and thus do not fall in this heading.

On the other hand, the same elements (potassium, rubidium, samarium, lutetium), if enriched in their radioactive isotopes (K 40, Rb 87, Sm 147, Lu 176, respectively), are to be considered as radioactive isotopes of this heading.

(B) **Radioactive isotopes.**

To the natural radioactive isotopes potassium 40, rubidium 87, samarium 147, and lutetium 176 already mentioned, may be added uranium 235 and uranium 238, which are discussed in more detail in Section (IV) below, and certain isotopes of thallium, lead, bismuth, polonium, radium, actinium or thorium, which are often known by a name different from that of the corresponding element. This name refers rather to the element from which they were derived by radioactive conversion. Thus, bismuth 210 is called *radium E*, polonium 212 is called *thorium C'* and actinium 228 is called *mesothorium II*.

Chemical elements which are normally stable may nonetheless become radioactive either after bombardment with particles having a very high kinetic energy (protons, deuterons) issuing from a particle accelerator (cyclotron, synchrotron, etc.) or after absorbing neutrons in a nuclear reactor.

The elements thus transformed are called artificial radioactive isotopes. Of these, about 500 are known at present, of which close to 200 are already being used in practical applications. Apart from uranium 233 and the plutonium isotopes, which are discussed later, some of the most important are : hydrogen 3 (tritium), carbon 14, sodium 24, phosphorus 32, sulphur 35, potassium 42, calcium 45, chromium 51, iron 59, cobalt 60, krypton 85, strontium 90, yttrium 90, palladium 109, iodine 131 and 132, xenon 133, caesium 137, thulium 170, iridium 192, gold 198, and polonium 210.

Radioactive chemical elements and radioactive isotopes transform themselves naturally into more stable elements or isotopes.

The time required for the quantity of a given radioactive isotope to decrease to one-half that initially present is known as the half-life or transformation rate of that isotope. It varies from a fraction of a second for certain highly radioactive isotopes (0.3×10^{-6} for thorium C') to billions of years (1.5×10^{11} years for samarium 147) and constitutes a convenient yardstick of the statistical instability of the nucleus concerned.

Radioactive chemical elements and isotopes fall in this heading, even when mixed together or with radioactive compounds, or with non-radioactive materials (e.g., unprocessed irradiated targets and radioactive sources), provided that the specific radioactivity of the product is greater than 74 Bq/g (0.002 μ Ci/g).

(C) Radioactive compounds; mixtures and residues containing radioactive substances.

The radioactive chemical elements and isotopes of the present heading are often used in the form of compounds or products which are "labelled" (i.e., contain molecules with one or more radioactive atoms). Such compounds remain classified in this heading, even when dissolved or dispersed in, or mixed naturally or artificially with, other radioactive or non-radioactive materials. These elements and isotopes are also classified in this heading when in the form of alloys, dispersions or cermets.

Inorganic or organic compounds, chemically or otherwise constituted of radioactive chemical elements or radioactive isotopes, and solutions thereof, still fall in this heading, even if the specific radioactivity of these compounds or solutions is below 74 Bq/g (0.002 µCi/g); on the other hand, alloys, dispersions (including cermets), ceramic products and mixtures containing radioactive substances (elements, isotopes or compounds thereof) fall in this heading if their specific radioactivity is greater than 74 Bq/g (0.002 µCi/g). The radioactive elements and isotopes, very rarely used in their free form, are commercially available in chemical compounds or alloys. Apart from compounds of fissile and fertile chemical elements and isotopes, which are mentioned in Section (IV) below on account of their characteristics and importance, the most important radioactive compounds are :

- (1) **Radium salts (chloride, bromide, sulphate, etc.)** used as radiation sources for treating cancer or for certain experiments in physics.
- (2) **Compounds of radioactive isotopes referred to under (III) (B) above.**

Artificial radioactive isotopes and their compounds are used :

- (a) **In industry**, e.g., for metal radiography, for measuring the thickness of sheets, plates, etc.; for measuring the level of liquids in an inaccessible container; for facilitating vulcanisation; to trigger off polymerisation or grafting of several organic compounds; for the manufacture of luminous paint (mixed, for example, with zinc sulphide); for clock and watch dials, instruments, etc.
- (b) **In medicine**, e.g., for diagnosing or treating certain diseases (cobalt 60, iodine 131, gold 198, phosphorus 32, etc.).
- (c) **In agriculture**, e.g., for sterilising agricultural produce; to prevent germination; for studies of fertiliser application or of fertiliser absorption by plants; to induce genetic mutations thus improving strains, etc. (cobalt 60, caesium 137, phosphorus 32, etc.).
- (d) **In biology**, e.g., for studying the functioning or development of certain animal or vegetable organs (tritium, carbon 14, sodium 24, phosphorus 32, sulphur 35, potassium 42, calcium 45, iron 59, strontium 90, iodine 131, etc.).
- (e) **In physical or chemical research.**

Radioactive isotopes and their compounds are normally put up in the form of powders, solutions, needles, thread or sheets. They are generally contained in glass ampoules, in hollow platinum needles, in stainless steel tubes, etc., which are packed in anti-radiation metal outer containers (generally of lead), the choice of thickness of which depends on the degree of radioactivity of the isotopes. In accordance with certain international agreements, a special label must then be affixed to the container, giving particulars of the isotope contained therein and its degree of radioactivity.

Mixtures may include certain neutron sources formed by associating (in a mixture, alloy, combinations, etc.) a radioactive element or isotope (radium, radon, antimony 124, americium 241, etc.) with another element (beryllium, fluorine, etc.) in such a way as to produce a (γ ,n) or (α ,n) reaction (introduction of a γ -photon or an α -particle, respectively, and emission of a neutron).

However, all assembled neutron sources, ready to be introduced into nuclear reactors to initiate a fission chain reaction, are to be considered as reactor components and consequently are to be classified in **heading 84.01**.

Microspheres of nuclear fuel coated with layers of carbon or silicon carbide intended for introduction into spherical or prismatic fuel elements fall in this heading.

Also included in this heading are the products used as luminophores, which have small quantities of radioactive substances added to make them self-luminescent, provided that the resulting specific radioactivity is greater than 74 Bq/g (0.002 μ Ci/g).

Of the radioactive residues, the most important from the point of view of re-use are :

- (1) **Irradiated or tritiated heavy water** : after a residence time of varying length in a nuclear reactor, some of the deuterium in the heavy water is converted, by absorption of neutrons, into tritium and thus the heavy water becomes radioactive.
- (2) **Spent (irradiated) fuel elements** (cartridges), generally very highly radioactive, mainly used for the purpose of recovering the fissile and fertile materials contained in them (see Section (IV) below).

(IV) FISSILE AND FERTILE CHEMICAL ELEMENTS AND ISOTOPES AND COMPOUNDS THEREOF; MIXTURES AND RESIDUES CONTAINING THOSE SUBSTANCES

(A) Fissile and fertile chemical elements and isotopes.

Certain of the radioactive chemical elements and isotopes mentioned in Section (III) have a high atomic mass, for example thorium, uranium, plutonium and americium, of which the nucleus of the atom has a particularly complex structure. These nuclei, when subjected to the action of subatomic particles (neutrons, protons, deuterons, tritons, α particles, etc.) may absorb these particles, thereby increasing their instability to a degree sufficient to cause them to split into two nuclei of medium weight with neighbouring masses (or more rarely into three or four fragments). This disintegration liberates a considerable amount of energy and is accompanied by the formation of secondary neutrons. It is known as the process of **fission** or **nuclear bipartition**.

Fission only seldom occurs spontaneously or under the action of photons.

The secondary neutrons released at the time of fission may cause a second fission to take place thus creating secondary neutrons and so on. The repetition of this process produces a **chain reaction**.

The probability of fission is generally very high for certain nuclides (U 233, U 235, Pu 239) if slow neutrons are used, i.e., neutrons of an average speed of approximately 2,200 m/sec. (or an energy of 1/40 of an electron volt (eV)). As this speed corresponds approximately to that of the molecules of a fluid (thermal motion) slow neutrons are also sometimes called **thermal** neutrons.

At present, fission caused by thermal neutrons is that most used in nuclear reactors.

For this reason, the term **fissile** is commonly used to describe isotopes which undergo fission by thermal neutrons, particularly uranium 233, uranium 235, plutonium 239 and the chemical elements that contain them, particularly uranium and plutonium.

Other nuclides, such as uranium 238 and thorium 232 only undergo direct fission by fast neutrons and are commonly considered, not as fissile, but as **fertile**. The "fertility" comes from the fact that these nuclides can absorb slow neutrons, giving rise to the formation of plutonium 239 and uranium 233, respectively, which are fissile.

In thermal nuclear reactors (with slowed-down neutrons), since the energy of secondary neutrons released by fission is much higher (approximately 2 million eV), these neutrons have to be slowed down if a chain reaction is to take place. This can be achieved by means of **moderators**, i.e., products with a low atomic mass (such as water, heavy water, certain hydrocarbons, graphite, beryllium, etc.) which, although they absorb part of the energy of the neutrons by a succession of shocks, do not absorb the neutrons themselves or absorb only a negligible proportion of them.

In order to start and maintain a chain reaction, the average number of secondary neutrons produced by fission must more than compensate the neutrons lost by the phenomena of capture and escape not leading to fission.

The **fissile and fertile chemical elements** are listed below :

(1) **Natural uranium.**

Uranium in the natural state is composed of three isotopes : uranium 238, which forms 99.28 % of the total mass, uranium 235 which represents 0.71 %, and a negligible quantity (about 0.006 %) of uranium 234. Consequently, it can be considered as both a fissile element (because of its U 235 content) and a fertile element (because of its U 238 content).

Uranium is mainly extracted from pitchblende, uraninite, autunite, brannerite, carnotite or torbernite. It is also obtained from other secondary sources, such as residues from the manufacture of superphosphates or gold-mine waste. The normal process is reduction of the tetrafluoride by means of calcium or magnesium, or by electrolysis.

Uranium is a slightly radioactive element, very heavy (specific gravity 19) and hard. It has a lustrous silver-grey surface, but tarnishes on contact with the oxygen in the air, forming oxides. In powder form it oxidises and ignites rapidly when in contact with air.

Uranium is normally marketed in the form of ingots ready for polishing, filing, rolling, etc. (to produce bars and rods, tubes, sheets, wire, etc.).

(2) Thorium.

Since thorite and orangite, though very rich in thorium, are rare, thorium is mainly obtained from monazite which is also the source of rare-earth metals.

The impure metal takes the form of an extremely pyrophoric grey powder. It is obtained by electrolysis of the fluorides or by reduction of the fluorides, chlorides or oxides. The resulting metal is purified and sintered in an inert atmosphere and transformed into heavy steel-grey ingots (specific gravity 11.5); they are hard (although softer than uranium) and oxidise rapidly on contact with air.

These ingots are rolled, extruded or drawn to produce sheets, rods, tubes, wire, etc. Natural thorium consists essentially of the isotope thorium 232.

Thorium and certain thorium alloys are mainly used as fertile materials in nuclear reactors. Thorium-magnesium and thorium-tungsten alloys, however, are used in the aircraft industry or in the manufacture of thermionic devices.

Articles or parts of articles, made of thorium of Sections XVI to XIX are **excluded** from this heading.

(3) Plutonium.

Industrial plutonium is obtained by irradiating uranium 238 in a nuclear reactor.

It is very heavy (specific gravity 19.8), radioactive and highly toxic. It is similar to uranium in appearance, and in its oxidising propensities.

It is put up in the same commercial forms as enriched uranium and requires the greatest care in handling.

The fissile isotopes include :

- (1) **Uranium 233** : this is obtained in nuclear reactors from thorium 232, which is transformed successively into thorium 233, protactinium 233 and uranium 233.
- (2) **Uranium 235** : this is the only fissile uranium isotope which occurs in nature, being present in the proportion of 0.71 % in natural uranium.

To obtain uranium enriched in U 235 and uranium depleted in U 235 (enriched in U 238), uranium hexafluoride is submitted to isotopic separation by the electro-magnetic, centrifugal or gas-diffusion processes.

- (3) **Plutonium 239** : this is obtained in nuclear reactors from uranium 238, which is successively transformed into uranium 239, neptunium 239 and plutonium 239.

Also to be mentioned are certain isotopes of transplutonium elements such as californium 252, americium 241, curium 242 and curium 244, which can give rise to fission (whether spontaneous or not) and which can be used as intense neutron sources.

Of the fertile isotopes, apart from thorium 232, depleted uranium (i.e. depleted in U 235 and consequently enriched in U 238) should be mentioned. This metal is a by-product of the production of uranium enriched in U 235. Because of its much lower cost and the large quantities available, it replaces natural uranium, especially as a fertile material, as a protective screen against radiations, as a heavy metal for the manufacture of fly-wheels or in the preparation of absorbent compositions (getters) used for purifying certain gases.

Articles or parts of articles, made of uranium depleted in U 235, of Sections XVI to XIX are **excluded** from this heading.

(B) Compounds of fissile and fertile chemical elements or isotopes.

The following compounds, in particular, fall in this heading :

(1) of uranium :

- (a) the oxides UO_2 , U_3O_8 , and UO_3
- (b) the fluorides UF_4 and UF_6 (the latter sublimes at 56 °C)
- (c) the carbides UC and UC_2
- (d) the uranates $\text{Na}_2\text{U}_2\text{O}_7$ and $(\text{NH}_4)\text{U}_2\text{O}_7$
- (e) uranyl nitrate $\text{UO}_2(\text{NO}_3)_2 \cdot 6 \text{H}_2\text{O}$
- (f) uranyl sulphate $\text{UO}_2\text{SO}_4 \cdot 3 \text{H}_2\text{O}$

(2) of plutonium :

- (a) the tetrafluoride PuF_4
- (b) the dioxide PuO_2
- (c) the nitrate $\text{PuO}_2(\text{NO}_3)_2$
- (d) the carbides PuC and Pu_2C_3
- (e) the nitride PuN .

The uranium or plutonium compounds are mainly used in the nuclear industry, either as intermediates or as finished products. The uranium hexafluoride is usually presented in sealed containers; it is rather toxic and should therefore be handled with care.

(3) of thorium :

- (a) oxide and hydroxide. Thorium oxide (ThO_2) (thoria) is a whitish-yellow powder, insoluble in water. The hydroxide ($\text{Th}(\text{OH})_4$) is hydrated thoria. Both are obtained from monazite. They are used in the manufacture of gas-mantles, as refractory products or as catalysts (acetone synthesis). The oxide is used as fertile material in nuclear reactors;
- (b) inorganic salts. These salts are usually white. The most important are :

- (i) thorium nitrate, appearing in the more or less hydrated state as crystals, or as powder (calcined nitrate). It is used to prepare luminescent paints. Mixed with cerium nitrate it is used to impregnate gas-mantles;
 - (ii) thorium sulphate, a crystalline powder, soluble in cold water; thorium hydrogen sulphate and alkali double sulphates;
 - (iii) thorium chloride (ThCl_4), anhydrous or hydrated, and oxychloride;
 - (iv) thorium nitride and thorium carbide. Used as refractory products, as abrasives or as fertile materials in nuclear reactors;
- (c) organic compounds. The best known organic compounds are thorium formate, acetate, tartrate and benzoate, all used in medicine.

(C) **Alloys, dispersions (including cermets), ceramic products, mixtures and residues containing fissile or fertile elements or isotopes or inorganic or organic compounds thereof.**

The principal products in this group are :

- (1) **Alloys of uranium or plutonium with** aluminium, chromium, zirconium, molybdenum, titanium, niobium or vanadium. Also uranium-plutonium and ferro-uranium alloys.
- (2) **Dispersions of uranium dioxide (UO_2) or of uranium carbide (UC)** (whether or not mixed with thorium dioxide or thorium carbide) in graphite or polyethylene.
- (3) **Cermets** consisting of various metals (e.g. stainless steel) together with uranium dioxide (UO_2) plutonium dioxide (PuO_2) uranium carbide (UC) or plutonium carbide (PuC) (or these compounds mixed with thorium oxide or carbide).

These products in the form of bars, plates, spheres, threads, powder, etc., are used either for the manufacture of fuel elements or, sometimes, directly in the reactors.

Bars, plates and spheres, contained in a sheath and fitted with special attachments for handling purposes, fall in **heading 84.01**.

- (4) Spent or irradiated fuel elements (cartridges), that is, those which, after more or less extensive use, must be replaced (e.g., because the accumulation of fission products is hampering the chain reaction or because the sheath has deteriorated). After sufficiently long storage in very deep water to cool them and to allow their radioactivity to decrease, these fuel elements are transported in lead containers, to specialised installations equipped for the recovery of the residual fissile material, of the fissile material derived from the transformation of fertile elements (which are usually contained in fuel elements) and of fission products.

28.45 - Isotopes other than those of heading 28.44; compounds, inorganic or organic, of such isotopes, whether or not chemically defined.

2845.10 - Heavy water (deuterium oxide)

2845.90 - Other

For the definition of the term "isotopes", see Part (I) of Explanatory Note to heading 28.44.

This heading covers stable isotopes, that is, non-radioactive isotopes and their inorganic or organic compounds, whether or not chemically defined.

The heading includes the following isotopes and their compounds :

- (1) **Heavy hydrogen or deuterium.** This is separated from normal hydrogen in which it occurs at a level of 1 part in 6,500.
- (2) **Heavy water,** which is deuterium oxide. Occurring in ordinary water at a level of 1 part in 6,500. It is normally obtained as a residue of the electrolysis of water. Used as a source of deuterium, and in nuclear reactors for slowing down the neutrons which split the uranium atoms.
- (3) **Other compounds made with deuterium,** e.g., heavy acetylene, heavy methane, heavy acetic acids and heavy paraffin wax.
- (4) **The isotopes of lithium** known as lithium 6 or 7, and their compounds.
- (5) **The isotope of carbon** known as carbon 13, and its compounds.

28.46 - Compounds, inorganic or organic, of rare-earth metals, of yttrium or of scandium or of mixtures of these metals.

2846.10 - Cerium compounds

2846.90 - Other

This heading covers the inorganic or organic compounds of yttrium, of scandium or of the rare-earth metals of heading 28.05 (lanthanum, cerium, praseodymium, neodymium, samarium, europium, gadolinium, terbium, dysprosium, holmium, erbium, thulium, ytterbium, lutetium). The heading also covers compounds derived directly by chemical treatment from mixtures of the elements. This means that the heading will include mixtures of oxides or hydroxides of these elements or mixtures of salts having the same anion (e.g., rare-earth metal chlorides), but not mixtures of salts having different anions, whether or not the cation is the same. The heading will not therefore, for example, cover a mixture of europium and samarium nitrates with the oxalates nor a mixture of cerium chloride and cerium sulphate since these examples are not compounds derived directly from mixtures of elements, but are mixtures of compounds which could be conceived as having been made intentionally for special purposes and which, accordingly, fall in heading 38.24.

The heading also includes double or complex salts of these with other metals.

The compounds of this heading include :

(1) Cerium compounds.

- (a) **Oxides and hydroxides.** Ceric oxide, a white powder insoluble in water, is obtained from cerium nitrate; it is used as an opacifier in ceramics, for colouring glass, in the preparation of arc-lamp carbons and as a catalyst in the manufacture of nitric acid and ammonia. There is also a ceric hydroxide. Cerous oxide and cerous hydroxide are not very stable.
- (b) **Cerium salts.** Cerous nitrate ($\text{Ce}(\text{NO}_3)_3$) is used in the manufacture of gas-mantles. Ammonium ceric nitrate appears in the form of red crystals.

Cerium sulphates (cerous sulphate and its hydrates, hydrated ceric sulphate, orange-yellow prisms soluble in water) are used in photography as reducers. There are also double sulphates of cerium.

In addition to cerous chloride (CeCl_3) there are various other colourless cerous salts and yellow or orange ceric salts.

Cerium oxalate appears as a powder or in yellowish-white hydrated crystals, practically insoluble in water; it is used in the isolation of metals of the cerium group or in medicine.

(2) Other rare-earth metal compounds. Yttrium oxide (yttria), terbium oxide (terbia), mixtures of ytterbium oxides (ytterbia) and of oxides of other rare-earth metals of commerce are reasonably pure. The heading includes mixtures of salts derived directly from such mixtures of oxides.

The oxides of europium, samarium, etc. are used in nuclear reactors for the absorption of slow neutrons.

This heading **excludes** :

- (a) Natural compounds of rare-earth metals, e.g., xenotime (complex phosphates), gadolinite or ytterbite and cerite (complex silicates) (**heading 25.30**) and monazite (phosphates of thorium and of rare-earth metals) (**heading 26.12**).
- (b) Salts and other compounds, inorganic or organic, of promethium (**heading 28.44**).

28.47 - Hydrogen peroxide, whether or not solidified with urea.

Hydrogen peroxide (H_2O_2) is obtained by electrolytic oxidation of sulphuric acid followed by distillation, or by treating barium or sodium peroxide or potassium persulphate with an acid. It is a colourless liquid with the appearance of ordinary water. It may have a syrupy consistency and corrodes the skin when concentrated. It is transported in carboys.

Hydrogen peroxide is very unstable in an alkaline medium, especially when exposed to heat or light. It nearly always contains small amounts of stabilisers (boric or citric acid, etc.) to prevent decomposition; such mixtures remain in this heading.

This heading also includes hydrogen peroxide, solidified with urea, whether or not stabilised.

Hydrogen peroxide is used for bleaching textiles, feathers, straw, sponges, ivory, hair, etc. It is also used for vat-dyeing, for purifying water, for restoring old pictures, in photography and in medicine (as an antiseptic and haemostat).

Presented as a medicament in measured doses or in forms or packings for retail sale, hydrogen peroxide falls in **heading 30.04**.

[28.48]

28.49 - Carbides, whether or not chemically defined.

2849.10 - Of calcium

2849.20 - Of silicon

2849.90 - Other

This heading covers :

- (A) **Binary carbides**, which are compounds of carbon with another element more electropositive than carbon. Those known as acetylides are also classified in this heading.

The best known binary carbides are :

- (1) **Calcium carbide** (CaC_2). A transparent, colourless solid in the pure state, opaque and grey when impure. Decomposed by water to produce acetylene; used for the production of the latter gas or of calcium cyanamide.
- (2) **Silicon carbide** (SiC) (carbon silicide). Obtained by treating carbon and silica in an electric furnace. Black crystals, lumps or shapeless masses, crushed or in grains. Fusible only with difficulty; resists chemical reagents; has a certain power of refraction, and is nearly as hard as diamond but rather brittle. Used extensively as an abrasive and as a refractory product; mixed with graphite it is used for lining electric furnaces or high temperature ovens. Also used for the manufacture of silicon. The heading **excludes** silicon carbide in the form of powder or grain on a backing of textile material, of paper, of paperboard or of other materials (**heading 68.05**), or in the form of grinding wheels, hand sharpening or polishing stones, etc. (**heading 68.04**).
- (3) **Boron carbide** (borocarbon). Obtained by treating graphite and boric acid in an electric furnace; hard brilliant blackish crystals. Used as abrasive, for boring rocks, in the manufacture of dies or electrodes.
- (4) **Aluminium carbide** (Al_4C_3). Obtained in an electric furnace by heating aluminium oxide with coke; transparent yellow crystals or flakes. Decomposed by water to produce methane.
- (5) **Zirconium carbide** (ZrC). Obtained in an electric furnace from zirconium oxide and carbon black; disintegrates on contact with air or water. Used in manufacture of lamp filaments.
- (6) **Barium carbide** (BaC_2). Usually obtained in an electric furnace; brownish, crystalline masses. Decomposed by water to produce acetylene.
- (7) **Tungsten carbides**. Obtained in an electric furnace from the metal powder or the oxide and carbon black; a powder not decomposed by water, with a high chemical stability. High melting point; very hard and resistant to heat. Its conductivity is similar to that of metals, and it associates easily with ferrous metals. Used in hard sintered compositions, e.g., in agglomerates for tooltips (usually associated with a binder such as cobalt or nickel).

(8) **Other carbides.** Molybdenum, vanadium, titanium, tantalum or niobium carbides, obtained from the metal powders or oxides and carbon black in an electric furnace; used for the same purposes as tungsten carbide. There are also chromium and manganese carbides.

- (B) **Carbides consisting of carbon combined with more than one metal element**, e.g., $(\text{Ti}, \text{W})\text{C}$.
- (C) **Compounds consisting of one or more metal elements combined with carbon and another non-metal element**, e.g., aluminium borocarbide, zirconium carbonitride, titanium carbonitride.

The proportions of the elements in some of these compounds may not be stoichiometric. Mechanical mixtures are however **excluded**.

The heading also **excludes**:

- (a) Binary compounds of carbon with the following elements: oxygen (**heading 28.11**), halogens (**heading 28.12** or **29.03**), sulphur (**heading 28.13**), precious metals (**heading 28.43**), nitrogen (**heading 28.53**), hydrogen (**heading 29.01**).
- (b) Mixtures of metal carbides, not agglomerated, but prepared for the manufacture of plates, sticks, tips, etc., for tools (**heading 38.24**).
- (c) The iron-carbon alloys of **Chapter 72**, such as white pig iron, regardless of their iron carbide content.
- (d) Mixtures of agglomerated metal carbides, in plates, sticks, tips and the like for tools (**heading 82.09**).

28.50 - Hydrides, nitrides, azides, silicides and borides, whether or not chemically defined, other than compounds which are also carbides of heading 28.49.

The four groups of compounds covered by this heading each contain two or more elements, one of which is described by the term used (hydrogen, nitrogen, silicon or boron), the others being non-metals or metals.

(A) HYDRIDES

The most important hydride is calcium hydride (CaH_2) (hydrolith) obtained by direct combination of its elements; white masses with a crystalline fracture, decomposing in the cold on contact with water and giving off hydrogen. It is a reducing agent used for producing sintered chromium from chromic chloride.

There are also hydrides of arsenic, silicon, boron (including sodium borohydride), lithium (and aluminium-lithium), sodium, potassium, strontium, antimony, nickel, titanium, zirconium, tin, lead, etc.

This heading **does not include** compounds of hydrogen with the following elements : oxygen (**headings 22.01, 28.45, 28.47 and 28.53**), nitrogen (**headings 28.11, 28.14 and 28.25**), phosphorus (**heading 28.53**), carbon (**heading 29.01**), and certain other non-metals (**headings 28.06 and 28.11**). Palladium hydrides and other precious metal hydrides fall in **heading 28.43**.

(B) NITRIDES

- (1) **Non-metal nitrides.** Boron nitride (BN) is a light white powder, highly refractory. A heat and electricity insulator; used for lining electric ovens or for the manufacture of crucibles. Silicon nitride (Si_3N_4) is a greyish-white powder.
- (2) **Metal nitrides.** Aluminium, titanium, zirconium, hafnium, vanadium, tantalum or niobium nitrides are obtained either by heating the pure metal in nitrogen at a temperature of 1,100 °C or 1,200 °C, or by heating at a higher temperature a mixture of oxide and carbon in a current of nitrogen or ammonia gas.

This heading **does not cover** combinations of nitrogen with the following elements : oxygen (**heading 28.11**), halogens (**heading 28.12**), sulphur (**heading 28.13**), hydrogen (**heading 28.14**), carbon (**heading 28.53**). Silver nitrides and other precious metal nitrides fall in **heading 28.43**, thorium and uranium nitrides in **heading 28.44**.

(C) AZIDES

Metal azides can be regarded as salts of hydrazoic acid (HN_3).

- (1) **Sodium azide** (NaN_3). Obtained by action of nitrous oxide on sodium amide, or from hydrazine, ethyl nitrite and sodium hydroxide; colourless crystalline flakes. Soluble in water, deteriorates slightly in humid atmosphere. Strongly affected by the carbon dioxide in the air. It is sensitive to shock, like mercury fulminate, but less sensitive to heat than the latter. Used for preparing primer explosives for detonators.
- (2) **Lead azide** (PbN_6). Obtained from sodium azide and lead acetate. White crystalline powder, very sensitive to shock, preserved under water. Used instead of mercury fulminate as an explosive.

(D) SILICIDES

- (1) **Calcium silicide.** Very hard, grey, crystalline masses. Used in metallurgy, for local production of hydrogen, and in the manufacture of smoke bombs.
- (2) **Chromium silicides.** There are several chromium silicides; these are very hard substances used as abrasives.
- (3) **Copper silicide (other than** copper silicon master alloys of **heading 74.05).** Usually in brittle plates. Reducing agent for refining copper, facilitating its moulding and increasing its hardness and resistance to rupture; it decreases the tendency of copper alloys to corrode. Also used in the manufacture of silicon bronze or of nickel-copper alloys.
- (4) **Magnesium or manganese silicides.**

This heading **does not cover** combinations of silicon with the following elements : oxygen (**heading 28.11**), halogens (**heading 28.12**), sulphur (**heading 28.13**), phosphorus (**heading 28.53**). Carbon silicide (silicon carbide) falls in **heading 28.49**, platinum and other precious metal silicides in **heading 28.43**, ferro-alloys and master alloys containing silicon in **heading 72.02** or **74.05**, and aluminium-silicon alloys in **Chapter 76**. See paragraph (A) above for combinations of silicon and hydrogen.

(E) BORIDES

- (1) **Calcium boride** (CaB_6). Obtained by electrolysing a mixture of a borate and calcium chloride; dark crystalline powder. A powerful reducing agent used in metallurgy.
- (2) **Aluminium boride.** Obtained in an electric furnace; crystalline masses. Used in the manufacture of glass.
- (3) **Titanium, zirconium, vanadium, niobium, tantalum, molybdenum and tungsten borides** are obtained by heating mixtures of metal powder and of pure boron powder in a vacuum at a temperature of 1,800 °C to 2,200 °C, or by treating vaporised metal with boron. These products are very hard and are good conductors of electricity. They are used in hard sintered compositions.
- (4) **Magnesium, antimony, manganese, and iron borides, etc.**

This heading **does not include** compounds of boron with the following elements : oxygen (**heading 28.10**), halogens (**heading 28.12**), sulphur (**heading 28.13**), precious metals (**heading 28.43**), phosphorus (**heading 28.53**), carbon (**heading 28.49**). See paragraphs (A), (B) and (D) above for combinations with hydrogen, nitrogen or silicon.

The heading **excludes** copper-boron master alloys (see the Explanatory Note to **heading 74.05**).

[28.51]

28.52 - Inorganic or organic compounds of mercury, whether or not chemically defined, excluding amalgams.

2852.10 - Chemically defined

2852.90 - Other

This heading covers inorganic or organic compounds of mercury, whether or not chemically defined, other than amalgams. The most common compounds of mercury are listed below :

(1) **Mercury oxides.** Mercuric oxide (HgO) is the most important oxide of mercury. It can exist as a bright-red crystalline powder (**red oxide**) or as a denser orange-yellow amorphous powder (**yellow oxide**). These oxides are toxic and turn black on exposure to light. They are used in the preparation of marine paints or mercury salts, and as catalysts.

(2) **Mercury chlorides.**

(a) **Mercurous chloride** (calomel) (Hg_2Cl_2). Can exist as amorphous masses, as a powder or in white crystals; insoluble in water. Mercurous chloride is used also in pyrotechnics, in the porcelain industry, etc.

(b) **Mercuric chloride** (mercury dichloride, corrosive sublimate) ($HgCl_2$). Crystallises in prisms or long white needles. Soluble in water (especially when hot); a violent poison. It is used for “bronzing” iron, for impregnating wood to render it fire-proof, as an intensifier in photography, as a catalyst in organic chemistry and in the manufacture of mercuric oxide.

(3) **Mercury iodides.**

(a) **Mercurous iodide** (HgI or Hg_2I_2). Powder, usually amorphous but sometimes crystalline; usually yellow but sometimes greenish or reddish; sparingly soluble in water and very toxic. It is used in organic synthesis.

(b) **Mercuric iodide** (mercury di-iodide, red iodide) (HgI_2). Crystalline red powder, almost insoluble in water, very toxic. Used in photography (as an intensifier) and in analysis.

(4) **Mercury sulphides.** Artificial mercury sulphide (HgS) is black. When sublimed or heated with alkali polysulphides, black sulphide is transformed into a red powder (red mercury sulphide, artificial vermillion), used as a pigment for paints or sealing wax. The product obtained by the wet process is shinier but does not resist the action of light so well. This salt is toxic.

Natural mercury sulphide (cinnabar, natural vermillion) is **excluded (heading 26.17)**.

(5) **Mercury sulphates.**

(a) **Mercurous sulphate** (Hg_2SO_4). White crystalline powder, decomposed by water into basic sulphate. Employed in the preparation of calomel and of standard electric cells.

(b) **Mercuric sulphate** ($HgSO_4$). White, anhydrous and crystalline masses, turning black in the light, or hydrated crystalline flakes (with 1 H_2O). Used for preparing mercuric chloride or other mercuric salts, in gold or silver metallurgy, etc.

(c) **Trimercury dioxide sulphate** ($\text{HgSO}_4 \cdot 2\text{HgO}$) (basic mercury sulphate).

(6) **Mercury nitrates.**

(a) **Mercurous nitrate** ($\text{HgNO}_3 \cdot \text{H}_2\text{O}$). Poisonous. Colourless crystals. Used in gilding; in medicine; by hatters for the carroting of hair before the felting operation (hatters' *aqua fortis*); for preparing mercurous acetate, etc.

(b) **Mercuric nitrate** ($\text{Hg}(\text{NO}_3)_2$). Hydrated salt (generally with 2 H_2O). Colourless crystals, or white or yellowish slabs, deliquescent and toxic. Used in hat-making and gilding. Also used as a nitration aid, and as a catalyst in organic synthesis, in the preparation of mercury fulminate or mercuric oxide, etc.

(c) **Basic mercury nitrates.**

(7) **Mercury cyanides.**

(a) **Mercuric cyanide** ($\text{Hg}(\text{CN})_2$).

(b) **Mercuric cyanide oxide** ($\text{Hg}(\text{CN})_2 \cdot \text{HgO}$).

(8) **Cyanomercurates of inorganic bases.** Potassium cyanomercurate. Colourless crystals, soluble in water and toxic. Used for silvering mirrors.

(9) **Mercury fulminate** (presumably $\text{Hg}(\text{ONC})_2$). White or yellowish crystals, needle-shaped, soluble in boiling water, poisonous. Gives off red fumes when exploding. Presented in non-metallic containers filled with water.

(10) **Mercuric thiocyanate** ($\text{Hg}(\text{SCN})_2$). White crystalline powder, sparingly soluble in water. Poisonous salt used in photography to intensify negatives.

(11) **Mercury arsenates.** Mercuric orthoarsenate ($\text{Hg}_3(\text{AsO}_4)_2$). Pale yellow powder, insoluble in water. Used in anti-fouling paints.

(12) **Double or complex salts.**

(a) **Chloride of ammonium with mercury (ammonium mercuric chloride or ammonium chloromercurate).** White crystalline powder, relatively soluble in hot water; toxic. Used in pyrotechnics.

(b) **Copper mercury iodide.** A dark red powder, insoluble in water and toxic. Used in thermoscopics.

(13) **Aminomericuric chloride** (HgNH_2Cl). White powder, turning greyish or yellowish on exposure to light; insoluble in water; poisonous. Used in pyrotechnics.

(14) **Mercury lactate**, salt of lactic acid.

(15) **Organo-inorganic mercury compounds**. These may contain one or more mercury atoms, in particular the $(-\text{Hg.X})$ group in which X is an inorganic or organic acid residue.

(a) **Diethylmercury**.

(b) **Diphenylmercury**.

(c) **Phenylmercury acetate**.

(16) **Hydromercuridibromofluorescein**.

(17) **Mercury compounds, not chemically defined** (tannates of mercury, albuminates of mercury, nucleoproteids of mercury, etc.).

The heading **does not include** :

(a) Mercury (**heading 28.05** or **Chapter 30**).

(b) Amalgams of precious metals, amalgams containing both precious metals and base metals (**heading 28.43**) and amalgams wholly of base metal (**heading 28.53**).

28.53 - Phosphides, whether or not chemically defined, excluding ferrophosphorus; other inorganic compounds (including distilled or conductivity water and water of similar purity); liquid air (whether or not rare gases have been removed); compressed air; amalgams, other than amalgams of precious metals.

2853.10 - Cyanogen chloride (chlorcyan)

2853.90 – Other

**(A) PHOSPHIDES, WHETHER OR NOT CHEMICALLY DEFINED,
EXCLUDING FERROPHOSPHORUS**

Phosphides are compounds of phosphorus with another element. The most important of the phosphides falling here are obtained by direct action of the constituent elements; they include :

- (1) **Copper phosphide** (cuprophosphorus, phosphor copper). Produced in a reverberatory furnace or in a crucible. Usually in yellowish-grey masses or in small, very brittle ingots of crystalline structure. The heading covers copper phosphide and master alloys of copper only if they contain more than 15 % by weight of phosphorus. Under this limit they fall generally in Chapter 74. Copper phosphide is a very good deoxidiser of copper, increasing the hardness of that metal; it improves the fluidity of molten metal, and is used in the manufacture of phosphor bronzes.
- (2) **Calcium phosphide** (Ca_3P_2). Small chestnut-coloured crystals or grey granular masses which, on contact with water, give off hydrogen phosphides which ignite spontaneously. Used with calcium carbide for naval signals (self-igniting flares for buoys).
- (3) **Zinc phosphide** (Zn_3P_2). Grey, poisonous powder with a vitreous fracture; gives off phosphine and deteriorates in moist air. Used for destroying rodents and locusts, and also in medicine (instead of phosphorus).
- (4) **Tin phosphide**. A very brittle silvery-white solid. Used in making alloys.
- (5) **Other phosphides**, e.g., hydrogen phosphides (solid, liquid, gaseous), and the phosphides of arsenic, boron, silicon, barium, cadmium.

This heading excludes :

- (a) Compounds of phosphorus with oxygen (**heading 28.09**), with halogens (**heading 28.12**) or with sulphur (**heading 28.13**).
- (b) Platinum and other precious metal phosphides (**heading 28.43**).
- (c) Ferrophosphorus (iron phosphide) (**heading 72.02**).

**(B) DISTILLED AND CONDUCTIVITY WATER
AND WATER OF SIMILAR PURITY**

The heading covers **only** distilled water, re-distilled or electro-osmotic water, conductivity water and water of similar purity, including water treated with ion exchange media.

Natural water, even if filtered, sterilised, purified or softened, is **excluded** (**heading 22.01**). When put up as a medicament in measured doses or in packings for retail sale, water falls in **heading 30.04**.

(C) MISCELLANEOUS INORGANIC COMPOUNDS

Inorganic chemical products not elsewhere specified or included are also included in this heading (including certain compounds of carbon listed in Chapter Note 2).

The heading includes :

- (1) **Cyanogen** and **halogen compounds of cyanogen**, e.g., cyanogen chloride (chlorcyan) (CNCl) **cyanamide** and its **metal derivatives (other than calcium cyanamide (heading 31.02 or 31.05))**.
- (2) **Non-metallic oxysulphides** (of arsenic, carbon, silicon) and **non-metallic chlorosulphides** (of phosphorus, carbon, etc.). Thiophosgene (CSCl_2) (thiocarbonyl chloride, carbon dichlorosulphide) obtained by the action of chlorine on carbon disulphide, is a red liquid, suffocating and lachrymatory, decomposed by water, used in organic synthesis.
- (3) **Alkali amides**. Sodamide or sodium amide (NaNH_2) is obtained by the action of heated ammonia on a sodium-lead alloy, or by passing ammonia in the gaseous state over molten sodium. Pinkish or greenish crystalline masses, decomposed by water. Used in organic synthesis, in the preparation of azides, cyanides, etc.

There are also potassium and other metal amides.

- (4) **Phosphonium iodide**. Obtained, for example, by the interaction of phosphorus, iodine and water; it is a reducing agent.
- (5) **Trichlorosilane** (SiHCl_3). Obtained by the reaction of hydrogen chloride (HCl) with silicon, it is used in the manufacture of fumed silica and very pure silicon.

(D) LIQUID AIR AND COMPRESSED AIR

In commerce, liquefied air is presented in steel or brass vacuum-jacketed containers. It can cause severe burns and renders soft organic materials brittle. It is used for obtaining oxygen, nitrogen and rare gases by fractional distillation. Because of its rapid evaporation, it is used in laboratories as a refrigerating agent. Mixed with charcoal and other products it constitutes a powerful explosive used in mining.

This heading also includes :

- (1) Liquid air from which rare gases have been removed.
- (2) Compressed air.

(E) AMALGAMS, EXCEPT AMALGAMS OF PRECIOUS METALS

Mercury forms amalgams with several base metals (alkali metals and alkaline-earth metals, zinc, cadmium, antimony, aluminium, tin, copper, lead, bismuth, etc.).
Amalgams can be obtained : by direct action of the metals with mercury; by electrolysing the metal salts using a mercury cathode; or by electrolysing a mercury salt (the cathode being of the metal).

Amalgams obtained by electrolysis and distilled at a low temperature are used to prepare pyrophoric metals more reactive than those obtained at high temperature. They are also used in the metallurgy of precious metals.

- (1) **Amalgams of alkali metals** decompose water with the production of less heat than the pure metals; they are therefore more active reducing agents than the latter. **Sodium amalgam** is used in the preparation of hydrogen.
- (2) **Aluminium amalgam** is used as a reducing agent in organic synthesis.
- (3) **Copper amalgam** containing a small added quantity of tin is used in dentistry. Copper amalgams are metallic cements, becoming soft when heated, suitable for moulding and for repairing china.
- (4) **Zinc amalgam** is used in batteries to prevent corrosion.
- (5) **Cadmium amalgam** is used in dentistry and in the manufacture of tungsten wire from sintered metal.
- (6) **Antimony-tin amalgam** is used for “ bronzing ” plaster.

Amalgams containing precious metals, whether or not associated with base metals, are **excluded (heading 28.43)**. Mercury compounds, whether or not chemically defined, other than amalgams fall in **heading 28.52**.

Chapter 29

Organic chemicals

Notes.

- 1.- Except where the context otherwise requires, the headings of this Chapter apply only to :
 - (a) Separate chemically defined organic compounds, whether or not containing impurities;
 - (b) Mixtures of two or more isomers of the same organic compound (whether or not containing impurities), except mixtures of acyclic hydrocarbon isomers (other than stereoisomers), whether or not saturated (Chapter 27);
 - (c) The products of headings 29.36 to 29.39 or the sugar ethers, sugar acetals and sugar esters, and their salts, of heading 29.40, or the products of heading 29.41, whether or not chemically defined;
 - (d) The products mentioned in (a), (b) or (c) above dissolved in water;
 - (e) The products mentioned in (a), (b) or (c) above dissolved in other solvents provided that the solution constitutes a normal and necessary method of putting up these products adopted solely for reasons of safety or for transport and that the solvent does not render the product particularly suitable for specific use rather than for general use;
 - (f) The products mentioned in (a), (b), (c), (d) or (e) above with an added stabiliser (including an anti-caking agent) necessary for their preservation or transport;
 - (g) The products mentioned in (a), (b), (c), (d), (e) or (f) above with an added anti-dusting agent or a colouring or odoriferous substance added to facilitate their identification or for safety reasons, provided that the additions do not render the product particularly suitable for specific use rather than for general use;
 - (h) The following products, diluted to standard strengths, for the production of azo dyes : diazonium salts, couplers used for these salts and diazotisable amines and their salts.
- 2.- This Chapter does not cover :
 - (a) Goods of heading 15.04 or crude glycerol of heading 15.20;
 - (b) Ethyl alcohol (heading 22.07 or 22.08);
 - (c) Methane or propane (heading 27.11);
 - (d) The compounds of carbon mentioned in Note 2 to Chapter 28;
 - (e) Immunological products of heading 30.02.
 - (f) Urea (heading 31.02 or 31.05);
 - (g) Colouring matter of vegetable or animal origin (heading 32.03), synthetic organic colouring matter, synthetic organic products of a kind used as fluorescent brightening agents or as luminophores (heading 32.04) or dyes or other colouring matter put up in forms or packings for retail sale (heading 32.12);
 - (h) Enzymes (heading 35.07);
 - (ij) Metaldehyde, hexamethylenetetramine or similar substances, put up in forms (for example, tablets, sticks or similar forms) for use as fuels, or liquid or liquefied-gas fuels in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³ (heading 36.06);

(k) Products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades, of heading 38.13; ink removers put up in packings for retail sale, of heading 38.24; or

(l) Optical elements, for example, of ethylenediamine tartrate (heading 90.01).

3.- Goods which could be included in two or more of the headings of this Chapter are to be classified in that one of those headings which occurs last in numerical order.

4.- In headings 29.04 to 29.06, 29.08 to 29.11 and 29.13 to 29.20, any reference to halogenated, sulphonated, nitrated or nitrosated derivatives includes a reference to compound derivatives, such as sulphohalogenated, nitrohalogenated, nitrosulphonated or nitrosulphohalogenated derivatives.

Nitro or nitroso groups are not to be taken as "nitrogen-functions" for the purpose of heading 29.29.

For the purposes of headings 29.11, 29.12, 29.14, 29.18 and 29.22, "oxygen-function" is to be restricted to the functions (the characteristic organic oxygen-containing groups) referred to in headings 29.05 to 29.20.

5.- (A) The esters of acid-function organic compounds of sub-Chapters I to VII with organic compounds of these sub-Chapters are to be classified with that compound which is classified in the heading which occurs last in numerical order in these sub-Chapters.

(B) Esters of ethyl alcohol with acid-function organic compounds of sub-Chapters I to VII are to be classified in the same heading as the corresponding acid-function compounds.

(C) Subject to Note 1 to Section VI and Note 2 to Chapter 28 :

(1) Inorganic salts of organic compounds such as acid-, phenol- or enol-function compounds or organic bases, of sub-Chapters I to X or heading 29.42, are to be classified in the heading appropriate to the organic compound;

(2) Salts formed between organic compounds of sub-Chapters I to X or heading 29.42 are to be classified in the heading appropriate to the base or to the acid (including phenol- or enol-function compounds) from which they are formed, whichever occurs last in numerical order in the Chapter; and

(3) Co-ordination compounds, other than products classifiable in sub-Chapter XI or heading 29.41, are to be classified in the heading which occurs last in numerical order in Chapter 29, among those appropriate to the fragments formed by "cleaving" of all metal bonds, other than metal-carbon bonds.

(D) Metal alcoholates are to be classified in the same heading as the corresponding alcohols except in the case of ethanol (heading 29.05).

(E) Halides of carboxylic acids are to be classified in the same heading as the corresponding acids.

6.- The compounds of headings 29.30 and 29.31 are organic compounds the molecules of which contain, in addition to atoms of hydrogen, oxygen or nitrogen, atoms of other non-metals or of metals (such as sulphur, arsenic or lead) directly linked to carbon atoms.

Heading 29.30 (organo-sulphur compounds) and heading 29.31 (other organo-inorganic compounds) do not include sulphonated or halogenated derivatives (including compound derivatives) which, apart from hydrogen, oxygen and nitrogen, only have directly linked to carbon the atoms of sulphur or of a halogen which give them their nature of sulphonated or halogenated derivatives (or compound derivatives).

7.- Headings 29.32, 29.33 and 29.34 do not include epoxides with a three-membered ring, ketone peroxides, cyclic polymers of aldehydes or of thioaldehydes, anhydrides of polybasic carboxylic acids, cyclic esters of polyhydric alcohols or phenols with polybasic acids, or imides of polybasic acids.

These provisions apply only when the ring-position hetero-atoms are those resulting solely from the cyclising function or functions here listed.

8.- For the purposes of heading 29.37 :

- (a) the term "hormones" includes hormone-releasing or hormone-stimulating factors, hormone inhibitors and hormone antagonists (anti-hormones);
- (b) the expression "used primarily as hormones" applies not only to hormone derivatives and structural analogues used primarily for their hormonal effect, but also to those derivatives and structural analogues used primarily as intermediates in the synthesis of products of this heading.

◦
◦ ◦

Subheading Notes.

- 1.- Within any one heading of this Chapter, derivatives of a chemical compound (or group of chemical compounds) are to be classified in the same subheading as that compound (or group of compounds) provided that they are not more specifically covered by any other subheading and that there is no residual subheading named "Other" in the series of subheadings concerned.
- 2.- Note 3 to Chapter 29 does not apply to the subheadings of this Chapter.

GENERAL

As a general rule, this Chapter is restricted to separate chemically defined compounds, subject to the provisions of Note 1 to the Chapter.

(A) Chemically defined compounds (Chapter Note 1)

A separate chemically defined compound is a substance which consists of one molecular species (e.g., covalent or ionic) whose composition is defined by a constant ratio of elements and can be represented by a definitive structural diagram. In a crystal lattice, the molecular species corresponds to the repeating unit cell.

Separate chemically defined compounds containing other substances deliberately added during or after their manufacture (including purification) are excluded from this Chapter. Accordingly, a product consisting of saccharin mixed with lactose, for example, to render the product suitable for use as a sweetening agent is **excluded** (see Explanatory Note to heading 29.25).

The separate chemically defined compounds of this Chapter may contain impurities (Note 1(a)). An exception to this rule is created by the wording of heading 29.40 which, with regard to sugars, restricts the scope of the heading to chemically pure sugars.

The term "impurities" applies exclusively to substances whose presence in the single chemical compound results solely and directly from the manufacturing process (including purification). These substances may result from any of the factors involved in the process and are principally the following :

- (a) Unconverted starting materials.
- (b) Impurities present in the starting materials.
- (c) Reagents used in the manufacturing process (including purification).
- (d) By-products.

It should be noted, however, that such substances are **not** in all cases regarded as " impurities " permitted under Note 1 (a). When such substances are deliberately left in the product with a view to rendering it particularly suitable for specific use rather than for general use, they are **not** regarded as permissible impurities. For example, a product consisting of methyl acetate with methanol deliberately left in with a view to improving its suitability as a solvent is **excluded (heading 38.14)**. For certain compounds (e.g., ethane, benzene, phenol, pyridine), there are specific purity criteria, indicated in Explanatory Notes to headings 29.01, 29.02, 29.07 and 29.33.

The separate chemically defined compounds of this Chapter may be **dissolved in water**. Subject to the same qualifications as those set out in the General Explanatory Note to Chapter 28, this Chapter also includes non-aqueous solutions and also compounds (or their solutions) with added stabilisers, antidusting agents or colouring substances. For example, styrene inhibited with tertiary butylcatechol remains classified in heading 29.02. The provisions in the General Explanatory Note to Chapter 28 concerning the addition of stabilisers, antidusting agents and colouring substances apply, *mutatis mutandis*, to the chemical compounds of this Chapter. **Subject** to the same qualifications as those made in respect of colouring substances, these compounds may also contain added odiferous substances (e.g., bromomethane of heading 29.03 to which small quantities of chloropicrin have been added).

This Chapter further includes, whether or not they contain impurities, **mixtures of isomers** of the same organic compound. This provision applies **only** to mixtures of compounds having the same chemical function (or functions) and which either coexist in their natural form or are obtained simultaneously in the course of the same synthesis. Mixtures of acyclic hydrocarbon isomers (**other than** stereoisomers), whether or not saturated, are, however, **excluded (Chapter 27)**.

(B) Distinction between the compounds of Chapter 28 and those of Chapter 29

Organic compounds of precious metals, radioactive elements, isotopes, rare-earth metals, yttrium and scandium, and the other compounds containing carbon listed in Part (B) of the General Explanatory Note to Chapter 28 are **excluded** from Chapter 29 (see Note 1 to Section VI and Note 2 to Chapter 28).

Organo-inorganic compounds, **other than** those listed in Note 2 to Chapter 28, fall in Chapter 29.

(C) Products which remain classified in Chapter 29, even when they are not separate chemically defined compounds

There are certain **exceptions** to the rule that Chapter 29 is limited to separate chemically defined compounds. These exceptions include the following products :

Heading 29.09 -	Ketone peroxides.
Heading 29.12 -	Cyclic polymers of aldehydes; paraformaldehyde.
Heading 29.19 -	Lactophosphates.
Heading 29.23 -	Lecithins and other phosphoaminolipids.

Heading 29.34 -	Nucleic acids and their salts.
Heading 29.36 -	Provitamins and vitamins (including concentrates and intermixtures), whether or not in a solvent.
Heading 29.37 -	Hormones.
Heading 29.38 -	Glycosides and their derivatives.
Heading 29.39 -	Vegetable alkaloids and their derivatives.
Heading 29.40 -	Sugar ethers, sugar acetals and sugar esters, and their salts.
Heading 29.41 -	Antibiotics.

This Chapter also includes diazonium salts (see Part (A) of Explanatory Note to heading 29.27), couplers used for these salts and diazotisable amines and their salts, diluted with e.g., neutral salts to standard strengths. These are designed for the production of azo dyes. They may be solid or liquid.

This Chapter further includes pegylated (polyethylene glycol (or PEGs) polymers) derivatives of products of headings 29.36 to 29.39 and 29.41. For these products, a pegylated derivative remains classified in the same heading as its non-pegylated form. However, pegylated derivatives of products of all other headings of Chapter 29 are **excluded** (generally **heading 39.07**).

(D) Exclusion from Chapter 29 of certain separate chemically defined organic compounds
(Chapter Note 2)

- (1) Certain separate chemically defined organic compounds are always **excluded** from Chapter 29, even when they are pure. In addition to those which fall in **Chapter 28** (see Part (B) of the General Explanatory Note to that Chapter), examples of compounds of this group are :
 - (a) Sucrose (**heading 17.01**); lactose, maltose, glucose and fructose (**heading 17.02**).
 - (b) Ethyl alcohol (**heading 22.07** or **22.08**).
 - (c) Methane and propane (**heading 27.11**).
 - (d) Immunological products (**heading 30.02**).
 - (e) Urea (**heading 31.02** or **31.05**).
 - (f) Colouring matter of animal or vegetable origin (e.g., chlorophyll) (**heading 32.03**).
 - (g) Synthetic organic colouring matter (including pigments), and synthetic organic products of a kind used as fluorescent brightening agents (e.g., certain stilbene derivatives) (**heading 32.04**).
- (2) Certain other separate chemically defined organic products, which would otherwise have been classified in Chapter 29, may be **excluded** when put up in certain forms, or if they have been subjected to certain treatments which leave their chemical composition unchanged. Examples are :
 - (a) Products for therapeutic or prophylactic uses, put up in measured doses or in forms or in packings for retail sale (**heading 30.04**).
 - (b) Products of a kind used as luminophores (e.g., salicylaldazine) which have been treated to render them luminescent (**heading 32.04**).
 - (c) Dyes and other colouring matter put up in forms or packings for retail sale (**heading 32.12**).
 - (d) Perfumery, cosmetic or toilet preparations (e.g., acetone), put up in packings for retail sale for such use (**headings 33.03 to 33.07**).
 - (e) Products suitable for use as glues or adhesives, put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg (**heading 35.06**).
 - (f) Solid fuels (e.g., metaldehyde, hexamethylenetetramine) put up in forms for use as fuels, and liquid or liquefied fuels (e.g., liquid butane) in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³ (**heading 36.06**).

- (g) Hydroquinone and other unmixed products for photographic uses, put up in measured portions or put up for retail sale in a form ready for photographic use (**heading 37.07**).
- (h) Disinfectants, insecticides, etc., put up as described **in heading 38.08**.
- (i) Products (e.g., carbon tetrachloride) put up as charges for fire-extinguishers or put up in fire-extinguishing grenades (**heading 38.13**).
- (k) Ink removers (e.g., chloramines of heading 29.35 dissolved in water) put up in packings for retail sale (**heading 38.24**).
- (l) Optical elements (e.g., ethylenediamine tartrate) (**heading 90.01**).

**(E) Products potentially classifiable
in two or more headings of Chapter 29**
(Chapter Note 3)

Such products are to be classified in the heading placed last in numerical order amongst those which could be applied. For example, ascorbic acid could be regarded as a lactone (heading 29.32) or as a vitamin (heading 29.36); it should therefore be classified in heading 29.36. For the same reason, allylestrenol which is a cyclic alcohol (heading 29.06) but also a steroid with unmodified gonane structure, used primarily for its hormone function (heading 29.37), should fall in heading 29.37.

It should, however, be noted that the last phrase of the text of heading 29.40 specifically excludes the products of headings 29.37, 29.38 and 29.39.

**(F) Halogenated, sulphonated, nitrated or nitrosated derivatives
and combinations thereof**
(Chapter Note 4)

Certain headings of Chapter 29 include references to halogenated, sulphonated, nitrated or nitrosated derivatives. Such references include compound derivatives, for example, sulphohalogenated, nitrohalogenated, nitrosulphonated, nitrosulphohalogenated, etc., derivatives.

Nitro and nitroso groups are not to be taken as nitrogen-functions for the purpose of heading 29.29.

The halogenated, sulphonated, nitrated and nitrosated derivatives are formed by substitution of one or more hydrogen atoms in the parent compound by one or more halogens, sulpho (-SO₃H), nitro (-NO₂) or nitroso (-NO) groups or by any combination thereof. Any functional group (e.g., aldehyde, carboxylic acid, amine) taken into consideration for classification should remain intact in such derivatives.

(G) Classification of esters, salts, co-ordination compounds and certain halides
(Chapter Note 5)

(1) Esters.

The esters of acid-function organic compounds of sub-Chapters I to VII with organic compounds of these sub-Chapters are to be classified with that compound which is classified in the heading which occurs last in numerical order in these sub-Chapters.

Examples :

- (a) Diethylene glycol acetate (ester formed by the reaction of acetic acid of heading 29.15 with diethylene glycol of heading 29.09) Heading 29.15
- (b) Methyl benzenesulphonate (ester formed by the reaction of benzene-sulphonic acid of heading 29.04 with methyl alcohol of heading 29.05) Heading 29.05
- (c) Butyl hydrogenphthalate (ester of a polycarboxylic acid where the hydrogen of only one (COOH) group has been substituted) Heading 29.17
- (d) Butyl phthalyl butyl glycollate (ester formed by the reaction of phthalic acid of heading 29.17 and glycollic acid of heading 29.18 with butyl alcohol of heading 29.05) Heading 29.18

This rule cannot be applied to the esters of such acid-function compounds with ethyl alcohol since this compound is not classified in Chapter 29. Such esters are to be classified with the acid-function compounds from which they are derived.

Example :

- Ethyl acetate (ester formed by the reaction of acetic acid of heading 29.15 with ethyl alcohol) Heading 29.15

It should further be noted that sugar esters and their salts are classified in heading 29.40.

(2) Salts.

Subject to Note 1 to Section VI and Note 2 to Chapter 28 :

- (a) Inorganic salts of organic compounds such as acid-, phenol- or enol-function compounds or organic bases, of sub-Chapters I to X or heading 29.42, are to be classified in the heading appropriate to the organic compound.

These salts may be formed by the reaction of :

- (i) Acid-, phenol- or enol-function organic compounds with inorganic bases.

Example :

- Sodium methoxybenzoate (salt formed by the reaction of methoxy-benzoic acid of heading 29.18 with sodium hydroxide) Heading 29.18

Salts of this category may also be formed by the reaction of acid esters of the type referred to above with inorganic bases.

Example :

- n-Butyl copper phthalate (salt formed by the reaction of butyl hydrogen phthalate of heading 29.17 with copper hydroxide) Heading 29.17

or (ii) Organic bases with inorganic acids.

Example :

Diethylamine hydrochloride (salt formed by the reaction of diethylamine of heading 29.21 with hydrochloric acid of heading 28.06) Heading 29.21

(b) Salts formed between organic compounds of sub-Chapters I to X or heading 29.42 are to be classified in the heading appropriate to the base or to the acid (including phenol- or enol-function compounds) from which they are formed, whichever occurs last in numerical order in the Chapter.

Examples :

- (i) Aniline acetate (salt formed by the reaction of acetic acid of heading 29.15 with aniline of heading 29.21) Heading 29.21
- (ii) Methylamine phenoxyacetate (salt formed by the reaction of methylamine of heading 29.21 with phenoxyacetic acid of heading 29.18) Heading 29.21

(3) Co-ordination compounds.

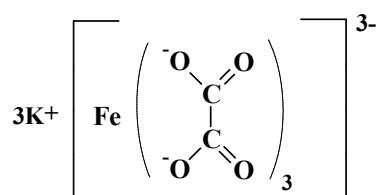

Metal co-ordination compounds generally include all the types, whether or not charged, in which a metal is bound to several atoms (generally 2 to 9 atoms) made available by one or more ligands. The skeletal geometry formed by the metal and the atoms which are bound to it as well as the number of metal links are generally characteristic for a given metal.

Co-ordination compounds, other than products classifiable in sub-Chapter XI or in heading 29.41, should be considered as being fragmented by "cleaving" of all metal bonds, apart from metal-carbon bonds, and should be classified according to the fragment (regarded as a real compound for classification purposes) falling in Chapter 29, in the heading occurring last in numerical order.

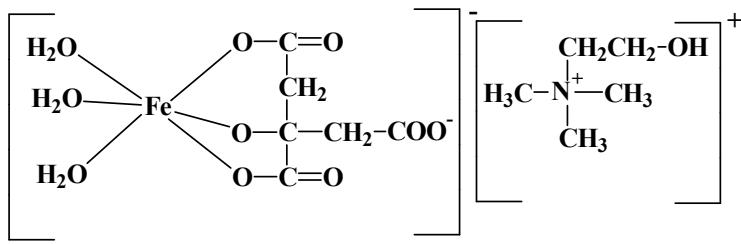

For the purposes of Note 5 (C) (3) to this Chapter, the term "fragments" covers the ligands and the part(s) containing the metal-carbon bond that have resulted from the cleavage.

Examples are shown below :

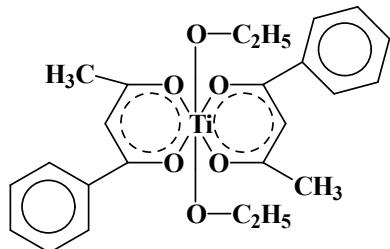

Potassium trioxalatoferrate (III) is classifiable in the heading in which the oxalic acid falls (heading 29.17), corresponding to the fragment obtained after cleaving of the metal bonds.

Ferrocholinate (INN) is classifiable in the heading covering choline (heading 29.23), which is classified in the heading occurring last in numerical order, rather than in the heading for citric acid corresponding to the other fragment that can be taken into account for classification purposes.

Budotitane (INN) : After cleaving of the metal bonds, two fragments are obtained, one corresponding to ethanol (Chapter 22), the other to benzoylacetone (and its enol-function) classified in heading 29.14. Budotitane (INN) should therefore be classified in heading 29.14.

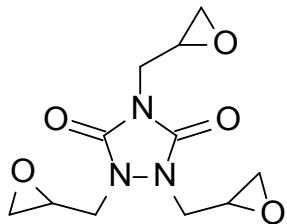

(4) Halides of carboxylic acids.

Such halides are classified in the same heading as the corresponding acids. For example, isobutyryl chloride is classified (like the isobutyric acid to which it corresponds) in heading 29.15.

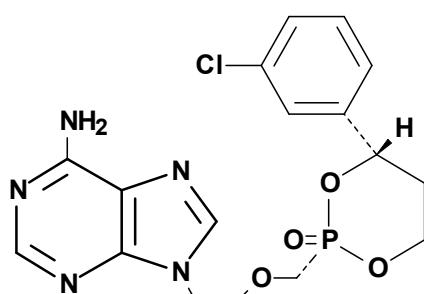

(H) Classification in headings 29.32, 29.33 and 29.34 (Chapter Note 7)

Headings 29.32, 29.33 and 29.34 do not include epoxides with a three-membered ring, ketone peroxides, cyclic polymers of aldehydes or of thioaldehydes, anhydrides of polybasic carboxylic acids, cyclic esters of polyhydric alcohols or phenols with polybasic acids, or imides of polybasic acids, if the ring-position hetero-atoms are those resulting solely from the cyclising function or functions here listed.

If, in addition to functions listed in the first sentence of Note 7 to Chapter 29, there are other ring-position hetero-atoms present in the structure, the classification should be carried out with reference to all the cyclising functions present. Thus, for example, anaxirone (INN) and pradefovir (INN) should be classified in heading 29.34 as heterocyclic compounds with two or more different hetero-atoms and **not** in heading 29.33 as heterocyclic compounds with nitrogen hetero-atoms only.

Anaxirone (INN)

Pradefovir (INN)

(IJ) Classification of derivatives

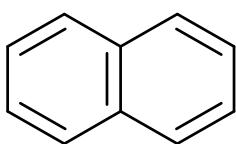

The classification of derivatives of chemical compounds at heading level is to be determined by application of the General Interpretative Rules. Note 3 to this Chapter applies when a derivative is potentially classifiable in two or more headings.

Within any one heading of this Chapter, derivatives are to be classified by application of Subheading Note 1.

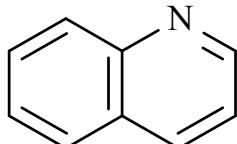

(K) Fused ring systems

A fused ring system is one in which there are at least two rings which have one, and only one, common bond and have two, **and** only two, atoms in common.

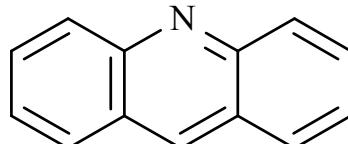

Fused ring systems appear in the molecules of polycyclic compounds (e.g., polycyclic hydrocarbons, heterocyclic compounds) in which two cyclic rings are joined by a common side involving two adjacent atoms. Examples are shown below :

Naphthalene

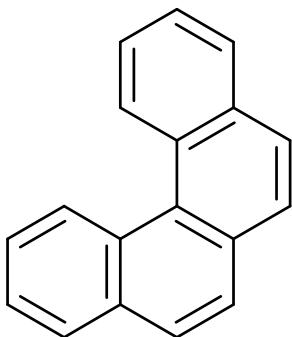

Quinoline

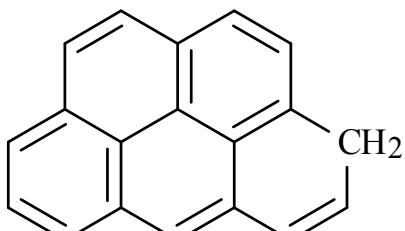

Fused quinoline

In complex ring systems, fusion can take place to more than one side of any particular ring. Polycyclic compounds in which two rings have two, and only two, atoms in common are said to be "ortho-fused". On the other hand, polycyclic compounds in which one ring contains two, and only two, atoms in common with each of the two or more rings of a contiguous series of rings are said to be "ortho- and peri-fused". These two different types of fused ring systems are illustrated by the following examples :

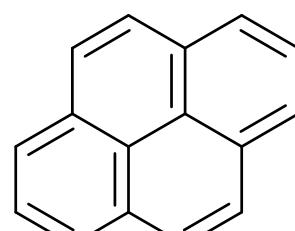

3 common faces
6 common atoms

" Ortho-fused " system

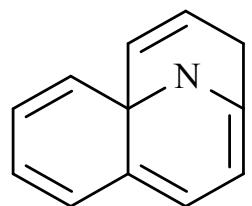

7 common faces
8 common atoms

" Ortho- and peri-fused " systems

5 common faces
6 common atoms

On the other hand, the following is an example of a bridged (**not fused**) quinoline :

Bridged quinoline.

Sub-Chapter I

HYDROCARBONS AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

29.01 - Acyclic hydrocarbons.

2901.10 - Saturated

- Unsaturated :

2901.21 -- Ethylene

2901.22 -- Propene (propylene)

2901.23 -- Butene (butylene) and isomers thereof

2901.24 -- Buta-1,3-diene and isoprene

2901.29 -- Other

Acyclic hydrocarbons are compounds containing only carbon and hydrogen which have no rings in their structure. They can be classified in two categories :

(A) **Saturated acyclic hydrocarbons.**

(B) **Unsaturated acyclic hydrocarbons.**

(A) SATURATED ACYCLIC HYDROCARBONS

These form a homologous series which may be represented by the general formula (C_nH_{2n+2}). They occur abundantly in nature and are the main components of petroleum oils.

The basic hydrocarbon is **methane** (CH_4) with one atom of carbon. Methane and also **propane** (C_3H_8) with three atoms of carbon are, however, classified in **heading 27.11** even if they are pure.

The saturated acyclic hydrocarbons of this heading include :

(1) **Ethane** (C_2H_6) with two atoms of carbon.

To be classified in this heading, ethane must have a purity of 95 % or more by volume. Ethane of lower purity is **excluded (heading 27.11)**.

(2) **Butanes** (C_4H_{10}) with four atoms of carbon.

(3) **Pentanes**, with five atoms of carbon.

(4) **Hexanes**, with six atoms of carbon.

(5) **Heptanes**, with seven atoms of carbon.

(6) **Octanes**, with eight atoms of carbon.

(7) **Nonanes**, with nine atoms of carbon.

- (8) **Decanes**, with ten atoms of carbon.
- (9) **Pentadecanes**, with fifteen atoms of carbon.
- (10) **Triacontanes**, with thirty atoms of carbon.
- (11) **Hexacontanes**, with sixty atoms of carbon.

These saturated hydrocarbons are all insoluble in water. At normal temperature and pressure, such hydrocarbons containing up to four atoms of carbon are gaseous; those containing five to fifteen atoms of carbon are liquid; hydrocarbons with a greater number of carbon atoms are generally solid.

One or more of the hydrogen atoms in these hydrocarbon molecules may be replaced by alkyl radicals (e.g., methyl, ethyl, propyl); thus isobutane (2-methylpropane, trimethylmethane) has the same molecular formula as the normal butane.

In industry and commerce, the most important hydrocarbons of this heading are **ethane and butane gases** which are derived from petroleum oil and natural gas.

To fall in this heading, these saturated acyclic hydrocarbons must be in the form of separate chemically defined compounds, whether obtained by refining petroleum oils and natural gas or by synthesis (as regards the purity criterion for ethane, see Item (1) above). But the heading **excludes** crude butane, crude petroleum gases and similar crude gaseous hydrocarbons of **heading 27.11**.

(B) UNSATURATED ACYCLIC HYDROCARBONS

These unsaturated hydrocarbons contain two, four, six, etc., less atoms of hydrogen than saturated acyclic hydrocarbons having the same number of atoms of carbon. This involves the presence of double or triple bonds.

(1) Monoethylenic hydrocarbons.

These constitute a homologous series represented by the general formula (C_nH_{2n}). They are found in the products obtained by thermal decomposition of numerous organic substances (coal gas, products of the cracking of petroleum oils, etc.); they may also be produced by synthesis.

(a) The first members of the series are gaseous, these are :

- (i) **Ethylene (ethene)** (C_2H_4). Colourless gas with a faint odour of ether and strong anaesthetic properties. Used in the preparation of a wide range of organic compounds (e.g., ethylene oxide, ethylbenzene, synthetic ethanol, polyethylene).

To fall in this heading, ethylene must have a purity of 95 % or more by volume. Ethylene of lower purity is **excluded (heading 27.11)**.

- (ii) **Propene (propylene)** (C_3H_6). Colourless, highly inflammable gas which is an asphyxiant.

To fall in this heading, propene (propylene) must have a purity of 90 % or more by volume. Propylene of lower purity is **excluded (heading 27.11)**.

(iii) **Butenes (butylenes)** (C_4H_8).

To fall in this heading, these unsaturated acyclic hydrocarbons must be in the form of separate chemically defined compounds. But the heading **excludes** crude gaseous hydrocarbons of **heading 27.11**.

In normal trade, all these products are in liquid form, under pressure.

(b) Monoethylenic hydrocarbons containing five to fifteen atoms of carbon are liquid. The most important include :

- (i) **Pentenes** (amylenes).
- (ii) **Hexenes**.
- (iii) **Heptenes**.
- (iv) **Octenes**.

(c) Those containing more than fifteen atoms of carbon are solids.

(2) **Polyethylenic hydrocarbons.**

These constitute a series with two or more double bonds.

They include :

- (a) **Propadiene** (allene) (C_3H_4)
- (b) **Buta-1,2-diene** (1,2-butadiene, methylallene) (C_4H_6)
- (c) **Buta-1,3-diene** (1,3-butadiene) (C_4H_6) a colourless, highly inflammable gas and
- (d) **2-Methylbuta-1,3-diene** (isoprene) (C_5H_8), a colourless, highly inflammable liquid.

(3) **Acetylene series.**

Acetylenic hydrocarbons contain either one triple bond (mono-acetylenes, general (C_nH_{2n-2})) or more than one triple bond (polyacetylenes).

The most important product is **acetylene** (C_2H_2), a colourless gas with a characteristic odour. From acetylene a wide range of products can be synthesised (e.g., acetic acid, acetone, isoprene, chloroacetic acid, ethanol).

It is presented dissolved in acetone under pressure in special steel cylinders packed with diatomite, and remains classified under the heading (see Chapter Note 1 (e)).

Other members of the series are :

- (a) **Propyne** (allylene, methylacetylene).
- (b) **Butyne** (ethylacetylene).

(4) **Ethylene-acetylene hydrocarbons.**

These contain both ethylenic and acetylenic bonds in their molecules. The most important of these are **vinylacetylene** (acetylene in which one hydrogen atom has been replaced by a vinyl group), and **methylvinylacetylene**, (in which both hydrogen atoms have been replaced - one by a vinyl group and the other by a methyl group).

29.02 - Cyclic hydrocarbons.

- Cyclanes, cyclenes and cycloterpenes :

2902.11 -- Cyclohexane

2902.19 -- Other

2902.20 - Benzene

2902.30 - Toluene

- Xylenes :

2902.41 -- *o*-Xylene

2902.42 -- *m*-Xylene

2902.43 -- *p*-Xylene

2902.44 -- Mixed xylene isomers

2902.50 - Styrene

2902.60 - Ethylbenzene

2902.70 - Cumene

2902.90 - Other

Cyclic hydrocarbons are compounds containing only carbon and hydrogen which have at least one ring in their structure. They can be classified in three categories :

(A) **Cyclanes and cyclenes.**

(B) **Cycloterpenes.**

(C) **Aromatic hydrocarbons.**

(A) CYCLANES AND CYCLENES

These are cyclic hydrocarbons which correspond to the general formula C_nH_{2n} when they are saturated monocyclic cyclanes and to the general formula C_nH_{2n-x} (in which x may be 2, 4, 6, etc.) when they are polycyclic cyclanes or when they are unsaturated (cyclenes).

(1) The **monocyclic cyclanes** include the polymethylene and naphthene hydrocarbons found in certain petroleum oils; examples are :

(a) **Cyclopropane** (C_3H_6) (gas).

(b) **Cyclobutane** (C_4H_8) (gas).

(c) **Cyclopentane** (C_5H_{10}) (liquid).

(d) **Cyclohexane** (C_6H_{12}) (liquid).

(2) The **polycyclic cyclanes** include :

- (a) **Decahydronaphthalene** ($C_{10}H_{18}$), a colourless liquid used as a solvent for paints and lacquers, for polishes, etc.
- (b) **Bridge-linked compounds** such as 1,4,4a,5,6,7,8,8a-octahydro-*exo*-1,4-*endo*-5,8-dimethanonaphthalene ($C_{12}H_{16}$) from which the pesticide HEOD is derived.
- (c) **Compounds with a "cage" structure** such as pentacyclo [$5.2.1.0^{2,6}.0^{3,9}.0^{5,8}$] decane ($C_{10}H_{12}$) from which the formula of dodecachloropentacyclo [$5.2.1.0^{2,6}.0^{3,9}.0^{5,8}$] decane is derived.

(3) The **cyclenes** include :

- (a) **Cyclobutene** (C_4H_6) gas.
- (b) **Cyclopentene** (C_5H_8), liquid.
- (c) **Cyclohexene** (C_6H_{10}), liquid.
- (d) **Cyclo-octatetraene** (C_8H_8), liquid.
- (e) **Azulene** ($C_{10}H_8$), solid.

This heading **does not**, however, **include** synthetic carotenes which fall in **heading 32.04**.

(B) CYCLOTERPENES

These hydrocarbons do not differ in general chemical structure from the cyclene group and have the general formula (C_nH_8)_n where n may be 2 or more. They occur naturally in the vegetable kingdom as odoriferous, volatile liquids, for example :

- (1) **Pinene**, a constituent of spirits of turpentine, pinewood oil, cinnamon oil, etc.; it is a colourless liquid.
- (2) **Camphene**, contained in nutmeg oil, petitgrain oil, etc.
- (3) **Limonene**, found in citrus fruit oils; **dipentene**, being the mixed optical isomers of limonene. Crude dipentene is **excluded** (**heading 38.05**).

This heading **excludes** essential oils (**heading 33.01**), and gum, wood or sulphate turpentine and other terpenic oils produced by the distillation or other treatment of coniferous woods (**heading 38.05**).

(C) AROMATIC HYDROCARBONS

These compounds contain one or more fused or unfused benzene rings, benzene being a hydrocarbon composed of 6 atoms of carbon and 6 atoms of hydrogen, arranged in 6 groups of (CH) to form a hexagonal ring.

- (I) **Hydrocarbons with only one benzene ring.** These include benzene and its homologues.

- (a) **Benzene** (C_6H_6). Occurs in coal gas, in some petroleum oils, and in the liquid products of the dry distillation of numerous organic compounds rich in carbon (coal, lignite, etc.); also obtained synthetically. In the pure state, it is a colourless, mobile, refractive liquid, volatile and inflammable, with an aromatic odour. It readily dissolves resins, fats, essential oils, rubber, etc. Numerous products can be obtained from benzene synthesis.

To fall in this heading, benzene must have a purity of 95 % or more by weight. Benzene of lower purity is excluded (heading 27.07).

- (b) **Toluene** (methylbenzene) ($C_6H_5CH_3$). A benzene derivative in which one atom of hydrogen has been replaced by a methyl group. Obtained by distilling light coal tar oil, or by cyclisation of acyclic hydrocarbons. Colourless, mobile, refractive, inflammable liquid, with an aromatic odour similar to that of benzene.

To fall in this heading, toluene must have a purity of 95 % or more by weight. Toluene of lower purity is excluded (heading 27.07).

- (c) **Xylene** (dimethylbenzene) ($C_6H_4(CH_3)_2$). A benzene derivative in which two atoms of hydrogen have been replaced by two methyl groups. There are three isomers: *o*-xylene, *m*-xylene and *p*-xylene. Xylene is a clear, inflammable liquid found in light coal tar oil.

To fall in this heading, xylene must contain 95 % or more by weight of xylene isomers, all isomers being taken together. Xylene of lower purity is excluded (heading 27.07).

- (d) Other aromatic hydrocarbons of this group are formed by a benzene ring and one or more side chains, open or closed; these include :

(1) **Styrene** ($C_6H_5CH=CH_2$). A colourless, oily liquid used mainly in the preparation of plastics (polystyrene) and of synthetic rubber.

(2) **Ethylbenzene** ($C_6H_5C_2H_5$). A colourless inflammable, mobile liquid, contained in coal tar, normally manufactured from benzene and ethylene.

(3) **Cumene** ($C_6H_5CH(CH_3)_2$). A colourless liquid found in certain petroleum oils. Used mainly in the production of phenol, acetone α -methylstyrene or as a solvent.

(4) ***p*-Cymene** ($CH_3C_6H_4CH(CH_3)_2$). Found abundantly in several essential oils. Colourless liquid with an agreeable odour.

Crude *p*-cymene is excluded (heading 38.05).

(5) **Tetrahydronaphthalene** (tetralin) ($C_{10}H_{12}$). Obtained by the catalytic hydrogenation of naphthalene. Colourless liquid, with a terpene-like odour, used as a solvent, etc.

(II) **Hydrocarbons with two or more unfused benzene rings**; these include :

- (a) **Biphenyl** ($C_6H_5C_6H_5$). Sparkling white crystals with an agreeable odour; used in particular for the preparation of the chlorinated derivatives (plasticisers), as a coolant (alone or mixed with biphenyl ether), and as a moderator in nuclear reactors.

- (b) **Diphenylmethane** ($C_6H_5CH_2C_6H_5$). A hydrocarbon with two benzene rings linked by a methylene group (CH_2). Crystallises in colourless needles with a strong odour reminiscent of geraniums; used in organic synthesis.
- (c) **Triphenylmethane** ($CH(C_6H_5)_3$). A methane with three atoms of hydrogen replaced by three benzene rings.
- (d) **Terphenyls**. The mixed terphenyl isomers are used as coolants and as moderators in nuclear reactors.

(III) Hydrocarbons with two or more benzene rings fused.

- (a) **Naphthalene** ($C_{10}H_8$). Results from the fusion of two benzene rings. It occurs in coal tar, in petroleum oils, in coal gas, in lignite tar, etc. It crystallises in fine white flakes, with a characteristic odour.

To fall in this heading, naphthalene must have a crystallising point of 79.4 °C or more. Naphthalene of lower purity is **excluded (heading 27.07)**.

- (b) **Phenanthrene** ($C_{14}H_{10}$). Results from the fusion of three benzene rings. One of the products of the distillation of coal tar; fine, colourless, fluorescent crystals.

Phenanthrene falls here only when it is a separate chemically defined compound in the pure or commercially pure state. When crude, it is **excluded (heading 27.07)**.

- (c) **Anthracene** ($C_{14}H_{10}$). Also results from the fusion of three benzene rings, and is found in coal tar. Colourless crystals or yellowish powder, and is purple-blue fluorescent.

To fall in this heading, anthracene must have a purity of 90 % or more by weight. Anthracene of lower purity is **excluded (heading 27.07)**.

This group also includes the following hydrocarbons :

- (1) **Acenaphthene**.
- (2) **Methylnaphthalenes**.
- (3) **Fluorene**.
- (4) **Fluoranthene**.
- (5) **Pyrene**.

This heading **excludes** those dodecylbenzenes and those nonylnaphthalenes which are mixed alkylarenes (**heading 38.17**).

29.03 - Halogenated derivatives of hydrocarbons.

- Saturated chlorinated derivatives of acyclic hydrocarbons :

2903.11 -- Chloromethane (methyl chloride) and chloroethane (ethyl chloride)

2903.12 -- Dichloromethane (methylene chloride)

2903.13 -- Chloroform (trichloromethane)

2903.14 -- Carbon tetrachloride

2903.15 -- Ethylene dichloride (ISO) (1,2-dichloroethane)

2903.19 -- Other

- Unsaturated chlorinated derivatives of acyclic hydrocarbons :

2903.21 -- Vinyl chloride (chloroethylene)

2903.22 -- Trichloroethylene

2903.23 -- Tetrachloroethylene (perchloroethylene)

2903.29 -- Other

- Fluorinated, brominated or iodinated derivatives of acyclic hydrocarbons :

2903.31 -- Ethylene dibromide (ISO) (1,2-dibromoethane)

2903.39 -- Other

- Halogenated derivatives of acyclic hydrocarbons containing two or more different halogens :

2903.71 -- Chlorodifluoromethane

2903.72 -- Dichlorotrifluoroethanes

2903.73 -- Dichlorofluoroethanes

2903.74 -- Chlorodifluoroethanes

2903.75 -- Dichloropentafluoropropanes

2903.76 -- Bromochlorodifluoromethane, bromotrifluoromethane and dibromotetrafluoroethanes

2903.77 -- Other, perhalogenated only with fluorine and chlorine

2903.78 -- Other perhalogenated derivatives

2903.79 -- Other

- Halogenated derivatives of cyclanic, cyclenic or cycloterpenic hydrocarbons :

2903.81 -- 1,2,3,4,5,6-Hexachlorocyclohexane (HCH (ISO)), including lindane (ISO, INN)

2903.82 -- Aldrin (ISO), chlordane (ISO) and heptachlor (ISO)

2903.83 -- Mirex (ISO)

2903.89 -- Other

- Halogenated derivatives of aromatic hydrocarbons :

2903.91 -- Chlorobenzene, *o*-dichlorobenzene and *p*-dichlorobenzene

2903.92 -- Hexachlorobenzene (ISO) and DDT (ISO) (clogenotane (INN), 1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane)

2903.93 -- Pentachlorobenzene (ISO)

2903.94 -- Hexabromobiphenyls

2903.99 -- Other

These are compounds obtained by the substitution in the structural formula of a hydrocarbon of one or more halogen atoms (fluorine, chlorine, bromine, iodine) for an equal number of hydrogen atoms.

(A) SATURATED CHLORINATED DERIVATIVES OF ACYCLIC HYDROCARBONS

- (1) **Chloromethane** (methyl chloride). Colourless gas, usually presented liquefied in steel cylinders. Used as a refrigerant, as an anaesthetic and in organic synthesis.
- (2) **Dichloromethane** (methylene chloride). A toxic, colourless, volatile liquid; used in organic synthesis.
- (3) **Chloroform** (trichloromethane). A colourless volatile liquid, with a characteristic odour; used as an anaesthetic, as a solvent and in organic synthesis.
- (4) **Carbon tetrachloride**. Colourless liquid; used in fire-extinguishers, and as a solvent for sulphur, oils, fats, varnishes, petroleum, resins, etc.
- (5) **Chloroethane** (ethyl chloride). Gaseous, liquefied in special containers; used as an anaesthetic.
- (6) **Ethylene dichloride** (ISO) (1,2-dichloroethane). Toxic, colourless liquid; used as a solvent.
- (7) **1,2-Dichloropropane** (propylene dichloride). Colourless, stable liquid. Chloroform-like odour. Used in organic synthesis, and as a solvent for fats, oils, waxes, gums and resins.
- (8) **Dichlorobutanes**.

This heading **excludes** :

- (a) Chloroparaffins if they are mixtures of chlorinated derivatives; solid chloroparaffins having the character of artificial waxes are classified in **heading 34.04**, while liquid chloroparaffins are classified in **heading 38.24**.
- (b) Products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades, of **heading 38.13**.

(B) UNSATURATED CHLORINATED DERIVATIVES OF ACYCLIC HYDROCARBONS

- (1) **Vinyl chloride** (chloroethylene). Gas with an odour of chloroform; presented in liquid form in steel containers; used for the preparation of poly(vinyl chloride) of heading 39.04.
- (2) **Trichloroethylene**. Colourless liquid with an odour of chloroform; solvent for varnishes, oils and fats; used in organic synthesis.
- (3) **Tetrachloroethylene** (perchloroethylene); colourless liquid used as a dry-cleaning solvent.
- (4) **Vinylidene chloride**.

(C) FLUORINATED, BROMINATED OR IODINATED DERIVATIVES OF ACYCLIC HYDROCARBONS

- (1) **Bromomethane** (methyl bromide). Gaseous, liquefied in special containers; used in fire-extinguishers and as a refrigerant.
- (2) **Bromoethane** (ethyl bromide). Colourless liquid with an odour similar to that of chloroform; used in organic synthesis.
- (3) **Bromoform**. Colourless liquid with a characteristic odour; used as a sedative.
- (4) **Allyl bromide**.
- (5) **Iodomethane** (methyl iodide) and **iodoethane** (ethyl iodide). Liquids, used in organic synthesis.
- (6) **Di-iodomethane** (methylene iodide).
- (7) **Iodoform**. Yellow powder or yellow crystals with a characteristic odour; used in medicine as an antiseptic.
- (8) **Allyl iodide** (3-iodopropene).

This heading **excludes** products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades, of **heading 38.13**.

(D) HALOGENATED DERIVATIVES OF ACYCLIC HYDROCARBONS CONTAINING TWO OR MORE DIFFERENT HALOGENS

Trade in **chlorodifluoromethane**, **dichlorotrifluoroethanes**, **dichlorofluoroethanes**, **chlorodifluoroethanes**, **dichloropentafluoropropanes**, **bromochlorodifluoromethane**, **bromotrifluoromethane**, **dibromotetrafluoroethanes**, **trichlorofluoromethane**, **dichlorodifluoromethane**, **trichlorotrifluoroethanes**, **dichlorotetrafluoroethanes** and **chloropentafluoroethane** is controlled by the Montreal Protocol on Substances that Deplete the Ozone Layer

This heading **excludes** products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades, of **heading 38.13**.

(E) HALOGENATED DERIVATIVES OF CYCLANIC, CYCLENIC OR CYCLOTERPENIC HYDROCARBONS

- (1) **1,2,3,4,5,6-Hexachlorocyclohexane** (HCH (ISO)), including lindane (ISO, INN). White or yellowish powder or flakes; a very strong insecticide.
- (2) **Halogenated derivatives of cyclopropane or cyclobutane.**
- (3) **Octachlorotetrahydro-4,7-endomethyleneindane**, also a very strong insecticide.
- (4) **Halogenated derivatives of "cage" structure hydrocarbons**, such as dodecachloro-pentacyclo [5.2.1.0^{2,6}.0^{3,9}.0^{5,8}] decane.
- (5) **Halogenated derivatives of cycloterpenes**, such as chlorocamphene, bornyl chloride.

(F) HALOGENATED DERIVATIVES OF AROMATIC HYDROCARBONS

- (1) **Chlorobenzene**. Inflammable liquid with a slightly aromatic odour; used in organic synthesis and also as a solvent for varnishes, resins and bitumens.
- (2) ***o*-Dichlorobenzene**. Colourless liquid.
- (3) ***m*-Dichlorobenzene**. Colourless liquid.
- (4) ***p*-Dichlorobenzene**. White crystals, used mainly as an insecticide, an air freshener or as an intermediate in the manufacture of dyes.
- (5) **Hexachlorobenzene (ISO) and pentachlorobenzene (ISO)**. White needles insoluble in water.
- (6) **DDT (ISO)** (clofenotane (INN), 1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane or dichlorodiphenyltrichloroethane). Colourless crystals or white to slightly off-white powder. Insecticide.
- (7) **Benzyl chloride**. Colourless liquid with an agreeable odour, highly lachrymatory; used in organic synthesis.
- (8) **Monochloronaphthalenes**, α (mobile liquid) or β (volatile crystals). They have an odour of naphthalene; used in organic synthesis, as plasticisers, etc.
- (9) **1,4-Dichloronaphthalene**, brilliant colourless crystals, and **octachloronaphthalene**, brilliant yellowish crystals, used as insecticides.

Liquid polychloronaphthalenes are classified in this heading if they are **not** mixtures; but those in the solid state which are mixtures having the character of artificial waxes are **excluded (heading 34.04)**.

- (10) **Bromostyrene**.
- (11) **Hexabromobiphenyls***. Typical examples are : 2.2'.4.4'.5.5'-hexabromobiphenyl* and 3.3'.4.4'.5.5'-hexabromobiphenyl. Colourless to offwhite solids.

This heading **excludes** mixtures of isomers of hexabromobiphenyls (**heading 38.24**). This heading also **excludes** polychlorobiphenyls which are mixtures of chlorinated derivatives; those in the solid form having the character of artificial waxes fall in **heading 34.04**, and liquid polychlorobiphenyls are classified in **heading 38.24**.

29.04 - Sulphonated, nitrated or nitrosated derivatives of hydrocarbons, whether or not halogenated.

2904.10 - Derivatives containing only sulpho groups, their salts and ethyl esters

2904.20 - Derivatives containing only nitro or only nitroso groups

- Perfluorooctane sulphonic acid, its salts and perfluorooctane sulphonyl fluoride :

2904.31 -- Perfluorooctane sulphonic acid

2904.32 -- Ammonium perfluorooctane sulphonate

2904.33 -- Lithium perfluorooctane sulphonate

2904.34 -- Potassium perfluorooctane sulphonate

2904.35 -- Other salts of perfluorooctane sulphonic acid

2904.36 -- Perfluorooctane sulphonyl fluoride

- Other :

2904.91 -- Trichloronitromethane (chloropicrin)

2904.99 -- Other

(A) SULPHONATED DERIVATIVES

These are hydrocarbons in which one or more atoms of hydrogen have been replaced by a like number of sulpho group (-SO₃H); they are generally called sulphonic acids. The heading also includes salts and ethyl esters of sulphonic acids (see Note 5 (B) to this Chapter).

(1) **Sulphonated derivatives of acyclic hydrocarbons.**

- (a) Ethylenesulphonic acid.
- (b) Ethanesulphonic acid.

(2) **Sulphonated derivatives of cyclic hydrocarbons.**

- (a) Benzenesulphonic acid.
- (b) Toluenesulphonic acids (sometimes erroneously called benzylsulphonic acids).
- (c) Xylenesulphonic acids.
- (d) Benzenedisulphonic acids.
- (e) Naphthalenesulphonic acids.

(B) NITRATED DERIVATIVES

These are hydrocarbons in which one or more hydrogen atoms have been replaced by a like number of nitro groups (-NO₂).

(1) **Nitrated derivatives of acyclic hydrocarbons.**

- (a) Nitromethane.
- (b) Nitroethane.

(c) Nitropropane.

(d) Trinitromethane, etc.

(2) **Nitrated derivatives of cyclic hydrocarbons.**

(a) **Nitrobenzene** (oil of mirbane). Shining yellow crystals or oily yellowish liquid, with the odour of bitter almonds; used in perfumery, in soap-making, in organic synthesis, as a denaturing agent, etc.

(b) **m-Dinitrobenzene**. Colourless needles or flakes; used for the preparation of explosives.

(c) **Nitrotoluene** (*o*-, *m*- and *p*-).

(d) **2,4-Dinitrotoluene**. Crystals used in the manufacture of explosives.

(e) **2,4,6-Trinitrotoluene**. Powerful explosive.

Prepared explosive mixtures of these derivatives are excluded (heading 36.02).

(f) **5-tert-Butyl-2,4,6-trinitrometaxylene** (xylene musk); used in perfumery.

(g) **Nitroxylene, 3-tert-butyl-2,6-dinitro-*p*-cymene (cymene musk), nitronaphthalene, etc.**

(C) NITROSATED DERIVATIVES

These are hydrocarbons in which one or more atoms of hydrogen have been replaced by a like number of nitroso groups (-NO).

(1) **Nitrosobenzene**.

(2) **Nitrosotoluene** (*o*-, *m*- and *p*-).

(D) SULPHOHALOGENATED DERIVATIVES

These are hydrocarbon derivatives the molecules of which contain one or more sulpho groups (-SO₃H) or salts or ethyl esters thereof and one or more halogens, or else a halosulphonyl group.

(1) **Chloro-, bromo- and iodobenzenesulphonic acids** (*o*-, *m* and *p*-).

(2) **Chloro-, bromo- and iodobenzenedisulphonic acids**.

(3) **Chloronaphthalenesulphonic acids**.

(4) ***p*-Toluenesulphonyl chloride**.

(5) Perfluorooctane sulphonic acid (PFOS)^{*}. The production and use of PFOS, its salts and perfluorooctane sulfonyl fluoride (PFOSF) is controlled by the Stockholm Convention on Persistent Organic Pollutants and by the Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade (see also headings 29.22, 29.23, 29.35, 38.08 and 38.24).

(E) NITROHALOGENATED DERIVATIVES

These are hydrocarbon derivatives the molecules of which contain one or more nitro groups (-NO₂) and one or more halogens.

- (1) **Trichloronitromethane or chloropicrin.**
- (2) **Iodotinitromethane (iodopicrin).**
- (3) **Chloronitromethane.**
- (4) **Bromonitromethane.**
- (5) **Iodonitromethane.**
- (6) **Chloronitrobenzene.**
- (7) **Chloronitrotoluene.**

(F) NITROSULPHONATED DERIVATIVES

These are hydrocarbon derivatives the molecules of which contain one or more nitro groups ($-NO_2$) and one or more sulpho groups ($-SO_3H$) or salts or ethyl esters thereof.

- (1) **Nitrobenzenesulphonic and di- and trinitrobenzenesulphonic acids.**
- (2) **Nitrotoluenesulphonic and di- and trinitrotoluenesulphonic acids.**
- (3) **Nitronaphthalenesulphonic acids.**
- (4) **Dinitrostilbenedisulphonic acids.**

(G) NITROSULPHOHALOGENATED OR OTHER COMPOUND DERIVATIVES

These are compound derivatives of a kind not specified above, for example, those which contain one or more nitro groups ($-NO_2$), sulpho groups ($-SO_3H$) or salts or ethyl esters thereof and one or more halogens. Specific examples are the sulphonated derivatives of chloronitrobenzenes, of chloronitrotoluenes, etc.

Sub-Chapter II

ALCOHOLS AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

29.05 - Acyclic alcohols and their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Saturated monohydric alcohols :

- 2905.11 -- Methanol (methyl alcohol)
- 2905.12 -- Propan-1-ol (propyl alcohol) and propan-2-ol (isopropyl alcohol)
- 2905.13 -- Butan-1-ol (*n*-butyl alcohol)
- 2905.14 -- Other butanols
- 2905.16 -- Octanol (octyl alcohol) and isomers thereof
- 2905.17 -- Dodecan-1-ol (lauryl alcohol), hexadecan-1-ol (cetyl alcohol) and octadecan-1-ol (stearyl alcohol)
- 2905.19 -- Other
 - Unsaturated monohydric alcohols :
- 2905.22 -- Acyclic terpene alcohols
- 2905.29 -- Other
 - Diols :
- 2905.31 -- Ethylene glycol (ethanediol)
- 2905.32 -- Propylene glycol (propane-1,2-diol)
- 2905.39 -- Other
 - Other polyhydric alcohols :
- 2905.41 -- 2-Ethyl-2-(hydroxymethyl)propane-1,3-diol (trimethylolpropane)
- 2905.42 -- Pentaerythritol
- 2905.43 -- Mannitol
- 2905.44 -- D-glucitol (sorbitol)
- 2905.45 -- Glycerol
- 2905.49 -- Other
 - Halogenated, sulphonated, nitrated or nitrosated derivatives of acyclic alcohols :
- 2905.51 -- Ethchlorvynol (INN)
- 2905.59 -- Other

Acyclic alcohols are derivatives of acyclic hydrocarbons obtained by replacing one or more atoms of hydrogen by the hydroxyl group. They are oxygenated compounds which react with acids giving the compounds known as esters.

The alcohols may be primary (containing the characteristic group $-CH_2OH$), secondary (containing the characteristic group $>CHOH$) or tertiary (containing the characteristic group $>COH$).

This heading covers the acyclic alcohols described below and their halogenated, sulphonated, nitrated, nitrosated, sulphohalogenated, nitrohalogenated, nitrosulphonated, nitrosulphohalogenated or other compound derivatives (e.g., the monochlorohydrins of glycerol and of ethylene glycol). Aldehyde-bisulphite compounds and ketone-bisulphite compounds are classified as sulphonated derivatives of alcohols, e.g., acetaldehyde sodium bisulphite, formaldehyde sodium bisulphite, valeraldehyde sodium bisulphite and acetone sodium bisulphite. The heading also covers metal alcoholates of alcohols of this heading and of ethanol.

This heading **excludes** ethanol (ethyl alcohol), whether or not pure (see Explanatory Notes to headings 22.07 and 22.08).

(A) SATURATED MONOHYDRIC ALCOHOLS

- (1) **Methanol** (methyl alcohol). Obtained by dry distillation of wood, or by synthesis. Pure methanol is a mobile, colourless, inflammable liquid, with a characteristic odour; used in organic synthesis, as a solvent, in the dyestuff industry, and for the manufacture of explosives, pharmaceutical products, etc. Wood naphtha (crude methyl alcohol) obtained by dry distillation of wood is **excluded** (heading 38.07).
- (2) **Propan-1-ol** (propyl alcohol) **and propan-2-ol** (isopropyl alcohol). These products are **colourless** liquids. The latter is obtained by synthesis from propylene and is used in the preparation of acetone, and methacrylates, and as a solvent, etc.
- (3) **Butan-1-ol** (*n*-butyl alcohol) **and other butanols** (4 isomers). Colourless liquids, used in organic synthesis and as solvents.
- (4) **Pentanol** (amyl alcohol) **and isomers thereof**. There are eight possible isomers. Fermentation amyl alcohol is chiefly obtained from fusel oil (also known as grain oil, molasses oil, potato oil, etc., heading 38.24) which is itself obtained during the rectification of ethyl alcohol. Amyl alcohols may also be synthesised from the hydrocarbon gases obtained during the cracking of petroleum.
- (5) **Hexanols and heptanols** (hexyl and heptyl alcohol).
- (6) **Octanol** (octyl alcohol) **and isomers thereof**.
- (7) **Dodecan-1-ol** (lauryl alcohol), **hexadecan-1-ol** (cetyl alcohol) **and octadecan-1-ol** (stearyl alcohol).

This heading **excludes** fatty alcohols of a purity of less than 90 % (calculated on the weight of the dry product) (heading 38.23).

(B) UNSATURATED MONOHYDRIC ALCOHOLS

- (1) **Allyl alcohol.**
- (2) **Ethylpropylallyl alcohol** (2-ethyl-2-hexen-1-ol).
- (3) **Oleyl alcohol.**
- (4) **Acylic terpene alcohols**, e.g., phytol. Terpene alcohols are fairly readily converted into hydro-aromatic compounds and are found in certain essential oils. Examples are geraniol, citronellol, linalool, rhodinol and nerol, used in perfumery.

(C) DIOLS AND OTHER POLYHYDRIC ALCOHOLS

(I) Diols

- (1) **Ethylene glycol** (ethanediol). A colourless, syrupy liquid with a faint, pungent odour. Used in the manufacture of nitroglycol (explosive), as a solvent for varnishes, as an anti-freeze agent or in organic synthesis.
- (2) **Propylene glycol** (propane-1,2-diol). Colourless, viscous and hygroscopic liquid.

(II) Other polyhydric alcohols

- (1) **Glycerol** (propane-1,2,3-triol). Glycerol (also known as glycerine) may be obtained either by purification of crude glycerol (e.g., by distillation, ion-exchange purification) or synthetically from propylene.

Glycerol has a sweet taste. It is in general colourless and odourless, but may sometimes have a slight yellowish shade.

To fall in this heading, glycerol must have a purity of 95 % or more (calculated on the weight of the dry product). Glycerol of lower purity (crude glycerol) is **excluded** (**heading 15.20**).
- (2) **2-Ethyl-2-(hydroxymethyl)propane-1,3-diol** (trimethylolpropane). Used in the manufacture of varnishes and alkyd resins, synthetic drying oils, urethane foams and coatings.
- (3) **Pentaerythritol**. White crystalline powder, used in the manufacture of explosives and plastics.
- (4) **Mannitol**. White crystalline powder or granules. Found in the vegetable kingdom (sap of the *Fraxinus ornus*); obtained by synthesis. Used as a mild laxative and in the manufacture of explosives (mannitol hexanitrate).
- (5) **D-glucitol** (sorbitol). White crystalline powder which is hygroscopic. Used in perfumery, in the manufacture of ascorbic acid (used in medicine) and of surface-active agents, as a substitute for glycerol and as a humectant (i.e., moisture-conditioning agent).
- (6) **Pantanetriol, hexanetriol, etc.**

This heading **excludes** sorbitol of **heading 38.24**.

**(D) HALOGENATED, SULPHONATED, NITRATED
OR NITROSATED DERIVATIVES OF ACYCLIC ALCOHOLS**

- (1) **Chloral hydrate** ($\text{CCl}_3\text{CH}(\text{OH})_2$) (2,2,2-trichloroethane-1,1-diol). Colourless toxic crystals; used as a hypnotic and in organic synthesis.
- (2) **Trichloro-tertiary-butyl alcohol**; used in medicine.
- (3) **Ethchlorvynol**. A psychotropic substance - see the list at the end of Chapter 29.

29.06 - Cyclic alcohols and their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Cyclanic, cyclenic or cycloterpenic :

2906.11 -- Menthol

2906.12 -- Cyclohexanol, methylcyclohexanols and dimethylcyclohexanols

2906.13 -- Sterols and inositol

2906.19 -- Other

- Aromatic :

2906.21 -- Benzyl alcohol

2906.29 -- Other

**(A) CYCLANIC, CYCLENIC OR CYCLOTERPENIC ALCOHOLS
AND THEIR HALOGENATED, SULPHONATED, NITRATED
OR NITROSATED DERIVATIVES**

- (1) **Menthol**, a secondary alcohol which is the main constituent of peppermint oil. Crystals; used as an antiseptic, as a local anaesthetic and also to relieve nasal congestion.
- (2) **Cyclohexanol, methyl- and dimethylcyclohexanols** are compounds with a characteristic odour like camphor. They are used as solvents for varnishes. Dimethylcyclohexanol is used in soap-making.
- (3) **Sterols** are alicyclic alcohols, saturated or unsaturated, the structure of which is derived from the hydrocarbon perhydro-1,2-cyclopentanophenanthrene, the hydroxyl group being linked to the 3-carbon, with a methyl group on the 10- and 13-carbons and a side chain of 8 to 10 carbon atoms linked to the 17-carbon. They exist abundantly both in the animal (zoosterols) and vegetable (phytosterols) kingdoms. The most important is **cholesterol** obtained mainly from the spinal cords of cattle and from wool grease; it is also obtained from bile, and as a by-product during the extraction of lecithin from egg-yolks. It is in the form of shiny, colourless tablets, insoluble in water.

This heading **excludes** ergosterol, found in fungi (mushrooms) and in spurred rye, a provitamin from which vitamin D₂ is obtained by ultra-violet irradiation. Both ergosterol and vitamin D₂ fall in **heading 29.36**.

- (4) **Inositol**, constituents of body tissue. There are nine isomeric forms of inositol. White crystals. Widely distributed in plants and animals.
- (5) **Terpineols**, very important alcohols used as a basis for perfumes such as lilac, etc. Found in nature either in the free state or esterified in many essential oils (e.g., of cardamoms, sweet orange, orange-flower, petit-grain, sweet marjoram, nutmeg, turpentine, cherry-laurel, camphor).

Commercial terpineol is usually a mixture of isomers but it remains in this heading (see Note 1 (b) to Chapter 29). It is a colourless, oily liquid, and is sometimes used as a bactericide. A solid isomer is used in medicine and may also be used as a bactericide.

- (6) **Terpin**, obtained synthetically. White crystals. Terpin hydrate is obtained from turpentine; colourless crystals, aromatic. Used in medicine, and also for the preparation of terpineol.
- (7) **Borneol** (Borneo camphor), the alcohol corresponding to the ketone camphor. Appearance and odour like natural camphor; crystalline white or sometimes brownish mass; volatile at room temperature.
- (8) **Isoborneol**, lamellar crystals; an intermediate stage in the conversion of alphapinene to camphor.
- (9) **Santalol**, main constituent of sandalwood oil.

(B) AROMATIC ALCOHOLS AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

Aromatic alcohols contain the hydroxyl group (-OH) linked not to the aromatic rings but to the side chains.

- (1) **Benzyl alcohol** (phenylmethanol, phenylcarbinol). Found in the free state or esterified in oils of jasmine and tuberoses, and esterified in storax and balsam of Tolu. Colourless liquid with a pleasant aromatic odour; used in organic synthesis and in the preparation of varnishes, dyestuffs, artificial perfumes, etc.
- (2) **2-Phenylethanol** (phenylethyl alcohol). A liquid forming the main constituent in attar of roses.
- (3) **3-Phenylpropanol** (phenylpropyl alcohol). Found in storax, in Sumatra gum benzoin, in cassia oil and in Chinese cinnamon oil; it is a dense, colourless liquid with a faint odour of hyacinths.
- (4) **Cinnamyl alcohol**. Found in liquid storax and in balsam of Peru. Crystallises in needles with an odour of hyacinths.
- (5) **Diphenylmethanol** (diphenylcarbinol, benzhydrol). Crystallises in needles.
- (6) **Triphenylmethanol** (triphenylcarbinol). Crystals. This alcohol is the parent substance of an important group of dyes which includes aurine, rosaniline, etc.

*
* * *

For the purposes of this heading, aldehyde-bisulphite compounds and ketone-bisulphite compounds are classified as sulphonated derivatives of alcohols. This heading also covers metal alcoholates of cyclic alcohols.

Sub-Chapter III

PHENOLS, PHENOL-ALCOHOLS, AND THEIR HALOGENATED, SULPHONATED, NITROSATED OR NITROSATED DERIVATIVES

29.07 - Phenols; phenol-alcohols.

- Monophenols :

2907.11 -- Phenol (hydroxybenzene) and its salts

2907.12 -- Cresols and their salts

2907.13 -- Octylphenol, nonylphenol and their isomers; salts thereof

2907.15 -- Naphthols and their salts

2907.19 -- Other

- Polyphenols; phenol-alcohols :

2907.21 -- Resorcinol and its salts

2907.22 -- Hydroquinone (quinol) and its salts

2907.23 -- 4,4-Isopropylidenediphenol (bisphenol A, diphenylolpropane) and its salts

2907.29 -- Other

Phenols are obtained by replacing one or more hydrogen atoms of the benzene ring by the hydroxyl radical (-OH).

Replacement of one hydrogen atom gives monohydric phenols (monophenols); replacement of two or more hydrogen atoms results in polyhydric phenols (polyphenols).

This substitution in its turn may affect one or more benzene rings; in the first case mononuclear phenols are obtained, in the second, polynuclear phenols.

The hydroxyl group may also be present as a substitute in benzene homologues; in the case of toluene, a phenol homologue known as cresol is obtained, in the case of xylene, xylenol is obtained.

The heading also covers salts and metal alcoholates of phenols or phenol-alcohols.

(A) MONONUCLEAR MONOPHENOLS

- (1) **Phenol** (hydroxybenzene) (C_6H_5OH). Obtained by fractional distillation of coal tars or by synthesis. White crystals, with a characteristic odour, which turn reddish when exposed to light, or may be in solution. It is an antiseptic product used in pharmacy. It is also used in the manufacture of explosives, synthetic resins, plastics, plasticisers and dyes.

To fall in this heading, phenol must have a purity of 90 % or more by weight. Phenol of lower purity is **excluded (heading 27.07)**.

- (2) **Cresols** ($\text{CH}_3\text{C}_6\text{H}_4\text{OH}$). These phenols derived from toluene are found in varying proportions in coal tar oil.

o-Cresol is a white crystalline powder with a characteristic odour of phenol, deliquescent, turning brown with age; *m*-cresol is a colourless or yellowish oily liquid, strongly refractive, with an odour of creosote; *p*-cresol is a colourless crystalline mass which turns reddish and then brownish when exposed to light; it has the odour of phenol.

To fall in this heading, single or mixed cresols must contain 95 % or more by weight of cresol, all cresol isomers being taken together. Cresols of lower purity are **excluded** (heading 27.07).

- (3) **Octylphenol, nonylphenol and their isomers.**

- (4) **Xylenols** ($(\text{CH}_3)_2\text{C}_6\text{H}_3\text{OH}$). These are phenol derivatives of xylene. Six isomers are known; they are obtained from coal tar oils.

To fall in this heading, single or mixed xylenols must contain 95 % or more by weight of xylenol, all xylenol isomers being taken together. Xylenols of lower purity are **excluded** (heading 27.07).

- (5) **Thymol** (5-methyl-2-isopropylphenol). Found in thyme oil. Colourless crystals with an odour of thyme; used in medicine, in perfumery, etc.

- (6) **Carvacrol** (2-methyl-5-isopropylphenol). An isomer of thymol obtained from origanum oil; a viscous liquid with a penetrating odour.

(B) POLYNUCLEAR MONOPHENOLS

- (1) **Naphthols** ($\text{C}_{10}\text{H}_7\text{OH}$). These are the phenols derived from naphthalene. There are two isomers :

(a) **α -Naphthol**. Colourless, shining crystalline needles, grey lumps or white powder, with a disagreeable odour faintly reminiscent of phenol. It is toxic and is used in organic synthesis (dyes, etc.).

(b) **β -Naphthol**. Brilliant colourless flakes or crystalline powder, white or slightly pink, with a very slight odour of phenol. It has the same uses as α -naphthol, and is also used in medicine and as an antioxidant for rubber, etc.

- (2) ***o*-Phenylphenol**.

(C) POLYPHENOLS

- (1) **Resorcinol** (*m*-dihydroxybenzene). Dihydric phenol; crystallises in tablets or in needles; colourless but turns brown in contact with air. Slight odour of phenol. Used for the manufacture of synthetic dyes and explosives, and in medicine and photography.

- (2) **Hydroquinone** (quinol, *p*-dihydroxybenzene). Small shining crystalline flakes. Used for preparing organic dyes, in medicine and photography, or as an antioxidant especially for the manufacture of rubber.

- (3) **4,4'-Isopropylidenediphenol** (bisphenol A, diphenylolpropane). White flakes.
- (4) **Pyrocatechol** (*o*-dihydroxybenzene). Colourless, shining crystalline needles or tablets, with a slight odour of phenol; used for preparing pharmaceutical and photographic products, etc.
- (5) **Hexylresorcinol**.
- (6) **Heptylresorcinol**.
- (7) **2,5-Dimethylhydroquinone** (2,5-dimethylquinol).
- (8) **Pyrogallol**. Small scales or in a shining white crystalline powder, light and odourless; it readily turns brown in contact with air and light and is toxic. It is used for preparing dyes, as a mordant, in photography, etc.
- (9) **Phloroglucinol**. Large colourless crystals, fluorescent in aqueous solution; used as a reagent in chemical analysis, in medicine, photography, etc.
- (10) **Hydroxyhydroquinone** (1,2,4-trihydroxybenzene). Microscopic colourless crystals or powder which darkens on exposure to light.
- (11) **Dihydroxynaphthalenes** ($C_{10}H_6(OH)_2$). A group of ten compounds obtained by replacing two hydrogen atoms in the ring of the naphthalene molecule by two hydroxyl groups. Some are used in the manufacture of dyes.

(D) PHENOL-ALCOHOLS

These are derived from aromatic hydrocarbons by replacing one hydrogen atom on the benzene ring with a phenolic hydroxyl group, and another hydrogen atom not on the ring with an alcoholic hydroxyl group; thus they have the characteristics of both phenols and alcohols.

The most important is **salicyl alcohol** (saligenin) ($HOC_6H_4CH_2OH$), white crystals, used in medicine as an analgesic and a febrifuge (antipyretic).

29.08 - Halogenated, sulphonated, nitrated or nitrosated derivatives of phenols or phenol-alcohols.

- Derivatives containing only halogen substituents and their salts :

2908.11 -- Pentachlorophenol (ISO)

2908.19 -- Other

- Other :

2908.91 -- Dinoseb (ISO) and its salts

2908.92 -- 4,6-Dinitro-*o*-cresol (DNOC (ISO)) and its salts

2908.99 -- Other

These are derived from phenols and phenol-alcohols by replacing one or more hydrogen atoms by a halogen, a sulpho group ($\text{-SO}_3\text{H}$), a nitro group (-NO_2), a nitroso group (-NO) or by any combination thereof.

(A) HALOGENATED DERIVATIVES

- (1) ***o*-Chlorophenol.** Liquid with a strong odour.
 - (2) ***m*-Chlorophenol.** Colourless crystals.
 - (3) ***p*-Chlorophenol.** Crystalline mass with a disagreeable odour.
- The three products above are used in organic synthesis (e.g., dyes).
- (4) ***p*-Chloro-*m*-cresol** (4-chloro-3-methylphenol). An odourless, disinfectant product, slightly soluble in water but easily emulsified with soap.
 - (5) **Chlorohydroquinone** (chloroquinol).

(B) SULPHONATED DERIVATIVES

- (1) **Phenolsulphonic acids** ($\text{HOCH}_2\text{SO}_3\text{H}$), obtained by sulphonating phenol.
- (2) **Naphtholsulphonic acids**, prepared by direct sulphonation of naphthols, or by other processes of synthesis. They constitute an extensive group of compounds used for the manufacture of dyes and include :
 - (a) **1-Naphthol-4-sulphonic acid** (Neville-Winther acid), brilliant transparent flakes or yellowish-white powder.
 - (b) **2-Naphthol-6-sulphonic acid** (Schaeffer acid), a pinkish-white powder.
 - (c) **2-Naphthol-7-sulphonic acid** (F acid), white powder.
 - (d) **1-Naphthol-5-sulphonic acid**, deliquescent crystals.
 - (e) **2-Naphthol-8-sulphonic acid** (crocein acid), yellowish-white powder.

(C) NITRATED DERIVATIVES

- (1) ***o*-, *m*- and *p*-Nitrophenols** ($\text{HO-C}_6\text{H}_4\text{NO}_2$). Yellowish crystals; used for preparing organic dyestuffs and pharmaceutical products.
- (2) **Dinitrophenols** ($\text{HO-C}_6\text{H}_3(\text{NO}_2)_2$). These are crystalline powders; used for the preparation of explosives, sulphur dyes, etc.
- (3) **Trinitrophenol (picric acid)** ($\text{HO-C}_6\text{H}_2(\text{NO}_2)_3$). Brilliant yellow crystals, odourless and toxic. Used for the treatment of burns and also as an explosive; its salts are known as picrates.
- (4) **Dinitro-*o*-cresols.**
- (5) **Trinitroxylenols.**

(D) NITROSATED DERIVATIVES

- (1) ***o*-, *m*- and *p*-Nitrosophenols.** The fact that nitrosophenols may react in the tautomeric form of quinone oximes does not affect their classification in this heading.
 - (2) **Nitrosonaphthols.**
-

Sub-Chapter IV

ETHERS, ALCOHOL PEROXIDES, ETHER PEROXIDES, KETONE PEROXIDES, EPOXIDES WITH A THREE-MEMBERED RING, ACETALS AND HEMIACETALS, AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

29.09 - Ethers, ether-alcohols, ether-phenols, ether-alcohol-phenols, alcohol peroxides, ether peroxides, ketone peroxides (whether or not chemically defined), and their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Acyclic ethers and their halogenated, sulphonated, nitrated or nitrosated derivatives :

2909.11 -- Diethyl ether

2909.19 -- Other

2909.20 - Cyclanic, cyclenic or cycloterpinic ethers and their halogenated, sulphonated, nitrated or nitrosated derivatives

2909.30 - Aromatic ethers and their halogenated, sulphonated, nitrated or nitrosated derivatives

- Ether-alcohols and their halogenated, sulphonated, nitrated or nitrosated derivatives :

2909.41 -- 2,2'-Oxydiethanol (diethylene glycol, digol)

2909.43 -- Monobutyl ethers of ethylene glycol or of diethylene glycol

2909.44 -- Other monoalkylethers of ethylene glycol or of diethylene glycol

2909.49 -- Other

2909.50 - Ether-phenols, ether-alcohol-phenols and their halogenated, sulphonated, nitrated or nitrosated derivatives

2909.60 - Alcohol peroxides, ether peroxides, ketone peroxides and their halogenated, sulphonated, nitrated or nitrosated derivatives

(A) ETHERS

Ethers may be considered as alcohols or phenols in which the hydrogen atom of the hydroxyl group is replaced by a hydrocarbon radical (alkyl or aryl). They have the general formula : (R-O-R'), where R and R' may be the same or different.

These ethers are very stable, neutral substances.

If the radicals belong to the acyclic series, the ether is also acyclic; cyclic radicals give cyclic ethers.

The first ether in the acyclic series is gaseous, but others are volatile liquids with a characteristic odour of ether; the higher members are liquids or sometimes solids.

(I) Symmetrical acyclic ethers.

- (1) **Diethyl ether** ($C_2H_5OC_2H_5$). Colourless, refractive liquid, with a characteristic burning odour; extremely volatile and very inflammable. Used as an anaesthetic and in organic synthesis.
- (2) **Di(chloroethyl) ether, or dichlorodiethyl ether.**
- (3) **Di-isopropyl ether.**
- (4) **Dibutyl ether.**
- (5) **Dipentyl ether** (diamyl ether).

(II) Non symmetrical acyclic ethers.

- (1) **Ethyl methyl ether.**
- (2) **Ethyl isopropyl ether.**
- (3) **Butyl ethyl ethers.**
- (4) **Pentyl ethyl ethers.**

(III) Cyclanic, cyclenic or cycloterpenic ethers.

(IV) Aromatic ethers.

- (1) **Anisole** ($C_6H_5OCH_3$) (methyl phenyl ether). Colourless liquid with a pleasant odour; used in organic synthesis (e.g., synthetic perfumes) and also as a solvent and vermifuge (anthelmintic).
- (2) **Phenetole** (ethyl phenyl ether) ($C_6H_5OC_2H_5$).
- (3) **Diphenyl ether** ($C_6H_5OC_6H_5$). Colourless crystalline needles with an odour like that of geraniums; used in perfumery.
- (4) **1,2-Diphenoxylethane** (ethylene glycol diphenyl ether).
- (5) **Anethole**, contained in aniseed oil. Small crystals at a temperature below 20 °C; at a higher temperature, it is a mobile liquid with a strong odour of aniseed oil.
- (6) **Dibenzyl ether.**
- (7) **Nitrophenetoles**, nitrated derivatives of phenetole. *o*-Nitrophenetole is a yellow oil. *p*-Nitrophenetole is crystalline.
- (8) **Nitroanisoles**, nitrated derivatives of anisole. *o*-Nitroanisole is liquid. *m*- and *p*-Nitroanisoles are lamelliform crystals. Trinitroanisole is a very violent explosive.
- (9) **2-tert-Butyl-5-methyl-4,6-dinitroanisole** (musk ambrette), yellowish crystals combining the perfumes of ambrette oil and natural musk.

- (10) **β -Naphthyl methyl and ethyl ethers** (artificial neroli oil). Colourless crystalline powders with an odour similar to that of orange-flower oil.
- (11) **Methyl ethers of *m*-cresol and butyl-*m*-cresols.**
- (12) **Phenyl tolyl ether.**
- (13) **Ditoly1 ether.**
- (14) **Benzyl ethyl ether.**

(B) ETHER-ALCOHOLS

These are derived from polyhydric alcohols or phenol-alcohols by replacing the hydrogen of the phenolic hydroxyl group (in the case of phenol-alcohols), or of one of the alcoholic hydroxyl groups (in the case of polyhydric alcohols), by an alkyl or aryl radical.

- (1) **2,2'-Oxydiethanol** (diethylene glycol, digol). Colourless liquid; used in organic synthesis, as a solvent for gums and resins, for the preparation of explosives and plastic materials.
- (2) **Monomethyl, monoethyl, monobutyl and other monoalkylethers of ethylene glycol or diethylene glycol.**
- (3) **Monophenyl ethers of ethylene glycol or of diethylene glycol.**
- (4) **Anisyl alcohol.**
- (5) **Guaietolin** (INN) (glycerol mono (2-ethoxyphenyl)ether); **guaifenesin** (INN) (glycerol mono(2-methoxyphenyl)ether).

(C) ETHER-PHENOLS AND ETHER-ALCOHOL-PHENOLS

These are derived from dihydric phenols or phenol alcohols by replacing the hydrogen of the alcohol hydroxyl group (in the case of phenol alcohols), or of one of the phenol hydroxyl groups (in the case of dihydric phenols), by an alkyl or aryl radical.

- (1) **Guaiacol**, found in beech-wood tar. The main component of wood creosote. Colourless crystals with a characteristic aromatic odour; but once melted, guaiacol remains liquid. Used in medicine and in organic synthesis.
- (2) **Sulfoguaiacol** (INN) (potassium guaiacolsulphonate), a fine powder, extensively used in medicine.
- (3) **Eugenol**, obtained from cloves, a colourless liquid with an odour of carnations.
- (4) **Isoeugenol**, obtained synthetically from eugenol. A component of nutmeg oil.
- (5) **Pyrocatechol monoethyl ether** (guaethol), found in Swedish pine-wood oil. Caustic, colourless crystals with an aromatic odour.

(D) ALCOHOL PEROXIDES, ETHER PEROXIDES AND KETONE PEROXIDES

These are compounds of the ROOH, ROOR¹ and ROOR²OOR¹ series, in which R, R¹ and R² are organic radicals and R and R¹ may be the same or different.

Examples are ethyl * hydroperoxide, diethyl peroxide and 1,1-di(tert-butylperoxy)cyclohexane.

This heading also includes **ketone peroxides** (whether or not chemically defined), e.g., cyclohexanone peroxide (1-hydroperoxycyclohexyl 1-hydroxycyclohexyl peroxide).

*
* *

This heading also covers the halogenated, sulphonated, nitrated or nitrosated derivatives of ethers, ether-alcohols, ether-phenols, ether-alcohol-phenols, alcohol peroxides, ether peroxides or ketone peroxides, and compound derivatives (for example, nitrosulphonated, sulphohalogenated, nitrohalogenated and nitrosulphohalogenated derivatives).

This heading **excludes** peroxyketals (**heading 29.11**).

29.10 - Epoxides, epoxyalcohols, epoxyphenols and epoxyethers, with a three-membered ring, and their halogenated, sulphonated, nitrated or nitrosated derivatives.

2910.10 - Oxirane (ethylene oxide)

2910.20 - Methyloxirane (propylene oxide)

2910.30 - 1-Chloro-2,3-epoxypropane (epichlorohydrin)

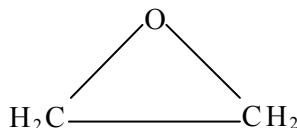

2910.40 - Dieldrin (ISO, INN)

2910.50 - Endrin (ISO)

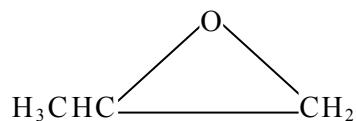

2910.90 - Other

If one molecule of water is removed from organic compounds (diols, glycols) having two hydroxyl groups in the molecule, stable internal ethers are formed.

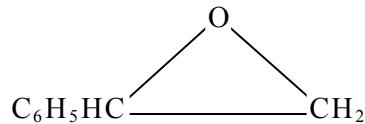

Thus ethylene glycol minus one molecule of water gives **oxirane (ethylene oxide or epoxyethane)** :

The epoxide derived from propylene glycol (i.e., ethylene glycol in which one atom of hydrogen has been replaced by a methyl radical ($-\text{CH}_3$) is known as **methyloxirane (1,2-epoxypropane or propylene oxide)** :

The epoxide derived from ethylene glycol in which one atom of hydrogen has been replaced by a phenyl radical ($-\text{C}_6\text{H}_5$) is known as **styrene oxide (α - β -epoxyethylbenzene)** :

This heading covers **only** compounds with three-membered epoxy rings, e.g. :

- (1) **Oxirane** (ethylene oxide). Colourless gas at room temperature; liquid below 12 °C. Obtained by catalytic oxidation of ethylene derived from cracking gases. An insecticide and fungicide; extensively used for preserving fruit and other foodstuffs. Also used in organic synthesis, and in the manufacture of plasticisers and surface-active products.

(2) **Methyloxirane** (propylene oxide). Colourless liquid with an ether-like odour; used as a solvent for cellulose nitrate, cellulose acetate, gums and resins, and as an insecticide; also employed in organic synthesis (plasticisers and surface-active products, etc.).

(3) **Styrene oxide.**

This heading also includes :

(A) **Epoxyalcohols, epoxyphenols and epoxyethers.** These contain alcohol, phenol and ether functions, respectively, in addition to the epoxide grouping.

(B) **Halogenated, sulphonated, nitrated or nitrosated derivatives of epoxides,** and any combinations of these derivatives (for example, nitrosulphonated, sulphohalogenated, nitrohalogenated and nitrosulphohalogenated derivatives).

These halogenated derivatives include : **1-chloro-2,3-epoxypropane** (epichlorohydrin), a highly volatile, unstable liquid.

This heading **excludes** epoxides with four-membered rings (**heading 29.32**).

29.11 - Acetals and hemiacetals, whether or not with other oxygen function, and their halogenated, sulphonated, nitrated or nitrosated derivatives.

(A) ACETALS AND HEMIACETALS

Acetals may be regarded as di-ethers of (normally hypothetical) hydrates of aldehydes and ketones.

Hemiacetals are mono-ethers in which the carbon-atom adjacent to the ether-oxygen atom also bears a hydroxyl group.

“Acetals and hemiacetals with other oxygen function” are acetals and hemiacetals containing one or more of the oxygen functions (e.g., alcohol function) referred to in the previous headings of this Chapter.

This heading also covers peroxyketals.

- (1) **Methylal** ($\text{CH}_2(\text{OCH}_3)_2$). Dimethyl ether of the hypothetical hydrate of formaldehyde. Colourless liquid with an ether-like odour; used as a solvent, as an anaesthetic and in organic synthesis.
- (2) **Dimethylacetal** ($\text{CH}_3\text{CH}(\text{OCH}_3)_2$). Dimethyl ether of the hypothetical hydrate of acetaldehyde; used as an anaesthetic.
- (3) **Diethylacetal** ($\text{CH}_3\text{CH}(\text{OC}_2\text{H}_5)_2$). Also derived from the hypothetical hydrate of acetaldehyde. A colourless liquid with an agreeable ether-like odour; used as a solvent and as an anaesthetic.
- (4) **1,1-di(tert-butylperoxy)cyclohexane** ($\text{C}_{14}\text{H}_{28}\text{O}_4$).^{*}

The heading excludes polyvinyl acetals (heading 39.05).

(B) HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES OF ACETALS AND HEMIACETALS

These are compounds obtained by wholly or partly replacing one or more of the hydrogen atoms in the acetal by halogens (e.g., chloral alcoholate, chloropropyl acetal), sulfo groups (-SO₃H), nitro groups (-NO₂) or nitroso groups (-NO).

This heading also covers any combinations of these derivatives (for example, nitrohalogenated, nitrosulphonated, sulphohalogenated and nitrosulphohalogenated derivatives).

Sub-Chapter V

ALDEHYDE-FUNCTION COMPOUNDS

29.12 - Aldehydes, whether or not with other oxygen function; cyclic polymers of aldehydes; paraformaldehyde.

- Acyclic aldehydes without other oxygen function :

2912.11 -- Methanal (formaldehyde)

2912.12 -- Ethanal (acetaldehyde)

2912.19 -- Other

- Cyclic aldehydes without other oxygen function :

2912.21 -- Benzaldehyde

2912.29 -- Other

- Aldehyde-alcohols, aldehyde-ethers, aldehyde-phenols and aldehydes with other oxygen function :

2912.41 -- Vanillin (4-hydroxy-3-methoxybenzaldehyde)

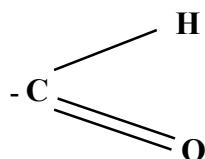

2912.42 -- Ethylvanillin (3-ethoxy-4-hydroxybenzaldehyde)

2912.49 -- Other

2912.50 - Cyclic polymers of aldehydes

2912.60 - Paraformaldehyde

These are compounds formed by oxidising primary alcohols; they contain the characteristic group :

They are generally colourless liquids with a strong, penetrating odour; many aromatic aldehydes readily oxidise on contact with air, being converted into acids.

The term "aldehydes, with other oxygen function" means aldehydes which contain also one or more of the oxygen functions referred to in previous sub-Chapters (alcohol, phenol, ether, etc., functions).

(A) ALDEHYDES

(I) Saturated acyclic aldehydes.

- (1) **Methanal** (formaldehyde) (HCHO). Obtained by catalytic oxidation of methanol. Colourless gas with a penetrating odour, highly soluble in water. Its aqueous solutions at about 40 % are known as formalin or formol, a colourless liquid with a penetrating and suffocating odour. These solutions may contain methanol as a stabiliser.
Methanal has many applications; in organic synthesis (dyestuffs, explosives, pharmaceutical products, synthetic tanning agents, plastics, etc.), as an antiseptic, deodorant and reducing agent.
- (2) **Ethanal** (acetaldehyde) (CH_3CHO). Obtained by oxidation of ethanol or from acetylene. Mobile, colourless liquid with a pungent, fruity odour; caustic; very volatile, inflammable; miscible with water, alcohol and ether. Used in organic synthesis to make plastics, varnishes, or in medicine as an antiseptic.
- (3) **Butanal** (butyraldehyde, normal isomer) ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO}$). Colourless liquid, miscible with water, alcohol and ether; used for the preparation of plastics, perfumes and accelerators for vulcanising rubber.
- (4) **Heptanal** (heptaldehyde, oenanthol) ($\text{CH}_3(\text{CH}_2)_5\text{CHO}$). Obtained by distilling castor oil; a colourless liquid with a penetrating odour.
- (5) **Octanal** (caprylaldehyde) ($\text{C}_8\text{H}_{16}\text{O}$); **nonanal** (pelargonaldehyde) ($\text{C}_9\text{H}_{18}\text{O}$); **decanal** (capraldehyde) ($\text{C}_{10}\text{H}_{20}\text{O}$); **undecanal** (undecylic aldehyde) ($\text{C}_{11}\text{H}_{22}\text{O}$); **dodecanal** (lauraldehyde) ($\text{C}_{12}\text{H}_{24}\text{O}$), etc. These are used as raw materials in the perfumery industry.

(II) Unsaturated acyclic aldehydes.

- (1) **Propenal** (acrylaldehyde, acraldehyde, acrolein) ($\text{CH}_2=\text{CHCHO}$). Formed when fatty matter is burned; a liquid with a characteristic bitter and irritating odour; used in organic synthesis.
- (2) **2-Butenal** (crotonaldehyde) ($\text{CH}_3\text{CH}=\text{CHCHO}$). Found in the first distillation products of crude alcohol; a colourless liquid with a penetrating odour.
- (3) **Citral**. Liquid with an agreeable odour, found in essential oil of tangerine, of citron, of lemons and, more especially, in lemon grass oil.
- (4) **Citronellaldehyde**. Found in citron oil.

(III) Cyclanic, cyclenic and cycloterpinic aldehydes.

- (1) **Phellandral** or tetrahydrocumarinaldehyde. Found in fennel and eucalyptus oils.
- (2) **Cyclocitrals A and B**. Obtained from citral.
- (3) **Perillaldehyde**. Found in essential oils of the *Perilla mankinensis*.
- (4) **Safranal**.

(IV) Aromatic aldehydes.

- (1) **Benzaldehyde** (C_6H_5CHO). Highly refractive, colourless liquid with a characteristic odour of bitter almonds; used in organic synthesis, in medicine, etc.
- (2) **Cinnamaldehyde** ($C_6H_5CH=CHCHO$). Oily yellowish liquid with a strong odour of cinnamon; used in perfumery.
- (3) **α -Amylcinnamaldehyde**.
- (4) **3-p-Cumenyl-2-methylpropionaldehyde**.
- (5) **Phenylacetaldehyde** ($C_6H_5CH_2CHO$). Liquid with a pronounced odour of hyacinths; used in perfumery.

(B) ALDEHYDE-ALCOHOLS, ALDEHYDE-ETHERS, ALDEHYDE-PHENOLS AND ALDEHYDES WITH OTHER OXYGEN FUNCTION

Aldehyde-alcohols are compounds which contain both the aldehyde function and the alcohol function.

Aldehyde-ethers are ethers which contain also the aldehyde group (-CHO).

Aldehyde-phenols are compounds which contain both the phenolic hydroxyl group (C_6H_5OH) and the aldehyde group (-CHO).

The most important aldehyde-alcohols, aldehyde-phenols and aldehyde-ethers are :

- (1) **Aldol** ($CH_3CH(OH)CH_2CHO$). Obtained by aldol condensation of acetaldehyde; colourless liquid which, when left undisturbed, polymerises to a crystalline mass (paraldol). Used in organic synthesis, for the manufacture of plastics, and in the flotation of ores.
- (2) **Hydroxycitronellaldehyde** ($C_{10}H_{20}O_2$). Colourless, slightly syrupy liquid with a very pronounced odour of lily of the valley; used as a fixative in perfumery.
- (3) **Glycollaldehyde** ($HOCH_2CHO$). Crystallises in colourless crystals.
- (4) **Vanillin** (4-hydroxy-3-methoxybenzaldehyde). The methyl ether of 3,4-dihydroxybenzaldehyde (protocatechualdehyde); found in vanilla. Brilliant needles or crystalline white powder.
- (5) **Ethylvanillin** (3-ethoxy-4-hydroxybenzaldehyde). Fine white crystals.
- (6) **Salicylaldehyde** (*o*-hydroxybenzaldehyde) (HOC_6H_4CHO). Colourless oily liquid with a characteristic odour of bitter almonds; used for the manufacture of synthetic perfumes.
- (7) **3,4-Dihydroxybenzaldehyde** (protocatechualdehyde) ($((HO)_2C_6H_3CHO$). Brilliant colourless crystals.
- (8) **Anisaldehyde** ($CH_3OC_6H_4CHO$) (*p*-methoxybenzaldehyde). Found in aniseed and fennel oils; colourless liquid. Used in perfumery under the name of "hawthorn essence (aubepine)".

(C) CYCLIC POLYMERS OF ALDEHYDES

- (1) **Trioxan** (trioxymethylene). A solid polymer of formaldehyde; white crystalline substance, soluble in water, alcohol or ether.
- (2) **Paraldehyde**. A polymer of ethanal; colourless liquid with an agreeable ether-like odour, highly inflammable. Used in organic synthesis, as a soporific and disinfectant in medicine, etc.
- (3) **Metaldehyde**. Also a polymer of ethanal; crystalline white powder, insoluble in water. This heading covers **only** metaldehyde in the form of crystals or powders.

Metaldehyde put up in forms (for example, tablets, sticks or similar forms) for use as fuels is **excluded** (**heading 36.06**) (see Note 2 (a) to Chapter 36).

(D) PARAFORMALDEHYDE

This polymer ($\text{HO}(\text{CH}_2\text{O})_n\text{H}$) is obtained by evaporating aqueous solutions of formaldehyde. A solid, white, flaky or powdered substance with a pronounced odour of formaldehyde. It is used to prepare plastics, waterproof glues and pharmaceutical products, and also as a disinfectant and a preserving agent.

This heading **excludes** aldehyde-bisulphite compounds which are classified as sulphonated derivatives of alcohols (**headings 29.05 to 29.11**).

29.13 - Halogenated, sulphonated, nitrated or nitrosated derivatives of products of heading 29.12.

These are derived from aldehydes by replacing one or more of the hydrogen atoms (other than a hydrogen in the aldehyde group (-CHO) by one or more halogens, sulpho groups (-SO₃H), nitro groups (-NO₂) or nitroso groups (-NO) or by any combination thereof.

The most important is **chloral** (trichloroacetaldehyde) (Cl₃CCHO); anhydrous, mobile, colourless liquid with a penetrating odour; a hypnotic.

This heading **excludes** chloral hydrate (Cl₃CCH(OH)₂) (2,2,2-trichloroethane-1,1-diol) which falls in **heading 29.05**.

This heading also **excludes** aldehyde-bisulphite compounds which are classified as sulphonated derivatives of alcohols (**headings 29.05 to 29.11**).

Sub-Chapter VI

KETONE-FUNCTION COMPOUNDS AND QUINONE-FUNCTION COMPOUNDS

29.14 - Ketones and quinones, whether or not with other oxygen function, and their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Acyclic ketones without other oxygen function :

2914.11 -- Acetone

2914.12 -- Butanone (methyl ethyl ketone)

2914.13 -- 4-Methylpentan-2-one (methyl isobutyl ketone)

2914.19 -- Other

- Cyclanic, cyclenic or cycloterpenic ketones without other oxygen function :

2914.22 -- Cyclohexanone and methylcyclohexanones

2914.23 -- Ionones and methylionones

2914.29 -- Other

- Aromatic ketones without other oxygen function :

2914.31 -- Phenylacetone (phenylpropan-2-one)

2914.39 -- Other

2914.40 - Ketone-alcohols and ketone-aldehydes

2914.50 - Ketone-phenols and ketones with other oxygen function

- Quinones :

2914.61 -- Anthraquinone

2914.62 -- Coenzyme Q10 (ubidecarenone (INN))

2914.69 -- Other

- Halogenated, sulphonated, nitrated or nitrosated derivatives :

2914.71 -- Chlordecone (ISO)

2914.79 -- Other

The term "ketones and quinones with other oxygen function" means ketones and quinones which contain also one or more of the oxygen functions referred to in previous sub-Chapters (alcohol, ether, phenol, aldehyde, etc., functions).

(A) KETONES

These are compounds containing the group ($>\text{C}=\text{O}$), so-called " carbonyl " group, and can be represented by the general formula ($\text{R}-\text{CO}-\text{R}'$), in which R and R' stand for alkyl or aryl radicals (methyl, ethyl, propyl, phenyl, etc.).

Ketones may have two tautomeric forms, the true ketonic form (-CO-) and the enolic form (=C(OH)-), both of which fall in this heading.

(I) Acyclic ketones.

- (1) **Acetone** (propanone) (CH_3COCH_3). Found in the products of the dry distillation of wood (methyl alcohol and crude pyroligneous acid), but is mainly obtained by synthesis. Colourless liquid with an agreeable ether-like odour. Used in numerous organic syntheses, for the manufacture of plastics, as a solvent for acetylene, acetylcellulose and resins, etc.
- (2) **Butanone** (methyl ethyl ketone) ($\text{CH}_3\text{COC}_2\text{H}_5$). Colourless liquid found in the by-products of the distillation of alcohol from beet molasses. Also obtained by the oxidation of secondary butyl alcohol.
- (3) **4-Methylpentan-2-one** (methyl isobutyl ketone) ($(\text{CH}_3)_2\text{CHCH}_2\text{COCH}_3$). Liquid with an agreeable odour; used as a solvent for cellulose nitrate, gums and resins.
- (4) **Mesityl oxide**. Colourless liquid formed by the condensation of two acetone molecules.
- (5) **Phorones**. Compounds formed by the condensation of three acetone molecules.
- (6) **Pseudoionones**. Complex ketones, liquid, yellowish in colour, smelling of violets; used for the preparation of ionone (artificial violet oil).
- (7) **Pseudomethylionones**. Liquids with the same properties as pseudoionones, with a violet-like odour. Used in perfumery.
- (8) **Diacetyl** ($\text{CH}_3\text{COCOCH}_3$). Greenish-yellow liquid, with a penetrating quinone-like odour. Used for flavouring butter and margarine.
- (9) **Acetylacetone** ($\text{CH}_3\text{COCH}_2\text{COCH}_3$). Colourless liquid, with an agreeable odour; used in organic synthesis.
- (10) **Acetonylacetone** ($\text{CH}_3\text{COCH}_2\text{CH}_2\text{COCH}_3$). Colourless liquid with an agreeable odour; used in organic synthesis.

(II) Cyclanic, cyclenic or cycloterpenic ketones.

- (1) **Camphor** ($\text{C}_{10}\text{H}_{16}\text{O}$). The heading covers **both** natural and synthetic camphor. The former is obtained from the *Laurus camphora* tree, indigenous to China and Japan. Synthetic camphor is derived from pinene (obtained from spirits of turpentine). Both are colourless crystalline masses, translucent, soft to the touch, and with a characteristic odour. Natural and synthetic camphor are used in medicine as an antiseptic, for the manufacture of celluloid and in moth balls.

So-called "Borneo camphor" or "borneol" is not a ketone but an alcohol, and is formed by reducing camphor; it is **excluded (heading 29.06)**.

- (2) **Cyclohexanone** ($C_6H_{10}O$). Obtained by synthesis; a liquid with an odour similar to that of acetone. Strong solvent for acetylcellulose and natural or artificial resins.
- (3) **Methylcyclohexanones**. Liquids insoluble in water.
- (4) **Ionones** ($C_{13}H_{20}O$), formed by the condensation of citral with acetone. They include :
 - (a) **α -Ionone**. Colourless liquid with a strong violet-like odour.
 - (b) **β -Ionone**. Colourless liquid with a violet-like odour less delicate than that of α -ionone.Both are used in perfumery.
- (5) **Methylionones**. Colourless to amber-yellow liquids.
- (6) **Fenchone** ($C_{10}H_{16}O$). Occurs in fennel and thuja oils. A clear, colourless liquid, with a camphor-like odour; used as a camphor substitute.
- (7) **Irone**. Occurs in the essential oil obtained from the roots of some varieties of iris. An oily liquid, colourless, with an iris-like odour; strongly diluted, it has a delicate, violet-like odour. Used in perfumery.
- (8) **Jasmone** ($C_{11}H_{16}O$). Derived from jasmine-blossom. A light yellow oil with a strong jasmine odour, used in perfumery.
- (9) **Carvone** ($C_{10}H_{14}O$). Occurs in caraway, aniseed and mint oils. A colourless liquid, with a strong aromatic odour.
- (10) **Cyclopentanone** (adipoketone) (C_4H_8CO). Occurs in the distillation products of wood. A liquid with a mint-like odour.
- (11) **Menthone** ($C_{10}H_{18}O$). Found in peppermint and other essential oils. Obtained synthetically by oxidation of menthol. An unstable, colourless, refractive liquid, with an odour of mint.

(III) **Aromatic ketones**.

- (1) **Methyl naphthyl ketone**.
- (2) **Benzylideneacetone** ($C_6H_5CH=CHCOCH_3$). Colourless crystals, smelling of sweet peas.
- (3) **Acetophenone** ($CH_3COC_6H_5$). Oily, colourless or yellow liquid, with an agreeable aromatic odour; used in perfumery and for organic synthesis.
- (4) **Propiophenone**.
- (5) **Methylacetophenone** ($CH_3C_6H_4COCH_3$). Colourless or yellowish liquid, with an agreeable odour.

- (6) **Butyldimethylacetophenone.**
- (7) **Benzophenone** ($C_6H_5COC_6H_5$). Colourless or slightly yellow crystals with an agreeable ether-like odour. Used in the manufacture of synthetic perfumes and for organic synthesis.
- (8) **Benzanthrone.** Yellowish needles.
- (9) **Phenylacetone** (phenylpropan-2-one). Colourless to light yellow liquid. Used principally in organic synthesis and as a precursor in the production of amphetamines (see the list of precursors at the end of Chapter 29).

(B) KETONE-ALCOHOLS

Compounds whose molecules contain both the alcohol and ketone functions.

- (1) **4-Hydroxy-4-methylpentan-2-one** (diacetone alcohol). Colourless liquid.
- (2) **Acetol** (acetylcarbinol) (CH_3COCH_2OH). Colourless liquid with a penetrating odour; used as a solvent for cellulose varnishes and resins.

(C) KETONE-ALDEHYDES

Compounds whose molecules contain both the ketone and aldehyde functions.

(D) KETONE-PHENOLS

Compounds whose molecules contain both the ketone and phenol functions.

(E) QUINONES

These are diketones derived from aromatic compounds by conversion of two $\geqslant CH$ groups into $>C=O$ groups with any necessary rearrangement of double bonds.

- (1) **Anthraquinone** ($C_6H_4(CO)_2C_6H_4$). Yellow needles which, when ground, give a white powder. Used in the manufacture of dyes.
- (2) **p-Benzoquinone** (quinone) ($C_6H_4O_2$). Yellow crystals with a penetrating odour.
- (3) **1,4-Naphthoquinone** ($C_{10}H_6O_2$). Yellow needles.
- (4) **2-Methylantraquinone.** White needles.
- (5) **Acenaphthenequinone.** Yellow needles.
- (6) **Phenanthraquinone.** Yellow needles.

(F) QUINONE-ALCOHOLS, QUINONE-PHENOLS, QUINONE-ALDEHYDES AND OTHER OXYGEN FUNCTION QUINONES

Quinone-alcohols, quinone-phenols and quinone-aldehydes are compounds which, independently of their quinone function, also contain, in their molecules, alcohol, phenol and aldehyde functions, respectively.

- (1) **α -Hydroxyanthraquinone**.
- (2) **Quinizarin**.
- (3) **Chrysazin**.
- (4) **Coenzyme Q10*** (ubidecarenone (INN)).

(G) HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES OF KETONES, QUINONES, KETONE-ALCOHOLS, ETC., QUINONE-ALCOHOLS, ETC.

- (1) **Bromocamphor** ($C_{10}H_{15}OBr$). Needles with a strong camphor-like odour. Used as a sedative.
- (2) **4'-Tert-butyl-2',6'-dimethyl-3',5'-dinitroacetophenone** (ketone musk).
- (3) **Camphorsulphonic acid**.
- (4) **Chlordecone** (ISO).

*
* *

This heading also covers combinations of halogenated, sulphonated, nitrated or nitrosated derivatives (e.g., sulphohalogenated, nitrohalogenated, nitrosulphonated and nitrosulphohalogenated derivatives).

Organic colouring matter is **excluded** from this heading (**Chapter 32**). The heading also **excludes** ketone-bisulphite compounds which are classified as sulphonated derivatives of alcohols (**headings 29.05 to 29.11**).

Sub-Chapter VII

CARBOXYLIC ACIDS AND THEIR ANHYDRIDES, HALIDES, PEROXIDES AND PEROXYACIDS AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

GENERAL

This sub-Chapter covers the **carboxylic acids** which contain the characteristic function ($-COOH$), called the carboxyl group. In theory, the heading also covers the **ortho-acids** ($RC(OH)_3$) since these may be regarded as hydrated carboxylic acids ($RCOOH + H_2O = RC(OH)_3$). In practice, however, these do not exist in the free state, but they do give rise to stable esters (ortho-esters, to be regarded as esters of hydrated carboxylic acids).

Carboxylic acids may contain one or more carboxyl groups ($-COOH$) (monocarboxylic acids or polycarboxylic acids, respectively).

If the hydroxyl group ($-OH$) is removed, the residue is an acyl radical which can be represented by the formula ($RCO-$) where R is an alkyl or aryl radical (methyl, ethyl, phenyl, etc.). Acyl radicals enter into the formulae of **anhydrides, halides, peroxides, peroxyacids, esters and salts**.

Sulphonic acids, which contain the group ($-SO_3H$) are quite different from carboxylic acids; they are classified as sulphonated derivatives in various sub-Chapters. This sub-Chapter includes only those which are sulphonated derivatives of the chemicals of this sub-Chapter.

(A) ACID ANHYDRIDES

Acid anhydrides result from the elimination of a molecule of water, either from two molecules of a monobasic acid, or from one molecule of dibasic acid. They are characterised by the group ($-C(O)OC(O)-$).

(B) ACID HALIDES

The halides (e.g., chlorides and bromides) of acids have the general formula ($RCOX$, where X is a halogen), i.e., they are represented by acyl radicals combined with chlorine, bromine or other halogens.

(C) ACID PEROXIDES

Acid peroxides, also known as diacyl peroxides, are compounds in which two acyl radicals are linked by two oxygen atoms; their general formula is $RC(O)OOC(O)R'$, in which R and R' may be the same or different.

(D) PEROXYACIDS

Peroxyacids have the general formula ($RC(O)OOH$).

(E) ESTERS OF ACIDS

Esters of carboxylic acids are obtained by replacing the hydrogen atom of the carboxyl group ($-COOH$) by an alkyl or aryl radical. They may be represented by the general formula $(RC(O)OR')$ in which R and R' are alkyl or aryl radicals (methyl, ethyl, phenyl, etc.).

(F) PEROXYESTERS

The general formula of peroxyesters is $RC(O)OOR'$, in which R and R' are organic radicals that may be the same or different.

(G) SALTS OF ACIDS

Salts of carboxylic acids are obtained by replacing the hydrogen atom of the carboxyl group ($-COOH$) by an inorganic cation, for example, sodium, potassium, ammonium. They may be represented by the formula $(RC(O)OM)$ in which R is an alkyl, aryl or alkaryl radical and M is a metallic or other inorganic cation.

(H) HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES OF ACIDS

In the halogenated, sulphonated, nitrated or nitrosated derivatives of the compounds described in Parts (A) to (F) above, the oxygen-containing functional groups remain intact, but one or more hydrogens in the radicals R or R' have been replaced, respectively, by halogens, sulpho ($-SO_3H$), nitro ($-NO_2$) or nitroso ($-NO$) groups or by any combination thereof.

29.15 - Saturated acyclic monocarboxylic acids and their anhydrides, halides, peroxides and peroxyacids; their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Formic acid, its salts and esters :

2915.11 -- Formic acid

2915.12 -- Salts of formic acid

2915.13 -- Esters of formic acid

- Acetic acid and its salts; acetic anhydride :

2915.21 -- Acetic acid

2915.24 -- Acetic anhydride

2915.29 -- Other

- Esters of acetic acid :

2915.31 -- Ethyl acetate

2915.32 -- Vinyl acetate

- 2915.33 - - *n*-Butyl acetate
- 2915.36 - - Dinoseb (ISO) acetate
- 2915.39 - - Other
- 2915.40 - Mono-, di- or trichloroacetic acids, their salts and esters
- 2915.50 - Propionic acid, its salts and esters
- 2915.60 - Butanoic acids, pentanoic acids, their salts and esters
- 2915.70 - Palmitic acid, stearic acid, their salts and esters
- 2915.90 - Other

This heading covers saturated acyclic monocarboxylic acids and their anhydrides, halides, peroxides and peroxyacids, esters and salts, as well as the halogenated, sulphonated, nitrated or nitrosated derivatives (including compound derivatives) of any of these products.

(I) Formic acid (HCOOH) and its salts and esters.

- (a) **Formic acid** is found in nature and obtained synthetically. A mobile, colourless liquid, giving off slight fumes when exposed to air; has an irritating odour and is caustic. Used in dyeing, in tanning, in the coagulation of latex, in medicine as an antiseptic, or in organic synthesis.
- (b) **The main salts of formic acid are :**
 - (1) **Sodium formate** (HCOONa). Deliquescent crystalline white powder; used in medicine, in tanning and in organic synthesis.
 - (2) **Calcium formate** ((HCOO)₂Ca). Crystals.
 - (3) **Aluminium formate** ((HCOO)₃Al). White powder used in the textile industry as a mordant and for waterproofing. There is also a basic formate usually put up in aqueous solution.
 - (4) **Nickel formate** ((HCOO)₂Ni). Used as a catalyst for the hydrogenation of oil.
- (c) **The main esters of formic acid are :**
 - (1) **Methyl formate** (HCOOCH₃). A colourless liquid with an agreeable odour.
 - (2) **Ethyl formate** (HCOOC₂H₅). A colourless, mobile, volatile and inflammable liquid with an odour of rum.
 - (3) **Benzyl, bornyl, citronellyl, geranyl, isobornyl, linalyl, menthyl, phenylethyl, rhodinyl and terpenyl formates.** Mainly used in perfumery.

(II) Acetic acid (CH₃COOH) and its salts and esters.

- (a) **Acetic acid** is obtained by the dry distillation of wood, or synthetically. A very acid liquid with a characteristic and penetrating odour of vinegar caustic. When cold it solidifies into colourless crystals (glacial acetic acid). A solvent for phosphorus and sulphur and for many organic substances.

Commercial acetic acid is slightly yellowish in colour, and has very often a slight empyreumatic odour. Used in the textile industry, in tanning, as a coagulant for latex, or for the manufacture of acetates, synthetic plasticisers, pharmaceutical products, etc.

(b) **The main salts of acetic acid are :**

- (1) **Sodium acetate** (CH_3COONa). Colourless and odourless crystals, or anhydrous white or faintly yellow powder. Used as a mordant and for many chemical preparations.
- (2) **Cobalt acetate** ($(\text{CH}_3\text{COO})_2\text{Co}$). Deliquescent violet-red crystals with an odour of acetic acid.
- (3) **Calcium acetate** ($(\text{CH}_3\text{COO})_2\text{Ca}$). Colourless crystals when pure.
- (4) **Basic copper acetate** ($\text{CH}_3\text{COOCuOH}$). Needles or small crystalline flakes, blue in colour; disintegrates on contact with air and turns greenish.
- (5) **Neutral copper acetate** ($(\text{CH}_3\text{COO})_2\text{Cu}$). Greenish-blue powder or small crystals; disintegrates on contact with air and turns to a whitish powder
- (6) **Lead acetate**, neutral ($(\text{CH}_3\text{COO})_2\text{Pb}$), or basic (e.g., $\text{Pb}(\text{CH}_3\text{COO})_2 \cdot 3\text{PbO} \cdot \text{H}_2\text{O}$). The neutral acetate occurs as colourless or faintly yellow or blue, toxic crystals. The basic acetate is a dense, white powder, used in medicine and as a reagent for chemical analyses.
- (7) **Lithium and potassium acetates**, used in medicine; **chromium, aluminium and iron acetates**, used as mordants.

(c) **The main esters of acetic acid are :**

- (1) **Methyl acetate** ($\text{CH}_3\text{COOCH}_3$). Found amongst the products of the dry distillation of wood. A liquid with a fruity odour; used for preparing artificial fruit essences, and as a solvent for fats, resins and cellulose nitrate, etc.
- (2) **Ethyl acetate** ($\text{CH}_3\text{COOC}_2\text{H}_5$). Colourless, very mobile, highly inflammable liquid with a fruity odour; it may contain ethanol as an impurity. Used as a solvent for cellulose nitrate, varnishes, etc.; also in medicine as an antispasmodic and analgesic.
- (3) **Vinyl acetate** ($\text{CH}_3\text{COOCH=CH}_2$). Colourless liquid with a characteristic odour; a monomer used for preparing poly(vinyl acetate) (polymers of **heading 39.05**).
- (4) ***n*-Propyl and isopropyl acetates**. Used for making artificial fruit essences.
- (5) ***n*-Butyl acetate**. Colourless liquid; used for making artificial fruit essences and as a solvent.
- (6) **Isobutyl acetate**. Colourless liquid; used for making artificial fruit essences and as a solvent.

- (7) ***n*-Pentyl acetate** (*n*-amyl acetate) and **3-methylbutyl acetate** (iso-amyl acetate). Used for making artificial fruit essences.
- (8) **2-Ethoxyethyl acetate**.
- (9) **Benzyl, terpenyl, linalyl, geranyl, citronellyl, anisyl, paratolyl, cinnamyl, phenylethyl, bornyl and isobornyl acetates**. All used in perfumery.
- (10) **Glycerol acetates** (mono-, di-, triacetin).

The heading also includes **acetic anhydride** ((CH₃CO)₂O). Colourless liquid with a strong, irritating odour; caustic; used for chemical syntheses.

(III) Mono-, di- and trichloroacetic acids and their salts and esters.

- (a) **Monochloroacetic acid** (ClCH₂COOH). Colourless crystals.
- (b) **Dichloroacetic acid** (Cl₂CHCOOH). Colourless liquid.
- (c) **Trichloroacetic acid** (Cl₃CCOOH). Colourless crystals with penetrating odour; used in organic synthesis and in medicine.

(IV) Propionic acid (CH₃CH₂COOH) and its salts and esters. Propionic acid is a liquid with an odour similar to acetic acid.

(V) Butanoic acids and their salts and esters.

- (a) **Butyric acid (butanoic acid)** is a dense, oily liquid with a disagreeable rancid odour; colourless. Used for deliming hides.
- (b) **Isobutyric acid (2-methylpropanoic acid)**.

(VI) Pentanoic acids and their salts and esters.

- (a) **Valeric acid (pentanoic acid)** is a colourless, transparent oily liquid with a disagreeable rancid odour.
- (b) **Isovaleric acid (3-methylbutanoic acid)**.
- (c) **Pivalic acid (2,2-dimethylpropanoic acid)**.
- (d) **2-Methylbutanoic acid**.

(VII) Palmitic acid (CH₃(CH₂)₁₄COOH) and its salts and esters.

- (a) **Palmitic acid** is found in fats as a glyceride; it is a white powder, shiny crystals or colourless flakes.
- (b) **Its main salts are :**
 - (1) **Calcium palmitate**, used in perfumery.

- (2) **Aluminium palmitate**, used for water-proofing textiles and for thickening lubricating oils.

The water-soluble palmitic salts (e.g., sodium, potassium and ammonium palmitates) are soaps but they remain classified in this heading.

(VIII) Stearic acid ($\text{CH}_3(\text{CH}_2)_{16}\text{COOH}$) and its salts and esters.

- (a) **Stearic acid** is found in fats as a glyceride; white, amorphous, and similar to wax.
- (b) **Its main salts are :**
 - (1) **Calcium stearate**, used in water-proofing textiles.
 - (2) **Magnesium stearate**, used in the manufacture of varnishes.
 - (3) **Zinc stearate**, used in medicine, in the rubber and plastics industries, and in the manufacture of oil-cloth.
 - (4) **Aluminium stearate**, used for the same purposes as aluminium palmitate.
 - (5) **Copper stearate**, used for bronzing plaster and as an antifouling agent.
 - (6) **Lead stearate**, used as a drier.

The water-soluble stearic salts (e.g., sodium, potassium and ammonium stearates) are soaps but they remain classified in this heading.

- (c) The **esters also include** ethyl and butyl stearates (used as plasticisers), and glycol stearate (used as a substitute for natural wax).

(IX) Other products of this heading include :

- (a) **Ethyl chloroformate**, sometimes called ethyl chlorocarbonate - a colourless, lachrymatory liquid with a suffocating odour; inflammable. Used in organic synthesis.
- (b) **Acetyl chloride** (CH_3COCl). Colourless liquid; when exposed to air gives off fumes irritating to the eyes; it has a strong odour.
- (c) **Acetyl bromide** (CH_3COBr). Same characteristics as the chloride; used in organic synthesis.
- (d) **Mono-, di- and tribromoacetic acids and their salts and esters.**
- (e) ***n*-Hexoic** (caproic) and **2-ethylbutyric acids and their salts and esters.**
- (f) ***n*-Octoic** (caprylic) and **2-ethylhexoic acids and their salts and esters.**

*
* *

This heading **excludes** :

- (a) Potable solutions of acetic acid in water containing 10 % or less by weight of acetic acid (**heading 22.09**).
- (b) Salts and esters of crude stearic acid (generally **heading 34.01, 34.04** or **38.24**).
- (c) Mixtures of glycerol mono-, di- and tristearates, fat emulsifiers (**heading 34.04** when they have the character of artificial waxes or **heading 38.24** in other cases).
- (d) Fatty acids of a purity of less than 90 % (calculated on the weight of the dry product) (**heading 38.23**).

29.16 - Unsaturated acyclic monocarboxylic acids, cyclic monocarboxylic acids, their anhydrides, halides, peroxides and peroxyacids; their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Unsaturated acyclic monocarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives :

- 2916.11 -- Acrylic acid and its salts
- 2916.12 -- Esters of acrylic acid
- 2916.13 -- Methacrylic acid and its salts
- 2916.14 -- Esters of methacrylic acid
- 2916.15 -- Oleic, linoleic or linolenic acids, their salts and esters
- 2916.16 -- Binapacryl (ISO)
- 2916.19 -- Other
- 2916.20 - Cyclanic, cyclenic or cycloterpinic monocarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives
 - Aromatic monocarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives :
- 2916.31 -- Benzoic acid, its salts and esters
- 2916.32 -- Benzoyl peroxide and benzoyl chloride
- 2916.34 -- Phenylacetic acid and its salts
- 2916.39 -- Other

This heading covers unsaturated acyclic monocarboxylic acids and cyclic monocarboxylic acids and their anhydrides, halides, peroxides, peroxyacids, esters and salts, as well as the halogenated, sulphonated, nitrated or nitrosated derivatives (including compound derivatives) of any of these products.

**(A) UNSATURATED ACYCLIC MONOCARBOXYLIC ACIDS
AND THEIR SALTS, ESTERS AND OTHER DERIVATIVES**

- (1) **Acrylic acid** ($\text{CH}_2=\text{CHCOOH}$). Colourless liquid with acrid odour. Polymerises readily; monomer for polyacrylic acids and other acrylic polymers.
- (2) **Methacrylic acid**. The polymers of esters of this acid constitute plastics (Chapter 39).
- (3) **Oleic acid** ($\text{C}_{18}\text{H}_{34}\text{O}_2$). Found in fats and oils as a glyceride. A colourless odourless liquid; crystallises in needles at a temperature of about 4°C .

The water-soluble oleic salts (e.g., sodium, potassium, and ammonium oleates) are soaps but they remain classified in this heading.

- (4) **Linoleic acid** ($C_{18}H_{32}O_2$). Contained in linseed oil as a glyceride; a drying acid.
- (5) **Linolenic acid** ($C_{18}H_{30}O_2$).
- (6) **Heptynoic and octynoic acids.**

(B) CYCLANIC, CYCLENIC OR CYCLOTERPENIC MONOCARBOXYLIC ACIDS AND THEIR SALTS, ESTERS AND OTHER DERIVATIVES

- (1) **Cyclohexanecarboxylic acid.**
- (2) **Cyclopentenylacetic acid.**

(C) AROMATIC SATURATED MONOCARBOXYLIC ACIDS AND THEIR SALTS, ESTERS AND OTHER DERIVATIVES

- (1) **Benzoic acid** (C_6H_5COOH). Found in some resins and balsams. Prepared synthetically; crystallises in white needles or shiny white flakes, odourless if the acid is pure; an antiseptic and antiputrefaction agent.

Its main salts are ammonium, sodium, potassium and calcium benzoates.

Its main esters are benzyl, naphthyl, methyl, ethyl, geranyl, citronellyl, linalyl and rhodinyl benzoates.

The heading also includes, *inter alia*, the following derivatives of benzoic acid :

- (a) **Benzoyl peroxide**. White, granular, crystalline solid. Used in medicine, in the rubber and plastics industries, for bleaching oils, fats, flours, etc.
 - (b) **Benzoyl chloride** (C_6H_5COCl). White crystals. Colourless liquid with a characteristic odour, lachrymatory; gives off fumes when exposed to air.
 - (c) **Nitrobenzoic acids** (*o*-, *m*- and *p*-) ($O_2NC_6H_4COOH$).
 - (d) **Nitrobenzoyl chlorides** (*o*-, *m*- and *p*-) ($O_2NC_6H_4COCl$).
 - (e) **Chlorobenzoic acids** (ClC_6H_4COOH).
 - (f) **Dichlorobenzoic acids** ($Cl_2C_6H_3COOH$).
- (2) **Phenylacetic acid** ($C_6H_5CH_2COOH$). Shiny, white crystal plates with a floral odour. Used in perfumes and flavourings, in the manufacture of penicillin G and fungicides, in organic synthesis and as a precursor in the production of amphetamines (see the list of precursors at the end of Chapter 29).

Its main esters are ethyl phenylacetate, methyl phenylacetate and *o*-methoxyphenyl phenylacetate (guaiacol phenylacetate).

- (3) **Phenylpropionic, naphthoic acids.**

**(D) AROMATIC UNSATURATED MONOCARBOXYLIC ACIDS
AND THEIR SALTS, ESTERS AND OTHER DERIVATIVES**

Cinnamic acid ($C_6H_5CH=CHCOOH$). Found in cinnamon oil and in balsams of Tolu and Peru. Colourless crystals.

Its main salts are sodium and potassium cinnamates.

Its main esters are methyl, ethyl, benzyl and propyl cinnamates, used in perfumery.

*
* * *

This heading **excludes** oleic acid of a purity of less than 85 % (calculated on the weight of the dry product) and other fatty acids of a purity of less than 90 % (calculated on the weight of the dry product) (**heading 38.23**).

29.17 - Polycarboxylic acids, their anhydrides, halides, peroxides and peroxyacids; their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Acyclic polycarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives :

2917.11 -- Oxalic acid, its salts and esters

2917.12 -- Adipic acid, its salts and esters

2917.13 -- Azelaic acid, sebacic acid, their salts and esters

2917.14 -- Maleic anhydride

2917.19 -- Other

2917.20 - Cyclanic, cyclenic or cycloterpnic polycarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives

- Aromatic polycarboxylic acids, their anhydrides, halides, peroxides, peroxyacids and their derivatives :

2917.32 -- Dioctyl orthophthalates

2917.33 -- Dinonyl or didecyl orthophthalates

2917.34 -- Other esters of orthophthalic acid

2917.35 -- Phthalic anhydride

2917.36 -- Terephthalic acid and its salts

2917.37 -- Dimethyl terephthalate

2917.39 -- Other

This heading covers polycarboxylic acids and their anhydrides, halides, peroxides, peroxyacids, esters and salts, as well as the halogenated, sulphonated, nitrated or nitrosated derivatives (including compound derivatives) of any of these products.

**(A) ACYCLIC POLYCARBOXYLIC ACIDS AND THEIR ESTERS,
SALTS AND DERIVATIVES**

- (1) **Oxalic acid** (HOOCCOOH). Fine crystals, colourless, transparent and odourless; toxic. Used as a bleaching agent for textiles and for hides, as a mordant in the textile industry, and in organic synthesis.

Its main salts are ammonium, potassium, sodium, calcium, iron and ammonium-iron oxalates.

Its main esters are dimethyl and diethyl oxalates.

- (2) **Adipic acid** ($\text{HOOC(CH}_2\text{)}_4\text{COOH}$). Crystallises in colourless needles; used, *inter alia*, for the manufacture of some plastics such as polyamides.

- (3) **Azelaic acid**. Yellowish to white crystalline powder; used, *inter alia*, for preparing plastics (alkyd resins, polyamides, polyurethanes) and in other organic syntheses.

- (4) **Sebacic acid.** White leaflets; used, *inter alia*, as stabiliser in plastics (in alkyd resins, maleic and other polyesters, polyurethanes); in the manufacture of plastics.
 - (5) **Maleic anhydride.** Colourless crystalline mass; used for preparing plastics (polyesters) and in other organic syntheses.
 - (6) **Maleic acid (HOOCCH=CHCOOH).** Large colourless crystals or in cast blocks; used, *inter alia*, for the preparation of certain plastics (e.g., polyesters).
 - (7) **Malonic acid (HOOCCH₂COOH).** Crystallises in large colourless flakes.
- The most important esters** include **diethyl malonate**, which is used in organic syntheses (e.g., of medicaments such as the barbiturates).
- (8) **Succinic acid (HOOC(CH₂)₂COOH).** Colourless, odourless and transparent crystals. Used in organic synthesis.

(B) CYCLANIC, CYCLENIC OR CYCLOTERPENIC POLYCARBOXYLIC ACIDS AND THEIR ESTERS, SALTS AND OTHER DERIVATIVES

(C) AROMATIC POLYCARBOXYLIC ACIDS AND THEIR ESTERS, SALTS AND OTHER DERIVATIVES

- (1) **Phthalic anhydride (C₆H₄(CO)₂O).** Crystallises in translucent white needles, crystalline masses or white flakes; very light and voluminous, with a characteristic odour. Used in organic synthesis (of plastics (alkyd resins) and of plasticisers, etc.).
- (2) **Benzenedicarboxylic acids (*o*-, *m*-, *p*-) (C₆H₄(COOH)₂).** *Ortho*-benzenedicarboxylic acid is commonly called phthalic acid (*ortho*-phthalic acid). *Meta*-benzenedicarboxylic acid is commonly called isophthalic acid, and *para*-benzenedicarboxylic acid is commonly called terephthalic acid. Crystals. They are used for preparing synthetic colouring matter, plastics (alkyd resins) and plasticisers.

The esters include dimethyl, diethyl, dibutyl (di-*n*-butyl, diisobutyl, etc.), dioctyl (di-*n*-octyl, diisoctyl, bis(2-ethylhexyl), etc.), dinonyl (di-*n*-nonyl, diisononyl, etc.), didecyl (di-*n*-decyl, etc.) or dicyclohexyl orthophthalates and other esters of orthophthalic acid, e.g., phthalates of ethylene glycol esters, as well as the dimethyl and other esters of terephthalic acid.

- (3) **Dichlorophthalic and tetrachlorophthalic acids and their anhydrides.**

29.18 - Carboxylic acids with additional oxygen function and their anhydrides, halides, peroxides and peroxyacids; their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Carboxylic acids with alcohol function but without other oxygen function, their anhydrides, halides, peroxides, peroxyacids and their derivatives :

2918.11 -- Lactic acid, its salts and esters

2918.12 -- Tartaric acid

2918.13 -- Salts and esters of tartaric acid

2918.14 -- Citric acid

2918.15 -- Salts and esters of citric acid

2918.16 -- Gluconic acid, its salts and esters

2918.17 -- 2,2-Diphenyl-2-hydroxyacetic acid (benzilic acid)

2918.18 -- Chlorobenzilate (ISO)

2918.19 -- Other

- Carboxylic acids with phenol function but without other oxygen function, their anhydrides, halides, peroxides, peroxyacids and their derivatives :

2918.21 -- Salicylic acid and its salts

2918.22 -- *O*-Acetylsalicylic acid, its salts and esters

2918.23 -- Other esters of salicylic acid and their salts

2918.29 -- Other

2918.30 - Carboxylic acids with aldehyde or ketone function but without other oxygen function, their anhydrides, halides, peroxides, peroxyacids and their derivatives

- Other :

2918.91 -- 2,4,5-T (ISO) (2,4,5-trichlorophenoxyacetic acid), its salts and esters

2918.99 -- Other

This heading covers carboxylic acids with additional oxygen function and their anhydrides, halides, peroxides, peroxyacids, esters and salts, as well as the halogenated, sulphonated, nitrated or nitrosated derivatives (including compound derivatives) of any of these products.

The term "additional oxygen function" means carboxylic acids which contain also one or more of the oxygen functions referred to in previous sub-Chapters (alcohol, ether, phenol, aldehyde, ketone, etc., functions).

(A) CARBOXYLIC ACIDS WITH ALCOHOL FUNCTION AND THEIR ESTERS, SALTS AND OTHER DERIVATIVES

These contain both the alcohol function ($-\text{CH}_2\text{OH}$, $\geqslant\text{CHOH}$ or $\geqslant\text{COH}$) and the acid function ($-\text{COOH}$). These two functions may each react according to their own nature, hence as alcohols, these compounds may give ethers, esters and other derivatives, and as acids, they may form salts, esters, etc. The main alcohol acids include :

- (1) **Lactic acid** ($\text{CH}_3\text{CH}(\text{OH})\text{COOH}$). Prepared by fermenting glucose or previously inverted cane-sugar with **lactic ferment**. Very hygroscopic crystalline masses, or a dense, syrupy liquid, colourless or faintly yellow. Used in medicine, for dyeing and for deliming hides. This heading includes lactic acid whether industrial, commercial or pharmaceutical. The **industrial acid** ranges from yellow to brown in colour and has a disagreeable, very acid odour. The **commercial or pharmaceutical acids** usually contain 75 % or more of lactic acid.

The main salts are calcium (used in medicine), strontium, magnesium, zinc, antimony, **iron** and bismuth lactates.

Its esters include ethyl and butyl lactates, used as solvents for varnishes.

Mercury lactate is **excluded (heading 28.52)**.

- (2) **Tartaric acid** ($\text{HOOCCH}(\text{OH})\text{CH}(\text{OH})\text{COOH}$). Transparent colourless crystals. Used in dyeing, photography, manufacture of baking powder, in oenology and medicine.

Its salts include :

- (a) **Sodium tartrate**.
 - (b) **Potassium tartrate**.
 - (c) **Refined potassium hydrogen tartrate** (cream of tartar).
- Crude tartar (Argol) is **excluded (heading 23.07)**.
- (d) **Calcium tartrate**, small crystals.

Crude calcium citrate is **excluded (heading 38.24)**.

- (e) **Antimony potassium tartrate** (emetic), **sodium potassium tartrate** (*sel de Seignette*) and **iron potassium tartrate**.

Its esters include :

- (i) **Ethyl tartrates**.
- (ii) **Butyl tartrates**.
- (iii) **Pentyl tartrates**.

- (3) **Citric acid**. Found in the free state of citrus fruit juices; also obtained from the fermentation of glucose or sucrose by some citromyces. Crystallises in large, colourless, transparent prisms or in crystalline, white, odourless powder. Used for preparing beverages, in the textile industry, in oenology, in medicine, in making citrates, etc.

Its salts include :

- (a) **Lithium citrate**.
- (b) **Calcium citrate**.

Crude calcium citrate is **excluded (heading 38.24)**.

- (c) **Aluminium citrate**, used as a mordant in dyeing.
- (d) **Iron citrate**, used in photography.

Its main esters are :

- (i) **Triethyl citrate**.
- (ii) **Tributyl citrate**.

- (4) **Gluconic acid and its salts**. Gluconic acid is normally presented as an aqueous solution. Its calcium salt is used e.g., in medicine, for cleaning and as a concrete additive.
- (5) **Glucoheptonic acid and its salts**, e.g., calcium glucoheptonate.
- (6) **Phenylglycolic acid** (mandelic acid).
- (7) **Malic acid** (HOOCCH(OH)CH2COOH). Deliquescent, colourless, crystalline masses; used in organic synthesis, in medicine, etc.
- (8) **2,2-Diphenyl-2-hydroxyacetic acid** (benzilic acid)^{*}. White crystalline aromatic acid soluble in many primary alcohols; used in organic synthesis, in medicine and precursor in the production of chemical warfare agents.

(B) CARBOXYLIC ACIDS WITH PHENOL FUNCTION AND THEIR ESTERS, SALTS AND OTHER DERIVATIVES

Phenol-acids, cyclic (aromatic) acids which contain both the acid group (–COOH) and one or more groups (–OH) in the nucleus. The simplest phenol-acid has the formula (HOC6H4COOH).

- (I) **Salicylic acid** (ortho-hydroxybenzoic acid) (HOC6H4COOH). Crystallises in white, voluminous flakes, or in white, light, odourless powder. Extensively used in medicine and also for preparing azo-dyes, etc.

Its most important salts are :

- (a) **Sodium salicylate**. Crystalline powder or white, odourless flakes. Used in medicine.
- (b) **Bismuth salicylate**, an odourless, white powder, used in medicine.

Its most important esters are :

- (a) **Methyl salicylate**. Constituent of oil of wintergreen. An oily, colourless liquid with a strong persistent aromatic odour; used in medicine.
- (b) **Phenyl salicylate** (salol). Crystallises as colourless flakes with a faint, agreeable, aromatic odour. Used in medicine and as an antiseptic.

(c) Ethyl, naphthyl, butyl, amyl, benzyl, bornyl, citronellyl, geranyl, menthyl, rhodinyl salicylates.

- (II) ***o*-Acetylsalicylic acid** ($\text{CH}_3\text{C}(\text{O})\text{OC}_6\text{H}_4\text{COOH}$). Crystalline white powder; odourless; used in medicine.
- (III) **Sulphosalicylic acid** (salicylsulphonic acid).
- (IV) ***p*-Hydroxybenzoic acid**, crystalline.

Its main esters include :

- (1) **Methyl *p*-hydroxybenzoate.**
- (2) **Ethyl *p*-hydroxybenzoate.**
- (3) **Propyl *p*-hydroxybenzoate.**

These esters are used as preservatives.

(V) **Cresotic acids.**

(VI) **Acetyl-*o*-cresotic acids.**

- (VII) **Gallic acid** ($(\text{HO})_3\text{C}_6\text{H}_2\text{COOH}$). Obtained from gall nuts. Fine, silky, shining colourless or faintly yellow, odourless crystals. Used for the preparation of dyes and inks, in photography, in tanning as a mordant, etc.

Its main salts and esters include :

- (1) **Basic bismuth gallate.** An amorphous powder, lemon-yellow, odourless, astringent and absorbent; used in medicine.
- (2) **Methyl gallate,** crystals. Used as a disinfectant and astringent, and also in ophthalmology.
- (3) **Propyl gallate.**

(VIII) **Hydroxynaphthoic acids.**

(IX) **Hydroxyanthracenecarboxylic acids.**

(C) CARBOXYLIC ACIDS WITH ALDEHYDE OR KETONE FUNCTION AND THEIR ESTERS, SALTS AND OTHER DERIVATIVES

- (1) **Aldehyde-acids** contain both the aldehyde ($-\text{CHO}$) group and the acid group ($-\text{COOH}$).
- (2) **Ketone-acids** contain both the ketone group ($>\text{C}=\text{O}$) and the acid group ($-\text{COOH}$).

The most important ester of these acids is **ethyl aceto-acetate** and its **sodium derivative**.

**(D) OTHER CARBOXYLIC ACIDS WITH ADDITIONAL
OXYGEN FUNCTION AND THEIR ESTERS,
SALTS AND OTHER DERIVATIVES**

Anisic acid ($\text{CH}_3\text{OC}_6\text{H}_4\text{COOH}$). Obtained by oxidation of anisaldehyde, of anethole and aniseed oil. Colourless crystals with a slight odour of anethole; used as an antiseptic, in medicine and in the manufacture of dyes.

Sub-Chapter VIII

ESTERS OF INORGANIC ACIDS OF NON-METALS AND THEIR SALTS, AND THEIR HALOGENATED, SULPHONATED, NITRATED OR NITROSATED DERIVATIVES

GENERAL

(A) ESTERS OF INORGANIC ACIDS OF NON-METALS

These compounds are usually formed by the reaction of an alcohol or phenol with inorganic acids of non-metals. They have the general formula (ROX) in which R is an alcoholic or phenolic radical and X is the residue of the inorganic acid molecule known as an acid radical.

The acid radical of nitric acid is ($-NO_2$), of sulphuric acid ($=SO_2$), of phosphoric acid ($\equiv PO$); and of carbonic acid ($>CO$).

This sub-Chapter **excludes** esters of later headings in this Chapter.

(B) SALTS OF ESTERS OF INORGANIC ACIDS OF NON-METALS

These can be obtained only from esters of inorganic polybasic acids of non-metals (sulphuric, phosphoric, silicic, etc.). Polybasic acids have more than one replaceable acidic element, and when all such elements are not esterified the result is an **acid ester**.

Appropriate treatment of these acid esters produces a **salt of an ester of an inorganic acid of a non-metal**.

Nitrous and nitric acids, on the other hand, being monobasic, can give only **neutral esters**.

29.19 - Phosphoric esters and their salts, including lactophosphates; their halogenated, sulphonated, nitrated or nitrosated derivatives.

2919.10 - Tris(2,3-dibromopropyl) phosphate

2919.90 - Other

Phosphoric acid, being tribasic, gives three types of phosphoric esters according to whether one, two or all of its acidic groups are esterified.

The esters and their salts include :

- (1) **Glycerophosphoric acid.** Derived from saturation of one of the primary alcoholic groups of glycerol with the residue of phosphoric acid.

The most important salts of these esters are used in medicine as tonics, e.g. :

- (a) Calcium glycerophosphate.
 - (b) Iron glycerophosphate.
 - (c) Sodium glycerophosphate.
- (2) **Inositolhexaphosphoric acid** and **inositolhexaphosphates**.
- (3) **Tributyl phosphate**. Colourless, odourless liquid; used as a plasticiser.
 - (4) **Triphenyl phosphate**. Colourless and odourless crystals; used for the manufacture of plastics (e.g., celluloid), for waterproofing paper, etc.
 - (5) **Tritolyl phosphate**. Colourless or yellowish liquid; used as a plasticiser for cellulose products and synthetic resins, for the flotation of ores, etc.
 - (6) **Trixylol phosphate**.
 - (7) **Triguaiacyl phosphate**.
 - (8) **Lactophosphates**, e.g., calcium lactophosphate, whether or not chemically defined.

29.20 - Esters of other inorganic acids of non-metals (excluding esters of hydrogen halides) and their salts; their halogenated, sulphonated, nitrated or nitrosated derivatives.

- Thiophosphoric esters (phosphorothioates) and their salts; their halogenated, sulphonated, nitrated or nitrosated derivatives :

2920.11 -- Parathion (ISO) and parathion-methyl (ISO) (methyl-parathion)

2920.19 -- Other

- Phosphite esters and their salts; their halogenated, sulphonated, nitrated or nitrosated derivatives :

2920.21 -- Dimethyl phosphate

2920.22 -- Diethyl phosphate

2920.23 -- Trimethyl phosphate

2920.24 -- Triethyl phosphate

2920.29 -- Other

2920.30 - Endosulfan (ISO)

2920.90 - Other

This heading covers esters of other inorganic acids of non-metals, that is, acids in which the anion contains only non-metal elements. This heading **does not cover** :

- (a) "Esters" of the hydrogen halides (generally **heading 29.03**), and
- (b) Esters included in later headings of this Chapter (e.g., "esters" of isocyanic acid (isocyanates) (**heading 29.29**) and "esters" of hydrogen sulphide (generally **heading 29.30**).

The esters of this heading include :

- (A) **Thiophosphoric esters** (phosphorothioates) **and their salts**, including sodium *O,O*-dibutyl- and *O,O*-ditolyldithiophosphates.
- (B) **Phosphite esters and their salts**. Phosphite esters or organophosphates have the general structure P(OR)₃ which can be considered as esters of phosphorous acid, H₃PO₃. Methyl and ethyl esters of phosphorous acid can be converted by chemical synthesis to nerve gases.

(C) Sulphuric esters and their salts.

Sulphuric esters may be either neutral or acid.

- (1) **Methyl hydrogen sulphate** (CH₃OSO₂OH). An oily liquid.
- (2) **Dimethyl sulphate** ((CH₃O)₂SO₂). Colourless or slightly yellow liquid with a slight odour of mint; toxic, corrosive, lachrymatory and irritating to the respiratory tracts. Used in organic synthesis.
- (3) **Ethyl hydrogen sulphate** (C₂H₅OSO₂OH). Syrupy liquid.
- (4) **Diethyl sulphate** ((C₂H₅O)₂SO₂). Liquid with an odour of mint.

(D) **Nitrous and nitric esters.**

Nitrous esters are liquids with an aromatic odour, e.g., methyl, ethyl, propyl, butyl and pentyl nitrites.

Nitric esters are mobile liquids with an agreeable odour; they decompose when suddenly heated. They include methyl, ethyl, propyl, butyl and pentyl nitrates.

Nitroglycerol, tetranitropentaerythritol (penthrite) and nitroglycol are classified here if unmixed; when presented in the form of prepared explosives they are **excluded** (**heading 36.02**).

(E) **Carbonic or peroxocarbonic esters and their salts.**

Esters of carbonic acid may be acid or neutral.

(1) **Diguaiacyl carbonate.** Crystalline light white powder, with a slight odour of **guaiacol**. Used in medicine and as an intermediate in synthesis of perfumes.

(2) **Tetraethyl orthocarbonate** ($C(OC_2H_5)_4$).

(3) **Diethyl carbonate** ($C(OC_2H_5)_2$).

(4) **Bis(4-tert-butylcyclohexyl) peroxodicarbonate.**

(5) **tert-Butylperoxy 2-ethylhexyl carbonate.**

Ethyl chlorocarbonate (or ethyl chloroformate) is **excluded** (**heading 29.15**).

(E) **Silicic acid esters and their salts** (tetraethyl silicate, etc.).

This heading **does not cover** alcoholates or esters of acid-function metal hydroxides, e.g., titanium tetra-*n*-butoxide (also known as tetrabutyl titanate) (**heading 29.05**).

Sub-Chapter IX

NITROGEN-FUNCTION COMPOUNDS

GENERAL

This sub-Chapter covers nitrogen-function compounds, for example, amines, amides, imides, but does not cover compounds containing nitro or nitroso groups as the only nitrogen function.

29.21 - Amine-function compounds (+).

- Acyclic monoamines and their derivatives; salts thereof :

2921.11 -- Methylamine, di- or trimethylamine and their salts

2921.12 -- 2-(N,N-Dimethylamino)ethylchloride hydrochloride

2921.13 -- 2-(N,N-Diethylamino)ethylchloride hydrochloride

2921.14 -- 2-(N,N-Diisopropylamino)ethylchloride hydrochloride

2921.19 -- Other

- Acyclic polyamines and their derivatives; salts thereof :

2921.21 -- Ethylenediamine and its salts

2921.22 -- Hexamethylenediamine and its salts

2921.29 -- Other

2921.30 - Cyclanic, cyclenic or cycloterpenic mono- or polyamines, and their derivatives; salts thereof

- Aromatic monoamines and their derivatives; salts thereof :

2921.41 -- Aniline and its salts

2921.42 -- Aniline derivatives and their salts

2921.43 -- Toluidines and their derivatives; salts thereof

2921.44 -- Diphenylamine and its derivatives; salts thereof

2921.45 -- 1-Naphthylamine (alpha-naphthylamine), 2-naphthylamine (beta-naphthylamine) and their derivatives; salts thereof

2921.46 -- Amphetamine (INN), benzphetamine (INN), dexamphetamine (INN), etilamphetamine (INN), fencamfamin (INN), lefetamine (INN), levamfetamine (INN), mefenorex (INN) and phentermine (INN); salts thereof

2921.49 -- Other

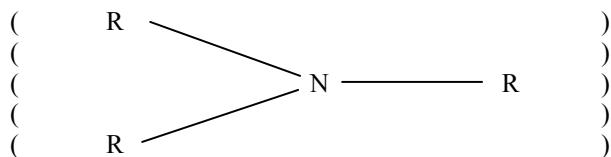

- Aromatic polyamines and their derivatives; salts thereof :

2921.51 -- *o*-, *m*-, *p*-Phenylenediamine, diaminotoluenes, and their derivatives; salts thereof

2921.59 -- Other

Amines are organic nitrogen compounds containing the amine function (i.e., a function derived from ammonia by replacing one, two or three hydrogen atoms by one, two or three alkyl or aryl radicals R (methyl, ethyl, phenyl, etc.), respectively).

If only one hydrogen atom in the ammonia has been replaced, the result is a primary amine (RNH_2); replacement of two hydrogen atoms gives a secondary amine (R-NH-R); and replacement of three hydrogen atoms results in a tertiary amine

Nitrosoamines, which may react in the tautomeric form of quinoneimine oximes, are included in this heading.

This heading covers also salts (for example, nitrates, acetates, citrates) and substitution derivatives of amines (for example, halogenated, sulphonated, nitrated or nitrosated derivatives); but it **excludes** substitution derivatives containing oxygen functions of **headings 29.05 to 29.20**, and salts thereof (**heading 29.22**). This heading also **excludes** substitution derivatives where one or more hydrogen atoms of the amine function have been replaced by one or more halogens, sulpho ($-\text{SO}_3\text{H}$), nitro ($-\text{NO}_2$) or nitroso ($-\text{NO}$) groups or by any combination thereof.

Diazotisable amines and their salts of this heading diluted to standard strengths for the production of azo-dyes are also included here.

(A) ACYCLIC MONOAMINES AND THEIR DERIVATIVES; SALTS THEREOF

- (1) **Methylamine** (CH_3NH_2). Colourless, inflammable gas with a strong, ammoniacal odour; used for preparing organic dyes and in the tanning industry, etc.
- (2) **Dimethylamine** ($(\text{CH}_3)_2\text{NH}$), similar to methylamine; used in organic synthesis, as a vulcanisation accelerator.
- (3) **Trimethylamine** ($(\text{CH}_3)_3\text{N}$), similar to methylamine; used in organic synthesis.
- (4) **Ethylamine**.
- (5) **Diethylamine**.
- (6) **Allylisopropylamine**.
- (7) **2-(N,N-Dimethylamino)ethylchloride hydrochloride, 2-(N,N-diethylamino)ethylchloride hydrochloride and 2-(N,N-diisopropylamino)ethylchloride hydrochloride.**

(B) ACYCLIC POLYAMINES AND THEIR DERIVATIVES; SALTS THEREOF

- (1) **Ethylenediamine** ($\text{H}_2\text{NCH}_2\text{CH}_2\text{NH}_2$). Caustic, colourless liquid with a faint ammoniacal odour; its salts.
- (2) **Hexamethylenediamine** ($\text{H}_2\text{N}(\text{CH}_2)_6\text{NH}_2$) and its salts. Crystals, needles, or elongated plates with a characteristic odour. Has a toxic action on the skin and causes lesions; used for the manufacture of man-made fibres (polyamides).

**(C) CYCLANIC, CYCLENIC OR CYCLOTERPENIC
MONO- OR POLYAMINES, AND THEIR DERIVATIVES;
SALTS THEREOF**

These include **cyclohexylamine**, **dimethylaminocyclohexane**, etc.

**(D) AROMATIC MONOAMINES AND THEIR DERIVATIVES;
SALTS THEREOF**

- (1) **Aniline** ($\text{C}_6\text{H}_5\text{NH}_2$) (phenylamine) and its salts. Aniline is a colourless, oily liquid with a faint aromatic odour. It is extensively used in the preparation of dyes, pharmaceutical products, etc.

Aniline derivatives, largely used as intermediates for dyes, include :

- (a) **Halogenated derivatives** : chloroanilines.
- (b) **Sulphonated derivatives** : *m*- and *p*-aminobenzenesulphonic acids (e.g., sulphanilic acid).
- (c) **Nitrated derivatives** : nitroanilines, etc.
- (d) **Nitrosated derivatives** in which one or more hydrogen atoms (other than those of the amine function) have been replaced by one or more nitroso groups (e.g., nitrosoaniline, methyl nitrosoaniline).
- (e) **Sulphohalogenated, nitrohalogenated and nitrosulphonated derivatives**.
- (f) **Alkyl derivatives** (N-methylaniline and N,N-dimethylaniline; N-ethylaniline and N,N-diethylaniline).

(2) **Toluidines**.

- (3) **Diphenylamine** ($(\text{C}_6\text{H}_5)_2\text{NH}$) a secondary amine. Crystallises in small colourless leaves; used in organic synthesis (dyes, etc.).
- (4) **1-Naphthylamine** (α -naphthylamine) ($\text{C}_{10}\text{H}_7\text{NH}_2$). Crystallises in white needles, but may also occur as masses or crystalline flakes, white or brownish; has an agreeable and penetrating odour. Turns pale violet when exposed to light. Used in organic synthesis and for the flotation of copper ores, etc.
- (5) **2-Naphthylamine** (β -naphthylamine) ($\text{C}_{10}\text{H}_7\text{NH}_2$). White powder or nacreous flakes, odourless; used in organic synthesis (dyes, etc.). This product is carcinogenic and should be handled with care.
- (6) **Xylidines**.
- (7) **Amphetamine** (INN) (Amphetamine).

(E) AROMATIC POLYAMINES AND THEIR DERIVATIVES; SALTS THEREOF

- (1) ***o*-, *m*-, *p*-Phenylenediamine** ($C_6H_4(NH_2)_2$).
 - (a) ***o*-Phenylenediamine.** Colourless monoclinic crystals; darkens in air.
 - (b) ***m*-Phenylenediamine.** Colourless needles becoming red in air.
 - (c) ***p*-Phenylenediamine.** White to light purple crystals.
- (2) **Diaminotoluenes** ($CH_3C_6H_3(NH_2)_2$).
- (3) ***N*-Alkylphenylenediamines**, for example *N,N*-Dimethyl-*p*-phenylenediamine.
- (4) ***N*-Alkyltolylenediamines**, for example *N,N*-Diethyl-3,4-tolylenediamine.
- (5) **Benzidine** ($H_2NC_6H_4C_6H_4NH_2$). Shiny, white crystalline flakes with an agreeable odour. Used for preparing dyestuffs, and in analytical chemistry.
- (6) **Polyamines.** Derived from di- and triphenylmethane and their homologues; their derivatives (tetramethyl- and tetraethyl-diaminodiphenylmethane, etc.).
- (7) **Amino- and diaminodiphenylamines.**
- (8) **Diaminostilbene.**

Certain substances of this heading, which are regarded as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

○
○ ○

Subheading Explanatory Note.

Subheadings 2921.42 to 2921.49

Hydrocarbon derivatives of an aromatic monoamine are derivatives obtained by the substitution of one or both hydrogens of the amine nitrogen only by an alkyl or cycloalkyl group. Substituents with one or more aromatic nuclei, whether or not linked to amine nitrogen by an alkyl chain, are therefore excluded.

Thus, for example, xylidine should be classified in subheading 2921.49 as "Other" aromatic monoamine and **not** as a derivative of aniline (subheading 2921.42) or of toluidine (subheading 2921.43).

29.22 - Oxygen-function amino-compounds (+).

- Amino-alcohols, other than those containing more than one kind of oxygen function, their ethers and esters; salts thereof :

2922.11 -- Monoethanolamine and its salts

2922.12 -- Diethanolamine and its salts

2922.14 -- Dextropropoxyphene (INN) and its salts

2922.15 -- Triethanolamine

2922.16 -- Diethanolammonium perfluorooctane sulphonate

2922.17 -- Methylmethanolamine and ethylmethanolamine

2922.18 -- 2-(N,N-Diisopropylamino)ethanol

2922.19 -- Other

- Amino-naphthols and other amino-phenols, other than those containing more than one kind of oxygen function, their ethers and esters; salts thereof :

2922.21 -- Aminohydroxynaphthalenesulphonic acids and their salts

2922.29 -- Other

- Amino-aldehydes, amino-ketones and amino-quinones, other than those containing more than one kind of oxygen function; salts thereof :

2922.31 -- Amfepramone (INN), methadone (INN) and normethadone (INN); salts thereof

2922.39 -- Other

- Amino-acids, other than those containing more than one kind of oxygen function, and their esters; salts thereof :

2922.41 -- Lysine and its esters; salts thereof

2922.42 -- Glutamic acid and its salts

2922.43 -- Anthranilic acid and its salts

2922.44 -- Tilidine (INN) and its salts

2922.49 -- Other

2922.50 - Amino-alcohol-phenols, amino-acid-phenols and other amino-compounds with oxygen function

The term "oxygen-function amino-compounds" means amino-compounds which contain, in addition to an amine function, one or more of the oxygen functions defined in Note 4 to Chapter 29 (alcohol, ether, phenol, acetal, aldehyde, ketone, etc., functions), as well as their organic and inorganic acid esters. This heading therefore covers amino-compounds which are

substitution derivatives of amines containing oxygen functions of headings 29.05 to 29.20, and esters and salts thereof.

Diazotisable amines and their salts of this heading diluted to standard strengths for the production of azo-dyes are also included here.

Organic dyes are **excluded** from this heading (**Chapter 32**).

(A) AMINO-ALCOHOLS, THEIR ETHERS AND ESTERS; SALTS THEREOF

These compounds contain one or more alcohol hydroxyl groups and one or more amino groups bound to atoms of carbon. These compounds contain as oxygen functions only alcohols, their ethers or esters, or a combination of these functions. Any oxygen function found in a non-parent segment attached to a parent amino-alcohol is disregarded for classification purposes.

- (1) **Monoethanolamine** ($\text{NH}_2(\text{CH}_2\text{CH}_2\text{OH})$). Rather viscous, colourless liquid; used for the manufacture of pharmaceutical products, soap, etc.
- (2) **Diethanolamine** ($\text{NH}(\text{CH}_2\text{CH}_2\text{OH})_2$). Colourless crystals or pale liquid; used for absorbing acid gases, in tanning for softening leathers, and in organic synthesis.
- (3) **Triethanolamine** ($\text{N}(\text{CH}_2\text{CH}_2\text{OH})_3$). Viscous liquid. A base used in the soap and emulsion industries, and for dressing and finishing fabrics.
- (4) **Diethanolammonium perfluorooctane sulphonate**. An ammonium salt of perfluorooctane sulfonate (PFOS) (see headings 29.04, 29.23, 29.35, 38.08 and 38.24).
- (5) **Methyldiethanolamine and ethyldiethanolamine**.
- (6) **2-(N,N-Diisopropylamino)ethanol** or N,N -diisopropylethanolamine($((\text{CH}_3)_2\text{CH})_2\text{NCH}_2\text{CH}_2\text{OH}$). Colourless to slightly yellow liquid.
- (7) **(2-Benzoyloxy-2-methylbutyl)dimethylammonium chloride**. Crystalline white powder; used as a local anaesthetic.
- (8) **Meclofenoxate**.
- (9) **Arnolol**.
- (10) **Sarpogrelate**.
- (11) **Arylethanolamines**.
- (12) **Tetramethyl- and tetraethyldiaminobenzhydrol**.
- (13) **Aminoethyl nitrate**.

(B) AMINO-NAPHTHOLS AND OTHER AMINO-PHENOLS, THEIR ETHERS AND ESTERS; SALTS THEREOF

These are phenolic compounds in which one or more hydrogen atoms have been replaced by an amino group ($-\text{NH}_2$). These compounds contain as oxygen functions only phenol functions, their ethers or esters, or a combination of these functions. Any oxygen function found in a non-

parent segment attached to a parent amino-naphthol or other amino-phenol is disregarded for classification purposes.

- (1) **Aminohydroxynaphthalenesulphonic acids**, e.g.,
 - (a) **7-Amino-1-naphthol-3-sulphonic acid** (gamma acid);
 - (b) **8-Amino-1-naphthol-3,6-disulphonic acid** (H acid).
- (2) ***o*-, *m*- and *p*-Aminophenols.**
- (3) **Amino-*o*-, *m*- and *p*-cresols.**
- (4) **Diaminophenols.**

The ethers of **amino-phenols** include :

- (a) **Anisidines.**
- (b) **Dianisidines** (bianisidines).
- (c) **Phenetidines.**
- (d) **Cresidines.**
- (e) **5-Nitro-2-propoxyaniline** (2-amino-4-nitrophenol *n*-propylether).

Hydroxy derivatives of diphenylamine and their salts are also included here.

(C) AMINO-ALDEHYDES, AMINO-KETONES AND AMINO-QUINONES; SALTS THEREOF

These contain the amino-group associated with the aldehyde group ($-\text{CHO}$), the ketone group ($\text{>}=\text{O}$) or the quinone group (see the Explanatory Note to heading 29.14), respectively.

- (1) **Aminobenzaldehydes.**
- (2) **Tetramethyl- and tetraethyldiaminobenzophenones.**
- (3) **Amino- and diaminoanthraquinones.**
- (4) **Anthrimides.**

(D) AMINO-ACIDS AND THEIR ESTERS; SALTS THEREOF

These compounds contain one or more carboxylic acid functions and one or more amine functions. Anhydrides, halides, peroxides and peroxyacids of carboxylic acids are regarded as acid functions.

These compounds contain as oxygen functions only acids, their esters or their anhydrides, halides, peroxides and peroxyacids or a combination of these functions. Any oxygen function found in a non-parent segment attached to a parent amino-acid is disregarded for classification purposes.

The amino-acids classified under this heading with their esters, salts and substitution derivatives include :

- (1) **Lysine** (diamino-*n*-hexanoic acid). Colourless crystals. A cleavage product of silk gum and other proteins.
- (2) **Glutamic acid**. Cleavage product of proteins. Obtained from gluten. Crystals used in medicine or in food industries.
- (3) **Glycine** (aminoacetic acid; glycocoll) (H_2NCH_2COOH). Large, colourless, regularly shaped crystals. Used in organic synthesis, etc.
- (4) **Sarcosine** (CH_3NHCH_2COOH). Methyl derivative of glycine; crystallises in prisms.
- (5) **Alanine** (2-aminopropionic acid). Hard needles.
- (6) β -**Alanine** (3-aminopropionic acid). Crystalline.
- (7) **Phenylalanine**.
- (8) **Valine** (α -aminoisovaleric acid). Crystals.
- (9) **Leucine** (α -aminoisocaproic acid). Obtained by hydrolysis of proteins; white opalescent crystals. **Isoleucine**.
- (10) **Aspartic acid**. Crystalline.
- (11) *o*-**Aminobenzoic acid** (anthranilic acid). Obtained synthetically; used for the manufacture of synthetic indigo. Among its derivatives is methyl anthranilate.
- (12) *m*-**Aminobenzoic acid**.
- (13) *p*-**Aminobenzoic acid**. Used in the preparation of dyestuffs, artificial perfumes and anaesthetics; also in medicine for its vitamin activity. Its derivatives include ethyl and butyl *p*-aminobenzoates. **Procaine hydrochloride** (diethylaminoethyl *p*-aminobenzoate hydrochloride), small colourless and odourless crystals, is a local anaesthetic used by oculists and dentists.
- (14) **Phenylglycine**.
- (15) **Lisadimate**.

(E) AMINO-ALCOHOL-PHENOLS, AMINO-ACID-PHENOLS AND OTHER AMINO-COMPOUNDS WITH OXYGEN FUNCTION

This part includes, *inter alia* :

- (1) **Tyrosine** (*p*-hydroxyphenylalanine).
- (2) **Serine** (α -amino- β -hydroxypropionic acid). A cleavage product of silk gum and other proteins.
- (3) **Aminosalicylic acids**, including **5-aminosalicylic acid** and **4-aminosalicylic acid**. Crystalline powders. **5-Aminosalicylic acid** is used in inorganic synthesis (e.g., for the manufacture of azo- and sulphur-dyes); the sodium salt of **4-aminosalicylic acid** is used in medicine for treating pulmonary tuberculosis.
- (4) **Medifoxamine** (N,N-dimethyl-2,2-diphenoxymethylamine), an amine compound with acetal function.
- (5) **Propoxycaine**.

* *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

○
○ ○

Subheading Explanatory Note.

Subheadings 2922.11 to 2922.50

For subheading classification purposes, ether or organic or inorganic acid ester functions are regarded either as alcohol, phenol or acid functions, depending on the position of the oxygen function in relation to the amine group. In these cases, only those oxygen functions present in that part of the molecule situated between the amine function and the oxygen atom of either the ether or the ester function should be taken into consideration. A segment containing an amine function is referred to as a "parent" segment. For example, in the compound 3-(2-aminoethoxy)propionic acid, the parent segment is aminoethanol, and the carboxylic acid group is disregarded for classification purposes; as an ether of an amino-alcohol, this compound is classifiable in subheading 2922.19.

If the compound contains two or more ether or ester functions, the molecule is segmented for classification purposes at the oxygen atom of each ether or ester function, and the only oxygen functions considered are those found in the same segment as an amine function.

If the compound has two or more amine functions linked to the same ether or ester function, it is classifiable in the subheading that is last in numerical order; that subheading is determined by considering the ether or ester function as either an alcohol, phenol or acid function, in relation to each amine function.

29.23 - Quaternary ammonium salts and hydroxides; lecithins and other phosphoaminolipids, whether or not chemically defined.

2923.10 - Choline and its salts

2923.20 - Lecithins and other phosphoaminolipids

2923.30 - Tetraethylammonium perfluorooctane sulphonate

2923.40 - Didecyldimethylammonium perfluorooctane sulphonate

2923.90 - Other

Quaternary organic ammonium salts contain one tetravalent nitrogen cation $R^1R^2R^3R^4N^+$ where R^1 , R^2 , R^3 and R^4 may be the same or different alkyl or aryl radicals (methyl, ethyl, tolyl etc.).

This cation may be associated with the hydroxide ion (OH^-) to give a **quaternary ammonium hydroxide** of general formula $R_4N^+OH^-$ corresponding to its inorganic parent ammonium hydroxide NH_4OH .

The residuary valence may, however, be filled by other anions (chloride, bromide, iodide, etc.) to give **quaternary ammonium salts**.

The most important salts and substitution derivatives of quaternary ammonium bases are :

- (1) **Choline**, its salts and derivatives. A hydroxyethyltrimethylammonium hydroxide found in the bile, in the brain, in egg-yolk, and in all fresh seeds. A compound from which other very important biological substances are derived (e.g., acetylcholine, methylcholine).
- (2) **Lecithins and other phosphoaminolipids**. These are esters (phosphatides) resulting from the combination of oleic, palmitic and other fatty acids with glycerophosphoric acid and an organic nitrogen base such as choline. They are usually yellowish-brown, waxy masses, soluble in ethanol. Lecithins are contained in egg-yolk (ovolecithin) and in animal and vegetable tissue.

Commercial lecithin, which is also included in this heading, is predominantly soya-bean lecithin and consists of a mixture of acetone-insoluble phosphatides (generally 60 to 70 % by weight), soya-bean oil, fatty acids and carbohydrates. Commercial soya-bean lecithin comes in brownish to light-coloured, more or less viscous form or, if the soya-bean oil has been extracted with acetone, in yellowish granules.

Ovolecithin is used in medicine. Commercial soya-bean lecithin is used as an emulsifying, dispersing, etc. agent in the food and animal feed industries, in paints, in the petroleum industry, etc.

- (3) **Tetraethylammonium perfluorooctane sulphonate and didecyldimethylammonium perfluorooctane sulphonate**. These are quaternary ammonium salts of perfluorooctane sulfonate (PFOS) (see headings **29.04, 29.22, 29.35, 38.08 and 38.24**).
- (4) **Tetramethylammonium iodide** ($(CH_3)_4NI$).
- (5) **Tetramethylammonium hydroxide** ($(CH_3)_4NOH$).
- (6) **Tetramethylammonium formate** ($HCOON(CH_3)_4$), used in medicine .
- (7) **Betaine**, a quaternary intramolecular salt, and **betaine hydrochloride**, used, e.g., in medicine, cosmetics and animal feeding.

29.24 - Carboxyamide-function compounds; amide-function compounds of carbonic acid.

- Acyclic amides (including acyclic carbamates) and their derivatives; salts thereof :

2924.11 -- Meprobamate (INN)

2924.12 -- Fluoroacetamide (ISO), monocrotophos (ISO) and phosphamidon (ISO)

2924.19 -- Other

- Cyclic amides (including cyclic carbamates) and their derivatives; salts thereof :

2924.21 -- Ureines and their derivatives; salts thereof

2924.23 -- 2-Acetamidobenzoic acid (N-acetylanthranilic acid) and its salts

2924.24 -- Ethinamate (INN)

2924.25 -- Alachlor (ISO)

2924.29 -- Other

This heading covers amide derivatives of carboxylic acids and of carbonic acid (but **not** amide derivatives of other inorganic acids - **heading 29.29**).

Amides are compounds which contain the following characteristic groups :

The hydrogen of the $(-\text{NH}_2)$ or $(>\text{NH})$ groups may be substituted by alkyl or aryl radicals, in which case the products are N- substituted amides.

Some amides of this heading also contain a diazotisable amine group. These amides and their salts, diluted to standard strengths for the production of azo dyes, are also included here.

Ureines are derived from urea by replacing one or more hydrogen atoms of the $-\text{NH}_2$ groups by alicyclic or aryl radicals.

Ureides are obtained from urea by replacing one or more of the hydrogen atoms of the $-\text{NH}_2$ group by acid radicals.

This heading **excludes**, however, urea (H_2NCONH_2), the diamide of carbonic acid, which is principally used as a fertiliser and, even if pure, falls in **heading 31.02 or 31.05**.

(A) ACYCLIC AMIDES

- (1) **Acetamide.**
- (2) **Asparagine**, the mono-amide of aspartic acid. Extracted from certain vegetables. Crystalline.
- (3) **Open chain ureides** (bromodiethylacetylurea, bromoisovalerylurea).

(4) **Ethyl carbamate** (urethan).

(5) **Glutamine.**

This heading **excludes** 1-cyanoguanidine (dicyandiamide) (**heading 29.26**).

(B) CYCLIC AMIDES

(1) **Ureines and ureides.**

The main ureines include :

(i) **p-Ethoxyphenylurea** (dulcin).

(ii) **Diethyldiphenylurea** (centralite).

(2) **Acetanilide, methyl- and ethylacetanilide, acet-p-phenetidide** (phenacetin), **p-acetamidophenol** and **p-acetamidosalol**, used in medicine.

(3) **Phenylacetamide.**

(4) **N-Acetoacetyl derivatives of cyclic amines**, e.g., acetoacetanilide; **amides of hydroxynaphthoic acid**, e.g., 3-hydroxy-2-naphthalide; **diatrizoic acid and its salts**, used as opacifiers in radiography. Some of these compounds are known in trade as “**arylates**”.

(5) **2-Acetamidobenzoic acid.** Colourless to yellowish crystals in the form of needles, plates or rhomboids. Used as a precursor in the production of methaqualone (INN) (see the list of precursors at the end of Chapter 29).

(6) **Alachlor (ISO).** 2-Chloro-N-(2,6-diethylphenyl)-N-(methoxymethyl)acetamide.
 $(C_{14}H_{20}ClNO_2)$.

This heading **excludes**, however, heterocyclic ureides, e.g., malonylurea (barbituric acid) and hydantoin (**heading 29.33**).

*
* *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the List appearing at the end of Chapter 29.

29.25 - Carboxyimide-function compounds (including saccharin and its salts) and imine-function compounds.

- Imides and their derivatives; salts thereof :

2925.11 -- Saccharin and its salts

2925.12 -- Glutethimide (INN)

2925.19 -- Other

- Imines and their derivatives; salts thereof :

2925.21 -- Chlordimeform (ISO)

2925.29 -- Other

(A) IMIDES

Imides have the general formula (R=NH), where R is a dibasic acyl radical.

- (1) **Saccharin or 1,2-benzisothiazolin-3-one 1,1-dioxide and its salts.** Saccharin is an odourless, white crystalline powder having a very sweet taste; its sodium and ammonium salts have a lower sweetening power but are more soluble. Tablets consisting solely of one of these products remain in this heading.

Preparations, used in human diets, consisting of a mixture of saccharin or its salts and a foodstuff, such as lactose, are however **excluded** from this heading and fall in **heading 21.06** (see Note 1 (b) to Chapter 38). Those preparations consisting of saccharin or its salts and substances, other than a foodstuff, such as sodium hydrogencarbonate (sodium bicarbonate) and tartaric acid fall in **heading 38.24**.

- (2) **Succinimide**, used in chemical synthesis.
(3) **Phthalimide**, used in chemical synthesis.
(4) **Glutethimide**. A psychotropic substance - see the list at the end of Chapter 29.

Organic imide derivatives of inorganic acids are classified in **heading 29.29**.

(B) IMINES

Imines, like imides, are characterised by the group =NH, but it is linked to a non-acidic organic radical : (R₂C=NH).

- (1) **Guanidines.** The action of cyanamide on ammonia gives an **imino-urea** known as **guanidine**; this can be regarded as derived from urea by replacing the oxygen of the (>C=O) group by an imino group (=NH):

Guanidine is also formed in the oxidation of proteins; it can also be obtained synthetically. It is crystalline, colourless and deliquescent.

Its **derivatives** include :

- (a) **Diphenylguanidine.** Rubber accelerator.
 - (b) **Di-*o*-tolylguanidine.** Rubber accelerator.
 - (c) ***o*-Tolyldiguanide.** Rubber accelerator.
- (2) **Aldimines.** These have the general formula ($\text{RCH}=\text{NR}^1$) where R and R^1 are alkyl or aryl radicals (methyl, ethyl, phenyl, etc.) or sometimes hydrogen.

They constitute the products known as **Schiff's bases**, the most important of which are :

- (a) **Ethylideneaniline.**
- (b) **Butylideneaniline.**
- (c) **Aldol- α - and - β -naphthylamines.**
- (d) **Ethylidene-*p*-toluidine.**

All these products are used in the rubber industry.

- (3) **Imino ethers.**
- (4) **Amidines.**
- (5) **2,6-Dichlorophenolindophenol.**

This heading **excludes**, however, cyclic polymers of aldimines (**heading 29.33**).

29.26 - Nitrile-function compounds.

- 2926.10 - Acrylonitrile
- 2926.20 - 1-Cyanoguanidine (dicyandiamide)
- 2926.30 - Fenproporex (INN) and its salts; methadone (INN) intermediate (4-cyano-2-dimethylamino-4,4-diphenylbutane)
- 2926.40 - alpha-Phenylacetoacetonitrile
- 2926.90 - Other

The general formula of **nitriles** is $\text{RC}\equiv\text{N}$ in which R is an alkyl or aryl radical or sometimes nitrogen. Mono-, di-, or tri-nitriles contain one, two or three cyanogen radicals ($-\text{CN}$) per molecule, respectively.

The heading includes :

- (1) **Acrylonitrile.** Colourless mobile liquid.
Acrylonitrile polymers and co-polymers are **excluded**; they constitute plastics (**Chapter 39**) or synthetic rubber (**Chapter 40**).
- (2) **1-Cyanoguanidine** (dicyandiamide). Pure white crystals.
- (3) **Acetaldehyde cyanohydrin.**
- (4) **Acetonitrile.**
- (5) **Adiponitrile.**
- (6) **Aminophenylacetonitrile.**
- (7) **Benzonitrile.**
- (8) **Acetone cyanohydrin.**
- (9) **Cyanoacetamide.**
- (10) **Cyanopinacoline.**
- (11) **Hydroxyphenylacetonitrile.**
- (12) **Iminodiacetonitrile.**
- (13) **Nitrobenzonitrile.**
- (14) **Naphthonitrile.**
- (15) **Nitrophenylacetonitrile.**
- (16) **Phenylcyanamide.**
- (17) **Tricyanotrimethylamine.**
- (18) **Methadone-intermediate** (INN) - see the list at the end of Chapter 29.
- (19) **alpha-Phenylacetoacetonitrile** (APAAN)^{*}. 3-Oxo-2-phenylbutanenitrile. See the list on Page VI-29-List I-14. III. Precursors.

29.27 - Diazo-, azo- or azoxy-compounds.

These compounds, the most important of which belong to the aromatic series, are characterised by two nitrogen atoms linked by a double bond.

(A) DIAZO-COMPOUNDS

This group of products includes :

- (1) **Diazonium salts.** These are products of general formula $\text{RN}_2^+ \text{X}^-$ where R is an organic radical and X^- is an anion, for example :

- (a) **Benzenediazonium chloride.**
- (b) **Benzenediazonium tetrafluoroborate.**

This heading covers diazonium salts, whether or not stabilised.

This heading also covers diazonium salts diluted to standard strengths (e.g., by the addition of a neutral salt such as sodium sulphate) for the production of azo dyes.

- (2) Compounds of general formula RN_2 where R is an organic radical, for example :

- (a) **Diazomethane.**
- (b) **Ethyl diazoacetate.**

- (3) Compounds of general formula $\text{R}^1 - \text{N} = \text{N} - \text{N} \begin{matrix} \text{R}^2 \\ \swarrow \\ \text{R}^3 \end{matrix}$ where R^1 and R^2 are organic radicals and R^3 is either an organic radical or hydrogen, for example :

- (a) **Diazoaminobenzene.**
 - (b) **N-Methyl diazoaminobenzene.**
 - (c) **3,3-Diphenyl-1-p-tolytriazene.**
- (Here $\text{R}^1 = \text{R}^2$)

(B) AZO-COMPOUNDS

These are compounds containing the group $\text{R}^1 - \text{N} = \text{N} - \text{R}^2$, where R^1 and R^2 are organic radicals with one of their carbon atoms linked directly to one of the nitrogen atoms, for example:

- (1) **Azobenzene.**
 - (2) **Azotoluenes.**
 - (3) **Azonaphthalenes.**
 - (4) **2,2'-Dimethyl-2,2'-azodipropionitrile.**
 - (5) **Aminoazobenzenesulphonic acids.**
 - (6) **p-Aminoazobenzene.**
- (Here $\text{R}^1 = \text{R}^2$)

The radicals R¹ and R² may themselves contain further –N=N– groups (bisazo-, trisazo-, etc., compounds).

(C) AZOXY-COMPOUNDS

These are compounds of the general formula R¹–N₂O–R² in which an oxygen atom is linked to one of the two nitrogen atoms and where R¹ and R² are generally aryl radicals.

Azoxy-compounds are generally pale yellow crystalline substances. They include :

- (1) **Azoxybenzene.**
- (2) **Azoxytoluene.**
- (3) **p-Azoxyanisole.**
- (4) **p-Azoxypheňetole.**
- (5) **Azoxybenzoic acid.**
- (6) **Azoxycinnamic acid.**
- (7) **Azoxytoluidine.**

*
* *

Diazo- and azo-compounds are the starting point in the formation of azo dyes. They give substitution derivatives which are also included here.

Organic colouring matters are **excluded** from this heading and are classified in **Chapter 32**.

29.28 - Organic derivatives of hydrazine or of hydroxylamine.

This heading **does not cover** hydrazine or hydroxylamine themselves or their inorganic salts (**heading 28.25**) but includes their organic derivatives **only**.

Hydrazine (H_2NNH_2) may, by replacement of one or more hydrogen atoms, give derivatives, e.g. (RHNNH_2), and (RHNNR'), in which R and R' represent organic radicals.

Hydroxylamine (H_2NOH) can also give numerous derivatives by substitution of one or more hydrogen atoms.

Nitrosophenols, which are tautomeric forms of quinone oximes, and nitrosoamines, which are tautomeric forms of quinoneimine oximes, are **excluded** from this heading (see Explanatory Notes to **headings 29.08** and **29.21**).

Organic derivatives of hydrazine and hydroxylamine include :

- (1) **Phenylhydrazine.**
- (2) **Tolylhydrazine.**
- (3) **Methylphenylhydrazine.**
- (4) **Bromophenylhydrazine.**
- (5) **Benzylphenylhydrazine.**
- (6) **Naphthylhydrazine.**
- (7) **Phenylhydroxylamine.**
- (8) **Nitrosophenylhydroxylamine.**
- (9) **Dimethylglyoxime.**
- (10) **Phenylglucosazone.**
- (11) **Phenylglyoxime.**
- (12) **Acetaldehyde phenylhydrazone.**
- (13) **Acetaldoxime.**
- (14) **Acetophenoxime.**
- (15) **Acetoxime.**
- (16) **Benzaldehyde semicarbazone.**
- (17) **Benzaldoxime.**
- (18) **Benzylideneacetoxime.**
- (19) **Hydroxamic acids.**
- (20) **Diphenylcarbazide.**

- (21) **Semicarbazide** (carbamylhydrazine).
- (22) **Phenylsemicarbazide** (1-carbamyl-2-phenylhydrazine).
- (23) **Quaternary hydrazinium salts and bases.**
- (24) **Hydrazides of carboxylic acids.**
- (25) **Hydrazidines.**

29.29 - Compounds with other nitrogen function.

2929.10 - Isocyanates

2929.90 - Other

This heading includes :

(1) Isocyanates

This group of chemicals includes mono- and polyfunctional isocyanates. Isocyanates with di- or higher functionality, such as methylene diphenyl isocyanate (MDI), hexamethylene diisocyanate (HDI), toluene diisocyanate (TDI) and toluene diisocyanate dimer, are used extensively in the manufacture of polyurethanes.

This heading **excludes** poly(methylene phenyl isocyanate) (crude MDI or polymeric MDI) (**heading 39.09**).

(2) Isocyanides (carbylaminates).

(3) Azides of carboxylic acids.

(4) Organic-substituted amide derivatives of inorganic acids (other than carbonic acid) and organic-substituted imide derivatives of inorganic acids.

(5) Calcium cyclamate (calcium cyclohexylsulphamate).

(6) Octamethylpyrophosphoramide (OMPA).

(7) Dimethylnitrosamine.

(8) Methyltrinitrophenylnitramine (tetryl), etc. Used as an explosive.

(9) Nitroguanidine. Explosive.

Sub-Chapter X

ORGANO-INORGANIC COMPOUNDS, HETEROCYCLIC COMPOUNDS, NUCLEIC ACIDS AND THEIR SALTS, AND SULPHONAMIDES

GENERAL

The organo-inorganic compounds covered by headings 29.30 and 29.31 are organic compounds whose molecules contain, in addition to atoms of hydrogen, oxygen or nitrogen, those of metals or other non-metals (such as sulphur, arsenic, lead, iron, etc.) **directly** linked to carbon.

Heading 29.30 (organo-sulphur compounds) and heading 29.31 (other organo-inorganic compounds) **do not include** sulphonated or halogenated derivatives (including compound derivatives) which, apart from hydrogen, oxygen and nitrogen, only have directly linked to carbon the atoms of sulphur or of halogens which give them their nature of sulphonated or halogenated derivatives (or compound derivatives).

Headings 29.32 to 29.34 cover heterocyclic compounds.

The term “**heterocyclic**” refers to organic compounds composed of one or more rings, and which contain in the ring(s), in addition to the carbon atoms, atoms of other elements such as oxygen, nitrogen or sulphur. In this way, the following heterocyclic groups are derived :

(A) FIVE-MEMBERED RINGS

(1) Containing one hetero-atom :

- (a) Of oxygen : **Furan** group (heading 29.32).
- (b) Of sulphur : **Thiophen** group (heading 29.34).
- (c) Of nitrogen : **Pyrrole** group (heading 29.33).

(2) Containing two hetero-atoms :

- (a) One oxygen, one nitrogen : **Oxazole** and **isoxazole** groups (heading 29.34).
- (b) One sulphur, one nitrogen : **Thiazole** group (heading 29.34).
- (c) Two nitrogen : **Imidazole** and **pyrazole** groups (heading 29.33).

(3) Containing three or more hetero-atoms :

- (a) One oxygen, two nitrogen : **Furazan** group (heading 29.34).
- (b) Three nitrogen : **Triazole** group (heading 29.33).
- (c) Four nitrogen : **Tetrazole** group (heading 29.33).

(B) SIX-MEMBERED RINGS

(1) Containing one hetero-atom :

- (a) Of oxygen : **Pyran** group (heading 29.32).
- (b) Of sulphur : **Thiin** (Thiapyran) group (heading 29.34).
- (c) Of nitrogen : **Pyridine** group (heading 29.33).

(2) Containing two hetero-atoms :

- (a) One oxygen, one nitrogen : **Oxazine** group (heading 29.34).
- (b) One sulphur, one nitrogen : **Thiazine** group (heading 29.34).
- (c) Two nitrogen : **Pyridazine**, **pyrimidine**, **pyrazine** and **piperazine** groups (heading 29.33).

(C) OTHER MORE COMPLEX HETEROCYCLIC COMPOUNDS

These result from the condensation of five- or six-membered heterocyclic compounds with other carbocyclic rings.

Examples include the following **groups** :

- (a) **Coumarone** (heading 29.32).
- (b) **Benzopyran** (heading 29.32).
- (c) **Xanthene** (heading 29.32).
- (d) **Indole** (heading 29.33).
- (e) **Quinoline** and **isoquinoline** (heading 29.33).
- (f) **Acridine** (heading 29.33).
- (g) **Benzothiophene** (Thionaphthene) (heading 29.34).
- (h) **Indazole** (heading 29.33).
- (ij) **Benzimidazole** (heading 29.33).
- (k) **Phenazine** (heading 29.33).
- (l) **Phenoxazine** (heading 29.34).
- (m) **Benzoxazole** (heading 29.34).
- (n) **Carbazole** (heading 29.33).
- (o) **Quinazoline** (heading 29.33).
- (p) **Benzothiazole** (heading 29.34).

For the purposes of headings 29.32 to 29.34, with respect to compounds containing more than one heterocyclic ring, if only one of the heterocyclic rings is specifically named in a subheading within headings 29.32 to 29.34, the compound should be classified in that subheading. However, if two or more of the heterocyclic rings are specifically named at the subheading level, the compound should be classified in the specific subheading that occurs last in numerical order.

* * *

29.30 - Organo-sulphur compounds.

- 2930.20 - Thiocarbamates and dithiocarbamates
- 2930.30 - Thiuram mono-, di- or tetrasulphides
- 2930.40 - Methionine
- 2930.60 - 2-(N,N-Diethylamino)ethanethiol
- 2930.70 - Bis(2-hydroxyethyl)sulfide (thiodiglycol (INN))
- 2930.80 - Aldicarb (ISO), captafol (ISO) and methamidophos (ISO)
- 2930.90 - Other

This heading includes organo-sulphur compounds whose molecules have sulphur atom(s) directly linked to carbon atom(s) (see Note 6 to this Chapter). It includes compounds whose molecules contain, in addition to sulphur atom(s), other non-metal or metal atom(s) directly linked to carbon atom(s).

(A) DITHIOCARBONATES (XANTHATES)

These are diesters or salts of monoesters of dithiocarbonic acid and correspond to the general formula $(ROC(S)SR')$ in which R is an organic radical and R' is a metal (sodium, potassium, etc.) or an organic radical.

- (1) **Sodium ethyldithiocarbonate** (ethylxanthate). Amorphous; used to prepare synthetic indigo, and in the flotation of ores.
- (2) **Potassium ethyldithiocarbonate** (ethylxanthate). Oily, yellowish crystals; used as a flotation agent for lead and zinc ores, and as an antiparasitic and anticryptogamic agent.
- (3) **Methyl-, butyl-, pentyl- and benzyl dithiocarbonates** (xanthates).

(B) THIOCARBAMATES, DITHIOCARBAMATES AND THIURAM SULPHIDES

- (1) **Thiocarbamates** include the salts and esters of thiocarbamic acid (H_2NCOSH or H_2NCSOH) (which does not exist in the free state), whether or not hydrogen atoms of the NH_2 group are substituted with alkyl or aryl groups.
- (2) **Dithiocarbamates** include the salts and esters of dithiocarbamic acid, whether or not hydrogen atoms of the NH_2 group are substituted with alkyl or aryl groups. The metal salts of substituted dithiocarbamic acids (e.g., zinc dibutyldithiocarbamate) are used as vulcanisation accelerators in the rubber industry.

- (3) **Thiuram mono-, di- or tetrasulphides.** The alkyl substituted derivatives (e.g., tetraethylthiuram disulphide) are used as vulcanisation accelerators.

(C) SULPHIDES (OR THIOETHERS)

These may be regarded as ethers in which the oxygen atom is replaced by one of sulphur

- (1) **Methionine.** White platelets or powder. An amino acid. Essential component in human nutrition, not synthesised by the body.
- (2) **Dimethyl sulphide, diphenyl sulphide.** Colourless liquids with a very disagreeable odour.
- (3) **Bis(2-hydroxyethyl)sulfide** or thiodiglycol (INN); a liquid used as a solvent for dyes in textile printing.
- (4) **Thioaniline** or 4,4'-diaminodiphenyl sulphide.

(D) THIOAMIDES

- (1) **Thiourea** (H_2NCSNH_2) is the diamide of thiocarbonic acid and is thus the sulphur analogue of urea. Lustrous, white crystals. Used in photography, as an auxiliary in dyeing, and for preparing intermediate compounds in the dyestuff and pharmaceutical industries.
- (2) **Thiocarbanilide** (diphenylthiourea). Colourless, crystalline tablets or amorphous white powder. Used for preparing intermediate compounds in the dyestuffs industry (sulphur dyes, indigo) and synthetic pharmaceutical products; also as an accelerator in the vulcanisation of rubber, and for the flotation of ores.
- (3) **Di-o-tolylthiourea.** White powder, insoluble in water; used as an accelerator in the vulcanisation of rubber.

(E) THIOLS (MERCAPTANS)

These sulphur compounds correspond to alcohols or phenols in which the oxygen atoms have been replaced by sulphur atoms.

- (1) **Thioalcohols**, like alcohols, may be primary, secondary or tertiary, containing the groups $(-\text{CH}_2\text{SH})$, $(>\text{CHSH})$ or $(\geqslant\text{CSH})$, respectively.

They are generally colourless or yellowish liquids with a disagreeable odour.

- (a) **Methanethiol** (methyl mercaptan).
- (b) **Ethanethiol** (ethyl mercaptan).

- (c) **Butanethiol** (butyl mercaptan).
- (d) **Pantanethiol** (pentyl mercaptan).

(2) **Thiophenols.**

- (a) **Thiophenol** (C_6H_5SH)
- (b) ***o*-Mercaptobenzoic acid**, sometimes described as thiosalicylic acid.

(F) THIOALDEHYDES

General formula (RCSH).

(G) THIOKETONES

General formula (RCSR¹).

(H) THIOACIDS

General formula (RCOSH or RCSOH and also RCSSH).

An example is dithiosalicylic acid (HOC_6H_4CSSH), but this name is often applied to the compound di(*o*-carboxyphenyl) disulphide.

(IJ) SULPHINIC ACIDS, SULPHOXIDES AND SULPHONES

These have the general formulae (RSO₂H), (RSOR¹) and (RSO₂R¹), respectively.

An example is sulphonal, colourless crystals, used in medicine.

(K) ISOTHIOCYANATES

General formula (RN=CS).

They may be regarded as the “esters” of *isothiocyanic acid*. They include ethyl *isothiocyanate*; phenyl *isothiocyanate*; allyl *isothiocyanate* (or artificial mustard oil).

29.31 - Other organo-inorganic compounds.

2931.10 - Tetramethyl lead and tetraethyl lead

2931.20 - Tributyltin compounds

- Other organo-phosphorous derivatives :

2931.31 - - Dimethyl methylphosphonate

2931.32 - - Dimethyl propylphosphonate

2931.33 - - Diethyl ethylphosphonate

2931.34 - - Sodium 3-(trihydroxysilyl)propyl methylphosphonate

2931.35 - - 2,4,6-Tripropyl-1,3,5,2,4,6-trioxatriphosphinane 2,4,6-trioxide

2931.36 - - (5-Ethyl-2-methyl-2-oxido-1,3,2-dioxaphosphinan-5-yl)methyl methyl methylphosphonate

2931.37 - - Bis[(5-ethyl-2-methyl-2-oxido-1,3,2-dioxaphosphinan-5-yl)methyl]methyl phosphonate

2931.38 - - Salt of methylphosphonic acid and (aminoiminomethyl)urea (1 : 1)

2931.39 - - Other

2931.90 - Other

This heading includes :

(1) **Tetramethyl lead** ($\text{Pb}(\text{CH}_3)_4$) **and tetraethyl lead** ($\text{Pb}(\text{C}_2\text{H}_5)_4$). Volatile liquids, colourless in the pure state, whereas the technical products are yellow; toxic; very efficient anti-knock agents.

(2) **Tributyltin compounds.**

(3) **Organophosphorus compounds.**

These are organic compounds containing at least one phosphorus atom directly linked to a carbon atom.

This group includes :

(a) **Dimethyl methylphosphonate***, **dimethyl propylphosphonate** and **diethyl ethylphosphonate**.

(b) **Sodium 3-(trihydroxysilyl)propyl methylphosphonate**.

(c) **2,4,6-Tripropyl-1,3,5,2,4,6-trioxatriphosphinane 2,4,6-trioxide**.

(d) **Salt of methylphosphonic acid and (aminoiminomethyl)urea (1 : 1)**.

(e) **O-Isopropyl methylphosphonofluoride (sarín)**.

- (f) **O-Pinacolyl methylphosphonofluoride (soman).**
- (4) **Organosilicon compounds.** These are separate chemically defined compounds in which the silicon atom is directly linked to at least one carbon atom of an organic radical. These compounds include organic silanes and siloxanes; in some cases these products are polymerized to make silicones. Silanes include chlorosilanes (e.g., dimethyldichlorosilane), alkoxy silanes (e.g., methyltrimethoxysilane), alkyl or aryl silanes (e.g., diphenylsilanediol, tetramethylsilane) and other multifunctional (amino, nitrile, oxiranyl, oximo, acetoxy, etc.) silanes. Siloxanes include hexamethyldisiloxane, octamethyltrisiloxane, octamethylcyclotetrasiloxane, decamethylcyclopentasiloxane and dodecamethylcyclohexasiloxane. The heading also includes hexamethyldisilazane and organo-disilanes.

This heading **does not include** inorganic silicon compounds, which are generally classifiable in Chapter 28 (e.g., silicon tetrachloride (SiCl_4) in **heading 28.12** or trichlorosilane (SiHCl_3) in **heading 28.53**). Silicic acid esters and their salts are classified in **heading 29.20**. Deliberate mixtures of separate chemically defined organo-silicon compounds are classified elsewhere in the Nomenclature, generally in **heading 38.24**. This heading further **excludes** non-chemically defined products containing in the molecule more than one silicon-oxygen-silicon linkage, and containing organic groups connected to the silicon atoms by direct silicon-carbon bonds. These are silicones of **heading 39.10**.”

(5) **Iron carbonyl, nickel carbonyl, etc.**

(6) **Organo-arsenic compounds.**

- (a) **Methylarsonic acid** ($\text{CH}_3\text{AsO}(\text{OH})_2$) and its salts. Crystallises in flakes, and forms crystalline salts such as sodium methylarsonate (colourless, used in medicine).
- (b) **Cacodylic acid** and its salts. These contain the radical $(-\text{As}(\text{CH}_3)_2)$ known as cacodyl. Used in medicine.
- Cacodylic acid occurs as odourless, colourless crystals. Its main salt is sodium cacodylate, a crystalline white powder.
- (c) **p-Aminophenylarsonic acid** ($\text{H}_2\text{NC}_6\text{H}_4\text{AsO}(\text{OH})_2$) and its salts. Crystallises in shiny white needles. Its main salt is sodium *p*-aminophenylarsonate, an odourless, white, crystalline powder; used in medicine, particularly against sleeping-sickness.
- (d) **Amino-hydroxyphenylarsonic acids, their formyl and acetyl derivatives and their salts.**
- (e) **Arsenobenzene** ($\text{C}_6\text{H}_5\text{As}=\text{AsC}_6\text{H}_5$) and its derivatives, compounds analogous to azo compounds but containing the arseno group $(-\text{As}=\text{As}-)$ instead of the azo group $(-\text{N}=\text{N}-)$.

(7) ***o*-Iodosobenzoic acid.**

(8) **Metal alkyls, metal fullerenes and metallocenes.**

This heading **excludes** organo-sulphur compounds whose molecules have sulphur atom(s) directly linked to carbon atom(s) (see Note 6 to this Chapter). It **excludes** compounds whose molecules contain, in addition to sulphur atom(s) directly linked to carbon atom(s), other non-metal or metal atom(s) directly linked to carbon atom(s) (e.g., fonofos (ISO)) (**heading 29.30**).

This heading also **excludes** organo-mercury compounds which may contain one or more mercury atoms, in particular the $(-\text{HgX})$ group in which X is an inorganic or organic acid residue (**heading 28.52**).

29.32 - Heterocyclic compounds with oxygen hetero-atom(s) only (+).

- Compounds containing an unfused furan ring (whether or not hydrogenated) in the structure :

2932.11 -- Tetrahydrofuran

2932.12 -- 2-Furaldehyde (furfuraldehyde)

2932.13 -- Furfuryl alcohol and tetrahydrofuranyl alcohol

2932.14 -- Sucralose

2932.19 -- Other

2932.20 - Lactones

- Other :

2932.91 -- Isosafrole

2932.92 -- 1-(1,3-Benzodioxol-5-yl)propan-2-one

2932.93 -- Piperonal

2932.94 -- Safrole

2932.95 -- Tetrahydrocannabinols (all isomers)

2932.99 -- Other

The **heterocyclic compounds** covered by this heading are :

(A) **Compounds containing an unfused furan ring (whether or not hydrogenated) in the structure.**

This part includes, *inter alia* :

- (1) **Tetrahydrofuran.** Colourless liquid.
- (2) **2-Furaldehyde** (furfural). Prepared by distilling cereal bran with sulphuric acid. Colourless liquid with a characteristic aromatic odour; it turns yellow and then brown when exposed to air. Used in the purification of mineral oils, for the preparation of synthetic resins, as a solvent for cellulose nitrate and varnishes, as an insecticide, etc.
- (3) **Furfuryl alcohol.** Colourless liquid which darkens when exposed to air. Reacts vigorously with concentrated mineral acids. Used as a solvent for cellulose nitrate, and for the preparation of varnishes and protective waterproof coatings.
- (4) **Tetrahydrofuranyl alcohol.** Colourless liquid.
- (5) **Sucralose*** (1,6-Dichloro-1,6-dideoxy- β -D-fructofuranosyl-4-chloro-4-deoxy- α -Dgalactopyranoside). Odorless, white to almost white crystalline powder. Artificial sweetener mainly used for medicine and food, especially for the treatment and diet of diabetic patients.
- (6) **Furan.**

(B) Lactones.

These compounds may be considered as internal esters of carboxylic acids with alcohol or phenol function, formed by elimination of water. The molecules may contain one or more ester functions in a ring. They are known as mono-, di-, trilactones, etc., according to the number of ester functions present. However, cyclic esters of polyhydric alcohols with polybasic acids are **excluded** (see Note 7 to this Chapter).

Lactones are fairly stable compounds, but are characterized by the ease with which the lactone ring can be opened using an alkali.

This part includes, *inter alia* :

- (a) **Coumarin (1,2-benzopyrone)**. This is the lactone of orthocoumaric acid. It crystallises in white flakes. It is used in perfumery, in medicine and for flavouring butter, castor oil, medicaments, etc. It also inhibits plant germination.
- (b) **Methylcoumarins**. Same appearance as coumarin and also used in perfumery.
- (c) **Ethylcoumarins**.
- (d) **Dicoumarol (dicoumarin)**. Crystals. Used in surgery as an anti-coagulant.
- (e) **7-Hydroxycoumarin (umbelliferone)**. White crystals. Absorbs ultra-violet rays, hence its use in suntan lotions and creams.
- (f) **Dihydroxycoumarins (aesculetin and daphnetin)**. Crystals soluble in hot water.
Glucosides of dihydroxycoumarins (aesculin and daphnin) fall in **heading 29.38**.
- (g) **Nonalactone**. Colourless or yellowish liquid; used in perfumery.
- (h) **Undecalactone**. Similar appearance and same uses as nonalactone.
- (ij) **Butyrolactone (hydroxybutyric acid lactone)**. Colourless liquid with a pleasant odour; miscible with water. An intermediate product and solvent for synthetic resins. Used in preparations for removing paint stains, and in the petroleum industries.
- (k) **Propionolactone**. Liquid, soluble in water. A disinfectant, sterilising agent and germicide.
- (l) **Glucuronolactone (glucuronic acid lactone)**. White powder, very soluble in water. Used in medicine and as a growth factor.
- (m) **D-Gluconolactone (gluconic acid δ -lactone)**. Soluble crystals. Used in foodstuffs as an acidulant.
- (n) **Pantolactone**. Soluble crystals. Used to rectify pantothenic acid.
- (o) **Santonin**. This is the internal ester of santonic acid extracted from santonica, the dried unexpanded flower heads of *Artemisia cina*. Odourless, colourless crystals; a fairly energetic vermicide (anthelmintic).

- (p) **Phenolphthalein.** Obtained by the condensation of phthalic anhydride with phenol. A white or yellowish-white, odourless crystalline powder, soluble in ethanol. Reacts with alkalis to give a cherry-red colour which disappears when the solution is acidified. Used as a chemical reagent and as a laxative.

This group includes **iodophenolphthalein**, a yellow powder, also used as a laxative.

This heading, however, **excludes** :

- (i) Sodium derivatives of phthalein tetrahalides (**heading 29.18**).
- (ii) Fluorescein (resorcinol-phthalein) (**heading 32.04**).

- (q) **Thymolphthalein.** White crystals, used also as a reagent in analyses and in medicine.

- (r) **Isoascorbic acid.** Granular crystals.

It should, however, be noted that this heading **excludes** ascorbic acid (**heading 29.36**).

- (s) **Dehydracetic acid.** Colourless crystals, insoluble in water.
- (t) **Ambrettolide.** Colourless liquid, musk-scented, used in perfumery.
- (u) **Diketene.** Colourless, non-hygroscopic liquid.
- (v) **3,6-Dimethyl-1,4-dioxane-2,5-dione.**

(C) **Other heterocyclic compounds with oxygen hetero-atom(s) only.**

This part includes, *inter alia* :

- (1) **Benzofuran** (coumarone). Found in light oils of the distillation of coal tar. A colourless liquid, used for the manufacture of artificial plastic materials (coumarone resins), etc.
- (2) **1,3-Dioxolan.**
- (3) **1,4-Dioxan** (diethylene dioxide), used as a solvent.
- (4) **1,3-Dioxan.**
- (5) **Safrole.** Obtained from sassafras oil. A colourless liquid which turns yellowish; used in perfumery and as a precursor for methylenedioxyamphetamine and methylenedioxymethamphetamine (see the list of precursors at the end of Chapter 29).
- (6) **Isosafrole.** Obtained from safrole; used in perfumery and as a precursor for methylenedioxyamphetamine and methylenedioxymethamphetamine (see the list of precursors at the end of Chapter 29).
- (7) **Tetrahydrocannabinols.**
- (8) **Piperonal** (piperonaldehyde or heliotropin) ($\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{CHO}$). White crystals or flakes with an odour of heliotrope; used in perfumery and to flavour liqueurs and as a precursor for methylenedioxyamphetamine and methylenedioxymethamphetamine (see the list of precursors at the end of Chapter 29).

(9) **Piperonylic acid.**

- (10) **1-(1,3-Benzodioxol-5-yl)propan-2-one** (3,4-methylenedioxyphenylacetone). White to yellowish crystals. Used as a precursor in the production of methylenedioxymphetamine and methylenedioxymethamphetamine (see the list of precursors at the end of Chapter 29).

Hydromercuridibromofluorescein is to be classified in **heading 28.52**.

*
* * *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

This heading **excludes** :

- (a) Ketone peroxides (**heading 29.09**).
- (b) Epoxides with a three-membered ring (**heading 29.10**).
- (c) Cyclic polymers of aldehydes (**heading 29.12**) or of thioaldehydes (**heading 29.30**).
- (d) Anhydrides of polybasic carboxylic acids and cyclic esters of polyhydric alcohols or phenols with polybasic acids (**heading 29.17**).

○
○ ○

Subheading Explanatory Note.

Subheading 2932.29

Lactones containing an additional hetero-atom, other than the oxygen atom of a lactone group (e.g., dilactone), **in the same ring** should not be classified in the subheadings for lactones. In such cases, the additional hetero-atom should be taken into account in determining the classification. Thus, for example, anhydromethylenecitric acid should be classified in subheading 2932.99 and **not** in subheading 2932.29.

If the ester function forms part of two or more rings and if one of these rings does not contain an additional hetero-atom (other than the oxygen atom of a lactone group), then the molecule should be considered as a lactone.

To be classified in subheading 2932.29, lactones must have the different lactone groups separated by at least one carbon atom at each end. However, this subheading **does not include** those products in which the carbon atoms separating and adjacent to the lactone groups form an oxo group (>C=O), an imino group (>C=NH) or a thioxo group (>C=S).

29.33 - Heterocyclic compounds with nitrogen hetero-atom(s) only (+).

- Compounds containing an unfused pyrazole ring (whether or not hydrogenated) in the structure :

2933.11 -- Phenazone (antipyrin) and its derivatives

2933.19 -- Other

- Compounds containing an unfused imidazole ring (whether or not hydrogenated) in the structure :

2933.21 -- Hydantoin and its derivatives

2933.29 -- Other

- Compounds containing an unfused pyridine ring (whether or not hydrogenated) in the structure :

2933.31 -- Pyridine and its salts

2933.32 -- Piperidine and its salts

2933.33 -- Alfentanil (INN), anileridine (INN), bezitramide (INN), bromazepam (INN), difenoxin (INN), diphenoxylate (INN), dipipanone (INN), fentanyl (INN), ketobemidone (INN), methylphenidate (INN), pentazocine (INN), pethidine (INN), pethidine (INN) intermediate A, phencyclidine (INN) (PCP), phenoperidine (INN), pipradrol (INN), piritramide (INN), propiram (INN) and trimeperidine (INN); salts thereof

2933.39 -- Other

- Compounds containing in the structure a quinoline or isoquinoline ring-system (whether or not hydrogenated), not further fused :

2933.41 -- Levorphanol (INN) and its salts

2933.49 -- Other

- Compounds containing a pyrimidine ring (whether or not hydrogenated) or piperazine ring in the structure :

2933.52 -- Malonylurea (barbituric acid) and its salts

2933.53 -- Allobarbital (INN), amobarbital (INN), barbital (INN), butalbital, cyclobarbital (INN), methylphenobarbital (INN), pentobarbital (INN), phenobarbital (INN), sebutabarbital (INN), secobarbital (INN) and vinylbital (INN); salts thereof

2933.54 -- Other derivatives of malonylurea (barbituric acid); salts thereof

2933.55 -- Loprazolam (INN), mecloqualone (INN), methaqualone (INN) and zipeprol (INN); salts thereof

2933.59 -- Other

- Compounds containing an unfused triazine ring (whether or not hydrogenated) in the structure :

2933.61 -- Melamine

2933.69 -- Other

- Lactams :

2933.71 -- 6-Hexanelactam (epsilon-caprolactam)

2933.72 -- Clobazam (INN) and methyprylon (INN)

2933.79 -- Other lactams

- Other :

2933.91 -- Alprazolam (INN), camazepam (INN), chlordiazepoxide (INN), clonazepam (INN), clorazepate, delorazepam (INN), diazepam (INN), estazolam (INN), ethyl loflazepate (INN), fludiazepam (INN), flunitrazepam (INN), flurazepam (INN), halazepam (INN), lorazepam (INN), lormetazepam (INN), mazindol (INN), medazepam (INN), midazolam (INN), nimetazepam (INN), nitrazepam (INN), nordazepam (INN), oxazepam (INN), pinazepam (INN), prazepam (INN), pyrovalerone (INN), temazepam (INN), tetrazepam (INN) and triazolam (INN); salts thereof

2933.92 -- Azinphos-methyl (ISO)

2933.99 -- Other

The **heterocyclic compounds** covered by this heading are :

(A) **Compounds containing an unfused pyrazole ring (whether or not hydrogenated) in the structure.**

This part includes, *inter alia* :

(1) **Phenazone (antipyrin, dimethylphenylpyrazolone).** Crystalline powder or flakes, colourless, odourless. Used in medicine as an anti-pyretic and anti-neuralgic agent.

(2) **Aminophenazone (4-dimethylamino-2,3-dimethyl-1-phenyl-5-pyrazolone) (amidopyrin, dimethylaminoanalgesine)** and its salts. Colourless, leaf-shaped crystals. It has stronger anti-pyretic and anti-neuralgic properties than analgesine.

(3) **1-Phenyl-3-pyrazolidone.**

(B) **Compounds containing an unfused imidazole ring (whether or not hydrogenated) in the structure.**

This part includes, *inter alia* :

(1) **Hydantoin, and its substitution derivatives** (e.g., nitrohydantoin, methylhydantoin and phenylhydantoin). Obtained by the condensation of glycollic acid with urea.

(2) **Lysidine.** Hygroscopic white crystals; used in medicine as a solvent for uric acid.

(C) **Compounds containing an unfused pyridine ring (whether or not hydrogenated) in the structure.**

This part includes, *inter alia* :

(1) **Pyridine.** Contained in coal tar, in bone oil, etc. Colourless or faintly yellow liquid with a strong, disagreeable odour. Used in organic synthesis, in the rubber industry, in dyeing and printing textile fabrics, as a denaturant for alcohol, in medicine, etc.

To fall in this heading, pyridine must have a purity of 95 % or more by weight. Pyridine of lower purity is excluded (**heading 27.07**).

(2) **Pyridine derivatives** include, *inter alia* :

(a) **Methylpyridine (picoline), 5-ethyl-2-methylpyridine (5-ethyl-2-picoline) and 2-vinylpyridine.**

To fall in this heading, these derivatives must have a purity of 90 % or more by weight (in the case of methylpyridine, all the methylpyridine isomers must be taken together). The derivatives of lower purity are excluded (**heading 27.07**).

(b) **Pyridine-carboxylic acids.**

These include **pyridine- γ -carboxylic acid (isonicotinic acid)**. Colourless crystals, formed by oxidation of γ -picoline, or by synthesis. Its hydrazide is used in the treatment of tuberculosis.

Pyridine- β -carboxylic acid, known as nicotinic acid is, however, excluded (**heading 29.36**).

(c) **Diethylamide of pyridine- β -carboxylic acid.** Oily liquid, almost colourless; used in medicine for stimulating the circulation and respiration.

(d) **mesoInositol hexanicotinate.**

(3) **Piperidine derivatives** include :

(a) **1-Methyl-4-phenylpiperidine carboxylic acid.**

(b) **1-Methyl-3-phenylpiperidine-3-carboxylic acid ethyl ester.**

(c) **1-Methyl-4-phenylpiperidine-4-carboxylic acid ethyl ester (pethidine).**

(d) **Ketobemidone (INN) (1-[4-(*m*-hydroxyphenyl)-1-methyl-4-piperidyl]propan-1-one).**

(D) **Compounds containing a quinoline or isoquinoline ring-system (whether or not hydrogenated), not further fused.**

Quinoline, isoquinoline and their derivatives, 2-ring systems comprising a benzene ring fused to a pyridine ring. Quinoline and isoquinoline are found in coal tar, but may also be prepared synthetically. Colourless liquids, highly refractive, with a characteristic disagreeable and penetrating odour. Used in organic synthesis (e.g., dyes, medicaments).

These derivatives include, *inter alia* :

- (1) **Methylquinoline**.
- (2) **Isobutylquinoline**.
- (3) **Isopropylquinoline**.
- (4) **Tetrahydromethylquinoline**.
- (5) **3-, 4-, 5-, 6-, 7- and 8-Hydroxyquinolines and their salts**. Derived by introducing a hydroxyl group into either ring of the quinoline molecule.

This group includes **metal complex compounds of 8-hydroxyquinoline**.

- (6) **Phenylquinolinecarboxylic acid** (phenylcinchoninic acid). Colourless needles or yellowish-white powder. An anti-gout and anti-rheumatism remedy.
- (7) **Octaverine** (INN) (6,7-dimethoxy-1-(3,4,5-triethoxyphenyl)isoquinoline).
- (8) **N-Methylmorphinan**.
- (9) **3-Hydroxy-N-methylmorphinan**.

(E) **Compounds containing a pyrimidine ring (whether or not hydrogenated) or piperazine ring in the structure.**

This part includes, *inter alia* :

- (1) **Malonylurea** (barbituric acid) **and its derivatives**. Barbituric derivatives. This is an important group of pyrimidine compounds. They form water-soluble sodium salts. Both the alkyl-substituted barbituric derivatives and their salts are used medicinally as hypnotics and sedatives. Compounds representative of this group include barbital (INN) (diethylmalonylurea), phenobarbital (INN) (ethylphenylmalonylurea), amobarbital (INN) (ethylisoamylmalonylurea), secobarbital (INN) (allyl-1-methylbutylmalonylurea) and cyclobarbital (INN) (5-cyclohex-1-enyl-5-ethylbarbituric acid).
- (2) **Thiopentone sodium** (penthiobarbital sodium), a cyclic thioureide. A yellowish-white water-soluble hygroscopic powder with an unpleasant odour. Used in medicine as an anaesthetic.
- (3) **Piperazine** (diethylenediamine). Crystalline white mass, hygroscopic, with an individual odour. Used in medicine as an anti-gout remedy.
- (4) **2,5-Dimethylpiperazine**. Colourless oily liquid or paste, used as a solvent for uric acid.

(F) **Compounds containing an unfused triazine ring (whether or not hydrogenated) in the structure.**

This part includes, *inter alia* :

- (1) **Melamine** (triaminotriazine). Sparkling white crystals used in the manufacture of plastics.
- (2) **Trimethylenetrinitramine** (hexogen). An explosive, crystalline white powder, sensitive to shock.
- (3) **Cyanuric acid** (enol and keto forms).
- (4) **Methenamine** (INN) (hexamethylenetetramine), its salts and derivatives. Regular shaped white crystals, very soluble in water. Used in medicine as a solvent for uric acid (urinary antiseptic), for the manufacture of synthetic resins, as an accelerator in the vulcanisation of rubber, as an anti-fermentation agent, etc.

This heading **excludes** pastilles and tablets of methenamine (INN) for medical uses (**heading 30.04**) and methenamine put up in forms (for example, tablets, sticks or similar forms) for use as fuels (**heading 36.06**).

(G) **Lactams.**

These compounds may be regarded as internal amides analogous to lactones; obtained from amino-acids by elimination of water. The molecules may contain one or more amide functions in a ring. They are known as mono-, di-, trilactams, etc., according to the number of amide functions present.

This heading also includes lactims, which are the enolic tautomers of lactams (these being the ketonic isomers).

This part includes, *inter alia* :

- (1) **6-Hexanellactam (ϵ -caprolactam).** White crystals; soluble in water; gives off pungent fumes. Used in the manufacture of plastics and man-made fibres.
- (2) **Isatin (lactam of isatic acid).** Brilliant yellowish-brown crystals. Used for the preparation of dyestuffs and in medicine.
- (3) **2-Hydroxyquinoline (carbostyryle),** a lactam of *o*-aminocinnamic acid.
- (4) **3,3-Di(*p*-acetoxyphenyl)oxindole** (diacetylhydroxydiphenylisatin). White crystalline powder, insoluble in water. Used as a laxative.
- (5) **1-Vinyl-2-pyrrolidone.** Yellowish crystalline powder with a pleasant odour. Used for the preparation of poly(vinyl pyrrolidone) (classified in **Chapter 39**), and in medicine.
- (6) **Primidone** (INN) (5-ethyl-5-phenylperhydropyrimidine-4,6-dione). White crystals; soluble in water.
- (7) **1,5,9-Triazacyclododecane-2,6,10-trione.**

The heading **does not include** betaine (trimethylglycine, trimethylglycocol), an intramolecular quaternary ammonium salt (**heading 29.23**).

(H) **Other heterocyclic compounds with nitrogen hetero-atom(s) only.**

This part includes, *inter alia* :

- (1) **Carbazole and its derivatives.** Derived from the fusion of two benzene rings with a pyrrole nucleus. Found in heavy fractions of coal tar oil, and also obtained synthetically. Sparkling crystalline flakes used in the manufacture of dyes and of plastics.
- (2) **Acridine and its derivatives.** Acridine results from the condensation of two benzene rings with a pyridine ring. Small quantities are found in coal tar, but it may also be prepared by synthesis. Used for the preparation of dyestuffs and certain medicaments.

The heading covers the following **acridine derivatives (other than those constituting dyestuffs)** :

(a) **Proflavine** (3,6-diaminoacridinium hydrogen sulphate), reddish-brown crystalline powder.

(b) **Lactate of 2,5-diamino-7-ethoxyacridine**, yellow powder.

Both of these derivatives have antiseptic and germicidal properties.

(3) **Indole.** Found in coal tar, but usually obtained by synthesis. Small crystalline leaves; colourless or very faintly yellow, turning red on exposure to air or light. A pronounced faecal odour when impure, but smells strongly of flowers when purified. Used for the preparation of synthetic perfumes and in medicine.

(4) **β -Methylindole (skatole).** Crystallises in colourless flakes; a faecal odour when impure.

(5) **Mercaptobenziminazole.**

(6) **Phthalhydrazide** (hydrazide of phthalic acid).

(7) **Ethyleneimine** (aziridine) and its *N*-substituted derivatives.

(8) **Porphyrins** (derivatives of porphine).

However, porphyrine (an alkaloid) is to be classified in **heading 29.39**.

(9) **Azinphos-methyl (ISO)** (O_2O -Dimethyl S-[(4-oxo-1,2,3-benzotriazin-3(4H)-yl)methyl]dithiophosphate) ($C_{10}H_{12}N_3O_3PS_2$).

*
* * *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

This heading **excludes** imides of polybasic acids.

○ ○

Subheading Explanatory Notes.

Subheadings 2933.11, 2933.21 and 2933.54

Phenazone (subheading 2933.11), hydantoin (subheading 2933.21) and barbituric acid (subheading 2933.52) are products characterized by their heterocyclic structure. Derivatives of these products classified in their respective subheadings should also retain the basic structure of the parent compound. Thus, when compared to the parent compound, these derivatives generally :

- (a) have the functional groups (e.g., oxo-group) unmodified;
- (b) retain the number and position of double bonds;
- (c) retain the substituents (e.g., phenyl group and the two methyl groups of phenazone); and
- (d) have further substitutions of hydrogen atoms only (e.g., a hydrogen atom in the pyrimidine ring of barbituric acid substituted by an alkyl group).

However, salts obtained from the enol form of a parent compound are to be regarded as derivatives of the keto form.

Subheading 2933.79

Lactams containing an additional hetero-atom, other than the nitrogen atom of a lactam group (e.g., dilactams), **in the same ring** should not be classified in the subheading for lactams. In such cases, the additional hetero-atom should be taken into account in determining the classification. Thus, for example, oxazepam (INN) should be classified in subheading 2933.91 and **not** in subheading 2933.79.

If the amide function forms part of two or more rings and if one of these rings does not contain an additional hetero-atom (other than the nitrogen of a lactam group), then the molecule should be considered as a lactam.

To be classified in subheading 2933.79, lactams must have the different lactam groups separated by at least one carbon atom at each end. However, this subheading **does not include** those products in which the carbon atoms separating and adjacent to the lactam groups form an oxo group ($>\text{C}=\text{O}$), an imino group ($>\text{C}=\text{NH}$) or a thioxo group ($>\text{C}=\text{S}$). Thus, for example, barbituric acid is **excluded** from subheading 2933.79 (**subheading 2933.52**).

29.34 - Nucleic acids and their salts, whether or not chemically defined; other heterocyclic compounds.

2934.10 - Compounds containing an unfused thiazole ring (whether or not hydrogenated) in the structure

2934.20 - Compounds containing in the structure a benzothiazole ring-system (whether or not hydrogenated), not further fused

2934.30 - Compounds containing in the structure a phenothiazine ring-system (whether or not hydrogenated), not further fused

- Other :

2934.91 - - Aminorex (INN), brotizolam (INN), clotiazepam (INN), cloxazolam (INN), dextromoramide (INN), haloxazolam (INN), ketazolam (INN), mesocarb (INN), oxazolam (INN), pemoline (INN), phenidimetrazine (INN), phenmetrazine (INN) and sufentanil (INN); salts thereof

2934.99 - - Other

This heading includes **nucleic acids and their salts**. These are complex compounds which, when combined with proteins, form the nucleo-proteins found in the nucleii of animal and vegetable cells. They are combinations of phosphoric acids with sugar and pyrimidine or purine compounds. Generally in the form of white powders, soluble in water.

The acids, or more often their salts (e.g., sodium and copper nucleates), are used as tonics and stimulants for the nervous system and solvents for uric acid.

The **heterocyclic compounds** covered by this heading are :

(A) **Compounds containing an unfused thiazole ring (whether or not hydrogenated) in the structure.**

The term "thiazole" includes both 1,3-thiazole and 1,2-thiazole (isothiazole).

(B) **Compounds containing a benzothiazole ring-system (whether or not hydrogenated), not further fused.**

The term "benzothiazole" includes both 1,3-benzothiazole and 1,2-benzothiazole (benzisothiazole).

This part includes, *inter alia* :

(1) **Mercaptobenzothiazole**. White-yellowish fine powder. Used as an accelerator in the rubber industry.

(2) **Dibenzothiazolyl disulphide**. Used as an accelerator in the rubber industry.

(3) **Ipsapirone** (INN) (2-[4-(4-pyrimidin-2-yl)piperazin-1-yl]butyl]-1,2-benzothiazol-3(2H)-one 1,1-dioxide). Used as an anxiolytic.

(4) **Dehydrothio-p-toluidine** (4-(6-methyl-1,3-benzothiazol-2-yl)aniline).

(C) **Compounds containing a phenothiazine ring-system (whether or not hydrogenated), not further fused.**

This part includes, *inter alia* :

Phenothiazine (thiodiphenylamine). Sparkling yellowish flakes or grey-green powder; used for the preparation of dyes, etc.

(D) **Other heterocyclic compounds.**

This part includes, *inter alia* :

(1) **Sultones.** These may be considered as internal esters of hydroxysulphonic acids. They include the sulphonephthaleins, for example :

- (a) **Phenol red (phenolsulphonephthalein).** Used in medicine and as an indicator in analysis.
- (b) **Thymol blue (thymolsulphonephthalein).** Used as a reagent.
- (c) **1,3-Propanesultone.**

(2) **Sultams.** These may be considered as internal amides of aminosulphonic acids. They include **naphthosultam-2,4-disulphonic acid**, obtained from periacid, and which is used for the manufacture of SS acid (8-amino-1-naphthol-5,7-disulphonic acid or 1-amino-8-naphthol-2,4-disulphonic acid).

(3) **Thiophen.** Found in coal and lignite tars. Also obtained synthetically. A mobile, colourless liquid with a benzene-like odour.

(4) **Furazolidone (INN)** (3-(5-nitrofurfurylideneamino) oxazolidin-2-one).

(5) **Adenosine tri- or pyrophosphoric acid.**

(6) **3-Methyl-6,7-methylenedioxy-1-(3,4-methylenedioxybenzyl)isoquinoline hydrochloride.**

(7) **3-Methyl-6,7-methylenedioxy-1-(3,4-methylenedioxyphenyl)isoquinoline.**

This heading **excludes** mercury nucleates answering to a description in **heading 28.52**, and cyclic polymers of thioaldehydes (**heading 29.30**).

*
* *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

29.35 - Sulphonamides.

- 2935.10 - N-Methylperfluoroctane sulphonamide
- 2935.20 - N-Ethylperfluoroctane sulphonamide
- 2935.30 - N-Ethyl-N-(2-hydroxyethyl) perfluoroctane sulphonamide
- 2935.40 - N-(2-Hydroxyethyl)-N-methylperfluoroctane sulphonamide
- 2935.50 - Other perfluoroctane sulphonamides
- 2935.90 – Other

Sulphonamides have the general formula ($R^1SO_2NR^2R^3$) where R^1 is an organic radical of varying complexity having a carbon atom directly attached to the SO_2 group and R^2 and R^3 are either : hydrogen, another atom or an inorganic or organic radical of varying complexity (including double bonds or rings). Many are used in medicine as powerful bactericides. They include, *inter alia* :

- (1) **N-Alkylperfluoroctane sulphonamides.*** Examples are Nmethylperfluoroctane sulphonamide or N-ethyl-N-(2-hydroxyethyl) perfluoroctane sulphonamide. These chemicals break down to form perfluoroctane sulfonate (PFOS) (see also **headings 29.04, 29.22, 29.23, 38.08 and 38.24**).
- (2) ***o*-Toluenesulphonamide.**
- (3) ***o*-Sulphamoylbenzoic acid.**
- (4) ***p*-Sulphamoylbenzylamine.**
- (5) ***p*-Aminobenzenesulphonamide** ($H_2NC_6H_4SO_2NH_2$) (sulphanilamide).
- (6) ***p*-Aminobenzenesulphonacetamide.**
- (7) **Sildenafil citrate.**
- (8) **Sulphapyridine** (INN) or *p*-aminobenzenesulphonamidopyridine.
- (9) **Sulphadiazine** (INN) or *p*-aminobenzenesulphonamidopyrimidine.
- (10) **Sulphamerazine** (INN) or *p*-aminobenzenesulphonamidomethylpyrimidine.
- (11) **Sulphathiourea** (INN) or *p*-aminobenzenesulphonamidothiourea.
- (12) **Sulphathiazole** (INN) or *p*-aminobenzenesulphonamidothiazole.
- (13) **Chlorinated sulphonamides** whether or not the chlorine atom is directly linked to nitrogen (e.g., sulphonchloramides or N-chlorosulphonamides, known as “chloramines”, “chlorothiazide” or 6-chloro-7-sulphamoylbenzo-1,2,4-thiadiazine 1,1-dioxide; 6-chloro-3,4-dihydro-7-sulphamoylbenzo-1,2,4-thiadiazine 1,1-dioxide).

This heading **excludes** compounds in which all of the S-N bonds of the sulphonamide group(s) are part of a ring. They are other heterocyclic compounds (sultams) of **heading 29.34**.

Sub-Chapter XI

PROVITAMINS, VITAMINS AND HORMONES

GENERAL

This sub-Chapter covers active substances which constitute a group of compounds of fairly complex chemical composition, essential for the proper functioning and harmonious development of the animal and vegetable organism.

They have mainly a physiological action and are used in medicine or industry because of their individual characteristics.

In this Sub-Chapter, the term "derivatives" refers to chemical compounds which could be obtained from a starting compound of the heading concerned and which retain the essential characteristics of the parent compound, including its basic chemical structure.

29.36 - Provitamins and vitamins, natural or reproduced by synthesis (including natural concentrates), derivatives thereof used primarily as vitamins, and intermixtures of the foregoing, whether or not in any solvent (+).

- Vitamins and their derivatives, unmixed :

- 2936.21 -- Vitamins A and their derivatives
- 2936.22 -- Vitamin B₁ and its derivatives
- 2936.23 -- Vitamin B₂ and its derivatives
- 2936.24 -- D- or DL-Pantothenic acid (Vitamin B₃ or Vitamin B₅) and its derivatives
- 2936.25 -- Vitamin B6 and its derivatives
- 2936.26 -- Vitamin B12 and its derivatives
- 2936.27 -- Vitamin C and its derivatives
- 2936.28 -- Vitamin E and its derivatives
- 2936.29 -- Other vitamins and their derivatives
- 2936.90 - Other, including natural concentrates

Vitamins are active agents, usually of complex chemical composition, which are obtained from outside sources and are essential for the proper functioning of human or other animal organisms. They cannot be synthesised by the human body and must therefore be obtained in final or nearly final form (provitamins) from outside sources. They are effective in relatively minute amounts and may be regarded as exogenous biocatalysts, their absence or deficiency giving rise to metabolic disturbances or "deficiency diseases".

This heading includes :

- (a) **Provitamins and vitamins, whether natural or reproduced by synthesis, and derivatives thereof used primarily as vitamins.**
- (b) **Concentrates of natural vitamins** (e.g., of vitamin A or of vitamin D); these are enriched forms of these vitamins. These concentrates may be used as such (e.g., for adding to animal feeding stuffs), or they may be worked up for the isolation of the vitamin.
- (c) **Intermixtures of vitamins, of provitamins or of concentrates**, such as, for instance, natural concentrates of vitamins A and D in various proportions, to which an additional quantity of vitamin A or D has been added subsequently.
- (d) **The above products diluted in any solvent** (e.g., ethyl oleate, propane-1,2-diol, ethanediol, vegetable oils).

The products of this heading may be stabilised for the purposes of preservation or transport :

- by adding anti-oxidants,
- by adding anti-caking agents (e.g., carbohydrates),
- by coating with appropriate substance (e.g., gelatin, waxes or fats), whether or not plasticised, or
- by adsorbing on appropriate substances (e.g., silicic acid),

provided that the quantity added or the processing in no case exceeds that necessary for their preservation or transport and that the addition or processing does not alter the character of the basic product and render it particularly suitable for specific use rather than for general use.

List of products which are to be classified as provitamins or vitamins within the meaning of heading 29.36.

The list of products in each of the following groups is not exhaustive. The products listed are examples only.

(A) PROVITAMINS

Provitamins D.

- (1) **Non-irradiated ergosterol or provitamin D₂.** Ergosterol is found in the ergot of rye, in brewer's yeast, in mushrooms and in other fungi. It has no vitamin activity. White flakes which become yellow on exposure to air; insoluble in water but soluble in alcohol and benzene.
- (2) **Non-irradiated 7-dehydrocholesterol or provitamin D₃.** Found in the skin of animals. It is extracted from wool grease or from by-products of the manufacture of lecithin. Platelets insoluble in water but soluble in organic solvents.
- (3) **Non-irradiated 22,23-dihydroergosterol or provitamin D₄.**
- (4) **Non-irradiated 7-dehydro-β-sitosterol or provitamin D₅.**

- (5) **Non-irradiated ergosteryl acetate.**
- (6) **Non-irradiated 7-dehydrocholesteryl acetate.**
- (7) **Non-irradiated 22,23-dihydroergosteryl acetate.**

(B) VITAMINS A AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamins A (growth or anti-xerophthalmic vitamins) are essential for the normal development of the body, particularly of the skin, the bones and the retina. They help to maintain normal infection-resistant epithelial tissue and are required for normal reproduction and lactation. They are liposoluble and, as a rule, insoluble in water.

- (1) **Vitamin A₁ alcohol** (axerophthol, retinol (INN)).

Vitamin A₁ aldehyde (retinene-1, retinal).

Vitamin A₁ acid (tretinooin (INN), retinoic acid).

Vitamin A₁ is found, as the alcohol or in the form of fatty acid esters, in animal products (salt water fish, dairy products, eggs). It is mainly extracted from fresh fish liver oil, but may also be obtained by synthesis. It is a yellow solid which may remain oily at room temperature but, when cooled, it forms yellow crystals. Since it is unstable in air, it is often stabilised by the addition of anti-oxidants.

- (2) **Vitamin A₂ alcohol** (3-dehydroaxerophthol, 3-dehydroretinol).

Vitamin A₂ aldehyde (retinene-2,3-dehydroretinal).

Vitamin A₂ is not found as widely in nature as vitamin A₁. It is extracted from fresh water fish. The alcohol does not crystallise; the aldehyde, however, occurs as orange crystals.

- (3) **Vitamin A acetate, palmitate and other fatty acid esters.** These products are obtained from synthetic vitamin A; they are all sensitive to oxidation. The acetate is a yellow powder and the palmitate is a yellow liquid, which may crystallise in its pure state.

(C) VITAMIN B₁ AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamin B₁ is the anti-neuritic vitamin, essential for the prevention of beri-beri. It is important in carbohydrate metabolism. It is used in the treatment of polyneuritis, gastric disturbances and for the maintenance of good appetite. This vitamin is soluble in water and is not very stable to heat.

- (1) **Vitamin B₁** (thiamine (INN), aneurine). Thiamine is found in most animal and vegetable tissues (e.g., in cereal grain husks, brewers' yeast, pork, liver, dairy products, eggs, etc.); it is usually obtained synthetically. It is a white crystalline powder, stable to air.
- (2) **Thiamine hydrochloride.** A white crystalline powder. Hygroscopic, not very stable.
- (3) **Thiamine mononitrate.** White crystalline powder, fairly stable.
- (4) **Thiamine-1,5-salt** (aneurine-1,5-salt, aneurine naphthalene-1,5-disulphonate).

- (5) **Thiamine salicylate hydrochloride** (aneurine salicylate hydrochloride).
- (6) **Thiamine salicylate hydrobromide** (aneurine salicylate hydrobromide).
- (7) **Iodothiamine**.
- (8) **Iodothiamine hydrochloride**.
- (9) **Iodothiamine hydriodide**.
- (10) **Orthophosphoric ester of vitamin B₁ or thiamine orthophosphate and the mono- and dihydrochloride and the monophosphate of this ester**.
- (11) **Nicotinic ester of vitamin B₁**.

**(D) VITAMIN B₂ AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

Vitamin B₂ is a nutrition and growth-promoting vitamin; it is biologically important as a utilisation factor for carbohydrates. It is soluble in water and stable to heat.

- (1) **Vitamin B₂** (riboflavine (INN), lactoflavine). Riboflavin is found in association with vitamin B₁ in many products and foodstuffs. It may be extracted from distiller's and fermentation residues and from beef liver, but generally it is obtained by synthesis. Orange yellow crystals, fairly sensitive to light.
- (2) **5'-orthophosphoric ester of riboflavin or riboflavin 5'-orthophosphate and its sodium or diethanolamine salt**. These products are more soluble in water than is riboflavin.
- (3) **(Hydroxymethyl)riboflavin or methylolriboflavin**.

**(E) D- OR DL-PANTOTHENIC ACID (ALSO KNOWN AS
VITAMIN B₃ OR VITAMIN B₅) AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

These compounds play a part in preventing grey hair, in the development of skin, and in fat and carbohydrate metabolism. They are essential for the activity of the glands and liver, and of the gastro-intestinal and respiratory tracts. They are soluble in water.

- (1) **D- or DL- Pantothenic acid** (*N*-(α,γ -dihydroxy- β,β -dimethylbutyryl)- β -alanine). This vitamin, also known as vitamin B₃ or vitamin B₅, is found in all living cells and tissues (e.g., in the liver and kidneys of mammals, in the pericarp of rice, in brewers' yeast, milk, crude molasses, etc.). It is generally obtained by synthesis. Yellow viscous oil; slowly soluble in water and most organic solvents.
- (2) **Sodium D- and DL-pantothenate**.
- (3) **Calcium D- and DL-pantothenate**. This white powder, soluble in water, is the most common form of vitamin B₃.
- (4) **Pantothenyl alcohol or pantothenol (D- and DL-)** (α,γ -dihydroxy-*N*-3-hydroxypropyl- β,β -dimethylbutyramide). Viscous liquid, soluble in water.

- (5) **D-pantthenol ethyl ether** (D- α,γ -dihydroxy-*N*-3-ethoxypropyl- β,β -dimethylbutyramide). Viscous liquid, water-miscible and readily soluble in organic solvents.

(F) VITAMIN B₆ AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamin B₆ is the anti-dermatitic vitamin (skin protection). It plays a part in the nervous system, nutrition and in amino-acid, protein and fat metabolism. It is used to alleviate sickness due to pregnancy or post-operative conditions. It is soluble in water and fairly sensitive to light.

- (1) **Pyridoxine** (INN) or **adermin** (pyridoxol) (3-hydroxy-4,5-bis(hydroxymethyl)-2-methylpyridine).

Pyridoxal (4-formyl-3-hydroxy-5-hydroxymethyl-2-methylpyridine).

Pyridoxamine (4-aminomethyl-3-hydroxy-5-hydroxymethyl-2-methylpyridine).

These three forms of vitamin B₆ are found in brewers' yeast, sugar cane, the outer part of cereal grains, rice bran, wheat germ oil, linseed oil, and in the liver, meat and fat of mammals and fish. This vitamin is nearly always made synthetically.

- (2) **Pyridoxine hydrochloride.**

Pyridoxine orthophosphate.

Pyridoxine tripalmitate (tripalmitate ester of pyridoxine).

Pyridoxal hydrochloride.

Pyridoxamine dihydrochloride.

Pyridoxamine phosphate.

These are the normal forms of vitamin B₆. Colourless crystals or flakes.

- (3) **Pyridoxine orthophosphoric ester and its sodium salt.**

Pyridoxal orthophosphoric ester and its sodium salt.

Pyridoxamine orthophosphoric ester and its sodium salt.

(G) VITAMIN B₉ AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamin B₉ is essential for the development of blood cells and is effective in treating pernicious anaemia. It is found in spinach and green plants, in brewers' yeast and in the liver of animals, but is usually obtained by synthesis.

- (1) **Vitamin B₉** (folic acid (INN) or pteroylglutamic acid) and the **sodium salt** and the **calcium salt** of this vitamin.

(2) **Folinic acid** (INNM) (5-formyl-5,6,7,8,-tetrahydropteroylglutamic acid).

**(H) VITAMIN B₁₂ (CYANOCOBALAMIN (INN))
AND OTHER COBALAMINS (HYDROXOCOBALAMIN (INN),
METHYLCOBALAMIN, NITRITOCOBALAMIN,
SULPHITOCOBALAMIN, ETC.) AND THEIR DERIVATIVES**

Vitamin B₁₂ is even more effective than vitamin B₉ in treating pernicious anaemia. It has a high molecular weight and contains cobalt. It is found in various forms in the liver and flesh of mammals and of fish, in eggs and in milk. It is obtained from spent antibiotic liquors, sugar beet molasses, whey, etc. Dark red crystals, soluble in water.

**(IJ) VITAMIN C AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

Vitamin C is the anti-scorbutic vitamin, and increases resistance to infections. It is soluble in water.

- (1) **Vitamin C** (L- or DL-ascorbic acid (INN)). Ascorbic acid is contained in many foodstuffs of vegetable (fruit and green vegetables, potatoes, etc.) or animal (liver, spleen, adrenal glands, brains, milk, etc.) origin; it can be extracted from lemon juice, green and red peppers, green aniseed leaves, and from residual liquors from the treatment of agave fibres. Nowadays, it is obtained almost exclusively by synthesis. It is a white crystalline powder, fairly stable in dry air, and acts as a strong reducing agent.
- (2) **Sodium ascorbate.**
- (3) **Calcium ascorbate and magnesium ascorbate.**
- (4) **Strontium (L) ascorbocinchoninate** (strontium (L) ascorbo-2-phenylquinoline-4-carboxylate).
- (5) **Sarcosine ascorbate.**
- (6) **L-Arginine ascorbate.**
- (7) **Ascorbyl palmitate.** This liposoluble form of vitamin C is also used as an emulsifier and anti-oxidant for fats and oils.
- (8) **Calcium hypophosphitoascorbate.**
- (9) **Sodium ascorboglutamate.**
- (10) **Calcium ascorboglutamate.**

**(K) VITAMINS D AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

Vitamins D are the anti-rachitic vitamins. They regulate the utilisation of phosphorus and of calcium in the organism and assist in the development of teeth and bones; they are liposoluble. They are obtained by activation or irradiation of various provitamins D, which are sterols or sterol derivatives normally produced and transformed by the organism.

(1) **Vitamin D₂ and derivatives thereof with similar activity.**

(a) **Vitamin D₂ or activated or irradiated ergosterol** (calciferol, ergocalciferol). A white crystalline powder, becoming yellow when exposed to air, light or heat; insoluble in water, soluble in fats. It is found in cocoa beans and in fish liver; generally obtained by activation or irradiation of provitamin D₂.

(b) **Acetate and other fatty acid esters of vitamin D₂.**

(2) **Vitamin D₃ and derivatives thereof with similar activity.**

(a) **Vitamin D₃ or activated or irradiated 7-dehydrocholesterol** (cholecalciferol). White crystalline powder. It deteriorates slowly when exposed to air; insoluble in water, soluble in fats. It can be extracted from fish oil and from fish liver oil, but is generally obtained by activating or irradiating provitamin D₃. It has a stronger activity than vitamin D₂.

(b) **Activated or irradiated 7-dehydrocholesteryl acetate and other fatty acid esters of vitamin D₃.**

(c) **Vitamin D₃-cholesterol molecular compound.**

(3) **Vitamin D₄ or activated or irradiated 22,23-dihydroergosterol.** White flakes; lower biological activity than vitamin D₂.

(4) **Vitamin D₅ or activated or irradiated 7-dehydro-β-sitosterol.**

**(L) VITAMIN E AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

Vitamin E is the anti-sterility vitamin, and is important in the nervous and muscular systems. It is liposoluble.

(1) **Vitamin E or (D- and DL-) α-tocopherol; β- and γ-tocopherol.** Tocopherol is found in various vegetable and animal products (e.g., cocoa and cotton seeds, vegetable oils, leguminous plant leaves, salad leaves, lucerne, dairy products). It is extracted mainly from wheat germ oil. The racemic isomers are obtained by synthesis. Colourless oil, insoluble in water, soluble in alcohol, benzene and fats; it is stable to heat in the absence of oxygen and light. Its anti-oxidising properties also make it suitable for use as an inhibiting agent for fats and foodstuffs.

(2) **α-Tocopheryl acetate and α-tocopheryl hydrogen succinate; α-tocopheryl poly(oxyethylene) succinate (also known as α-tocopheryl polyethylene glycol succinate).**

(3) **Disodium α-tocopheryl phosphate.**

(4) **Tocopheryl diaminoacetate.**

**(M) VITAMIN H AND DERIVATIVES THEREOF
USED PRIMARILY AS VITAMINS**

Vitamin H is necessary for the growth of certain micro-organisms; it is essential for the health of the skin, muscles and nervous system. It is soluble in water and stable to heat.

- (1) **Vitamin H or biotin.** Biotin is found in egg-yolk, in kidneys and liver, milk, brewers' yeast, molasses, etc. It is prepared by synthesis.
- (2) **Biotin methyl ester.**

(N) VITAMINS K AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamins K are anti-haemorrhage factors; they accelerate blood coagulation by maintaining the prothrombin content and increasing capillary resistance.

- (1) **Vitamin K₁.**
 - (a) **Phytomenadione** (INN), **phyloquinone**, **phytonadione** or **3-phytylmenadione** (2-methyl-3-phytyl-1,4-naphthoquinone). Extracted from dry lucerne; also found in hazel and chestnut leaves, barley and oat shoots, cabbage, cauliflower, spinach, tomatoes, vegetable oil, etc. Also obtained by synthesis. Light yellow oil, soluble in fats; stable to heat but unstable to sunlight.
 - (b) **Vitamin K₁ oxide (epoxide)** (2-methyl-3-phytyl-1,4-naphthoquinone-2,3-oxide or 2-methyl-3-phytyl-2,3-epoxy-2,3-dihydro-1,4-naphthoquinone).
 - (c) **Dihydrophylloquinone** (3-dihydrophytyl-2-methyl-1,4-naphthoquinone).
- (2) **Vitamin K₂ or farnoquinone** (3-difarnesyl-2-methyl-1,4-naphthoquinone). Extracted from the meal of putrefied sardines. Weaker activity than vitamin K₁. Yellow crystals very unstable to light.

(O) VITAMIN PP AND DERIVATIVES THEREOF USED PRIMARILY AS VITAMINS

Vitamin PP is the anti-pellagra vitamin essential for growth, oxidations, cellular respiration, protein and carboxyhydrate metabolism.

- (1) **Nicotinic acid** (INN) (pyridine-β-carboxylic acid, niacin). Animal sources (e.g., liver, kidney, fresh meat of mammals and certain kinds of fish) and vegetable sources (brewers' yeast, cereal germs and pericarp, etc.). Obtained synthetically. Colourless crystals, soluble in alcohol, liposoluble; relatively stable to heat and oxidation.
- (2) **Sodium nicotinate.**
- (3) **Calcium nicotinate.**
- (4) **Nicotinamide** (INN) (nicotinic acid amide, niacinamide). Sources, properties and uses as the nicotinic acid. Obtained synthetically. Soluble in water and stable to heat.
- (5) **Nicotinamide hydrochloride.**
- (6) **Nicotinomorpholide.**

EXCLUSIONS

The heading **excludes** :

- (1) The products listed below which, though sometimes called vitamins, have no vitamin activity or have a vitamin activity which is of secondary importance in relation to their other uses :
 - (a) *meso*Inositol, *myo*inositol, *i*-inositol or *meso*inosite (**heading 29.06**), used for gastro-intestinal and hepatic disturbances (especially as calcium or magnesium hexaphosphates).
 - (b) Vitamin H₁ : *p*-aminobenzoic acid (**heading 29.22**), which is growth inducing and neutralises the antibacteriostatic effects of some sulphonamides.
 - (c) Choline or bilineurine (**heading 29.23**), which stabilises fat metabolism.
 - (d) Vitamin B₄ : adenine or 6-aminopurine (**heading 29.33**), used in post-medicinal haematological accidents and in tumor therapeutics.
 - (e) Vitamin C₂ or P : citrin, hesperidin, rutoside (rutin), aesculin (**heading 29.38**), used as anti-haemorrhage factors and to develop capillary resistance.
 - (f) Vitamin F : linoleic or linolic acid (α - and β -), linolenic acid, arachidonic acid (**heading 38.23**), used to treat dermatitis and liver disturbances.
- (2) Synthetic substitutes for vitamins :
 - (a) Vitamin K₃ : menadione, menaphthone, methylnaphthone or 2-methyl-1,4-naphthoquinone; sodium salt of 2-methyl-1,4-naphthoquinone bisulphite derivative (**heading 29.14**); Menadiol or 1,4-dihydroxy-2-methyl- naphthalene (**heading 29.07**).
 - (b) Vitamin K₆ : 1,4-diamino-2-methylnaphthalene (**heading 29.21**).
 - (c) Vitamin K₅ : 4-amino-2-methyl-1-naphthol hydrochloride (**heading 29.22**).
 - (d) Cysteine, a vitamin B substitute (**heading 29.30**).
 - (e) Phthiocol : 2-hydroxy-3-methyl-1,4-naphthoquinone, a vitamin K substitute (**heading 29.41**).
- (3) Sterols, other than ergosterol : cholesterol, sitosterol, stigmasterol and the sterols obtained during preparation of vitamin D₂ (tachysterol, lumisterol, toxisterol, suprasterol) (**heading 29.06**).
- (4) Medicaments of heading **30.03** or **30.04**.
- (5) Xanthophyll, carotenoid of natural origin (**heading 32.03**).
- (6) Provitamins A (α -, β - and γ -carotenes and cryptoxanthin) because of their use as colouring substances (**heading 32.03** or **32.04**).
○
○ ○

Subheading Explanatory Note.

Subheading 2936.90

This subheading includes, *inter alia*, intermixtures of two or more vitamin derivatives. Thus, for example, a mixture of D-pantothenol ethyl ether and dexpantol, obtained by chemical synthesis, i.e., by a reaction of D-pantolactone, amino-3-propanol-1 and 3-ethoxypropylamine in a predetermined ratio, should be classified in subheading 2936.90 as "Other" and **not** as unmixed derivatives of D- or DL-pantothenic acid (subheading 2936.24).

29.37 - Hormones, prostaglandins, thromboxanes and leukotrienes, natural or reproduced by synthesis; derivatives and structural analogues thereof, including chain modified polypeptides, used primarily as hormones.(+)

- Polypeptide hormones, protein hormones and glycoprotein hormones, their derivatives and structural analogues :

2937.11 -- Somatotropin, its derivatives and structural analogues

2937.12 -- Insulin and its salts

2937.19 -- Other

- Steroidal hormones, their derivatives and structural analogues :

2937.21 -- Cortisone, hydrocortisone, prednisone (dehydrocortisone) and prednisolone (dehydrohydrocortisone)

2937.22 -- Halogenated derivatives of corticosteroidal hormones

2937.23 -- Oestrogens and progestogens

2937.29 -- Other

2937.50 - Prostaglandins, thromboxanes and leukotrienes, their derivatives and structural analogues

2937.90 - Other

This heading includes :

- (I) **Natural hormones**, which are active substances produced in the living tissues of man or animals, extremely small amounts of which are capable of inhibiting or stimulating the functioning of particular organs by acting directly on them or controlling the synthesis or secretion of secondary or tertiary hormone systems. A fundamental defining characteristic of a hormone is that it binds to a stereospecific molecular receptor to activate a response. The secretion of these substances, usually by the endocrine glands, is governed by the sympathetic and para-sympathetic systems. Hormones are carried by the blood, lymph or other fluids of the body. They may also originate in glands which are both endo- and exocrinal or in various cellular tissues. Transport in the blood is not a requisite for a hormonal response. Responses can occur after release of hormones into the interstitial fluid with binding to receptors in nearby cells (paracrine control) or to receptors on the cell that released the hormone (autocrine control).
- (II) **Natural prostaglandins, thromboxanes and leukotrienes**, compounds which are secreted by the body and behave like locally-acting hormones. Prostaglandins are a class of hormones or hormone-like substances which are synthesised by the tissue in which they act (or act in the local cellular environment) by binding to specific cellular receptors and act as important modulators of cell activity in many tissues. These three related chemical families (arachidonic acid derivatives) are said to have "hormone-like action".

- (III) **Natural hormones, prostaglandins, thromboxanes and leukotrienes reproduced by synthesis (including biotechnological processes)**, that is, having the same chemical structure as the natural substance.
- (IV) **Derivatives of natural or synthetically reproduced hormones, prostaglandins, thromboxanes and leukotrienes**, such as salts, halogenated derivatives, cyclic acetals, esters, etc., including mixed **derivatives** (e.g., esters of halogenated derivatives), **provided that** they are used primarily as hormones.
- (V) **Analogues of hormones, prostaglandins, thromboxanes and leukotrienes.** The term “analogue” refers to chemicals having a close structural relationship to the parent compound, but which are not considered to be derivatives. It includes compounds which have a structural resemblance to the natural compounds, but have had one or more atoms in the structure replaced by others.
- Analogues of polypeptide hormones are formed by adding, separating, replacing or altering certain amino acids in the natural polypeptide chain. **Somatrem** (INN), an analogue of the growth hormone somatotropin, is the result of adding a terminal amino acid to the natural somatotropin molecule. **Ornipressin** (INN), an analogue of natural argipressin (INN) and lypressin (INN), is the result of replacing an internal amino acid in the argipressin or lypressin molecule. The synthetic gonadoliberins, **buserelin** (INN), **nafarelin** (INN), **fertirelin** (INN), **leuprorelin** (INN) and **lutrelin** (INN), analogues of **gonadorelin** (INN) are the result of altering and replacing certain amino acids in the polypeptide chain of natural gonadorelin. **Giractide** (INN), an analogue of **corticotropin** (INN) has the same structure as the first 18 amino acids of natural corticotropin, with the first amino acid replaced. **Metreleptin** (INN), an analogue of leptin, is the recombinant methionyl derivative of human leptin. **Saralasin** (INN), which contains three different amino acids in comparison to the molecule of angiotensin II, should be considered as a structural analogue of angiotensin II, although with antagonist effects (the former is a hypotensor and the latter an hypertensor).
 - Analogues of steroid hormones must have the gonane structure, which can be altered by ring contraction or extension or by replacing some atoms in the ring by others (hetero-atoms). **Domoprednate** (INN) and **oxandrolone** (INN) represent two examples of this kind of analogues. The family of analogues and derivatives, which retain the fundamental structure of the gonane described, contains a large number of substances used as hormone inhibitors and antagonists (antihormones). Examples are **ciproterone** (INN), an antiandrogen, **danazol** (INN), an antigonadotropin, **eopostane** (INN), which inhibits progesterone production.
 - Analogues of prostaglandins, thromboxanes and leukotrienes may be formed by substitution of atoms in a chain, or formation or elimination of rings. In **tilsuprost** (INN), a prostaglandin analogue, oxygen and carbon atoms are replaced by nitrogen and sulphur atoms and one ring is closed.

- (VI) **Natural mixtures of hormones** or their derivatives or of steroids recognised as having a hormonal effect (e.g., a natural mixture of corticosteroid hormones or of conjugated oestrogens). Deliberate mixtures or preparations are excluded (generally **heading 30.03** or **30.04**).

Hormone-releasing factors (hormone-stimulating factors), hormone inhibitors and hormone antagonists (antihormones) are also included in this heading (see Note 8 to this Chapter). The heading also includes derivatives and structural analogues of hormones, provided that they are based on natural hormones, or on those reproduced by synthesis, and that they act using mechanisms similar to those of hormones.

A list of the products of this heading, arranged according to chemical structure, is given below. This list is not exhaustive.

◦ ◦

List of products which are to be classified as products of heading 29.37 (*)

(A) POLYPEPTIDE HORMONES, PROTEIN HORMONES AND GLYCOPROTEIN HORMONES, THEIR DERIVATIVES AND STRUCTURAL ANALOGUES

This part includes, *inter alia* :

- (1) **Somatotropin, its derivatives and structural analogues.** **Somatotropin** (growth hormone, GH, STH (somatotropic hormone)). Water soluble protein which promotes growth of tissues and is involved in the regulation of other phases of protein metabolism. It is secreted by the somatotropic cells of the anterior pituitary gland. Secretion is regulated by a releasing factor (growth hormone-releasing hormone) and by an inhibitory factor, somatostatin. Human growth hormone (hGH) is a single polypeptide chain of 191 amino acids manufactured almost exclusively by recombinant DNA technology. This part also includes derivatives and analogues such as **somatrem** (INN) (methionyl hGH), **acetylated hGH**, **desamido hGH** and **somenopor** (INN) and antagonists such as **pegvisomant** (INN).
- (2) **Insulin and its salts.** Insulin is a polypeptide containing 51 amino-acid groups and is produced in the islets of Langerhans of the pancreas of numerous animals. Human insulin can be obtained by extraction from the pancreas, by modification of bovine or porcine insulin or by biotechnological processes involving bacteria or yeasts to produce recombinant human insulin. Insulin is a factor in the cellular uptake of circulating glucose and other nutrients, as well as their storage as glycogen and fat. Pure insulin is a white, non-hygroscopic amorphous powder or shiny crystals, soluble in water. Its clinical use is in the treatment of diabetes. Insulin salts include insulin hydrochloride.
- (3) **Corticotropin** (INN) (ACTH (adrenocorticotropic hormone), adrenocorticotropin). A polypeptide, soluble in water. It stimulates increased production of adrenocortical steroids. **Giractide** (INN) is an analogue of corticotropin.
- (4) **Lactogenic hormone** (LTH, galactin, galactogene hormone, luteotrophin, mammotrophin, prolactin). A polypeptide which can be crystallised. Activates milk secretion and influences the activity of the *corpus luteum*.

(*) If a name is used in the International Nonproprietary Names or the International Nonproprietary Names (Modified) for pharmaceutical substances published by the World Health Organization, this name is mentioned first and marked (INN) or (INNM), respectively.

- (5) **Thyrotrophin** (INN) (thyrotrophic hormone, TSH (thyroid-stimulating hormone)). A glycoprotein which intervenes in the action of the thyroid gland on the blood and in the removal of iodine. It affects growth and secretion.
- (6) **Follicle-stimulating hormone** (FSH). A glycoprotein, soluble in water. It activates sexual functions.
- (7) **Luteinising hormone** (LH, ICSH (interstitial-cell-stimulating hormone), luteinostimulin). A glycoprotein, soluble in water. It stimulates sexual functions by stimulating steroid secretion, ovulation and interstitial cell development.
- (8) **Chorionic gonadotrophin** (INN) (hCG (human chorionic gonadotrophin)). Formed in the placenta; it is a glycoprotein extracted from the urine of pregnant women. White crystals, relatively unstable in aqueous solution. Stimulates follicle maturity.
- (9) **Serum gonadotrophin** (INN) (equine chorionic gonadotropin (eCG)). It is a gonad-stimulating glycoprotein produced in the placenta and endometrium of pregnant mares. Originally called pregnant mare serum gonadotropin.
- (10) **Oxytocin** (INN) (α -hypophamin). A polypeptide, soluble in water. Its chief action is on the contraction of the uterus and on milk ejection from the mammary gland. Also included are the analogues **carbetocin** (INN), **demoxycytocin** (INN), etc.
- (11) **Vasopressins** : **argipressin** (INN) and **lypressin** (INN), their derivatives and structural analogues. Vasopressins are polypeptides which raise blood pressure and cause an increase in water retention by the kidney. Also included here are polypeptide analogues such as **terlipressin** (INN), **desmopressin** (INN), etc.
- (12) **Calcitonin** (INN). (TCA (thyrocalcitonin)). A hypocalcaemic and hypophosphatemic polypeptide.
- (13) **Glucagon** (INN) (HGF (hyperglycaemic-glycogenolytic factor)). A polypeptide which has the property of increasing the blood-glucose concentration.
- (14) **Thyroliberin** (TRF, TRH). This polypeptide stimulates the secretion of thyrotropin.
- (15) **Gonadorelin** (INN) (gonadoliberin, gonadotrophin releasing hormone, LRF, GnRH). This polypeptide promotes the secretion of follicle-stimulating and lutein-stimulating hormones in the pituitary gland. Also included are the polypeptide analogues **buserelin** (INN), **goserelin** (INN), **fertirelin** (INN), **sermorelin** (INN), etc.
- (16) **Somatostatin** (INN) (SS, SRIH, SRIF). This polypeptide inhibits the release of growth hormone and TSH from the pituitary gland and has a neurotropic action.
- (17) **Atrial natriuretic hormone** (ANH, ANF), a polypeptide hormone secreted from the atria of the heart. When the cardiac atrium is stretched by increased blood volume, secretion of ANH is stimulated. ANH in turn increases salt and water excretion and reduces blood pressure.
- (18) **Endothelin**, a polypeptide hormone secreted by endothelial cells throughout the vasculature. Although endothelin is released into the blood circulation, it acts locally in a paracrine fashion to constrict adjacent vascular smooth muscle and to increase blood pressure.
- (19) **Inhibin** and **activin**, hormones found in gonadal tissue.

(20) **Leptin**, a polypeptide hormone produced by adipose tissue that is thought to act on receptors in the brain to regulate body weight and fat deposition. Also included here is **metreleptin** (INN), the recombinant methionyl derivative of leptin, which has a similar activity and which is considered to be an analogue of leptin.

(B) STEROIDAL HORMONES, THEIR DERIVATIVES AND STRUCTURAL ANALOGUES

(1) **Corticosteroid hormones**, secreted in the cortical zone of the adrenal glands, play an important role in the functioning of the body's metabolism. They are also known as adrenal cortical hormones or corticoids, and are generally divided into two groups, depending upon their physiological action : (i) glucocorticoids, which regulate protein and carbohydrate metabolism and (ii) mineralocorticoids, which cause the retention of sodium and water by the body and hasten the excretion of potassium. The properties of mineralocorticoids are utilised in the treatment of kidney deficiencies and of Addison's disease. These include the following corticosteroid hormones, derivatives and analogues :

- (a) **Cortisone** (INN). A glucocorticoid which regulates protein and carbohydrate metabolism and also has a local anti-inflammatory effect.
- (b) **Hydrocortisone** (INN) (cortisol). A glucocorticoid with effects similar to those of cortisone.
- (c) **Prednisone** (INN) (dehydrocortisone). Glucocorticoid. A derivative of cortisone.
- (d) **Prednisolone** (INN) (dehydrohydrocortisone). Glucocorticoid. A derivative of hydrocortisone.
- (e) **Aldosterone** (INN). A mineralocorticoid.
- (f) **Cortodoxone** (INN).

Some derivatives are modified so as to suppress their cortical hormone effect in favour of their anti-inflammatory effect, which is regarded as being a hormonal effect. These are principally derivatives of cortisone (INN), hydrocortisone (INN), prednisone (INN) and prednisolone (INN), which are used as anti-inflammatory and antirheumatism agents.

- (2) **Halogenated derivatives of corticosteroid hormones** are steroids in which the hydrogen atom generally at the 6- or 9-position on the gonane ring is substituted by a chlorine or fluorine atom (e.g., **dexamethasone** (INN)) and which greatly enhance the glucocorticoid and anti-inflammatory effect of the corticoids from which they are derived. These derivatives are often further modified and marketed in the form of esters, acetonides (e.g., **fluocinolone acetonide** (INN)), etc.
- (3) **Oestrogens and progestogens**. These are two major groups of sex hormones secreted by the male and female genital organs. They may also be obtained by synthesis. These hormones are also called progestins and gestagens.

Oestrogens are female sex hormones produced by the ovaries, testes, adrenal glands, placenta and other steroid-producing tissues. They are characterised by their ability to produce oestrus in the female mammal. Oestrogens are responsible for the development of female sex characteristics and are used in the treatment of menopause or in the preparation of contraceptive drugs. They include the following oestrogens, derivatives and analogues :

- (a) **Estrone** (INN). A principal oestrogen in humans.
- (b) **Estradiol** (INN). An important natural oestrogen.
- (c) **Estriol** (INN). A natural oestrogen.
- (d) **Ethinyl estradiol** (INN). An important synthetic oestrogen which is orally active and used as a main oestrogenic component in combination oral contraceptives.
- (e) **Mestranol** (INN). Ether derivative of ethinyl estradiol. Used as an oral contraceptive.

Progestogens are a class of steroids named for their progestational effects, which are essential for the initiation and continuation of pregnancy. These female sex hormones prepare the uterus for pregnancy and for the maintenance of pregnancy. Because they suppress ovulation, many progestins are used as components of contraceptive drugs. They include :

- (a) **Progesterone** (INN). The primary progestin in humans and an intermediate in the biosynthetic pathways of oestrogens, androgens and corticosteroids. It is produced by the *corpus luteum* after release of the ovum and in the adrenal gland, the placenta and the testes.
- (b) **Pregnandiol**. Naturally occurring progestin with a much weaker biological activity than that of progesterone.

(4) Other steroidal hormones.

Androgens are a major group of sex hormones not included above, which are produced mainly by the testes and, to a lesser extent, by the ovaries, adrenal glands and placenta. Androgens are responsible for the development of male sex characteristics. Androgens influence metabolism, i.e., have an anabolic effect. **Testosterone** (INN) is one of the most important androgens.

This part also includes synthetic steroids used to inhibit or counteract the effects of hormones, such as anti-oestrogens, anti-androgens, and anti-progestogens (antiprogestins, antiestagens). Steroidal antiprogestins are progestin antagonists which have found many uses in the treatment of some diseases. Examples of this group include **onapristone** (INN) and **aglepristone** (INN).

The most important of these steroids in international trade are listed below. The products are cited in alphabetical order, according to their short names, followed by an indication of their main hormonal function. If several names exist, the name used is that of the International Nonproprietary Names for pharmaceutical preparations (INN) published by the World Health Organization or that of the International Nonproprietary Names Modified (INNM). The **chemical names** given are in accordance with the IUPAC 1957 Rules for Nomenclature of Steroids.

**List of steroids used primarily
for their hormone function**

Short name Chemical name	Main hormonal function
Adrenosterone androst-4-ene-3,11,17-trione	Androgen
Aldosterone (INN) 11 β ,21-dihydroxy-3,20-dioxopregn-4-en-18-al	Corticosteroid
Allylestrenol (INN) 17 α -allyloestr-4-en-17 β -ol	Progestogen
(No short name) 5 α -androstane-3,17-dione	Androgen intermediate
Androstanolone (INN) 17 β -hydroxy-5 α -androstan-3-one	Androgen
Androstenediols androst-5-ene-3 β ,17 β -diol androst-5-ene-3 β ,17 α -diol	Anabolic intermediate
(No short name) androst-4-ene-3,17-dione	Androgen intermediate
Androsterone 3 α -hydroxy-5 α -androstan-17-one	Androgen
Betamethasone (INN) 9 α -fluoro-11 β ,17 α ,21-trihydroxy-16 β -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Bolasterone (INN) 17 β -hydroxy-7 α ,17 α -dimethylandrost-4-en-3-one	Anabolic
Chlormadinone (INN) 6-chloro-17 α -hydroxypregna-4,6-diene-3,20-dione	Progestogen

Short name Chemical name	Main hormonal function
Chloroprednisone (INN) 6 α -chloro-17 α ,21-dihydroxypregna-1,4-diene-3,11,20-trione	Corticosteroid
Clocortolone (INN) 9 α -chloro-6 α -fluoro-11 β ,21-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Clostebol (INN) 4-chloro-17 β -hydroxyandrost-4-en-3-one	Anabolic
Corticosterone 11 β ,21-dihydroxypregn-4-ene-3,20-dione	Corticosteroid
Cortisol - see Hydrocortisone	
Cortisone (INN) 17 α ,21-dihydroxypregn-4-ene-3,11,20-trione	Corticosteroid
11-Dehydrocorticosterone 21-hydroxypregn-4-ene-3,11,20-trione	Corticosteroid
Deoxycorticosterone - see Desoxycortone	
Desoxycortone (INN) 21-hydroxypregn-4-ene-3,20-dione	Corticosteroid
Dexamethasone (INN) 9 α -fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Dihydroandrosterone 5 α -androstane-3 α ,17 β -diol	Androgen intermediate
Dydrogesterone (INN) 9 β ,10 α -pregna-4,6-diene-3,20-dione	Progestogen
Equilenin 3-hydroxyoestra-1,3,5(10),6,8-pentaen-17-one	Oestrogen
Equilin 3-hydroxyoestra-1,3,5(10),7-tetraen-17-one	Oestrogen

Short name Chemical name	Main hormonal function
Estradiol (INN) oestra-1,3,5(10)-triene-3,17 β -diol	Oestrogen
Estriol (INNM) oestra-1,3,5(10)-triene-3,16 α ,17 β -triol	Oestrogen
Estrone (INN) 3-hydroxyoestra-1,3,5(10)-trien-17-one	Oestrogen
Ethinylestradiol (INN) 17 α -ethynloestra-1,3,5(10)-triene-3,17 β -diol	Oestrogen
Ethisterone (INN) 17 α -ethynyl-17 β -hydroxyandrost-4-en-3-one	Progestogen
Ethylestrenol (INN) 17 α -ethyloestr-4-en-17 β -ol	Anabolic
Etynodiol (INN) 17 α -ethynloestr-4-ene-3 β ,17 β -diol	Progestogen
Fludrocortisone (INN) 9 α -fluoro-11 β ,17 α ,21-trihydroxypregn-4-ene-3,20-dione	Corticosteroid
Flumetasone (INN) 6 α ,9 α -difluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Fluocinolone (INNM) 6 α ,9 α -difluoro-11 β ,16 α ,17 α ,21-tetrahydroxy-pregna-1,4-diene-3,20-dione	Corticosteroid
Fluocortolone (INN) 6 α -fluoro-11 β ,21-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Fluorometholone (INN) 9 α -fluoro-11 β ,17 α -dihydroxy-6 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
9α-Fluoroprednisolone 9 α -fluoro-11 β ,17 α ,21-trihydroxypregn-4-ene-3,20-dione	Corticosteroid

Short name	Chemical name	Main hormonal function
Fluoxymesterone (INN)	9 α -fluoro-11 β ,17 β -dihydroxy-17 α -methylandrost-4-en-3-one	Androgen
Fluprednidene (INN)	9 α -fluoro-11 β ,17 α ,21-trihydroxy-16-methylenepregna-1,4-diene-3,20-dione	Corticosteroid
Fluprednisolone (INN)	6 α -fluoro-11 β ,17 α ,21-trihydroxypregna-1,4-diene-3,20-dione	Corticosteroid
Flurandrenolone	6 α -fluoro-11 β ,16 α ,17 α ,21-tetrahydroxypregn-4-ene-3,20-dione	Corticosteroid
Formocortal (INN)	3-(2-chloroethoxy)-9 α -fluoro-6-formyl-11 β ,21-dihydroxy-16 α ,17-isopropylidenedioxypregna-3,5-dien-20 one 21-acetate	Corticosteroid
Gestonorone (INNM)	17 β -ethyl-17 α -hydroxyoestr-4-ene-3,20-dione	Progestogen
Hydrocortisone (INN)	11 β ,17 α ,21-trihydroxypregn-4-ene-3,20-dione	Corticosteroid
Hydroxyprogesterone (INN)	17 α -hydroxypregn-4-ene-3,20-dione	Progestogen
Lynestrenol (INN)	17 α -ethynyloestr-4-en-17 β -ol	Progestogen
Medroxyprogesterone (INN)	17 α -hydroxy-6 α -methylpregn-4-ene-3,20-dione	Progestogen
Megestrol (INN)	17 α -hydroxy-6-methylpregna-4,6-diene-3,20-dione	Progestogen
Mestanolone (INN)	17 β -hydroxy-17 α -methyl-5 α -androstan-3-one	Anabolic
Mesterolone (INN)	17 β -hydroxy-1 α -methyl-5 α -androstan-3-one	Androgen

Short name Chemical name	Main hormonal function
Mestranol (INN) 17 α -ethynl-3-methoxyoestra-1,3,5(10)-trien-17 β -ol	Oestrogen
Metandienone (INN) 17 β -hydroxy-17 α -methylandrosta-1,4-dien-3-one	Anabolic
Metenolone (INN) 17 β -hydroxy-1-methyl-5 α -androst-1-en-3-one	Anabolic
Methandriol (INN) 17 α -methylandrost-5-ene-3 β ,17 β -diol	Anabolic
2-Methylhydrocortisone 11 β ,17 α ,21-trihydroxy-2 β -methylpregn-4-ene-3,20-dione	Corticosteroid
6α-Methylhydrocortisone 11 β ,17 α ,21-trihydroxy-6 α -methylpregn-4-ene-3,20-dione	Corticosteroid
Methylnortestosterone 17 β -hydroxy-17 α -methyloestr-4-en-3-one	Progestogen
17α-Methyloestradiol 17 α -methyloestra-1,3,5(10)-triene-3,17 β -diol	Oestrogen
Methylprednisolone (INN) 11 β ,17 α ,21-trihydroxy-6 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Methyltestosterone (INN) 17 β -hydroxy-17 α -methylandrost-4-en-3-one	Androgen
Nandrolone (INN) 17 β -hydroxyoestr-4-en-3-one	Anabolic
Norethandrolone (INN) 17 α -ethyl-17 β -hydroxyoestr-4-en-3-one	Anabolic
Norethisterone (INN) 17 α -ethynyl-17 β -hydroxyoestr-4-en-3-one	Progestogen
Noretynodrel (INN) 17 α -ethynyl-17 β -hydroxyoestr-5(10)-en-3-one	Progestogen

Short name Chemical name	Main hormonal function
Norgestrel (INN) 13 β -ethyl-17 α -ethynyl-17 β -hydroxygon-4-en-3-one	Progestogen
Normethandrone - see Methylnortestosterone	
Nortestosterone - see Nandrolone	
Oxabolone (INNM) 4,17 β -dihydroxyoestr-4-en-3-one	Anabolic
Oxymesterone (INN) 4,17 β -dihydroxy-17 α -methylandrost-4-en-3-one	Anabolic
Oxymetholone (INN) 17 β -hydroxy-2-hydroxymethylene-17 α -methyl-5 α -androstan-3-one	Anabolic
Paramethasone (INN) 6 α -fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione	Corticosteroid
Prasterone (INN) 3 β -hydroxyandrost-5-en-17-one	Androgen
Prednisolone (INN) 11 β ,17 α ,21-trihydroxypregna-1,4-diene-3,20-dione	Corticosteroid
Prednisone (INN) 17 α ,21-dihydroxypregna-1,4-diene-3,11,20-trione	Corticosteroid
Prednylidene (INN) 11 β ,17 α ,21-trihydroxy-16-methylenepregna-1,4-diene-3,20-dione	Corticosteroid
Pregnenolone (INN) 3 β -hydroxypregn-5-en-20-one	Corticosteroid
Progesterone (INN) pregn-4-ene-3,20-dione	Progestogen
Stanolone - see Androstanolone	

Short name Chemical name	Main hormonal function
Testosterone (INN) 17 β -hydroxyandrost-4-en-3-one	Androgen
Tiomesterone (INN) 1 α ,7 α -di(acetylthio)-17 β -hydroxy-17 α -methylandrost-4-en-3-one	Anabolic
Triamcinolone (INN) 9 α -fluoro-11 β ,16 α ,17 α ,21-tetrahydroxypregna-1,4-diene-3,20-dione	Corticosteroid

(C) PROSTAGLANDINS, THROMBOXANES AND LEUKOTRIENES, THEIR DERIVATIVES AND STRUCTURAL ANALOGUES

These products are derivatives of arachidonic acid.

(1) Prostaglandins.

The most important arachidonic acid derivatives are prostaglandins, endogenous substances operating in minute doses as hormones and containing the fundamental structure of prostanoic acid. Prostaglandins influence the regulation of blood circulation, kidney function and the endocrine system (e.g., by reducing the production of progesterone by the *corpus luteum*); they also stimulate the contraction of smooth muscles or dilation of blood vessels, prevent platelet aggregation and regulate gastric secretions. These include the following prostaglandins, derivatives and analogues :

- (a) **Alprostadil** (INN) (prostaglandin E₁). A primary prostaglandin crystallised from biological extracts. It is used as a vasodilator. It also functions to stimulate the release of erythropoietin from the renal cortex and inhibits blood platelet aggregation.
- (b) **Alfaprostol** (INN). A synthetic prostaglandin analogue used in the treatment of infertility in mares.
- (c) **Tilsuprost** (INN). A prostaglandin analogue which has had an oxygen and a carbon atom replaced by a nitrogen and a sulphur atom with ring closure.

This group also includes other synthetic products such as **prostalene** (INN), **dinoprost** (INN), etc., which retain the basic structure of natural products and have similar physiological activity.

(2) Thromboxanes and leukotrienes.

Thromboxanes and leukotrienes, like prostaglandins, are synthesised in cells from arachidonic acid; although their function is comparable to that of prostaglandins and their structure is very similar, they do not contain the fundamental structure of prostanoic acid. Thromboxanes are biosynthetically derived from prostaglandins. They cause platelet aggregation and contraction of arteries, and are important regulators of the actions of polyunsaturated fatty acids. Leukotrienes received their name because of their origin in leukocytes and their conjugated triene structure. They are potent bronchoconstrictors and play an important role in hypersensitivity reactions.

- (a) **Thromboxane B₂**. A vasoconstrictor, a bronchoconstrictor and an inducer of blood platelet aggregation.
- (b) **Leukotriene C₄**. Found to be 100 to 1,000 times more potent than histamine or prostaglandins in their effects on pulmonary air passages.

(D) OTHER HORMONES

Classified here are other hormones whose structure differs from that of the hormones referred to above. An example is **melatonin**, which is found in the pineal gland and can be considered to be a derivative of indol. Other hormones classified here are the following :

(1) Catecholamine hormones, their derivatives and structural analogues.

This group of hormones includes those found in the medullar zone of the adrenal glands.

- (a) **Epinephrine** (INN) (adrenaline or (-)-3,4-dihydroxy- α -[(methylamino)methyl]benzyl alcohol) and **racepinephrine** (INN) ((\pm)-3,4-dihydroxy- α -[(methylamino)methyl]benzyl alcohol). The structure of both of these hormones corresponds to the chemical name 1-(3,4-dihydroxyphenyl)-2-methylaminoethanol. Epinephrine is a light brown or nearly white crystalline powder, affected by light; it is slightly soluble in water and organic solvents. It may be derived from the adrenal glands of horses, but is obtained mostly by synthesis. A hypertension hormone, it stimulates the sympathetic nervous system, increases the number of corpuscles and the sugar content in blood; it also has a strong vasoconstrictive action.
- (b) **Norepinephrine** (INN) (levarterenol, noradrenaline or (-)-2-amino-1-(3,4-dihydroxyphenyl)ethanol). Norepinephrine occurs as white crystals, soluble in water. Its physiological activity is intermediate between that of adrenaline and of ephedrine.

(2) Amino-Acid Derivatives.

- (a) **Levothyroxine** (INNM) and **DL-thyroxine** (3-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]alanine or 3,5,3',5'-tetraiodothyronine). Thyroxine is extracted from the thyroid gland or obtained by synthesis. It is an aromatic amino acid; it occurs as white or yellowish crystals, insoluble in water or in any of the common solvents. It increases the basic metabolic rate and oxygen consumption, acts on the sympathetic system, controls the action of proteins and fats and makes up any iodine deficiency in the organism; used to treat goitre and cretinism. The L-isomer is the active form. The sodium salt is a white powder, slightly soluble in water, with similar activity.
- (b) **Liothyronine** (INN) and **rathyronine** (INN) (DL-3,5,3'-triiodothyronine) (3-[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]alanine). Triiodothyronine is also extracted from the thyroid gland; its physiological activity is greater than that of thyroxine.

EXCLUSIONS

The heading **excludes** :

- (1) Products not having a hormonal effect, but having a hormone-like structure :
 - (a) Androst-5-ene-3 α ,17 α -diol, androst-5-ene-3 α ,17 β -diol (**heading 29.06**) and their diacetates (**heading 29.15**).
 - (b) Adrenalone (INN) (3',4'-dihydroxy-2-methylaminoacetophenone) (**heading 29.22**).

- (c) The following products which are classified in **heading 29.22** :
- (i) 2-Amino-1-(3,4-dihydroxyphenyl)butan-1-ol.
 - (ii) Corbadrine (INN) (2-amino-1-(3,4-dihydroxyphenyl)propan-1-ol, 3,4-dihydroxynorephedrine, homoarterenol).
 - (iii) Deoxyepinephrine (deoxyadrenaline,1-(3,4-dihydroxyphenyl)-2-methylaminoethane, epinin).
 - (iv) 3',4'-Dihydroxy-2-ethylaminoacetophenone (4-ethylaminoacetylcatechol).
 - (v) 1-(3,4-Dihydroxyphenyl)-2-methylaminopropan-1-ol (3,4-dihydroxyephedrine).
 - (vi) (\pm)-N-Methylepinephrine ((\pm)-1-(3,4-dihydroxyphenyl)-2-dimethylaminoethanol, methadrene, (\pm)-N-methyladrenaline).
- (2) Products having a hormonal effect, but not having a hormone-like structure :
- (a) Dienestrol (INN) (3,4-bis(*p*-hydroxyphenyl)hexa-2,4-diene) (**heading 29.07**).
 - (b) Hexestrol (INN) (3,4-bis(*p*-hydroxyphenyl)hexane) (**heading 29.07**).
 - (c) Diethylstilbestrol (INN) (*trans*-3,4-bis(*p*-hydroxyphenyl)hex-3-ene) (**heading 29.07**), its dimethyl ether (**heading 29.09**), its dipropionate (**heading 29.15**) and its furoate (**heading 29.32**).
 - (d) Clomifene (INN) (anti-oestrogen) (**heading 29.22**).
 - (e) Tamoxifen (INN) (anti-oestrogen) (**heading 29.22**).
 - (f) Flutamide (INN) (anti-androgen) (**heading 29.24**).
 - (g) Endothelin antagonists, such as darusentan (INN) (**heading 29.33**), atrasentan (INN) (**heading 29.34**) and sitaxentan (INN) (**heading 29.35**).
- (3) Natural substances with hormonal effects, but which are not secreted in the bodies of humans or animals :
- (a) Zearalenone, an anabolic agent (**heading 29.32**).
 - (b) Asperlicin, a cholecystoquinine antagonist (**heading 29.33**).
- (4) The following products sometimes considered to be hormones but which have no real hormone activity :
- (a) Cystine, cysteine (INN) and their hydrochlorides (**heading 29.30**).
 - (b) Methionine and its calcium salts (**heading 29.30**).
 - (c) Neurotransmitters and neuromodulators, such as sepranolone (INN) (**heading 29.14**), dopamine (**heading 29.22**), acetylcholine (**heading 29.23**), serotonin (5-hydroxytryptamine or 5-hydroxy-3-(β -aminoethyl)indole) (**heading 29.33**), histamine (**heading 29.33**) and related products, such as their receptor agonists and antagonists.
 - (d) Leukemia-inhibiting factor (human) growth factor emfifermin (INN) (**heading 29.33**) and fibroblast growth factor repifermin (INN) (**heading 29.33**).
 - (e) NMDA (N-methyl-D-aspartic acid) receptor antagonists, such as lanicemine (INN) (**heading 29.33**) and nebostinel (INN) (**heading 29.24**).
 - (f) Heparin (**heading 30.01**).
 - (g) Modified immunological products (**heading 30.02**).

- (5) Plant-growth regulators (e.g., phytohormones), natural or synthetic, which are classified :
- (A) When unmixed and not put up for retail sale, according to their chemical composition, for instance :
- (a) α -Naphthylacetic acid and its sodium salt (**heading 29.16**).
 - (b) 2,4-Dichlorophenoxyacetic acid (2,4-D), 2,4,5-T (ISO) (2,4,5-trichlorophenoxyacetic acid) and 4-chloro-2-methyl-phenoxyacetic acid (MCPA) (**heading 29.18**).
 - (c) β -Indolylacetic acid and its sodium salt (**heading 29.33**).
- (B) When put up in forms or packings for retail sale or as preparations or articles, in **heading 38.08**.
- (6) Antagonists of thromboxanes and leukotrienes, which are classified according to their structure (e.g., seratrodast (INN) (**heading 29.18**) and montelukast (INN) (**heading 29.33**)).
- (7) Antagonists of tumor necrosis factor, such as ataquimast (INN) (**heading 29.33**).
- (8) Immunological products of **heading 30.02**.
- (9) Medicaments of **heading 30.03** or **30.04**, in particular, " Retard Insulin " (zinc-insulin, protamin-zinc insulin, globin-insulin, zinc-globin insulin, histone-insulin).

○
○ ○

Subheading Explanatory Note.

Subheadings 2937.11 to 2937.19

These subheadings include peptide hormones containing two or more amino acids.

Sub-Chapter XII

GLYCOSIDES AND ALKALOIDS, NATURAL OR REPRODUCED BY SYNTHESIS, AND THEIR SALTS, ETHERS, ESTERS AND OTHER DERIVATIVES

GENERAL

In this Sub-Chapter, the term “derivatives” refers to chemical compounds which could be obtained from a starting compound of the heading concerned and which retain the essential characteristics of the parent compound, including its basic structure.

29.38 - Glycosides, natural or reproduced by synthesis, and their salts, ethers, esters and other derivatives.

2938.10 - Rutoside (rutin) and its derivatives

2938.90 - Other

Glycosides occur mainly in the vegetable kingdom. Usually, under the action of acids, bases or enzymes, they are split into a sugar part and a non-sugar part (aglycone). These parts are bonded to each other via the anomeric carbon atom of the sugar. Thus, products such as vacciniin and hamamelitannin of heading 29.40 are not considered to be glycosides.

The most common naturally-occurring glycosides are the O-glycosides, in which the sugar moiety and aglycone normally are linked by an acetal function. However, there are also naturally-occurring N-glycosides, S-glycosides and C-glycosides, in which the sugar's anomeric carbon is linked to the aglycone via a nitrogen atom, a sulphur atom or a carbon atom, respectively (e.g., casimiroedine (an N-glycoside) sinigrin (an S-glycoside) and aloin (a C-glycoside)). The aglycone is sometimes linked to the sugar by an ester group.

Glycosides are generally solid, colourless compounds; they form the reserve substances in vegetable organisms, or act as stimulants. Many are used for therapeutic purposes.

- (1) **Rutoside** (rutin), found in many plants, especially the buckwheat plant (*Fagopyrum esculentum Moench.*, *Polygonaceae*) which contains about 3 % (dry basis).
- (2) **Digitalis glycosides**, present in plants of the *Digitalis* genus (e.g., *D. lanata*, *D. purpurea*). Certain are important in medicine as heart stimulants. The group includes **digitoxin**, white crystalline powder, odourless, very toxic; **digoxin**; and **digitonin**, a saponin of digitalis, used as a chemical reagent.
- (3) **Glycyrrhizin and glycyrrhizates**, present in liquorice root; colourless crystals. Ammonium glycyrrhizate is a reddish-brown mass used in the preparation of drinks. Glycyrrhizates are also used in medicine.

- (4) **Strophanthin**, glycosides found in many species of the *Strophanthus* genus; very efficacious heart stimulants. Several are known, including **ouabain** or **Strophanthin-G**, in colourless crystals; very toxic.
- (5) **Saponins**, amorphous glycosides fairly abundant in the vegetable kingdom; sternutatory properties. Their aqueous solutions froth when shaken. Used in medicine, in the manufacture of detergents and in foam fire extinguishers.
- (6) **Aloin**, present in the leaves of various species of aloe.
- (7) **Amygdalin**, contained in bitter almonds and various fruit stones. Used as expectorant.
- (8) **Arbutin**, contained in leaves of arbutus; used as a diuretic.
- (9) **Sinigrin**, present in black mustard seeds and horse radish root. Used in medicine.

This heading also includes certain tannin derivatives of natural or synthetically-reproduced glycosides.

This heading also covers **natural mixtures** of glycosides and of their derivatives (e.g., a natural mixture of digitalis glycosides containing purpurea glycosides A and B, digitoxin, gitoxin, gitaloxin, etc.); but deliberate intermixtures or preparations are **excluded**.

This heading also **excludes** :

- (1) Nucleosides and nucleotides (**heading 29.34**).
- (2) Alkaloids (e.g., tomatine) (**heading 29.39**).
- (3) Non-natural glycosides (other than products of heading 29.37 or 29.39) in which the glycosidic linkage is an acetal function formed by etherification at the anomeric carbon (α -methylglucoside, tribenoside (INN)) (**heading 29.40**).
- (4) Antibiotics (e.g., toyocamycin) (**heading 29.41**).

29.39 - Alkaloids, natural or reproduced by synthesis, and their salts, ethers, esters and other derivatives.

- Alkaloids of opium and their derivatives; salts thereof :

2939.11 -- Concentrates of poppy straw; buprenorphine (INN), codeine, dihydrocodeine (INN), ethylmorphine, etorphine (INN), heroin, hydrocodone (INN), hydromorphone (INN), morphine, nicomorphine (INN), oxycodone (INN), oxymorphone (INN), pholcodine (INN), thebacon (INN) and thebaine; salts thereof

2939.19 -- Other

2939.20 - Alkaloids of cinchona and their derivatives; salts thereof

2939.30 - Caffeine and its salts

- Ephedrines and their salts :

2939.41 -- Ephedrine and its salts

2939.42 -- Pseudoephedrine (INN) and its salts

2939.43 -- Cathine (INN) and its salts

2939.44 -- Norephedrine and its salts

2939.49 -- Other

- Theophylline and aminophylline (theophylline-ethylenediamine) and their derivatives; salts thereof :

2939.51 -- Fenetylline (INN) and its salts

2939.59 -- Other

- Alkaloids of rye ergot and their derivatives; salts thereof :

2939.61 -- Ergometrine (INN) and its salts

2939.62 -- Ergotamine (INN) and its salts

2939.63 -- Lysergic acid and its salts

2939.69 -- Other

- Other, of vegetal origin :

2939.71 - - Cocaine, ecgonine, levometamfetamine, metamfetamine (INN), metamfetamine racemate; salts, esters and other derivatives thereof

2939.79 -- Other

2939.80 - Other

These alkaloids are complex organic bases; they have a strong physiological action. Some are obtained by synthesis. They are all more or less poisonous.

This heading covers **unmixed** alkaloids and **natural mixtures** of alkaloids (e.g., **veratrine** or the total alkaloids of opium); but deliberate intermixtures or preparations are **excluded**. The heading also **excludes** saps and vegetable extracts, such as dried saps of opium (**heading 13.02**).

This heading includes hydrogenated, dehydrogenated, oxygenated and deoxygenated alkaloid derivatives and, in general, any alkaloid derivative the structure of which is to a large extent the same as that of the natural alkaloid from which it is obtained.

(A) ALKALOIDS OF OPIUM AND THEIR DERIVATIVES; SALTS THEREOF

- (1) **Morphine**, present in opium; colourless crystals; a powerful narcotic; very poisonous.
- (2) **Dihydromorphine**, **desomorphine** (INN) (dihydrodeoxymorphine), **hydromorphone** (INN) (dihydromorphinone) and **metopon** (INN) (5-methyldihydromorphinone).
- (3) **Diacetylmorphine** (heroin), crystalline white powder; used as a sedative in place of codeine and morphine.
- (4) **Ethylmorphine**, crystalline white powder, odourless; used internally as a hypnotic and analgesic, externally as a local anaesthetic.
- (5) **Codeine** (methylmorphine, monomethyl ether of morphine). Present in opium together with morphine. Crystals; used as a sedative in replacement of morphine.
- (6) **Dihydrocodeine** (INN), **hydrocodone** (INN) (dihydrocodeinone), **oxycodone** (INN) (dihydrohydroxycodeinone).
- (7) **Narceine**, secondary alkaloid in opium; crystals; a hypnotic and an analgesic.
- (8) **Noscapine** (INN) (narcotine), secondary alkaloid in opium; crystals; less potent than morphine and only slightly toxic.
- (9) **Cotarnine and hydrocotarnine**, derived from narcotine.
- (10) **Papaverine**, secondary alkaloid in opium; crystals; narcotic and sedative action, but less intense than that of morphine.
- (11) **Ethaverine hydrochloride** (INNM)(1-(3,4-diethoxybenzyl)-6,7-diethoxyisoquinoline hydrochloride).
- (12) **Thebaine**, secondary alkaloid in opium; crystals; odourless; toxic.
- (13) **Concentrates of poppy straw**. A natural mixture of alkaloids obtained from parts of the poppy plant (*Papaver somniferum*) by extraction, followed by purification, and containing not less than 50 % by weight of alkaloids.

Derivatives of the alkaloids of opium are classified in this heading provided they retain the epoxy-bridged morphine structure, whether or not hydrogenated.

(B) ALKALOIDS OF CINCHONA AND THEIR DERIVATIVES; SALTS THEREOF

- (1) **Quinine**, present in the bark of various plants of the *Cinchona* genus, particularly *Cinchona officinalis*, *Cinchona calisaya* and *Cinchona succirubra*. Crystalline white powder. Quinine and its salts have a paralysing effect on the protoplasm of protozoa present in the blood, so they are used as febrifuges (antipyretics) and antimalarials.
- (2) **Quinidine**. Contained in the bark of plants of the *Cinchona* genus. Crystals; may be extracted from the mother-liquors of quinine sulphate.
- (3) **Cinchonine**, ranks second in importance to quinine among the alkaloids contained in *Cinchona* bark; crystals.
- (4) **Cinchonidine**, found in *Cinchona* bark; crystals.
- (5) **Quinine tannate**.

(C) CAFFEINE AND ITS SALTS

Caffeine, extracted from coffee beans, tea and cola nuts; or obtained by synthesis. Silky crystals; used in medicine.

(D) EPHEDRINES AND THEIR SALTS

- (1) **Ephedrine**, contained in *Ephedra vulgaris* and also obtained synthetically; colourless crystals; used in medicine.
- (2) **Methylephedrine**.
- (3) **Etafedrine (INN)**.
- (4) **Norephedrine**.
- (5) **Pseudoephedrine (INN)**.

(E) THEOPHYLLINE AND AMINOPHYLLINE (THEOPHYLLINE-ETHYLENEDIAMINE) AND THEIR DERIVATIVES; SALTS THEREOF

Theophylline, present in tea, but is also obtained synthetically. Crystals, often used as a diuretic, as is also aminophylline (theophylline-ethylenediamine).

(F) ALKALOIDS OF RYE ERGOT AND THEIR DERIVATIVES; SALTS THEREOF

- (1) **Ergometrine** (INN) (9,10-didehydro-N-[(S)-2-hydroxy-1-methylethyl]-6-methylergoline-8 β -carboxamide) (ergonovine). Tetrahedral or fine needle crystals. Used as an oxytocic and as a precursor in the production of lysergide (INN) (see the list of precursors at the end of Chapter 29). An important derivative is ergometrine maleate; this is also known as ergonovine maleate.
- (2) **Ergotamine** (INN) (12'-hydroxy-2'-methyl-5' α -(phenylmethyl) ergotaman-3',6',18-trione). Used as a vasoconstrictor and as a precursor in the production of lysergide (INN) (see the list of precursors at the end of Chapter 29). Its principal derivatives include ergotamine succinate and ergotamine tartrate.
- (3) **Lysergic acid** (9,10-didehydro-6-methylergoline-8-carboxylic acid). Prepared from the alkaline hydrolysis of ergot alkaloids. Also produced from *Claviceps paspali*. Crystals are in the form of hexagonal plates or scales. Used as a psychomimetic and as a precursor in the production of lysergide (INN) (see list of precursors at the end of Chapter 29).
- (4) Other **ergot alkaloids**, e.g., ergosine, ergocristine, ergocryptine, ergocornine and methylergometrine.

(G) NICOTINE AND ITS SALTS

Nicotine, alkaloid present in tobacco leaves; can also be obtained by synthesis. Colourless liquid which turns brown when exposed to air; has a characteristic, penetrating odour. A strong base, toxic, forms crystalline salts; used as a fungicide and insecticide for plants.

(H) OTHER VEGETABLE ALKALOIDS AND THEIR DERIVATIVES AND SALTS

- (1) **Arecoline**, alkaloid present in betel-nut (areca-nut).
- (2) **Aconitine**, one of the most violent poisons known; extracted from the dried roots of *Aconitus napellus*. Used in medicine as a powerful sedative.
- (3) **Physostigmine** (eserine). Occurs in Calabar-beans; colourless crystals which turn reddish-yellow when exposed to air; used in medicine.
- (4) **Pilocarpine**, principal alkaloid in *Pilocarpus jaborandi*; colourless mass which turns brown when exposed to air. Pilocarpine and its salts are used in medicine (to provoke perspiration) and by oculists; also used in the preparation of hair-growing lotions.
- (5) **Sparteine**, alkaloid present in broom; colourless liquid. Sparteine sulphate is used as a heart stimulant.
- (6) **Atropine**, obtained chiefly from *Datura stramonium*; also obtained synthetically; crystals; a violent poison which dilates the pupil of the eye.
- (7) **Homatropine**, colourless crystals; it has the same chemical and physiological action as atropine.

- (8) **Hyoscyamine**, the principal alkaloid present in *Atropa belladonna* and in numerous plants of the *Hyoscyamus* genus. Colourless crystals; highly toxic. Its salts (e.g., the sulphate and hydrobromide) are used in medicine.
- (9) **Scopolamine** (hyoscine), present in many plants of the *Datura* genus; colourless syrupy liquid or colourless crystals. Its salts (e.g., the hydrobromide and the sulphate) are crystalline; used in medicine.
- (10) **Colchicine**, found in the plant *Colchicum autumnale*. Gummy mass, yellow powder, crystals or flakes; used in medicine; very toxic.
- (11) **Veratrine**, a natural mixture of alkaloids extracted from sabadilla seeds; amorphous white powder; hygroscopic, irritant and highly sternutatory; toxic; used in medicine.
- (12) **Cevadine**, corresponds to crystallised veratrine.
- (13) **Cocaine**, crystals; extracted from the leaves of several varieties of coca, especially *Erythroxylum coca*; also obtained synthetically. The crude cocaine on the market is never pure, but contains from 80 % to 94 % of cocaine; in that form, it remains classified here. The aqueous solution of cocaine gives an alkaline reaction; it forms numerous salts; a powerful anaesthetic.
- (14) **Emetine**, present in the roots of *Uragoga ipecacuanha*. Amorphous white powder which turns yellow when exposed to light; used as an expectorant and as an emetic; its salts are used against amoebic dysentery.
- (15) **Strychnine**, extracted from various plants of the *Strychnos* genus (nux vomica, St. Ignatius' beans). Silky crystals; a violent poison. Forms crystalline salts, used in medicine.
- (16) **Theobromine**, extracted from cocoa and also obtained synthetically. Crystalline white powder, used in medicine as a diuretic and heart stimulant.
- (17) **Piperine**, extracted from the *Piper nigrum*; crystals.
- (18) **Coniine**, present in the conium (hemlock), and also obtained synthetically. Colourless oily liquid with a penetrating odour; violent poison; used in medicine.
- (19) **Curarine**, extracted from curare; used in medicine.
- (20) **Porphyrine** (alkaloid).
- (21) **Tomatine**.
- (22) **Alkaloid tannates** (chelidonine tannate, colchicine tannate, pelletierine tannate, etc.).
- (23) **Hydrastine**.
- (24) **Hydrastinine**.
- (25) **Hydrohydrastinine**.
- (26) **Oxohydrastinine**.
- (27) **Tropine** (tropan-3-ol).
- (28) **Tropinone**.
- (29) **Cephaeline**.

(30) **Metamfetamine** (INN) (methamphetamine, N-methylamphetamine, deoxyephedrine, 2-methylamino-1-phenylpropane).

(IJ) OTHER ALKALOIDS OF NON VEGETAL ORIGIN

Non vegetal alkaloids are found in certain types of fungi, such as psilocybin in the fungus of the genus *Psilocybe*, and in animals, such as bufotenin in the skin of some toads. Many marine organisms also contain alkaloids.

- (1) **Fungal Alkaloids** : Viridicatin^{*} (*Penicillium viridactum*); Rugulovasine A (*penicillium alcaloid*), sporidesmin A (a toxin which causes pithomycotoxicosis in animals); cytochalasin b; teoclidin B4 (indole alkaloid tumor promotor); penitrem D (tremorgenic mycotoxin); roquefortine (blue cheese).
- (2) **Animal Alkaloids** : Histrinocotoxin^{*} (South American poison dart frog spiro piperidine); samandarine; epabtidine; Castoramine and muscopyridine (isolated from the musk deer and the Canadian beaver).
- (3) **Insect Alkaloids** : Coccinelline^{*} (beetle); pyrazine; danaidone (African Monarch butterfly pheromone); glomerine (European millipede); epilachnene (Mexican bean beetle azamacrolide); subcoccinella 24-punctata (spotted ladybird).
- (4) **Marine Alkaloids** : Varacin^{*} (sea squirt); manzamine (Okinawan sponge); convolutamine D (moss animal); tetrodotoxin (Japanese puffer fish); Eudistomin (isolated mainly from marine tunicates of the genus *Eudistoma*).
- (5) **Bacterial Alkaloids** : Very rare in nature. Procyanine^{*}.

*
* *

Certain substances of this heading, which are regarded as narcotic drugs or as psychotropic substances under international instruments, are indicated in the list appearing at the end of Chapter 29.

Sub-Chapter XIII

OTHER ORGANIC COMPOUNDS

29.40 - Sugars, chemically pure, other than sucrose, lactose, maltose, glucose and fructose; sugar ethers, sugar acetals and sugar esters, and their salts, other than products of heading 29.37, 29.38 or 29.39.

(A) SUGARS, CHEMICALLY PURE

This heading covers **only chemically pure** sugars. The term "sugars" covers monosaccharides, disaccharides and oligosaccharides. Each saccharide unit must consist of at least four, but not more than eight, carbon atoms and, as a minimum, must contain a potential reducing carbonyl group (aldehydic or ketonic) **and** at least one asymmetric carbon atom bearing a hydroxyl group and a hydrogen atom. The heading **excludes** :

- a) Sucrose, this, **even when chemically pure**, falls in **heading 17.01**.
- b) Glucose and lactose; these, **even when chemically pure**, fall in **heading 17.02**.
- c) Maltose which, **even when chemically pure**, falls in **heading 17.02**. Isomeric with sucrose. Crystalline mass. Used in medicine.
- d) Fructose (laevulose) which, **even when chemically pure**, falls in **heading 17.02**. Isomeric with glucose. Yellowish crystals in the pure state. Used in medicine (for diabetic diets).
- e) Aldol (**heading 29.12**) and acetoin (3-hydroxy-2-butanone) (**heading 29.14**), which, though they meet the criteria for being saccharide units, are not sugars.

The following are included among the chemically pure sugars falling under this heading :

- (1) **Galactose**. Isomeric with glucose. Obtained by hydrolysing lactose. Found in pectin substances and mucilages. Crystalline when pure.
- (2) **Sorbose** (sorbenose). Isomeric with glucose. White crystalline powder, very soluble in water. Used in the synthesis of ascorbic acid (vitamin C), and in the preparation of culture media.
- (3) **Xylose** (wood sugar) ($C_5H_{10}O_5$). White crystals. Used in pharmacy.
- (4) **Trehalose**, isomeric with sucrose. **Ribose** and **arabinose**, isomeric with xylose. **Raffinose** ($C_{18}H_{32}O_{16}$). **Fucose**, **rhamnose** ($C_6H_{12}O_5$), **digitoxose** ($C_6H_{12}O_4$) and other deoxy sugars. These sugars are all essentially laboratory products.

The sugars of this heading may be in the form of aqueous solutions.

(B) SUGAR ETHERS, SUGAR ACETALS AND SUGAR ESTERS, AND THEIR SALTS

Heading 29.40 also covers sugar ethers, sugar acetals and sugar esters, as well as their salts. Sugar acetals may be formed between any two hydroxy groups of the sugar, or at the anomeric carbon to give a glycoside. However, natural glycosides **are excluded (heading 29.38)**. Sugar ethers, acetals and esters which are constituent parts of products of headings 29.37, 29.38, 29.39 or any heading later than heading 29.40 are also **excluded** (see General Explanatory Note to this Chapter, Part (E)).

These products, which fall in the heading **whether or not they are chemically defined**, include :

- (1) **Hydroxypropyl sucrose**. A sugar ether.
- (2) **Phosphoric esters of sugars** (e.g., glucose and fructose phosphates) **and their salts** (e.g., their barium, potassium, etc. salts). They are crystalline or amorphous powders, and are used in organic synthesis.
- (3) **Sucrose octa-acetate**. White hygroscopic powder. Used as an alcohol denaturant, in preparing adhesives, plasticisers and insecticides, in the paper industry and as a textile stiffener.
- (4) **Sucrose mono-acetate**. Has surface-active properties.
- (5) **Sucrose acetate isobutyrate**. Used as a modifying agent in varnishes.
- (6) **Lactitol** (INN) (4-O- β -D-galactopyranosyl-D-glucitol). Used as a sweetening agent.
- (7) **Non-natural glycosides (other than** products of **heading 29.37, 29.38 or 29.39**) in which the glycosidic linkage is an acetal function formed by etherification at the anomeric carbon atom (e.g., α -methyl glucoside, tribenoside (INN)).

This heading, however, **does not cover** deliberate intermixtures of sugar ethers, sugar acetals, sugar esters or their salts, **nor does it cover** products which have been deliberately prepared or manufactured from starting materials in which the non-sugar components are mixtures, e.g., sugar esters made from fatty acids of heading 38.23. In addition, the heading **excludes** sugar anhydrides, thio sugars, amino sugars, uronic acids and other sugar derivatives, which generally are classifiable elsewhere in Chapter 29, according to their chemical structure.

29.41 - Antibiotics (+).

- 2941.10 - Penicillins and their derivatives with a penicillanic acid structure; salts thereof
- 2941.20 - Streptomycins and their derivatives; salts thereof
- 2941.30 - Tetracyclines and their derivatives; salts thereof
- 2941.40 - Chloramphenicol and its derivatives; salts thereof
- 2941.50 - Erythromycin and its derivatives; salts thereof
- 2941.90 - Other

Antibiotics are substances secreted by living micro-organisms which have the effect of killing other micro-organisms or inhibiting their growth. They are used principally for their powerful inhibitory effect on pathogenic micro-organisms, particularly bacteria or fungi, or in some cases on neoplasms. They can be effective at a concentration of a few micrograms per ml in the blood.

Antibiotics may consist of a single substance or a group of related substances, their chemical structure may or may not be known or be chemically defined. They are chemically diverse and include the following :

- (1) **Heterocyclic**, e.g., novobiocin, cephalosporins, streptothricin, faropenem (INN), doripenem (INN), monobactams (e.g., aztreonam (INN)). The most important of this class are the **penicillins** which are secreted by several species of the fungus *Penicillium*. This class also includes procaine penicillin.
- (2) **Sugar-related**, e.g., streptomycins.
- (3) **Tetracyclines** and their derivatives, e.g., chlortetracycline (INN), oxytetracycline (INN).
- (4) **Chloramphenicol** and its derivatives, e.g., thiampenicol and florfenicol.
- (5) **Macrolides**, e.g., erythromycin, amphotericin B, tylosin.
- (6) **Polypeptides**, e.g., actinomycins, bacitracin, gramicidins, tyrocidin.
- (7) **Other antibiotics**, e.g., sarkomycin, vancomycin.

This heading also includes chemically modified antibiotics used as such. These may be prepared by isolating ingredients produced by natural growth of the micro-organism and then modifying the structure by chemical reaction or by adding sidechain precursors to the growth-medium so that desired groups are incorporated into the molecule by the cell-processes (semi-synthetic penicillins); or by bio-synthesis (e.g., penicillins from selected amino-acids).

Natural antibiotics reproduced by synthesis (e.g., chloramphenicol) are classified in this heading, as are certain synthetic products closely related to natural antibiotics and used as such (e.g., thiampenicol).

In this heading, the term “derivatives” refers to active antibiotic compounds which could be obtained from a compound of this heading and which retain the essential characteristics of the parent compound, including its basic chemical structure.

This heading **does not cover** :

- (a) Antibiotic preparations of a kind used in animal feeding (e.g. dried and standardised complete mycelium) (**heading 23.09**).
- (b) Chemically defined organic compounds with a very low antibiotic activity, used as intermediates in the manufacture of antibiotics (**earlier headings of this Chapter according to structure**).
- (c) Quinolinecarboxylic acid derivatives, nitrofurans, sulphonamides and other chemically defined organic compounds of **earlier headings of this Chapter** having antibacterial action.
- (d) Deliberate intermixtures of antibiotics (e.g., a mixture of penicillin and streptomycin) for therapeutic or prophylactic uses (**heading 30.03** or **30.04**).
- (e) Intermediate products obtained during the manufacture of antibiotics by filtering and first-stage extraction, with an antibiotic content generally not exceeding 70 % (**heading 38.24**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheading 2941.10

This subheading includes all penicillins, that is, all active antibiotic compounds whose molecules contain the penicillin or 6-aminopenicillanic acid skeleton of a β -lactam of amino-(4-carboxy-5,5-dimethylthiazolidin-2-yl)acetic acid, in which the amine group of the lactam ring is attached to organic acids by an amide bond. Neither the structure of these organic acids, nor the salt formation or other substitutions on the carboxyl group of the thiazolidine ring, affect the classification. However, the basic structure of penicillin (skeleton) should remain unmodified.

This subheading includes, *inter alia*, ampicillin (INN), amoxicillin (INN) and talampicillin (INN).

However, this subheading **excludes** other antibiotics containing a beta-lactam ring such as cephalosporins (e.g., cefazolin (INN), cefaclor (INN)), cephamycins (e.g., cefoxitin (INN)), oxacephems, penems, carbapenems, etc.

Subheading 2941.20

Streptomycin derivatives are active antibiotics whose molecules contain in their structure all the three following constituents of the streptomycin skeleton : streptidine and methylglucosamine linked to 5-deoxylyxose. Esters in any position and glycosides are also considered as derivatives.

This subheading includes, *inter alia*, dihydrostreptomycin (INN) and streptoniazid (INN). However, neither bluensomycin (INN) which does not retain the two amidino groups of streptidine, nor other aminoglycosides containing derivatives of streptamine, such as neomycin (INN), are regarded as streptomycin derivatives.

Subheading 2941.30

Tetracycline derivatives are active antibiotics whose molecules contain partially hydrogenated 4-dimethylamino-naphthacene-2-carboxamide of the tetracycline skeleton. Esters are also considered as derivatives.

This subheading includes, *inter alia*, chlortetracycline (INN), eravacycline (INN) and rolitetracycline (INN). However, anthracyclines of the "rubicin" type, such as aclarubicin (INN) and doxorubicin (INN), are not regarded as tetracycline derivatives.

Subheading 2941.40

Chloramphenicol derivatives are active antibiotics whose molecules contain N-(2-hydroxy-1-methyl-2-phenethyl)acetamide of the chloramphenicol skeleton.

This subheading includes, *inter alia*, thiamphenicol (INN) and florfenicol (INN). However, cetofenicol (INN) does not belong to this group because it is not antibiotically active.

Subheading 2941.50

Erythromycin derivatives are active antibiotics whose molecules contain the following constituents of the erythromycin skeleton : 13-ethyl-13-tridecanolide with linked desosamine and mycarose (or cladinose). Esters are also considered as derivatives.

This subheading includes, *inter alia*, clarithromycin (INN) and dirithromycin (INN). However, azithromycin (INN) which contains a 15-atom central ring and picromycin which contains no cladinose or mycarose, are not regarded as erythromycin derivatives.

29.42 - Other organic compounds.

This heading covers separate chemically defined organic compounds **not classified elsewhere**.

- (1) **Ketenes.** Like ketones, these are characterised by a carbonyl group ($>\text{C}=\text{O}$) but it is linked to the neighbouring carbon atom by a double bond (e.g., ketene, diphenylketene).

This heading however **excludes** diketene which is a lactone of **heading 29.32**.

- (2) **Boron trifluoride complexes with acetic acid, diethyl ether or phenol.**
 - (3) **Dithymol di-iodide.**
-

List I

LIST OF NARCOTIC DRUGS AND PSYCHOTROPIC SUBSTANCES ARRANGED IN ALPHABETICAL ORDER BY TYPE OF DRUG.

I. **Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol.**

Name	HS subheading	CAS No.	Convention Schedule No.
Acetorphine (INN)	2939.19	25333-77-1	4
Acetorphine hydrochloride	2939.19	25333-78-2	4
Acetyldihydrocodeine	2939.19	3861-72-1	2
Acetyldihydrocodeine hydrochloride	2939.19		2
Acetylmethadol (INN)	2922.19	509-74-0	1
Acetyl- α -methylfentanyl	2933.39		4
Acetylmorphine	2939.19		1
3-Acetylmorphine	2939.19		1
6-Acetylmorphine	2939.19	2784-73-8	1
Alfentanil (INN)	2933.33	71195-58-9	1
Alfentanil hydrochloride	2933.33	69049-06-5	1
Allylprodine (INN)	2933.39	25384-17-2	1
Allylprodine hydrochloride	2933.39		1
Alphacetylmethadol (INN)	2922.19	17199-58-5	1
L-Alphacetylmethadol	2922.19		
Alphacetylmethadol hydrochloride	2922.19		1
Alphameprodine (INN)	2933.39	468-51-9	1
Alphamethadol (INN)	2922.19	17199-54-1	1
Alphaprodine (INN)	2933.39	77-20-3	1
Alphaprodine hydrochloride	2933.39	561-78-4	1
Anileridine (INN)	2933.33	144-14-9	1
Anileridine dihydrochloride	2933.33	126-12-5	1
Anileridine phosphate	2933.39	4268-37-5	1
Benzethidine (INN)	2933.39	3691-78-9	1
Benzethidine hydrobromide	2933.39		1
Benzethidine hydrochloride	2933.39		1
Benzoylmorphine	2939.19		1
Benzylmorphine	2939.19	14297-87-1	1
Benzylmorphine hydrochloride	2939.19	630-86-4	1
Benzylmorphine mesilate	2939.19		1
Betacetylmethadol (INN)	2922.19	17199-59-6	1
Betameprodine (INN)	2933.39	468-50-8	1
Betamethadol (INN)	2922.19	17199-55-2	1
Betaprodine (INN)	2933.39	468-59-7	1
Betaprodine hydrochloride	2933.39		1
Bezitramide (INN)	2933.33	15301-48-1	1
Bezitramide hydrochloride	2933.33		1
Cannabis	1211.90		4
Cannabis extracts and tinctures	1302.19		
Cannabis oil	1302.19		
Cannabis resin	1301.90		
Clonitazene (INN)	2933.99	3861-76-5	1
Clonitazene hydrochloride	2933.99		1
Clonitazene mesilate	2933.99		1
Coca leaf	1211.30		
Coca paste	1302.19		
Cocaine	2939.71	50-36-2	1
d-Cocaine	2939.71	478-73-9	
Cocaine benzoate	2939.71		1
Cocaine borate	2939.71		1
Cocaine citrate	2939.71		1
Cocaine formate	2939.71		1
Cocaine hydriodide	2939.71		1
Cocaine hydrobromide	2939.71		1

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Cocaine hydrochloride	2939.71	53-21-4	1
Cocaine lactate	2939.71		1
Cocaine nitrate	2939.71	5913-62-2	1
Cocaine salicylate	2939.71	5913-64-4	1
Cocaine sulfate	2939.71		1
Cocaine tartrate	2939.71		1
Codeine	2939.11	76-57-3	2
Codeine acetate	2939.11		2
Codeine allobarbiturate	2939.11		2
Codeine barbiturate	2939.11		2
Codeine camphosulfonate	2939.11		2
Codeine citrate	2939.11	5913-73-5	2
Codeine cyclobarbiturate	2939.11		2
Codeine cyclopentobarbiturate	2939.11		2
Codeine 6-glucuronide	2939.19		2
Codeine hydrobromide	2939.11	125-25-7	2
Codeine hydrochloride	2939.11	1422-07-7	2
Codeine hydroiodide	2939.11	125-26-8	2
Codeine methylbromide	2939.19	125-27-9	2
Codeine phenobarbiturate	2939.11		2
Codeine phosphate	2939.11	52-28-8	2
Codeine resinate	3003.49		2
Codeine salicylate	2939.11		2
Codeine sulfate	2939.11	1420-53-7	2
Codeine-N-oxide	2939.19	3688-65-1	
Codeine-N-oxide hydrochloride	2939.19		
Codoxime (INN)	2939.19	7125-76-0	1
Concentrate of poppy straw	1302.11		1
	2939.11		
Desomorphine (INN)	2939.19	427-00-9	4
Desomorphine hydrobromide	2939.19		4
Desomorphine hydrochloride	2939.19		4
Desomorphine sulfate	2939.19		4
Dextromoramide (INN)	2934.91	357-56-2	1
Dextromoramide dihydrochloride	2934.91		1
Dextromoramide hydrochloride	2934.91		1
Dextromoramide hydrogen tartrate (bitartrate)	2934.99	2922-44-3	1
Dextropropoxyphene (INN)	2922.14	469-62-5	2
Dextropropoxyphene hydrochloride	2922.14	1639-60-7	2
Napsilate	2922.19	17140-78-2	2
Dextropropoxyphene resinate	3003.90		2
Diampromide (INN)	2924.29	552-25-0	1
Diampromide sulfate	2924.29		1
Diethylthiambutene (INN)	2934.99	86-14-6	1
Diethylthiambutene hydrochloride	2934.99	132-19-4	1
Difenoxin (INN)	2933.33	28782-42-5	1
Difenoxin hydrochloride	2933.33	35607-36-4	1
Dihydrocodeine (INN)	2939.11	125-28-0	2
Dihydrocodeine hydrochloride	2939.11		2
Dihydrocodeine hydrogen tartrate (bitartrate)	2939.11	5965-13-9	2
Dihydrocodeine phosphate	2939.11	24204-13-5	2
Dihydrocodeine resinate	3003.49		2
Dihydrocodeine thiocyanate	2939.11		
Dihydroisomorphin	2939.19		
Dihydroisomorphin 6-glucuronide	2939.19		
Dihydromorphine	2939.19	509-60-4	2

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Dihydromorphine hydroiodide	2939.19		2
Dihydromorphine hydrochloride	2939.19	1421-28-9	2
Dihydromorphine picrate	2939.19		2
Dimenoxadol (INN)	2922.19	509-78-4	1
Dimenoxadol hydrochloride	2922.19	242-75-1	1
Dimepheptanol (INN)	2922.19	545-90-4	1
Dimepheptanol hydrochloride	2922.19		1
Dimethylthiambutene (INN)	2934.99	524-84-5	1
Dimethylthiambutene hydrochloride	2934.99		1
Dioxaphetyl butyrate (INN)	2934.99	467-86-7	1
Dioxaphetyl butyrate hydrochloride	2934.99		1
Diphenoxylate (INN)	2933.33	915-30-0	1
Diphenoxylate hydrochloride	2933.33	3810-80-8	1
Dipipanone (INN)	2933.33	467-83-4	1
Dipipanone hydrobromide	2933.33		1
Dipipanone hydrochloride	2933.33	75783-06-1	1
Drotebanol (INN)	2933.49	3176-03-2	1
Ecgonine, its esters and derivatives which are convertible to ecgonine and cocaine	2939.71	481-37-8	1
Ecgonine benzoylethyl ester	2939.71		1
Ecgonine benzoylpropyl ester	2939.71		1
Ecgonine cinnamoylmethyl ester	2939.71		1
Ecgonine 2,6-dimethylbenzoylmethyl ester	2939.71		1
Ecgonine hydrochloride	2939.71		1
Ecgonine methyl ester	2939.71		1
Ecgonine methyl ester hydrochloride	2939.71		1
Ecgonine phenylacetyl-methyl ester	2939.71		1
Ethylmethylthiambutene (INN)	2934.99	441-61-2	1
Ethylmethylthiambutene hydrochloride	2934.99		1
Ethylmorphine	2939.11	76-58-4	2
Ethylmorphine camphosulfonate	2939.11		2
Ethylmorphine hydrobromide	2939.11		2
Ethylmorphine hydrochloride	2939.11	125-30-4	2
Ethylmorphine methyl iodide	2939.19		2
Ethylmorphine phenobarbiturate	2939.11		2
Etonitazene (INN)	2933.99	911-65-9	1
Etonitazene hydrochloride	2933.99		1
Etorphine (INN)	2939.11	14521-96-1	4
Etorphine hydrochloride	2939.11	13764-49-3	4
Etorphine 3-methyl ether	2939.19		4
Etoxeridine (INN)	2933.39	469-82-9	1
Etoxeridine hydrochloride	2933.39		1
Fentanyl (INN)	2933.33	437-38-7	1
Fentanyl citrate	2933.33	990-73-8	1
p-Fluorofentanyl	2933.39		4
p-Fluorofentanyl hydrochloride	2933.39		4
Furethidine (INN)	2934.99	2385-81-1	1
Furethidine hydrobromide	2934.99		1
Furethidine methyl iodide	2934.99		1
Furethidine picrate	2934.99		1
Heroin	2939.11	561-27-3	4
Heroin hydrochloride	2939.11	1502-95-0	4
Heroin methyl iodide	2939.19		4
Hydrocodone (INN)	2939.11	125-29-1	1
Hydrocodone citrate	2939.11		1

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Hydrocodone hydriodide	2939.11		1
Hydrocodone hydrochloride	2939.11	25968-91-6	1
Hydrocodone hydrogen tartrate (bitartrate)	2939.11	143-71-5	1
Hydrocodone methyl iodide	2939.19		1
Hydrocodone phosphate	2939.11	34366-67-1	1
Hydrocodone resinate	3003.49		1
Hydrocodone terephthalate	2939.11		1
Hydromorphenol (INN)	2939.19	2183-56-4	1
Hydromorphenol hydrochloride	2939.19		1
Hydromorphenol hydrogen tartrate (bitartrate)	2939.19		1
Hydromorphone (INN)	2939.11	466-99-9	1
Hydromorphone hydrochloride	2939.11	71-68-1	1
Hydromorphone sulfate	2939.11		1
Hydromorphone terephthalate	2939.11		1
β -Hydroxyfentanyl	2933.39		4
β -Hydroxyfentanyl hydrochloride	2933.39		4
(+)-cis- β -Hydroxy-3-methylfentanyl	2933.39		4
β -Hydroxy-3-methylfentanyl	2933.39		4
β -Hydroxy-3-methylfentanyl hydrochloride	2933.39		4
Hydroxypethidine (INN)	2933.39	468-56-4	1
Hydroxypethidine hydrochloride	2933.39		1
Isomethadone (INN)	2922.39	466-40-0	1
<i>d</i> -Isomethadone	2922.39		
<i>l</i> -Isomethadone	2922.39		
Isomethadone hydrobromide	2922.39		1
Isomethadone hydrochloride	2922.39		1
Ketobemidone (INN)	2933.33	469-79-4	4
Ketobemidone hydrochloride	2933.33	5965-49-1	4
Levacetyl methadol (INN)	2922.19	34433-66-4	1
Levomethorphan (INN) ^(*)	2933.49	125-70-2	1
Levomethorphan hydrobromide	2933.49		1
Levomethorphan hydrogen tartrate (bitartrate)	2933.49		1
Levomoramide (INN)	2934.99	5666-11-5	1
Levomoramide dihydrochloride	2934.99		1
Levophenacylmorphan (INN)	2933.49	10061-32-2	1
Levophenacylmorphan hydrochloride	2933.49		1
Levophenacylmorphan methylsulfonate	2933.49		1
Levopropoxyphene (INN)	2922.19	2338-37-6	1
Levorphanol (INN) ^(**)	2933.41	77-07-6	1
Levorphanol hydrogen tartrate (bitartrate)	2933.41	125-72-4	1
Levorphanol hydrochloride	2933.41		1
Metazocine (INN)	2933.39	3734-52-9	1
Metazocine hydrobromide	2933.39		1
Metazocine hydrochloride	2933.39		1

(*) Dextromethorphan (INN) ((+)-3- methoxy-N- Methylmorphinan) is specifically excluded from this list.
(**) Dextrophane (INN) ((+)-3-hydroxy-N-methylmorphinan) is specifically excluded from this list.

Morphine 6-glucuronide	2939.19		1
Morphine 3- β -D-glucuronide	2939.19		1
Morphine 6- β -D-glucuronide	2939.19		1
Morphine hydriodide	2939.11		1
Morphine hydrobromide	2939.11	630-81-9	1
Morphine hydrochloride	2939.11	52-26-6	1
Morphine hypophosphite	2939.11		1
Morphine isobutyrate	2939.11		1
Morphine lactate	2939.11		1
Morphine meconate	2939.11		1
Morphine methylbromide	2939.19		1
Morphine methylchloride	2939.19		1
Morphine methiodide	2939.19		1
Morphine methylsulfonate	2939.11		1

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Morphine mucate	2939.11		1
Morphine nitrate	2939.11	596-16-7	1
Morphine phenylpropionate	2939.11		1
Morphine phosphate	2939.11		1
Morphine phthalate	2939.11		1
Morphine stearate	2939.11		1
Morphine sulfate	2939.11	64-31-3	1
Morphine tartrate	2939.11	302-31-8	1
Morphine valerate	2939.11		1
Morphine-N-oxide	2939.19	639-46-3	1
Morphine-N-oxide quinate	2939.19		1
MPPP	2933.39		4
MPPP hydrochloride	2933.39		4
Myrophine (INN)	2939.19	467-18-5	1
Myrophine hydrochloride	2939.19		1
Nicocodine (INN)	2939.19	3688-66-2	2
Nicocodine hydrochloride	2939.19		2
Nicodicodine (INN)	2939.19	808-24-2	2
Nicomorphine (INN)	2939.11	639-48-5	1
Nicomorphine hydrochloride	2939.11		1
Noracymethadol (INN)	2922.19	1477-39-0	1
Noracymethadol gluconate	2922.19		1
Noracymethadol hydrochloride	2922.19		1
Norcodeine (INN)	2939.19	467-15-2	2
Norcodeine acetate	2939.19		2
Norcodeine hydriodide	2939.19		2
Norcodeine hydrochloride	2939.19	14648-14-7	2
Norcodeine nitrate	2939.19		2
Norcodeine platinichloride	2843.90		2
Norcodeine sulfate	2939.19		2
Norlevorphanol (INN)	2933.49	1531-12-0	1
Norlevorphanol hydrobromide	2933.49		1
Norlevorphanol hydrochloride	2933.49		1
Normethadone (INN)	2922.31	467-85-6	1
Normethadone 2,6-di-tert-butylnaphthalenedisulfonate	2922.31		1
Normethadone hydrobromide	2922.31		1
Normethadone hydrochloride	2922.31	847-84-7	1
Normethadone methyliodide	2922.39		1
Normethadone oxalate	2922.31		1
Normethadone picrate	2922.31		1
Normethadone (INN) intermediate	2926.90		
Normorphine (INN)	2939.19	466-97-7	1
Normorphine hydrochloride	2939.19		1
Norpipanone (INN)	2933.39	561-48-8	1
Norpipanone hydrobromide	2933.39		1
Norpipanone hydrochloride	2933.39		1
Opium	1302.11		1

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Opium, mixed alkaloids of	1302.11(*) 2939.11(**)		
Opium, prepared	1302.19 2939.11		
Oxycodone (INN)	2939.11	76-42-6	1
Oxycodone camphosulfonate	2939.11		1
Oxycodone hydrochloride	2939.11	124-90-3	1
Oxycodone hydrogen tartrate (bitartrate)	2939.11		1
Oxycodone pectinate	2939.11		1
Oxycodone phenylpropionate	2939.11		1
Oxycodone phosphate	2939.11		1
Oxycodone terephthalate	2939.11		1
Oxymorphone (INN)	2939.11	76-41-5	1
Oxymorphone hydrochloride	2939.11	357-07-3	1
Papaver bracteatum	1211.90		
PEPAP	2933.39		4
PEPAP hydrochloride	2933.39		4
Pethidine (INN)	2933.33	57-42-1	1
Pethidine hydrochloride	2933.33	50-13-5	1
Pethidine (INN) intermediate A	2933.33		1
Pethidine (INN) intermediate B	2933.39		1
Pethidine intermediate B hydrobromide	2933.39		1
Pethidine intermediate B hydrochloride	2933.39		1
Pethidine (INN) intermediate C	2933.39		1
Phenadoxone (INN)	2934.99	467-84-5	1
Phenadoxone hydrochloride	2934.99	545-91-5	1
Phenampromide (INN)	2933.39	129-83-9	1
Phenampromide hydrochloride	2933.39		1
Phenazocine (INN)	2933.39	127-35-5	1
Phenazocine hydrobromide	2933.39		1
Phenazocine hydrochloride	2933.39	7303-75-5	1
Phenazocine mesilate	2933.39		1
Phenomorphan (INN)	2933.49	468-07-5	1
Phenomorphan hydrobromide	2933.49		1
Phenomorphan hydrogen tartrate (bitartrate)	2933.49		1
Phenomorphan methylbromide	2933.49		1
Phenoperidine (INN)	2933.33	562-26-5	1
Phenoperidine hydrochloride	2933.33	3627-49-4	1
Pholcodine (INN)	2939.11	509-67-1	2
Pholcodine hydrogen tartrate (bitartrate)	2939.11		2
Pholcodine citrate	2939.11		2
Pholcodine guaiacolsulfonate	2939.11		2
Pholcodine hydrochloride	2939.11		2
Pholcodine phenylacetate	2939.11		2

(*) Other substances not added.

(**)Natural mixtures, constituents other than alkaloids sufficiently removed, other substances not added.

List I

I. Narcotic drugs subject to control under the Single Convention on Narcotic Drugs, 1961, as amended by the 1972 Protocol (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Pholcodine phosphate	2939.11		2
Pholcodine sulfonate	2939.11		2
Pholcodine tartrate	2939.11	7369-11-1	2
Piminodine (INN)	2933.39	13495-09-5	1
Piminodine dihydrochloride	2933.39		1
Piminodine esilate	2933.39	7081-52-9	1
Piritramide (INN)	2933.33	302-41-0	1
Poppy straw	1211.40		
Proheptazine (INN)	2933.99	77-14-5	1
Proheptazine citrate	2933.99		1
Proheptazine hydrobromide	2933.99		1
Proheptazine hydrochloride	2933.99		1
Properidine (INN)	2933.39	561-76-2	1
Properidine hydrochloride	2933.39		1
Propiram (INN)	2933.33	15686-91-6	2
Propiram fumarate	2933.33		2
Racemethorphan (INN)	2933.49	510-53-2	1
Racemethorphan hydrobromide	2933.49		1
Racemethorphan hydrogen tartrate (bitartrate)	2933.49		1
Racemoramide (INN)	2934.99	545-59-5	1
Racemoramide dihydrochloride	2934.99		1
Racemoramide hydrogen tartrate (bitartrate)	2934.99		1
Racemoramide tartrate	2934.99		1
Racemorphan (INN)	2933.49	297-90-5	1
Racemorphan hydrobromide	2933.49		1
Racemorphan hydrochloride	2933.49		1
Racemorphan hydrogen tartrate (bitartrate)	2933.49		1
Sufentanil (INN)	2934.91	56030-54-7	1
Sufentanil citrate	2934.91		1
Thebacon (INN)	2939.11	466-90-0	1
Thebacon hydrochloride	2939.11	20236-82-2	1
Thebaine	2939.11	115-37-7	1
Thebaine hydrochloride	2939.11		1
Thebaine hydrogen tartrate (bitartrate)	2939.11		1
Thebaine oxalate	2939.11		1
Thebaine salicylate	2939.11		1
Thiofentanyl	2934.99		4
Thiofentanyl hydrochloride	2934.99		4
Tilidine (INN)	2922.44	20380-58-9	1
Tilidine hydrochloride	2922.44	27107-79-5	1
Trimeperidine (INN)	2933.33	64-39-1	1
Trimeperidine hydrochloride	2933.33	125-80-4	1

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances

Name	HS subheading	CAS No.	Convention Schedule No.
Allobarbital (INN)	2933.53	52-43-7	4
Allobarbital aminophenazone	2933.54		4
Alprazolam (INN)	2933.91	28981-97-7	4
Amfepramone (INN)	2922.31	90-84-6	4

List I

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Amfepramone glutamate	2922.42		4
Amfepramone hydrochloride	2922.31	134-80-5	4
Amfepramone resinate	3003.90		4
Amfetamine (INN)	2921.46	300-62-9	2
Amfetamine acetylsalicylate	2921.46		2
Amfetamine adipate	2921.46		2
Amfetamine p-aminophenylacetate	2922.49		2
Amfetamine aspartate	2922.49		2
Amfetamine p-chloro-phenoxycetate	2921.46		2
Amfetamine hydrochloride	2921.46		2
Amfetamine hydrogen tartrate (bitartrate)	2921.46		2
Amfetamine pentobarbiturate	2933.54		2
Amfetamine phosphate	2921.46	139-10-6	2
Amfetamine resinate	3003.90		2
Amfetamine sulfate	2921.46	60-13-9	2
Amfetamine tannate	3201.90		2
Amfetamine tartrate	2921.46		2
Aminorex (INN)	2934.91	2207-50-3	4
Amobarbital (INN)	2933.53	57-43-2	3
Amobarbital resinate	3003.90		3
Amobarbital sodium	2933.53	64-43-7	3
Barbital (INN)	2933.53	57-44-3	4
Barbital calcium	2933.53		4
Barbital magnesium	2933.53		4
Barbital sodium	2933.53	144-02-5	4
Benzfetamine (INN)	2921.46	156-08-1	4
Benzfetamine hydrochloride	2921.46	5411-22-3	4
Brolamfetamine (INN) (DOB)	2922.29	64638-07-9	1
Brolamfetamine (DOB) hydrochloride	2922.29		1
Bromazepam (INN)	2933.33	1812-30-2	4
Brotizolam (INN)	2934.91	57801-81-7	4
Buprenorphine (INN)	2939.11	52485-79-7	3
Buprenorphine hydrochloride	2939.11	53152-21-9	3
Buprenorphine hydrogen tartrate (bitartrate)	2939.11		3
Buprenorphine sulfate	2939.11		3
Butalbital (INN)	2933.53	77-26-9	3
Butobarbital	2933.53	77-28-1	4
Camazepam (INN)	2933.91	36104-80-0	4
Cathine (INN)	2939.43	492-39-7	3
Cathine hydrochloride	2939.43	2153-98-2	3
Cathine phenobarbiturate	2939.43		3
Cathine resinate	3003.49		3
Cathine sulfate	2939.43		3
Cathinone (INN)	2939.79	71031-15-7	1
Chlordiazepoxide (INN)	2933.91	58-25-3	4
Chlordiazepoxide dibunate	2933.91		4
Chlordiazepoxide hydrochloride	2933.91	438-41-5	4
Clobazam (INN)	2933.72	22316-47-8	4
Clonazepam (INN)	2933.91	1622-61-3	4
Clorazepate	2933.91		4
Clorazepate dipotassium	2933.91	57109-90-7	4
Clorazepate monopotassium	2933.91	5991-71-9	4
Clotiazepam (INN)	2934.91	33671-46-4	4
Clozazolam (INN)	2934.91	24166-13-0	4
Cyclobarbital (INN)	2933.53	52-31-3	3

List I

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Cyclobarbital calcium	2933.53	5897-20-1	3
Delorazepam (INN)	2933.91	2894-67-9	4
DET	2939.79	61-51-8	1
DET hydrochloride	2939.79		1
Dexamfetamine (INN)	2921.46	51-64-9	2
Dexamfetamine adipate	2921.46		2
Dexamfetamine carboxy-methylcellulose	3912.31		2
Dexamfetamine hydrochloride	2921.46	405-41-4	2
Dexamfetamine hydrogen tartrate (bitartrate)	2921.46		2
Dexamfetamine pento-barbiturate	2933.54		2
Dexamfetamine phosphate	2921.46	7528-00-9	2
Dexamfetamine resinate	3003.90		2
Dexamfetamine saccharate	2921.49		2
Dexamfetamine sulfate	2921.46	51-63-8	2
Dexamfetamine tannate	3201.90		2
Diazepam (INN)	2933.91	439-14-5	4
DMA	2922.29		1
DMA hydrochloride	2922.29		1
DMHP	2932.99		1
DMT	2939.79	61-50-7	1
DMT hydrochloride	2939.79		1
DMT methyliodide	2939.79		1
DOET	2922.29		1
DOET hydrochloride	2922.29		1
Estazolam (INN)	2933.91	29975-16-4	4
Ethchlorvynol (INN)	2905.51	113-18-8	4
Ethinamate (INN)	2924.24	126-52-3	4
Ethyl loflazepate (INN)	2933.91	29177-84-2	4
N-Ethyl MDA	2932.99		1
N-Ethyl MDA hydrochloride	2932.99		1
Eticyclidine (PCE) (INN)	2921.49	2201-15-2	1
Eticyclidine (PCE) hydrochloride	2921.49		1
Etilamfetamine (INN)	2921.46	457-87-4	4
Etilamfetamine hydrochloride	2921.46		4
Fencamfamin (INN)	2921.46	1209-98-9	4
Fencamfamin hydrochloride	2921.46	2240-14-4	4
Fenetylline (INN)	2939.51	3736-08-1	2
Fenetylline hydrochloride	2939.51	1892-80-4	2
Fenproporex (INN)	2926.30	15686-61-0	4
Fenproporex diphenylacetate	2926.30		4
Fenproporex hydrochloride	2926.30	18305-29-8	4
Fenproporex resinate	3003.90		4
Fludiazepam (INN)	2933.91	3900-31-0	4
Flunitrazepam (INN)	2933.91	1622-62-4	4
Flurazepam (INN)	2933.91	17617-23-1	4
Flurazepam dihydrochloride	2933.91	1172-18-5	4
Flurazepam hydrochloride	2933.91	36105-20-1	4
Glutethimide (INN)	2925.12	77-21-4	3
Halazepam (INN)	2933.91	23092-17-3	4
Haloxazolam (INN)	2934.91	59128-97-1	4
N-Hydroxy MDA	2932.99		1
N-Hydroxy MDA hydrochloride	2932.99		1
Ketazolam (INN)	2934.91	27223-35-4	4
Lefetamine (INN)	2921.46	7262-75-1	4
Lefetamine hydrochloride	2921.46	14148-99-3	4
Levamfetamine (INN)	2921.46	156-34-3	2

List I

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Levamfetamine alginate	3913.10		2
Levamfetamine succinate	2921.49	5634-40-2	2
Levamfetamine sulfate	2921.49		2
Levometamfetamine	2939.71		2
Levometamfetamine hydrochloride	2939.71		2
Loprazolam (INN)	2933.55	61197-73-7	4
Loprazolam mesilate	2933.55		4
Lorazepam (INN)	2933.91	846-49-1	4
Lorazepam acetate	2933.91		4
Lorazepam mesilate	2933.91		4
Lorazepam pivalate	2933.91		4
Lormetazepam (INN)	2933.91	848-75-9	4
Lysergide (INN), LSD, LSD-25	2939.69	50-37-3	1
(+)-Lysergide tartrate	2939.69		1
Mazindol (INN)	2933.91	22232-71-9	4
MDMA	2932.99		1
MDMA hydrochloride	2932.99		1
Mecloqualone (INN)	2933.55	340-57-8	2
Mecloqualone hydrochloride	2933.55		2
Medazepam (INN)	2933.91	2898-12-6	4
Medazepam dibunate	2933.91		4
Medazepam hydrochloride	2933.91		4
Mefenorex (INN)	2921.46	17243-57-1	4
Mefenorex hydrochloride	2921.46		4
Meprobamate (INN)	2924.11	57-53-4	4
Mescaline	2939.79	54-04-6	1
Mescaline aurichloride	2843.30		1
Mescaline hydrochloride	2939.79	832-92-8	1
Mescaline picrate	2939.79		1
Mescaline platinichloride	2843.90		1
Mescaline sulfate	2939.79	1152-76-7	1
Mesocarb (INN)	2934.91	34262-84-5	4
Metamfetamine (INN)	2939.71	537-46-2	2
Metamfetamine hydrochloride	2939.71	51-57-0	2
Metamfetamine hydrogen tartrate (bitartrate)	2939.71		2
Metamfetamine racemate	2939.71	4846-07-5	2
Metamfetamine sulfate	2939.71		2
Methaqualone (INN)	2933.55	72-44-6	2
Methaqualone hydrochloride	2933.55	340-56-7	2
Methaqualone resinate	3003.90		2
Methylaminorex	2934.99		1
Methylaminorex hydrochloride	2934.99		1
Methylphenidate (INN)	2933.33	113-45-1	2
Methylphenidate hydrochloride	2933.33	298-59-9	2
Methylphenobarbital (INN)	2933.53	115-38-8	4
Methylphenobarbital sodium	2933.53		4
Methyprylon (INN)	2933.72	125-64-4	4
Midazolam (INN)	2933.91	59467-70-8	4
Midazolam hydrochloride	2933.91		4
Midazolam maleate	2933.91		4
MMDA	2932.99		1
MMDA hydrochloride	2932.99		1
Nimetazepam (INN)	2933.91	2011-67-8	4
Nitrazepam (INN)	2933.91	146-22-5	4
Nordazepam (INN)	2933.91	1088-11-5	4
Oxazepam (INN)	2933.91	604-75-1	4
Oxazepam acetate	2933.91		4
Oxazepam hemisuccinate	2933.91		4

List I

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Oxazepam succinate	2933.91		4
Oxazepam valproate	2933.91		4
Oxazolam (INN)	2934.91	24143-17-7	4
Parahexyl	2932.99		1
Pemoline (INN)	2934.91	2152-34-3	4
Pemoline copper	2934.91		4
Pemoline iron	2934.91		4
Pemoline magnesium	2934.91		4
Pemoline nickel	2934.91		4
Pentazocine (INN)	2933.33	359-83-1	3
Pentazocine hydrochloride	2933.33		3
Pentazocine lactate	2933.33	17146-95-1	3
Pentobarbital (INN)	2933.53	76-74-4	3
Pentobarbital calcium	2933.53	7563-42-0	3
Pentobarbital sodium	2933.53	57-33-0	3
Phencyclidine (INN) (PCP)	2933.33	77-10-1	2
Phencyclidine hydrobromide	2933.33		2
Phencyclidine hydrochloride	2933.33	956-90-1	2
Phendimetrazine (INN)	2934.91	634-03-7	4
Phendimetrazine hydrochloride	2934.91		4
Phendimetrazine hydrogen tartrate (bitartrate)	2934.91	50-58-8	4
Phendimetrazine pamoate	2934.91		4
Phenmetrazine (INN)	2934.91	134-49-6	2
Phenmetrazine hydrochloride	2934.91	1707-14-8	2
Phenmetrazine hydrogen tartrate (bitartrate)	2934.91		2
Phenmetrazine sulfate	2934.91		2
Phenmetrazine teoclate	2939.59	13931-75-4	2
Phenobarbital (INN)	2933.53	50-06-6	4
Phenobarbital ammonium	2933.53		4
Phenobarbital calcium	2933.53	58766-25-9	4
Phenobarbital diethylamine	2933.53		4
Phenobarbital diethylaminoethanol	2933.53		4
Phenobarbital lysidine	2933.53		4
Phenobarbital magnesium	2933.53		4
Phenobarbital propylhexedrine	2933.53		4
Phenobarbital quinidine	2939.20		4
Phenobarbital sodium, magnesium	2933.53		4
Phenobarbital sodium (INN)	2933.53	57-30-7	4
Phenobarbital sparteine	2939.79		4
Phenobarbital tetramethyl-ammonium	2933.53		4
Phenobarbital yohimbine	2939.79		4
Phentermine (INN)	2921.46	122-09-8	4
Phentermine hydrochloride	2921.46	1197-21-3	4
Phentermine resinate	3003.90		4
Pinazepam (INN)	2933.91	52463-83-9	4
Pipradrol (INN)	2933.33	467-60-7	4
Pipradrol hydrochloride	2933.33	71-78-3	4
PMA	2922.29		1
PMA hydrochloride	2922.29		1
Prazepam (INN)	2933.91	2955-38-6	4
Psilocine, psilotsin	2939.79		1
Psilocine, psilotsin hydrochloride	2939.79		1
Psilocybine (INN)	2939.79	520-52-5	1
Psilocybine hydrochloride	2939.79		1
Pyrovalerone (INN)	2933.91	3563-49-3	4
Pyrovalerone hydrochloride	2933.91	1147-62-2	4

List I

II. Psychotropic substances subject to control under the 1971 Convention on Psychotropic Substances (contd.)

Name	HS subheading	CAS No.	Convention Schedule No.
Rolicyclidine (INN) (PHP, PCPY)	2933.99	2201-39-0	1
Secbutabarital (INN)	2933.53	125-40-6	4
Secbutabarital sodium	2933.53		4
Secobarbital (INN)	2933.53	76-73-3	2
Secobarbital calcium	2933.53		2
Secobarbital resinate	3003.90		2
Secobarbital sodium	2933.53	309-43-3	2
STP, DOM	2922.29	15588-95-1	1
STP, DOM hydrochloride	2922.29		1
Temazepam (INN)	2933.91	846-50-4	4
Tenamfetamine (INN) (MDA)	2932.99	51497-09-7	1
Tenamfetamine (MDA) hydrochloride	2932.99		1
Tenocyclidine (INN)	2934.99	21500-98-1	1
Tenocyclidine hydrochloride	2934.99		1
Tetrahydrocannabinols, all isomers	2932.95	various	2
d-9-Tetrahydrocannabinol	2932.99	1972-08-3	2
Tetrazepam (INN)	2933.91	10379-14-3	4
TMA	2922.29		1
TMA hydrochloride	2922.29		1
Triazolam (INN)	2933.91	28911-01-5	4
Vinylbital (INN)	2933.53	2430-49-1	4
Zipeprol (INN)	2933.55	34758-83-3	2

List I

III. Precursors

Name	HS subheading	CAS No.
Acetic anhydride	2915.24	108-24-7
Acetone	2914.11	67-64-1
N-Acylanthranilic acid	2924.23	89-52-1
Anthrаниlic acid	2922.43	118-92-3
Butanone (ethyl methyl ketone)	2914.12	78-93-3
Diethyl ether	2909.11	60-29-7
alpha-Phenylacetoacetonitrile (APAAN)	2926.40	4468-48-8
Ephedrine	2939.41	299-42-3
Ephedrine hydrochloride	2939.41	50-98-6
Ephedrine nitrate	2939.41	81012-98-8
Ephedrine sulfate	2939.41	134-72-5
Ergometrine (INN)	2939.61	60-79-7
Ergometrine hydrochloride	2939.61	74283-21-9
Ergometrine hydrogen maleate	2939.61	129-51-1
Ergometrine oxalate	2939.61	
Ergometrine tartrate	2939.61	129-50-0
Ergotamine (INN)	2939.62	113-15-5
Ergotamine hydrochloride	2939.62	
Ergotamine succinate	2939.62	
Ergotamine tartrate	2939.62	379-79-3
Hydrogen chloride (hydrochloric acid)	2806.10	7647-01-0
Isosafrole	2932.91	120-58-1
Lysergic acid	2939.63	82-58-6
3,4-(Methylenedioxy)phenyl-2-propanone	2932.92	4676-39-5
Norephedrine	2939.44	14838-15-4
Norephedrine hydrochloride	2939.44	154-41-6
Phenylacetone (benzyl methyl ketone, phenylpropan-2-one)	2914.31	103-79-7
Phenylacetic acid	2916.34	103-82-2
Piperidine	2933.32	110-89-4
Piperidine aurichloride	2843.30	
Piperidine hydrochloride	2933.32	6091-44-7
Piperidine hydrogen tartrate (bitartrate)	2933.32	6091-46-9
Piperidine nitrate	2933.32	6091-45-8
Piperidine phosphate	2933.32	
Piperidine picrate	2933.32	6091-49-2
Piperidine platinichloride	2843.90	
Piperidine thiocyanate	2933.32	22205-64-7
Piperonal	2932.93	120-57-0
Potassium permanganate	2841.61	7722-64-7
Pseudoephedrine (INN)	2939.42	90-82-4
Pseudoephedrine hydrochloride	2939.42	345-78-8
Pseudoephedrine sulfate	2939.42	7460-12-0
Safrole	2932.94	94-59-7
Sulphuric acid	2807.00	7664-93-9
Toluene	2902.30	108-88-3

List II

**LIST OF PRECURSORS AND ESSENTIAL CHEMICALS
WHICH ARE MOST COMMONLY USED IN THE ILLEGAL PRODUCTION
OF CERTAIN CONTROLLED SUBSTANCES**

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
HEROIN or DIACETYL- MORPHINE (2939.11)	(i) Codeine (P) (2939.11)	Codicept Codoxept 7,8-Didehydro-4,5- epoxy-3-methoxy-17- methylmorphinan-6-ol Methylmorphine 3-O-Methylmorphine Morphinan-6-ol, 7,8-didehydro-4,5-epoxy- 3-methoxy-17-methyl Morphine, 3-methyl ether Morphine monomethyl ether	76-57-3 52-28-8 (S)
	(ii) Morphine (P) (2939.11)	7,8-Didehydro-4,5- epoxy- 17-methyl- morphinan-3,6- diol Morphinan-3,6-diol, 7,8-didehydro-4,5- epoxy-1 7-methyl	57-27-2 (anhydrous) 6009-81-0 (monohydrate)
	(iii) Acetic anhydride (E) (2915.24)	Acetanhydride Acetic oxide Acetyl oxide Ethanoic anhydride	108-24-7
	(iv) Acetyl chloride (E) (2915.90)	Ethanoyl chloride	75-36-5
	(v) Ethylidene diacetate (E) (2915.39)	Acetic acid, ethylidene ester 1,1-Diacetoxyethane	542-10-9
COCAINE or METHYL BENZOYL- ECGONINE (2939.71)	(i) Acetone (E) (2914.11)	2-Propanone Dimethylketone β -Ketopropane Pyroacetic ether Propane-2-one	67-64-1
	(ii) Diethyl ether (E) (2909.11)	Ethyl ether Ether Ethoxyethane Ethyl oxide Diethyl oxide Anaesthetic ether	60-29-7
	(iii) Methyl ethyl ketone (MEK) (E) (2914.12)	Butanone	78-93-3

List II

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABS- TRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
LYSERGIDE (INN) or LSD or N,N-DIETHYL- LYSERGAMIDE (2939.69)	(i) Ergotamine (INN) (P) (2939.62)	5'-Benzyl-12'-hydroxy- 2'- methylergotaman- 3',6',18-trione Ergotaman-3',6',18- trione, 12'-hydroxy-2'- methyl-5'- (phenylmethyl) 12'-Hydroxy-2'-methyl- 5'-(phenylmethyl) ergotaman-3',6',18- trione Indolo[4,3-fg]quinoline, ergotaman-3',6',18- trione derivative 8H-Oxazolo[3,2,-a]- pyrrolo[2,1-c]pyrazine, ergotaman-3',6',18- trione derivative N-(5-Benzyl-10b- hydroxy- 2-methyl-3,6- dioxoperhydrooxazolo- [3,2-a]pyrrolo[2,1-c]- pyrazin-2-yl)- D- lysergamide Ergam Ergate Ergomar Ergostat Ergotamine bitartrate Ergotamine, tartrate (2:1) (S) Ergotamini tartras Ergotaman-3',6',18- trione, 12'-hydroxy-2'- methyl-5'-(phenyl- methyl)-, -2,3dihydroxy- butanedioate (2:1) (S) Ergotartrate Etin Exmigra Femergin Gotamine tartrate Gynergene Lingraine Lingran Medihaler Ergotamine Neo-Ergotine Rigetamine Secagyne Secupan (ii) Lysergamide (P) (2939.69)	113-15-5 379-79-3 (S) 9,10-Didehydro-6- methylergoline-8- carboxamide Ergine Ergoline-8-carboxamide, 9,10-didehydro-6-methyl Indolo[4,3-fg]quinoline, ergoline-8-carboxamide derivative
			478-94-4

List II

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
	(iii) Lysergic acid (P) (2939.63)	Ergoline-8-carboxylic acid, 9,10-didehydro-6-methyl- indolo [4,3-fg] quinoline, ergoline-8-carboxylic acid derivative 4,6,6a,7,8,9-Hexahydro- 7- methylindolo-[4,3-fg]- quinoline-9-carboxylic acid 9,10-Didehydro- 6-methyl- ergoline-8- carboxylic acid	82-58-6
	(iv) Methyl 6- methylnico- tinate (P) (2933.39)	Methyl 6-methylpyridine-3- carboxylate 6-Methylnicotinic acid, methyl ester Nicotinic acid, 6-methyl-, methyl ester 3-Pyridinecarboxylic acid, 6-methyl-, methyl ester	5470-70-2
	(v) Ergometrine (INN) (P) (2939.61)	Ergonovine Ergobasine Ergotocine Ergostetrine Ergotrate Ergoklinine Syntometrine 9,10-Didehydro-N-(2- hydroxy-1-methylethyl)- 6-methylergoline-8- carboxamide N-(2-Hydroxy-1-methyl- etethyl)lysergamide Lysergic acid, 2-propanolamide Lysergic acid, 2-hydroxy-1-methylethyl amide Hydroxypropyllyser- amide Basergin Neofemergen Cornocentin Ermetrine	60-79-7 60-79-7 129-50-0 (S) 129-51-1 (S)

List II

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
AMFETAMINE (INN) (AMPHETAMINE) or α-METHYL- PHENETHYLAMINE (2921.46)	(i) Allylbenzene (P) (2902.90)	3-Phenylprop-1-ene	300-57-2
	(ii) Phenyl- acetone (P) (2914.31)	P-2-P Phenylpropan-2-one 1-Phenyl-2-oxopropane Benzyl methyl ketone BMK	103-79-7
	(iii) Cathine (INN) (P) (2939.43)	Norpseudoephedrine Adiposetten N 2-Amino-1-hydroxy-1- phenylpropane 2-Amino-2-methyl-1- phenylethanol 2-Amino-1-phenylpropan- 1-ol Benzinemethanol, α -(1-aminoethyl) E 50 Exponcit Fugoa-Depot Katine Miniscap M.D. Minusin(e) Norisoephedrine 1-Phenyl-2-aminopropan-1- ol Phenylpropanolamine Pseudonorephedrin(e) Redufrom	37577-07-04 36393-56-3 492-39-7
	(iv) Phenylacetic acid (P) (2916.34)	Benzeneacetic acid α -Toluic acid	103-82-2
	(v) Formamide (P) (2924.19)	Methanamide Carbamaldehyde Formic acid amide	75-12-7
	(vi) Benzaldehyde (P) (2912.21)	Benzoic aldehyde Benzencarbonal	100-52-7
	(vii) Ammonium formate (E) (2915.12)	—	540-69-2
	(viii) Nitroethane (E) (2904.20)	—	79-24-3
	(ix) Hydroxyl- ammonium chloride (E) (2825.10)	Hydroxylamine hydrochloride Oxammonium hydro- chloride	5470-11-1
	(x) Trans- β - Methyl-styrene (P) (2902.90)	1-Phenylpropene Prop-1-enylbenzene	873-66-5

List II

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
METHYLENE DIOXYAMPHETA- MINE or MDA or α-METHYL-3,4- METHYLENE- DIOXYPHEN- ETHYLAMINE (2932.99)	(i) Piperonal (P) (2932.93)	1,3-Benzodioxole-5- carbaldehyde Protocatechualdehyde, methylene ether 1,3-Benzodioxole-5- carboxaldehyde 3,4-(Methylenedioxy)- benzaldehyde Heliotropin Piperonylaldehyde Dioxymethyleneproto- catechuic aldehyde	120-57-0
	(ii) Safrole (P) (2932.94)	5-Allyl-1,3-benzodioxole 1,2-Methylenedioxy- 4-prop-2-enylbenzene 5-Prop-2-enyl-1,3- benzodioxole	94-59-7
	(iii) Isosafrole (P) (2932.91)	5-Prop-1-enyl-1,3- benzodioxole 1,2-Methylenedioxy-4- prop-1-enylbenzene	120-58-1
	(iv) Nitroethane (E) (2904.20)	—	79-24-3
	(v) 1-(1,3-Benzo- dioxole-5-yl) propan-2- one (P) (2932.92)	3,4-Methylenedioxy- phenylacetone 3,4-Methylenedioxy- phenylpropane-2-one	4676-39-5
	(vi) Ammonium formate (E) (2915.12)	—	540-69-2
	(vii) Hydroxyl- ammonium chloride (E) (2825.10)	Hydroxylamine hydrochloride Oxammonium hydrochloride	5470-11-1
	(viii) Formamide (E) (2924.19)	Methanamide Carbamaldehyde Formic acid amide	75-12-7
METAMFETAMINE (INN) (METHAMPHE- TAMINE) or 2- METHYLAMINO-1- PHENYLPROPANE or DEOXYEPHEDRINE (2939.91)	(i) Phenyl- acetone (P) (2914.31)	P-2-P Phenylpropan-2-one 1-Phenyl-2-oxopropane Benzyl methyl ketone BMK	103-79-7
	(ii) N-Methyl- formamide (P) (2924.19)	Methylformamide	123-39-7
	(iii) Benzyl chloride(P) (2903.99)	(Chloromethyl)benzene α-Chlorotoluene	100-44-7
	(iv) Ephedrine (P) (2939.41)	1-Phenyl-1-hydroxy-2- methylaminopropane 2-Methylamino-1-phenyl- propan-1-ol	299-42-3

List II

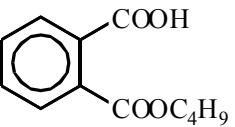

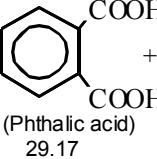

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
METHYLENE-DIOXYMETHAMPHETAMINE or MDMA or α-METHYL-3,4-METHYLENE-DIOXYPHENETHYL-(METHYL)AMINE or XTC (Ecstasy) (2932.99)	(v) Methylamine (P) (2921.11)	Aminomethane Monomethylamin(e) Methanamine	74-89-5
	(vi) Phenylacetic acid (P) (2916.34)	Benzeneacetic acid α-Toluic acid	103-82-2
	(vii) Benzaldehyde (P) (2912.21)	Benzoic aldehyde Benzeneacraldehyde	100-52-7
	(i) Methylamine (E) (2921.11)	Aminomethane Monomethylamine Methanamine	74-89-5
	(ii) Piperonal (P) (2932.93)	1,3-Benzodioxole-5-carbaldehyde Protocatechualdehyde, methylene ether 1,3-Benzodioxole-5-carboxaldehyde 3,4-(Methylenedioxy)-benzaldehyde Heliotropin Piperonylaldehyde Dioxymethyleneprotocat-technic aldehyde	120-57-0
	(iii) Safrole (P) (2932.94)	5-Allyl-1,3-benzodioxole 1,2-Methylenedioxy-4-prop-2-enylbenzene 5-Prop-2-enyl-1,3-benzodioxole	94-59-7
	(iv) Isosafrole (P) (2932.91)	5-Prop-1-enyl-1,3-benzodioxole 1,2-Methylenedioxy-4-prop-1-enylbenzene	120-58-1
	(v) Nitroethane (E) (2904.20)	—	79-24-3
	(vi) 1-(1,3-Benzodioxole-5-yl)propan-2-one (P) (2932.92)	3,4-Methylenedioxy-phenylacetone 3,4-Methylenedioxyphenyl-propane-2-one	4676-39-5
	(i) Anthranilic acid (P) (2922.43)	o-Aminobenzoic acid 2-Aminobenzoic acid	118-92-3
METHAQUALONE (INN) or 2-METHYL-3-O-TOLYL-4-(3H)-QUINAZOLINONE (2933.55)	(ii) o-Toluidine (P) (2921.43)	o-Aminotoluene 2-Aminotoluene	95-53-4
	(iii) o-Nitrotoluene (P) (2904.20)	1-Methyl-2-nitrobenzene 2-Nitrotoluene	88-72-2
	(iv) Acetic anhydride (E) (2915.24)	Acetanhydride Acetic oxide Acetyl oxide Ethanoic anhydride	108-24-7
	(v) 2-Methyl-1,3-benzoxazole (P) (2934.99)	—	95-21-6

List II

CONTROLLED SUBSTANCE (SUBHEADING NUMBER)	PRECURSOR (P) ESSENTIAL CHEMICAL (E) (SUBHEADING NUMBER)	SYNONYM	CHEMICAL ABSTRACTS SERVICE (CAS) NUMBER OF (P) OR (E) OR OF THEIR SALTS (S)
MESCALINE or 3,4,5- TRIMETHOXY- PHENETHYLAMIN E (2939.79)	(vi) 2-Acetamido- benzoic acid (P) (2924.23)	2-Acetylaminobenzoic acid <i>o</i> -Acetylaminobenzoic acid N-Acetylanthranilic acid	89-52-1
	(i) 3,4,5- Trimethoxy- benzalde-hyde (P) (2912.49)	3,4,5-Trimethoxyformyl- benzene	86-81-7
	(ii) 3,4,5- Trimethoxy- benzoic acid (P) (2918.99)	Gallic acid, trimethyl	118-41-2
	(iii) 3,4,5-Trimeth- oxybenzoyl chloride (P) (2918.99)	—	4521-61-3
	(iv) 3,4,5-Trimeth- oxybenzyl alcohol (P) (2909.49)	—	3840-31-1
PHENCYCLIDINE (INN) or PCP or 1-(1-PHENYL- CYCLOHEXYL) PIPERIDINE (2933.33)	(v) Nitromethane (E) (2904.20)	—	75-52-5
	(i) Piperidine (P) (2933.32)	Hexahydropyridine Pentamethylenimine	110-89-4
	(ii) Cyclohexanone (P) (2914.22)	Pimelic ketone Ketohexamethylene Hytrol o Anone Nadone	108-94-1
	(iii) Bromobenzene (P) (2903.99)	Monobromobenzene Phenyl bromide	108-86-1

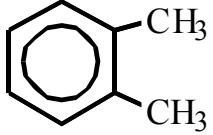

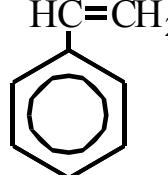

CHEMICAL STRUCTURES OF CERTAIN PRODUCTS DESCRIBED IN THE EXPLANATORY NOTES TO CHAPTER 29

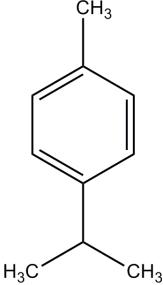

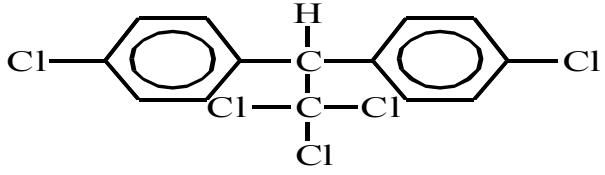

Page	Heading	Paragraph			Description in the Explanatory Notes	Chemical Structure
	General	(G)			Classification of esters, salts, co-ordination compounds and certain halides	
			(1)		Esters	
VI-29-7				(a)		$\text{CH}_3\overset{\text{O}}{\underset{\text{C}}{\overset{ }{\text{COH}}} + \text{HO}\cdot\text{CH}_2\cdot\text{CH}_2 \rightarrow \begin{array}{c} \text{O} \\ \\ \text{CH}_3\cdot\text{C}\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2 \\ \\ \text{CH}_3\cdot\text{C}\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2 \\ \\ \text{O} \end{array}$ <p style="text-align: center;">(Diethylene glycol acetate) 29.15 29.09 29.15</p>
				(b)		<p style="text-align: center;"> SO_3H (Benzenesulphonic acid) 29.04 </p> <p style="text-align: center;"> CH_3OH (Methyl alcohol) 29.05 </p> <p style="text-align: center;"> OCH_3 (Methyl benzenesulphonate) 29.05 </p>

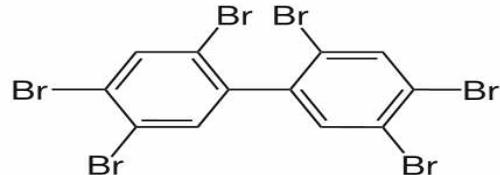

Page	Heading	Paragraph			Description in the Explanatory Notes	Chemical Structure
		(c)				 (Butyl hydrogenphthalate) 29.17
(VI-29-7)		(G)	(1)	(d)		<p style="text-align: center;">  + HOCH₂COOH + C₄H₉OH (Phthalic acid) (Glycolic acid) (Butyl alcohol) 29.17 29.18 29.05 ↓  (Butyl phthalyl butyl glycollate) 29.18 </p>
				(d)		$\text{CH}_3\text{COOH} + \text{HOCH}_2\text{CH}_3 \longrightarrow \text{CH}_3\text{COOCH}_2\text{CH}_3$ (Acetic acid) (Ethyl alcohol) (Ethyl acetate) 29.15 29.15

		(d)(1)		Styrene	

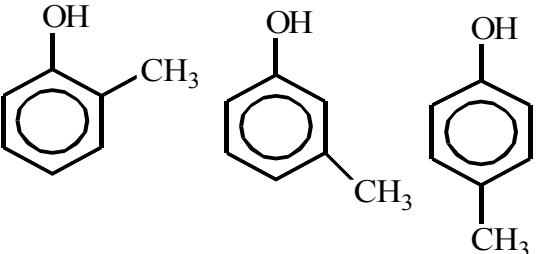

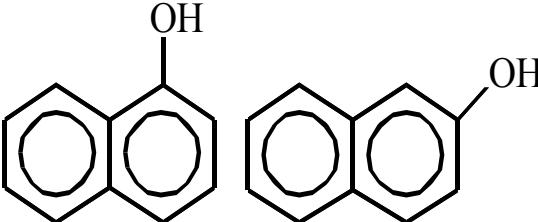

Page	Heading	Paragraph		Description in the Explanatory Notes	Chemical Structure	
				(d)(4) <i>p</i> -Cymene	 <p>The chemical structure of <i>p</i>-cymene is a benzene ring with two methyl groups (CH₃) attached at the para positions (2 and 6).</p>	
	29.03			Halogenated derivatives of hydrocarbons		
		(F)		HALOGENATED DERIVATIVES OF AROMATIC HYDROCARBONS		
VI-2903-4	(29.03)	(F)	(6)	DDT (ISO) (clofenotane (INN), 1,1,1-trichloro-2,2-bis(<i>p</i> -chlorophenyl)ethane or dichlorodiphenyltrichloroethane)		 <p>The chemical structure of DDT is a central carbon atom bonded to a hydrogen atom (top), two chlorine atoms (bottom-left and bottom-right), and two phenyl groups (left and right). Each phenyl group is substituted with a chlorine atom at the para position.</p>

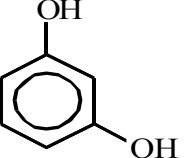

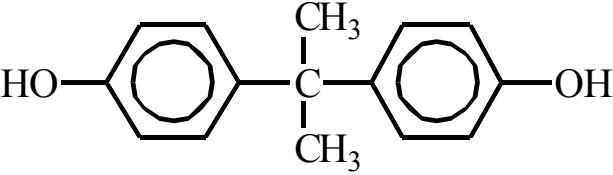

Page	Heading	Paragraph			Description in the Explanatory Notes	Chemical Structure
		(F)	(11)		2,2',4,4',5,5'-hexabromobiphenyl	 <p>The chemical structure shows a biphenyl core where each phenyl ring is substituted with three bromine atoms (Br) at the para, meta, and ortho positions relative to the point of connection.</p>
29.04					Sulphonated, nitrated or nitrosated derivatives of hydrocarbons, whether or not halogenated	

		(A)			SULPHONATED DERIVATIVES

		(2)			Boron trifluoride complexes with diethyl ether	$(\text{C}_2\text{H}_5)_2\text{O} \bullet \text{BF}_3$

Chapter 30

Pharmaceutical products

Notes.

- 1.- This Chapter does not cover :
 - (a) Foods or beverages (such as dietetic, diabetic or fortified foods, food supplements, tonic beverages and mineral waters), other than nutritional preparations for intravenous administration (Section IV);
 - (b) Preparations, such as tablets, chewing gum or patches (transdermal systems), intended to assist smokers to stop smoking (heading 21.06 or 38.24);
 - (c) Plasters specially calcined or finely ground for use in dentistry (heading 25.20);
 - (d) Aqueous distillates or aqueous solutions of essential oils, suitable for medicinal uses (heading 33.01);
 - (e) Preparations of headings 33.03 to 33.07, even if they have therapeutic or prophylactic properties;
 - (f) Soap or other products of heading 34.01 containing added medicaments;
 - (g) Preparations with a basis of plaster for use in dentistry (heading 34.07); or
 - (h) Blood albumin not prepared for therapeutic or prophylactic uses (heading 35.02).
- 2.- For the purposes of heading 30.02, the expression “immunological products” applies to peptides and proteins (other than goods of heading 29.37) which are directly involved in the regulation of immunological processes, such as monoclonal antibodies (MAB), antibody fragments, antibody conjugates and antibody fragment conjugates, interleukins, interferons (IFN), chemokines and certain tumor necrosis factors (TNF), growth factors (GF), hematopoietins and colony stimulating factors (CSF).
- 3.- For the purposes of headings 30.03 and 30.04 and of Note 4 (d) to this Chapter, the following are to be treated :
 - (a) As unmixed products :
 - (1) Unmixed products dissolved in water;
 - (2) All goods of Chapter 28 or 29; and
 - (3) Simple vegetable extracts of heading 13.02, merely standardised or dissolved in any solvent;
 - (b) As products which have been mixed :
 - (1) Colloidal solutions and suspensions (other than colloidal sulphur);
 - (2) Vegetable extracts obtained by the treatment of mixtures of vegetable materials; and
 - (3) Salts and concentrates obtained by evaporating natural mineral waters.

- 4.- Heading 30.06 applies only to the following, which are to be classified in that heading and in no other heading of the Nomenclature :
- (a) Sterile surgical catgut, similar sterile suture materials (including sterile absorbable surgical or dental yarns) and sterile tissue adhesives for surgical wound closure;
 - (b) Sterile laminaria and sterile laminaria tents;
 - (c) Sterile absorbable surgical or dental haemostatics; sterile surgical or dental adhesion barriers, whether or not absorbable;
 - (d) Opacifying preparations for X-ray examinations and diagnostic reagents designed to be administered to the patient, being unmixed products put up in measured doses or products consisting of two or more ingredients which have been mixed together for such uses;
 - (e) Blood-grouping reagents;
 - (f) Dental cements and other dental fillings; bone reconstruction cements;
 - (g) First-aid boxes and kits;
 - (h) Chemical contraceptive preparations based on hormones, on other products of heading 29.37 or on spermicides;
 - (ij) Gel preparations designed to be used in human or veterinary medicine as a lubricant for parts of the body for surgical operations or physical examinations or as a coupling agent between the body and medical instruments;
 - (k) Waste pharmaceuticals, that is, pharmaceutical products which are unfit for their original intended purpose due to, for example, expiry of shelf life; and
 - (l) Appliances identifiable for ostomy use, that is, colostomy, ileostomy and urostomy pouches cut to shape and their adhesive wafers or faceplates.
- ◦◦

Subheading Notes.

- 1.- For the purposes of subheadings 3002.13 and 3002.14, the following are to be treated :
- (a) As unmixed products, pure products, whether or not containing impurities;
 - (b) As products which have been mixed :
 - (1) The products mentioned in (a) above dissolved in water or in other solvents;
 - (2) The products mentioned in (a) and (b) (1) above with an added stabiliser necessary for their preservation or transport; and
 - (3) The products mentioned in (a), (b) (1) and (b) (2) above with any other additive.
- 2.- Subheadings 3003.60 and 3004.60 cover medicaments containing artemisinin (INN) for oral ingestion combined with other pharmaceutical active ingredients, or containing any of the following active principles, whether or not combined with other pharmaceutical active ingredients : amodiaquine (INN); artelinic acid or its salts; arteminol (INN); artemotil (INN); artemether (INN); artesunate (INN); chloroquine (INN); dihydroartemisinin (INN); lumefantrine (INN); mefloquine (INN); piperaquine (INN); pyrimethamine (INN) or sulfadoxine (INN).

GENERAL

This Chapter includes pegylated products which consist of polyethylene glycol (or PEGs) polymers bonded to pharmaceuticals of Chapter 30 (e.g., functional proteins and peptides, antibody fragments) in order to improve their efficacy as drugs. Pegylated products of headings of this Chapter remain classified in the same heading as their non-pegylated forms (e.g., Peginterferon (INN) of heading 30.02).

30.01 - Glands and other organs for organo-therapeutic uses, dried, whether or not powdered; extracts of glands or other organs or of their secretions for organo-therapeutic uses; heparin and its salts; other human or animal substances prepared for therapeutic or prophylactic uses, not elsewhere specified or included.

3001.20 - Extracts of glands or other organs or of their secretions

3001.90 - Other

This heading covers :

- (A) **Glands and other organs of animal origin for organo-therapeutic uses** (e.g., the brain, spinal cord, liver, kidneys, spleen, pancreas, mammary glands, testes, ovaries), dried, whether or not powdered.
- (B) **Extracts of glands or other organs or of their secretions for organo-therapeutic uses**, obtained by solvent extraction, precipitation, coagulation or by any other process. These extracts may be in solid, semi-solid or liquid form, or in solution or suspension in any media necessary for their preservation.

The organo-therapeutic extracts of secretions of glands or organs include bile extract.

- (C) **Heparin and its salts.** Heparin consists of a mixture of complex organic acids (mucopolysaccharides) obtained from mammalian tissues. Its composition varies according to the origin of the tissues. Heparin and its salts are used chiefly in medicine, especially as blood anti-coagulants. They remain classified here whatever their degree of activity.
- (D) **Other human or animal substances prepared for therapeutic or prophylactic uses and which are not specified or included in more specific headings of the Nomenclature**, including :
 - (1) **Red bone marrow** preserved in glycerol.
 - (2) **Snake or bee venom** put up in dried flakes and the non-microbial crypto-toxins formed from such venom.

These products ((1) and (2) above), when put up as medicaments in measured doses or in forms or packings for retail sale, fall in **heading 30.04**.
 - (3) **Bone, organs and other human or animal tissue**, whether living or preserved, suitable for permanent grafting or implantation, put up in sterile packings which may bear indications as to method of use, etc.

The heading **excludes** :

- (a) Glands and other animal organs, fresh, chilled, frozen or otherwise provisionally preserved (**Chapter 2 or 5**).
- (b) Bile, whether or not dried (**heading 05.10**).
- (c) Separate chemically defined compounds and other products of **Chapter 29** obtained by the treatment of extracts of glands or other organs, e.g., amino-acids (**heading 29.22**), vitamins (**heading 29.36**), hormones (**heading 29.37**).

- (d) Human blood, animal blood prepared for therapeutic, prophylactic or diagnostic uses, and antisera (including specific immunoglobulins) and other blood fractions (e.g., "normal" sera, human normal immunoglobulin, plasma, fibrinogen, fibrin) (**heading 30.02**).
- (e) Products having the character of medicaments of **heading 30.03** or **30.04** (see corresponding Explanatory Notes).
- (f) Globulins and globulin fractions (other than those of blood or serum) not prepared for therapeutic or prophylactic use (**heading 35.04**).
- (g) Enzymes (**heading 35.07**).

30.02 - Human blood; animal blood prepared for therapeutic, prophylactic or diagnostic uses; antisera, other blood fractions and immunological products, whether or not modified or obtained by means of biotechnological processes; vaccines, toxins, cultures of micro-organisms (excluding yeasts) and similar products.(+)

- Antisera, other blood fractions and immunological products, whether or not modified or obtained by means of biotechnological processes :

3002.11 - - Malaria diagnostic test kits

3002.12 - - Antisera and other blood fractions

3002.13 - - Immunological products, unmixed, not put up in measured doses or in forms or packings for retail sale

3002.14 - - Immunological products, mixed, not put up in measured doses or in forms or packings for retail sale

3002.15 - - Immunological products, put up in measured doses or in forms or packings for retail sale

3002.19 - - Other

3002.20 - Vaccines for human medicine

3002.30 - Vaccines for veterinary medicine

3002.90 - Other

This heading covers :

- (A) **Human blood** (e.g., human blood in sealed ampoules).
- (B) **Animal blood prepared for therapeutic, prophylactic or diagnostic uses.**
Animal blood not prepared for such uses falls in **heading 05.11**.
- (C) **Antisera, other blood fractions and immunological products, whether or not modified or obtained by means of biotechnological processes.**

These products include :

- (1) **Antisera and other blood fractions, whether or not modified or obtained by means of biotechnological processes.**

Sera are the fluid fractions separated from blood after clotting.

The heading covers, *inter alia*, the following products derived from blood (including vascular endothelial cells) : “normal” sera, human normal immunoglobulin, blood fractions and truncated variants (parts) thereof with enzymatic properties/activity, plasma, thrombin, fibrinogen, fibrin and other blood coagulation factors, thrombomodulin, blood globulins, serum globulins, and haemoglobin. This group also includes modified thrombomodulins and modified haemoglobins obtained by means of biotechnological processes, e.g., sothrombomodulin alfa (INN) and thrombomodulin alfa (INN), as well as cross-linked haemoglobins such as hemoglobin crosfumaril (INN), hemoglobin glutamer (INN) and hemoglobin raffimer (INN).

The heading further includes blood albumin (e.g., human albumin obtained by fractionating the blood fractions and truncated variants (parts) thereof with enzymatic plasma of whole human blood), prepared for therapeutic or prophylactic uses.

Antisera are obtained from the blood of humans or of animals which are immune or have been immunised against diseases or ailments, whether these are caused by pathogenic bacteria and viruses, toxins or allergic phenomena, etc. Antisera are used against diphtheria, dysentery, gangrene, meningitis, pneumonia, tetanus, staphylococcal or streptococcal infections, snake bite, vegetable poisoning, allergic diseases, etc. Antisera are also used for diagnostic purposes, including in vitro tests. Specific immunoglobulins are purified preparations of antisera.

The heading **does not cover** blood albumin not prepared for therapeutic or prophylactic uses (**heading 35.02**) or globulins (other than blood globulins and serum globulins) (**heading 35.04**). The heading also **excludes** medicaments which are not separated from the blood but which in some countries are described as "sera" or "artificial sera"; they include isotonic solutions based on sodium chloride or other chemicals and suspensions of pollen which are used against allergic diseases.

(2) Immunological products, whether or not modified or obtained by means of biotechnological processes.

Products used for diagnostic or therapeutic purposes and for immunological tests are to be regarded as falling within this product group. They can be defined as follows :

- (a) **Monoclonal antibodies (MAB)** - specific immunoglobulins from selected and cloned hybridoma cells cultured in a culture medium or ascites.
- (b) **Antibody fragments** – active parts of an antibody protein obtained by means of e.g., specific enzymatic splitting. This group includes inter alia single-chain (scFv) antibodies.
- (c) **Antibody conjugates and antibody fragment conjugates** – conjugates which contain at least one antibody or an antibody fragment. The simplest types are a combination of the following :
 - (i) antibody – antibody;
 - (ii) antibody fragment – antibody fragment;
 - (iii) antibody - antibody fragment;
 - (iv) antibody – other substance;
 - (v) antibody fragment – other substance.

Conjugates of types (iv) and (v) include, for example, enzymes (e.g., alkaline phosphatase, peroxidase or betagalactosidase) or dyes (fluorescin) covalently bound to the protein structure, which are used for straightforward detection reactions.

This heading also covers interleukins, interferons (IFN), chemokines and certain tumor necrosis factors (TNF), growth factors (GF), hematopoietins and colony stimulating factors (CSF).

(D) Vaccines, toxins, cultures of micro-organisms (excluding yeasts) and similar products.

These products include :

(1) Vaccines.

The most typical vaccines are prophylactic preparations of microbial origin containing either viruses or bacteria suspended in saline solutions, oil (lipovaccines) or other media. These preparations have usually been treated to reduce their toxicity without destroying their immunizing properties.

Other vaccines include recombinant vaccines, peptide vaccines and carbohydrate vaccines. These vaccines generally contain an antigen, a recognised part of an antigen or a gene coding for a recognised part of an antigen (peptides, recombinants or conjugates of protein and others). The “recognised part of an antigen” is the part of an antigen which triggers the immunological response in the organism. Many of these vaccines target a specific virus or bacterium. These vaccines are used for prophylactic or therapeutic purposes.

The heading also covers mixtures consisting of vaccines or toxoids (such as Diphtheria, Tetanus and Pertussis (DPT) vaccine).

- (2) **Toxins** (poisons), toxoids, crypto-toxins, protoxins (e.g., topsalysin (INN)) and anti-toxins.
- (3) **Cultures of micro-organisms (excluding yeasts)**. These include ferments such as lactic ferments used in the preparation of milk derivatives (kefir, yogurt, lactic acid) and acetic ferments for making vinegar; moulds for the manufacture of penicillin and other antibiotics; and cultures of micro-organisms for technical purposes (e.g., for aiding plant growth).

Milk or whey containing small quantities of lactic ferments is classifiable in **Chapter 4**.

- (4) **Virus, human, animal and vegetable and anti-virus.**
- (5) **Bacteriophage.**

The heading also includes diagnostic reagents of microbial origin, **other than** those provided for in Note 4 (d) to this Chapter - see **heading 30.06**. It **does not cover** enzymes (rennet, amylase, etc.) even if of microbial origin (streptokinase, streptodornase, etc.) (**heading 35.07**) **nor dead** single-cell micro-organisms (other than vaccines) (**heading 21.02**).

(E) Diagnostic kits.

Diagnostic kits are classified here when the essential character of the kit is given by any of the products of this heading. Common reactions occurring in the use of such kits include agglutination, precipitation, neutralization, binding of complement, haemagglutination, enzyme-linked immunosorbent assay (ELISA), etc. Malaria diagnostic kits based on monoclonal antibodies to pLDH (plasmodium lactate dehydrogenase) are for instance classified here. The essential character is given by that single component which governs to the greatest extent the specificity of the test procedure.

The products of this heading remain classified here whether or not in measured doses or put up for retail sale and whether in bulk or in small packings.

◦
◦◦

Subheading Explanatory Note.

Subheading 3002.13

The unmixed immunological products of subheading 3002.13 may contain impurities. The term "impurities" applies exclusively to substances whose presence in the products results solely and directly from the manufacturing process (including purification). These substances may result from any of the factors involved in the process and are principally the following :

- (a) Unconverted starting materials.
- (b) Impurities present in the starting materials.
- (c) Reagents used in the manufacturing process (including purification).
- (d) By-products.

30.03 - Medicaments (excluding goods of heading 30.02, 30.05 or 30.06) consisting of two or more constituents which have been mixed together for therapeutic or prophylactic uses, not put up in measured doses or in forms or packings for retail sale.

- 3003.10 - Containing penicillins or derivatives thereof, with a penicillanic acid structure, or streptomycins or their derivatives
- 3003.20 - Other, containing antibiotics
 - Other, containing hormones or other products of heading 29.37 :
- 3003.31 -- Containing insulin
- 3003.39 -- Other
 - Other, containing alkaloids or derivatives thereof :
- 3003.41 -- Containing ephedrine or its salts
- 3003.42 -- Containing pseudoephedrine (INN) or its salts
- 3003.43 -- Containing norephedrine or its salts
- 3003.49 -- Other
- 3003.60 - Other, containing antimalarial active principles described in Subheading Note 2 to this Chapter
- 3003.90 - Other

This heading covers medicinal preparations for use in the internal or external treatment or prevention of human or animal ailments. These preparations are obtained by mixing together two or more substances. However, if put up in measured doses or in forms or packings for retail sale, they fall in **heading 30.04**.

The heading includes :

- (1) Mixed medicinal preparations such as those listed in an official pharmacopoeia, proprietary medicines, etc., including those in the form of gargles, eye drops, ointments, liniments, injections, counter-irritant and other preparations **not falling in heading 30.02, 30.05 or 30.06**.

However, this should not be taken to mean that preparations listed in an official pharmacopoeia, proprietary medicines, etc. are always classified in **heading 30.03**. For example, anti-acne preparations which are designed primarily to cleanse the skin and which do not contain sufficiently high levels of active ingredients to be regarded as having a primary therapeutic or prophylactic effect against acne are to be classified in **heading 33.04**.

- (2) Preparations containing a single pharmaceutical substance together with an excipient, sweetening agent, agglomerating agent, support, etc.
- (3) Nutritional preparations for intravenous administration only, i.e., by injection or drip into a vein.

- (4) Colloidal solutions and suspensions (e.g., colloidal selenium) for medicinal purposes, **but not including** colloidal sulphur or single colloidal precious metals. Colloidal sulphur falls in **heading 30.04** when put up in measured doses or in packings for retail sale for therapeutic or prophylactic uses and in **heading 28.02** in all other cases. Single colloidal precious metals fall in **heading 28.43** whether or not put up for medicinal use. Mixtures of colloidal precious metals or mixtures of one or more colloidal precious metals with other substances, for therapeutic or prophylactic purposes, are, however, classified in this heading.
- (5) Medicinal compound vegetable extracts **including** those obtained by treating a mixture of plants.
- (6) Medicinal mixtures of the plants or parts of plants of heading 12.11.
- (7) Medicinal salts obtained by the evaporation of natural mineral waters and similar products artificially prepared.
- (8) Concentrated waters from salt sources (such as Kreuznach waters) used in therapeutics; mixed salts prepared for medicinal baths (sulphurous, iodized, etc., baths), whether or not perfumed.
- (9) Health salts (e.g., a mixture of sodium hydrogencarbonate, tartaric acid, magnesium sulphate and sugar) and similar mixed effervescent salts used for medicinal purposes.
- (10) Camphorated oil, phenolated oil, etc.
- (11) Anti-asthmatic products such as anti-asthmatic papers and powders.
- (12) "Retarded effect medicaments" such as those consisting of a medicinal component fixed to a polymeric ion-exchanger.
- (13) Anaesthetics used in human or veterinary medicine or surgery.

*
* *

The provisions of the heading text do not apply to foodstuffs or beverages such as dietetic, diabetic or fortified foods, tonic beverages or mineral waters (natural or artificial), which fall to be **classified under their own appropriate headings**. This is essentially the case as regards food preparations containing only nutritional substances. The major nutritional substances in food are proteins, carbohydrates and fats. Vitamins and mineral salts also play a part in nutrition.

Similarly foodstuffs and beverages containing medicinal substances are **excluded** from the heading if those substances are added solely to ensure a better dietetic balance, to increase the energy-giving or nutritional value of the product or to improve its flavour, always provided that the product retains its character of a foodstuff or a beverage.

Moreover, products consisting of a mixture of plants or parts of plants or consisting of plants or parts of plants mixed with other substances, used for making herbal infusions or herbal "teas" (e.g., those having laxative, purgative, diuretic or carminative properties), and claimed to offer relief from ailments or contribute to general health and well-being, are also **excluded** from this heading (**heading 21.06**).

Further this heading **excludes** food supplements containing vitamins or mineral salts which are put up for the purpose of maintaining health or well-being but have no indication as to use for the prevention or treatment of any disease or ailment. These products which are usually in liquid form but may also be put up in powder or tablet form, are generally classified in **heading 21.06** or **Chapter 22**.

On the other hand, the heading covers preparations in which the foodstuff or the beverage merely serves as a support, vehicle or sweetening agent for the medicinal substances (e.g., in order to facilitate ingestion).

In addition to foodstuffs and beverages, the heading **excludes** :

- (a) Goods of **heading 30.02, 30.05 or 30.06**.
- (b) Aqueous distillates or aqueous solutions of essential oils and preparations of headings 33.03 to 33.07, even if they have therapeutic or prophylactic properties (**Chapter 33**).
- (c) Medicated soaps (**heading 34.01**).
- (d) Insecticides, disinfectants, etc., of **heading 38.08**.

30.04 - Medicaments (excluding goods of heading 30.02, 30.05 or 30.06) consisting of mixed or unmixed products for therapeutic or prophylactic uses, put up in measured doses (including those in the form of transdermal administration systems) or in forms or packings for retail sale.

3004.10 - Containing penicillins or derivatives thereof, with a penicillanic acid structure, or streptomycins or their derivatives

3004.20 - Other, containing antibiotics

- Other, containing hormones or other products of heading 29.37 :

3004.31 -- Containing insulin

3004.32 -- Containing corticosteroid hormones, their derivatives or structural analogues

3004.39 -- Other

- Other, containing alkaloids or derivatives thereof :

3004.41 -- Containing ephedrine or its salts

3004.42 -- Containing pseudoephedrine (INN) or its salts

3004.43 -- Containing norephedrine or its salts

3004.49 -- Other

3004.50 - Other, containing vitamins or other products of heading 29.36

3004.60 - Other, containing antimalarial active principles described in Subheading Note 2 to this Chapter

3004.90 - Other

This heading covers medicaments consisting of mixed or unmixed products, **provided they are :**

- (a) Put up **in measured doses** or in forms such as tablets, ampoules (for example, re-distilled water, in ampoules of 1.25 to 10 cm³, for use either for the direct treatment of certain diseases, e.g., alcoholism, diabetic coma or as a solvent for the preparation of injectible medicinal solutions), capsules, cachets, drops or pastilles, medicaments in the form of transdermal administration systems, or small quantities of powder, ready for taking as single doses for therapeutic or prophylactic use.

The heading also includes measured doses in the form of transdermal administration systems which are generally put up in the form of self-adhesive patches (usually rectangular or round) and which are applied directly to the skin of patients. The active substance is contained in a reservoir which is closed by a porous membrane on the side entering into contact with the skin. The active substance released from the reservoir is absorbed by passive molecular diffusion through the skin and passes directly into the bloodstream. These systems should not be confused with medical adhesive plasters of heading 30.05.

The heading applies to such single doses whether in bulk, in packings for retail sale, etc.; or

- (b) **In packings for retail sale for therapeutic or prophylactic use.** This refers to products (for example, sodium bicarbonate and tamarind powder) which, because of their packing and, in particular, the presence of appropriate indications (statement of disease or condition for which they are to be used, method of use or application, statement of dose, etc.) are clearly intended for sale directly to users (private persons, hospitals, etc.) without repacking, for the above purposes.

These indications (in any language) may be given by label, literature or otherwise. However, the mere indication of pharmaceutical or other degree of purity is not alone sufficient to justify classification in this heading.

On the other hand, even if no indications are given, unmixed products are to be regarded as being put up for retail sale for therapeutic or prophylactic use if they are put up in a form clearly specialised for such use.

Medicaments consisting of mixed products for therapeutic or prophylactic uses and not put up in measured doses or in forms or packings for retail sale are classified in **heading 30.03** (see the corresponding Explanatory Note).

Under the terms of Chapter Note 3, the following are also regarded as unmixed products :

- (1) Unmixed products dissolved in water.
- (2) All goods of Chapter 28 or 29. Such products include colloidal sulphur and stabilised solutions of hydrogen peroxide.
- (3) Single vegetable extracts of heading 13.02, merely standardised or dissolved in any solvent (see the Explanatory Note to heading 13.02).

It should be noted, however, that unmixed products of **headings 28.43 to 28.46 and 28.52** are always **excluded** from heading 30.04, even if they satisfy the requirements of paragraph (a) or (b) above. For example, colloidal silver remains classified in **heading 28.43** even if put up in measured doses or packed and presented as a medicament.

*
* *

This heading includes pastilles, tablets, drops, etc., of a kind suitable **only** for medicinal purposes, such as those based on sulphur, charcoal, sodium tetraborate, sodium benzoate, potassium chlorate or magnesia.

However, preparations put up as throat pastilles or cough drops, consisting essentially of sugars (whether or not with other foodstuffs such as gelatin, starch or flour) and flavouring agents (including substances having medicinal properties, such as benzyl alcohol, menthol, eucalyptol and tolu balsam) fall in **heading 17.04**. Throat pastilles or cough drops containing substances having medicinal properties, other than flavouring agents, remain classified in this heading when put up in measured doses or in forms or packings for retail sale, **provided** that the proportion of those substances in each pastille or drop is such that they are thereby given therapeutic or prophylactic uses.

The heading also covers the following products, provided they are put up as prescribed in paragraph (a) or (b) above :

- (1) Organic surface-active products and preparations, with active cation (e.g., quaternary ammonium salts), having antiseptic, disinfectant, bactericidal or germicidal properties.
- (2) Poly(vinyl pyrrolidone)-iodine, being a reaction product of iodine and poly(vinyl pyrrolidone).
- (3) Bone graft substitutes, such as those made from surgical grade calcium sulfate, which are injected into a cavity of the fractured bone and spontaneously resorbed and replaced by bone tissue; these products provide a crystalline matrix on which new bone can grow as the matrix is resorbed.

However, the heading **excludes** bone reconstruction cements, usually containing a hardener (curing agent) and an activator and used, e.g., for attaching prosthetic implants to existing bone (**heading 30.06**).

* * *

The provisions of the heading text do not apply to foodstuffs or beverages such as dietetic, diabetic or fortified foods, tonic beverages or mineral waters (natural or artificial), which fall to be classified under **their own appropriate headings**. This is essentially the case as regards food preparations containing only nutritional substances. The major nutritional substances in food are proteins, carbohydrates and fats. Vitamins and mineral salts also play a part in nutrition.

Similarly foodstuffs and beverages containing medicinal substances are **excluded** from the heading if those substances are added solely to ensure a better dietetic balance, to increase the energy-giving or nutritional value of the product or to improve its flavour, always provided that the product retains its character of a foodstuff or a beverage.

Moreover, products consisting of a mixture of plants or parts of plants or consisting of plants or parts of plants mixed with other substances, used for making herbal infusions or herbal "teas" (e.g., those having laxative, purgative, diuretic or carminative properties), and claimed to offer relief from ailments or contribute to general health and well-being, are also **excluded** from this heading (**heading 21.06**).

Further, this heading **excludes** food supplements containing vitamins or mineral salts which are put up for the purpose of maintaining health or well-being but have no indication as to use for the prevention or treatment of any disease or ailment. These products which are usually in liquid form but may also be put up in powder or tablet form, are generally classified in **heading 21.06** or **Chapter 22**.

On the other hand, the heading covers preparations in which the foodstuff or the beverage merely serves as a support, vehicle or sweetening agent for the medicinal substances (e.g., in order to facilitate ingestion).

The heading also **excludes** :

- (a) Snake or bee venom, not put up as medicaments (**heading 30.01**).
- (b) Goods of **heading 30.02, 30.05 or 30.06**, however they are put up.
- (c) Aqueous distillates or aqueous solutions of essential oils and preparations of headings 33.03 to 33.07, even if they have therapeutic or prophylactic properties (**Chapter 33**).
- (d) Medicated soaps however they are put up (**heading 34.01**).
- (e) Insecticides, disinfectants, etc., of **heading 38.08**, not put up for internal or external use as medicines.
- (f) Preparations, such as tablets, chewing gum or patches (transdermal systems), intended to assist smokers to stop smoking (**heading 21.06 or 38.24**).

30.05 - Wadding, gauze, bandages and similar articles (for example, dressings, adhesive plasters, poultices), impregnated or coated with pharmaceutical substances or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes.

3005.10 - Adhesive dressings and other articles having an adhesive layer

3005.90 - Other

This heading covers articles such as wadding, gauze, bandages and the like, of textile, paper, plastic, etc., impregnated or coated with pharmaceutical substances (counter-irritant, antiseptic, etc.) for medical, surgical, dental or veterinary purposes.

These articles include wadding impregnated with iodine or methyl salicylate, etc., various prepared dressings, prepared poultices (e.g., linseed or mustard poultices), medicated adhesive plasters, etc. They may be in the piece, in discs or in any other form.

Wadding and gauze for dressings (usually of absorbent cotton) and bandages, etc., not impregnated or coated with pharmaceutical substances, are also classified in this heading, provided they are put up in forms or packings for retail sale directly to private persons, clinics, hospitals, etc., without repacking, and they are recognizable by their characteristics (presented in rolls or folded, protective packaging, labelling, etc.) as exclusively intended for medical, surgical, dental or veterinary uses.

This heading also covers the following types of dressings :

- (1) **Cutaneous dressings** consisting of prepared frozen or lyophilised (dried) strips of animal skin tissue, usually porcine, used as temporary biological dressings for direct application to areas of skin loss, open tissue wounds, surgical infections, etc. They are available in various sizes and are packed in sterile containers (retail packings) labelled with information concerning their use.
- (2) **Liquid dressings** put up in a spray can (retail packing) and used to cover wounds with a protective transparent film. They may consist of a sterile solution of a plastic (e.g., a modified vinyl copolymer or a methacrylic plastic) in a volatile organic solvent (e.g., ethyl acetate) and a propellant, whether or not with added pharmaceutical substances (antiseptics in particular).

The heading **excludes** bandages, adhesive plasters, etc., containing zinc oxide, and plaster-coated fracture bandages, not put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes.

The heading also **excludes** :

- (a) Plasters specially calcined or finely ground for use in dentistry and preparations with a basis of plaster for use in dentistry (**headings 25.20** and **34.07** respectively).
- (b) Medicaments put up in the form of transdermal administration systems (**heading 30.04**).
- (c) Goods specified in Note 4 to this Chapter (**heading 30.06**).
- (d) Sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles of **heading 96.19**.

30.06 - Pharmaceutical goods specified in Note 4 to this Chapter.

3006.10 - Sterile surgical catgut, similar sterile suture materials (including sterile absorbable surgical or dental yarns) and sterile tissue adhesives for surgical wound closure; sterile laminaria and sterile laminaria tents; sterile absorbable surgical or dental haemostatics; sterile surgical or dental adhesion barriers, whether or not absorbable

3006.20 - Blood-grouping reagents

3006.30 - Opacifying preparations for X-ray examinations; diagnostic reagents designed to be administered to the patient

3006.40 - Dental cements and other dental fillings; bone reconstruction cements

3006.50 - First-aid boxes and kits

3006.60 - Chemical contraceptive preparations based on hormones, on other products of heading 29.37 or on spermicides

3006.70 - Gel preparations designed to be used in human or veterinary medicine as a lubricant for parts of the body for surgical operations or physical examinations or as a coupling agent between the body and medical instruments

- Other :

3006.91 -- Appliances identifiable for ostomy use

3006.92 -- Waste pharmaceuticals

This heading covers **only** the following goods :

- (1) **Sterile surgical catgut, similar sterile suture materials and sterile tissue adhesives for surgical wound closure.**

This item covers all kinds of ligatures for surgical sutures, provided they are sterile. These ligatures are usually put up in antiseptic solutions or in sealed sterile containers.

The materials used for such ligatures include :

- (a) catgut (processed collagen from the intestines of cattle, sheep or other animals);
- (b) natural fibres (cotton, silk, linen);
- (c) synthetic polymer fibres, such as polyamides (nylons), polyesters;
- (d) metals (stainless steel, tantalum, silver, bronze).

The item also covers tissue adhesives such as those consisting of butyl cyanoacrylate and a dye; after application, the monomer polymerises and the product is therefore used in place of conventional suture materials for closing internal or external wounds of the human body.

The heading **excludes** non-sterile suture materials. These are classified according to their nature, e.g., catgut (**heading 42.06**), silkworm gut, textile yarns, etc. (**Section XI**), metal wire (**Chapter 71** or **Section XV**).

(2) **Sterile laminaria and sterile laminaria tents.**

This item is restricted to **sterile** laminaria and **sterile** laminaria tents (small lengths of algae, sometimes brown and with a rough grooved surface). They swell considerably on contact with moist substances and become smooth and flexible.

They are therefore used in surgery as a means of dilation.

Non-sterile products are **excluded** (**heading 12.12**).

(3) **Sterile absorbable surgical or dental haemostatics.**

This item covers sterile products used in surgery or dentistry to stop bleeding and having the property of being absorbed by the body fluids. It includes oxidised cellulose, generally in the form of gauze or fibres ("wool"), in pads, pledgets or strip; gelatin sponge or foam; calcium alginate gauze, "wool" or "film".

(4) **Sterile surgical or dental adhesion barriers, whether or not absorbable.**

(5) **Blood-grouping reagents.**

The reagents under this heading must be suitable for direct use in blood-grouping. They are either sera of human or animal origin, or vegetable extracts of seeds or other parts of plants (phytagglutinins). These reagents are used in the determination of blood-groups by reference to the characteristics of the blood corpuscles or of the blood serum. In addition to the active principle(s), they may contain substances to strengthen their activity or stabilise them (antiseptics, antibiotics, etc.).

A. The following are to be regarded as reagents for determining blood-group by reference to the **characteristics of blood corpuscles** :

- (i) Preparations for determining the A, B, O and AB groups, A₁ and A₂ sub-groups and Factor H.
- (ii) Preparations for determining the M, N, S and P groups and other groups such as Lu, K and Le.
- (iii) Preparations for determining the Rh groups and C^w, F, V, etc. sub-groups.
- (iv) Preparations for determining the blood-groups of animals.

B. The preparations to be regarded as reagents for determining the **characteristics of sera** are those used to determine :

- (i) characteristics of Gm, Km, etc., systems;
- (ii) serum groups Gc, Ag, etc.

C. Anti-human globulin serum (Coombs serum), which is essential in certain blood-grouping techniques, is also to be regarded as a reagent of this heading.

Crude sera and other semi-finished substances which require further treatment before becoming suitable for use as reagents are to be classified by reference to their constituent material.

D. Reagents for the determination of HLA properties (HLA antigens) fall in this heading; they must be directly applicable. They are sera of either human or animal origin. These reagents react with peripheral blood lymphocytes of the test subject for the determination of the HLA antigens. The HLA antigens of the test subject may be determined on the basis of the reaction pattern of different HLA test sera. Besides the active ingredients the reagents contain additives for stabilisation and conservation.

These include :

- (a) Preparations for the determination of the HLA A, B and C antigens.
- (b) Preparations for the determination of the HLA DR antigens.
- (c) Preparations for the determination of the HLA D antigens.
- (d) Finished reagents for the determination of the HLA A, B and C antigens which contain a range of different HLA antisera (e.g., test plates).
- (e) Finished reagents for the determination of the HLA DR locus (e.g., test plates).

(6) **Opacifying preparations for X-ray examinations and diagnostic reagents designed to be administered to the patient, being unmixed products put up in measured doses or products consisting of two or more ingredients which have been mixed together for such uses.**

The opacifying preparations are used in X-ray examination of internal organs, arteries, veins, urinary passages, bile duct, etc. They are based on barium sulphate or other substances opaque to X-rays and may be put up for injection or for oral administration (e.g., barium meal).

The diagnostic reagents (including microbial diagnostic reagents) covered by the heading are those administered by ingestion, injection, etc.

Diagnostic reagents **not** designed to be administered to the patient (e.g., those for carrying out tests on blood, urine, etc., samples taken from a patient or for use as laboratory reagents) are **excluded**; they fall in the headings appropriate to the materials of which they are made (e.g., **Chapter 28, Chapter 29 or heading 30.02 or 38.22**).

(7) Dental cements and fillings and bone reconstruction cements.

Dental cements and fillings are generally based on metallic salts (zinc chloride, zinc phosphate, etc.), metallic oxides, gutta-percha or plastic materials. They may also consist of metallic alloys (including precious metal alloys) specially prepared for dental fillings. Such alloys are sometimes called "amalgams" even though they do not contain mercury. The heading covers both temporary and permanent fillings and includes cements and fillings containing added medicinal substances and having prophylactic properties.

They are usually in the form of powders or tablets, sometimes accompanied by the liquid required for their preparation, and the packings normally indicate dental use.

Points (e.g., of silver, gutta-percha, paper) for filling dental root canals are also covered by this heading.

The heading also covers bone reconstruction cements, usually containing a hardener (curing agent) and activator and used, e.g., for attaching prosthetic implants to existing bone; these cements usually cure at body temperature.

Plasters specially calcined or finely ground for use in dentistry and preparations with a basis of plaster for use in dentistry are **excluded** (**headings 25.20 and 34.07** respectively).

Bone graft substitutes, such as those made from surgical grade calcium sulfate, which provide a crystalline matrix on which new bone can grow as the matrix is resorbed are also **excluded** (**heading 30.04**).

(8) First-aid boxes and kits.

These contain small quantities of a few common medicaments (hydrogen peroxide, tincture of iodine, mercurochrome, tincture of arnica, etc.), a few dressings, bandages, plasters, etc., and, optionally, a few instruments such as scissors, tweezers, etc.

The heading **does not cover** the more elaborate medical kits as used by doctors.

(9) Chemical contraceptive preparations based on hormones, on other products of heading 29.37 or on spermicides, whether or not put up in packings for retail sale.

(10) Gel preparations designed to be used in human or veterinary medicine as a lubricant for parts of the body for surgical operations or physical examinations or as a coupling agent between the body and medical instruments.

These preparations usually contain polyhydric alcohols (glycerol, propylene glycol, etc.), water and a thickener. They are generally used as a lubricant between parts of the body during physical examination (e.g., vaginal lubrication) or between the parts of the body and the surgeon's hands, gloves or medical instruments, for medical or veterinary purposes. They are also used as a coupling agent between the body and medical instruments (e.g., electrocardiograph, ultrasound scanner).

(11) **Appliances identifiable for ostomy use**, that is, colostomy, ileostomy and urostomy pouches cut to shape and their adhesive wafers or faceplates.

(12) **Waste pharmaceuticals**.

The heading also covers pharmaceutical products which are unfit for their original intended purpose due to, for example, expiry of shelf life.

Chapter 31

Fertilisers

Notes.

- 1.- This Chapter does not cover :
 - (a) Animal blood of heading 05.11;
 - (b) Separate chemically defined compounds (other than those answering to the descriptions in Note 2 (a), 3 (a), 4 (a) or 5 below); or
 - (c) Cultured potassium chloride crystals (other than optical elements) weighing not less than 2.5 g each, of heading 38.24; optical elements of potassium chloride (heading 90.01).
- 2.- Heading 31.02 applies only to the following goods, provided that they are not put up in the forms or packages described in heading 31.05 :
Goods which answer to one or other of the descriptions given below :

- (i) Sodium nitrate, whether or not pure;
 - (ii) Ammonium nitrate, whether or not pure;
 - (iii) Double salts, whether or not pure, of ammonium sulphate and ammonium nitrate;
 - (iv) Ammonium sulphate, whether or not pure;
 - (v) Double salts (whether or not pure) or mixtures of calcium nitrate and ammonium nitrate;
 - (vi) Double salts (whether or not pure) or mixtures of calcium nitrate and magnesium nitrate;
 - (vii) Calcium cyanamide, whether or not pure or treated with oil;
 - (viii) Urea, whether or not pure.
- (b) Fertilisers consisting of any of the goods described in (a) above mixed together.
 - (c) Fertilisers consisting of ammonium chloride or of any of the goods described in (a) or (b) above mixed with chalk, gypsum or other inorganic non-fertilising substances.
 - (d) Liquid fertilisers consisting of the goods of subparagraph (a) (ii) or (viii) above, or of mixtures of those goods, in an aqueous or ammoniacal solution.
- 3.- Heading 31.03 applies only to the following goods, provided that they are not put up in the forms or packages described in heading 31.05 :
 - (a) Goods which answer to one or other of the descriptions given below :
 - (i) Basic slag;
 - (ii) Natural phosphates of heading 25.10, calcined or further heat-treated than for the removal of impurities;
 - (iii) Superphosphates (single, double or triple);
 - (iv) Calcium hydrogenorthophosphate containing not less than 0.2 % by weight of fluorine calculated on the dry anhydrous product.

- (b) Fertilisers consisting of any of the goods described in (a) above mixed together, but with no account being taken of the fluorine content limit.
 - (c) Fertilisers consisting of any of the goods described in (a) or (b) above, but with no account being taken of the fluorine content limit, mixed with chalk, gypsum or other inorganic non-fertilising substances.
- 4.- Heading 31.04 applies only to the following goods, provided that they are not put up in the forms or packages described in heading 31.05 :
- (a) Goods which answer to one or other of the descriptions given below :
 - (i) Crude natural potassium salts (for example, carnallite, kainite and sylvite);
 - (ii) Potassium chloride, whether or not pure, except as provided in Note 1 (c) above;
 - (iii) Potassium sulphate, whether or not pure;
 - (iv) Magnesium potassium sulphate, whether or not pure.
 - (b) Fertilisers consisting of any of the goods described in (a) above mixed together.
- 5.- Ammonium dihydrogenorthophosphate (monoammonium phosphate) and diammonium hydrogenorthophosphate (diammonium phosphate), whether or not pure, and intermixtures thereof, are to be classified in heading 31.05.
- 6.- For the purposes of heading 31.05, the term “other fertilisers” applies only to products of a kind used as fertilisers and containing, as an essential constituent, at least one of the fertilising elements nitrogen, phosphorus or potassium.

GENERAL

This Chapter covers most products in general use as natural or artificial fertilisers.

On the other hand, the Chapter **does not cover** products which improve rather than fertilise the soil, such as :

- (a) Lime (**heading 25.22**).
- (b) Marl and leaf mould (whether or not naturally containing small quantities of the fertilising elements nitrogen, phosphorus or potassium) (**heading 25.30**).
- (c) Peat (**heading 27.03**).

This Chapter also **excludes** micronutrient preparations which are applied to seeds, to foliage or to soil to assist in seed germination and plant growth. They may contain small amounts of the fertilising elements nitrogen, phosphorus and potassium, but not as essential constituents (e.g., **heading 38.24**).

It also **excludes** prepared plant growing media such as potting soils, based on peat or mixtures of peat and sand or of peat and clay (**heading 27.03**) and mixtures of earth, sand, clay, etc. (**heading 38.24**). All these products may contain small quantities of the fertilising elements nitrogen, phosphorus or potassium.

31.01 - Animal or vegetable fertilisers, whether or not mixed together or chemically treated; fertilisers produced by the mixing or chemical treatment of animal or vegetable products.

This heading covers :

- (a) Animal or vegetable fertilisers, whether or not mixed together or chemically treated;
- (b) Animal or vegetable products converted into fertilisers by mixing together or chemical treatment (**other than** bone superphosphates of **heading 31.03**).

However, these products fall in **heading 31.05** when put up in the forms or packages described in that heading.

The heading includes, *inter alia* :

- (1) Guano, which is an accumulation of the excreta and remains of sea birds, found in large quantities on certain islands and coasts. It is both nitrogenous and phosphatic, and is usually a yellowish powder with a strong ammoniacal odour.
- (2) Excreta, dung, soiled fleece waste and manure, unsuitable for use other than as fertilisers.
- (3) Rotted vegetable products, unsuitable for use other than as fertilisers.
- (4) Disintegrated guano.
- (5) Products resulting from the treatment of leather with sulphuric acid.
- (6) Compost consisting of rotted waste vegetable and other matter where decay has been accelerated or controlled by treatment with lime, etc.
- (7) Wool scouring residues.
- (8) Mixtures of dried blood and bone meal.
- (9) Stabilised sewage sludge from urban effluent treatment plants. Stabilised sewage sludge is obtained by screening the sewage effluent to remove large objects and settling out grit and heavy non-biological constituents; the remaining sludge is then allowed to air dry or is filtered. The stabilised sludge so obtained contains a high proportion of organic matter and also contains some fertilising elements (e.g., phosphorus and nitrogen). However, such sludge containing other materials (e.g., heavy metals) at a high concentration, which make the stabilised sludge unfit for use as fertilisers, is **excluded (heading 38.25)**.

The heading also **excludes** :

- (a) Animal blood, whether liquid or dried (**heading 05.11**).
- (b) Powdered bone, horn or hoof, or fish waste (**Chapter 5**).
- (c) Flours, meals and pellets of meat or meat offal, of fish or of crustaceans, molluscs or other aquatic invertebrates, unfit for human consumption (**heading 23.01**), and other products covered by **Chapter 23** (oil cakes, brewing or distilling dregs, etc.).
- (d) Ash from bone, wood, peat or coal (**heading 26.21**).
- (e) Mixtures of the natural fertilisers of this heading with chemical fertilising substances (**heading 31.05**).
- (f) Mixtures of stabilised sewage sludge with potassium or ammonium nitrate (**heading 31.05**).
- (g) Parings and other waste of leather; leather dust, powder and flour (**heading 41.15**).

31.02 - Mineral or chemical fertilisers, nitrogenous.

3102.10 - Urea, whether or not in aqueous solution

- Ammonium sulphate; double salts and mixtures of ammonium sulphate and ammonium nitrate :

3102.21 -- Ammonium sulphate

3102.29 -- Other

3102.30 - Ammonium nitrate, whether or not in aqueous solution

3102.40 - Mixtures of ammonium nitrate with calcium carbonate or other inorganic non-fertilising substances

3102.50 - Sodium nitrate

3102.60 - Double salts and mixtures of calcium nitrate and ammonium nitrate

3102.80 - Mixtures of urea and ammonium nitrate in aqueous or ammoniacal solution

3102.90 - Other, including mixtures not specified in the foregoing subheadings

This heading **applies only** to the following goods, provided they are **not** put up in the forms or packages described in heading 31.05 :

(A) **Goods which answer to one or other of the descriptions given below :**

- (1) **Sodium nitrate, whether or not pure.**
- (2) **Ammonium nitrate, whether or not pure.**
- (3) **Double salts (whether or not pure) of ammonium sulphate and ammonium nitrate.**
- (4) **Ammonium sulphate, whether or not pure.**
- (5) **Double salts (whether or not pure) or mixtures of calcium nitrate and ammonium nitrate.** Some mixtures of calcium nitrate and ammonium nitrate may be sold as "calcium nitrate fertiliser".
- (6) **Double salts (whether or not pure) or mixtures of calcium nitrate and magnesium nitrate.** This product is obtained by treating dolomite with nitric acid.
- (7) **Calcium cyanamide, whether or not pure or treated with oil.**
- (8) **Urea (diamide of carbonic acid), whether or not pure.** Used mainly as fertiliser but also as animal food, in the manufacture of urea-formaldehyde resins, in organic synthesis, etc.

It should be noted that the mineral or chemical products described in the limitative list above are classified in this heading **even when they are clearly not to be used as fertilisers.**

On the other hand, the heading **does not include** nitrogenous products, whether chemically defined (such as ammonium chloride, **heading 28.27**) or not, which are not described above, even if used as fertilisers.

- (B) **Fertilisers consisting of any of the goods referred to in paragraph (A) above mixed together** (e.g., a fertiliser consisting of a mixture of ammonium sulphate and ammonium nitrate).
- (C) **Fertilisers consisting of ammonium chloride or of any of the goods referred to in paragraph (A) or (B) above mixed** with chalk, gypsum or other inorganic non-fertilising substances (e.g., fertilisers obtained by adding to ammonium nitrate, **by mixing or by support on**, the above-mentioned inorganic non-fertilising substances).
- (D) **Liquid fertilisers** consisting of ammonium nitrate (whether or not pure), or of urea (whether or not pure), or of mixtures of those products, in an aqueous or ammoniacal solution.

It should be noted that, contrary to the case of paragraph (A) above, mixtures falling in paragraph (B), (C) or (D) are classified in the heading **only if of a kind used as fertilisers**.

31.03 - Mineral or chemical fertilisers, phosphatic.

- Superphosphates :

3103.11 -- Containing by weight 35 % or more of diphosphorus pentaoxide (P_2O_5)

3103.19 -- Other

3103.90 - Other

This heading **applies only** to the following goods, provided they are **not** put up in the forms or packages described in heading 31.05 :

(A) Goods which answer to one or other of the descriptions given below :

- (1) **Superphosphates (single, double or triple)** (soluble phosphates). Single superphosphate is obtained by the action of sulphuric acid on natural phosphates or powdered bone. Double and triple superphosphates are obtained by the action of phosphoric acid on these materials.
- (2) **Basic slag** (also known as "Thomas slag", "Thomas phosphates", "phosphatic slag" or "metallurgical phosphates"). It is a by-product of the manufacture of steel from phosphatic iron in basic furnaces or converters.
- (3) **Natural phosphates** of heading 25.10, calcined or further heat-treated than for the removal of impurities.
- (4) **Calcium hydrogenorthophosphate containing not less than 0.2 % by weight of fluorine calculated on the dry anhydrous product.** Calcium hydrogenorthophosphate containing less than 0.2 % by weight of fluorine calculated on the dry anhydrous product is classified in **heading 28.35**.

It should be noted that the mineral or chemical products described in the limitative list above are classified in this heading **even when they are clearly not to be used as fertilisers**.

On the other hand, the heading **does not include** phosphatic products, whether chemically defined (such as sodium phosphate, **heading 28.35**) or not, which are not described above, even if used as fertilisers.

- (B) **Fertilisers consisting of any of the goods referred to in paragraph (A) above**, but with no account being taken of the fluorine content limit as indicated in paragraph (A) (4) above, mixed together (e.g., a fertiliser consisting of superphosphates mixed with calcium hydrogenorthophosphate).
- (C) **Fertilisers consisting of any of the products described in paragraph (A) or (B) above**, but with no account being taken of the fluorine content limit as indicated in paragraph (A) (4) above, mixed with chalk, gypsum or other inorganic non-fertilising substances (e.g., fertilisers consisting of superphosphates mixed with dolomite, or of superphosphates mixed with borax).

It should be noted that, contrary to the case of paragraph (A) above, mixtures falling in paragraph (B) or (C) are classified in the heading **only if of a kind used as fertilisers**. Subject to this condition, the mixtures may be in any proportions and without regard for the fluorine content limit prescribed in paragraph (A) (4) above.

31.04 - Mineral or chemical fertilisers, potassic.

3104.20 - Potassium chloride

3104.30 - Potassium sulphate

3104.90 - Other

This heading **applies only** to the following goods, provided they are **not** put up in the forms or packages described in heading 31.05 :

(A) Goods which answer to one or other of the descriptions given below :

- (1) **Potassium chloride, whether or not pure, but not including** cultured crystals (other than optical elements) weighing not less than 2.5 g each, of **heading 38.24**, nor optical elements of potassium chloride (**heading 90.01**).
- (2) **Potassium sulphate, whether or not pure.**
- (3) **Crude natural potassium salts** (carnallite, kainite, sylvite, etc.).
- (4) **Magnesium potassium sulphate, whether or not pure.**

It should be noted that the mineral or chemical products described in the limitative list above are classified in this heading **even when they are clearly not to be used as fertilisers.**

On the other hand, the heading **does not include** potassic products, whether chemically defined (such as potassium carbonate of **heading 28.36**) or not, which are not described above, even if used as fertilisers.

(B) **Fertilisers consisting of any of the goods referred to in paragraph (A) above mixed together** (e.g., a fertiliser consisting of a mixture of potassium chloride and potassium sulphate).

It should be noted that, contrary to the case of paragraph (A) above, mixtures falling in paragraph (B) are classified in the heading **only if of a kind used as fertilisers.**

31.05 - Mineral or chemical fertilisers containing two or three of the fertilising elements nitrogen, phosphorus and potassium; other fertilisers; goods of this Chapter in tablets or similar forms or in packages of a gross weight not exceeding 10 kg.

3105.10 - Goods of this Chapter in tablets or similar forms or in packages of a gross weight not exceeding 10 kg

3105.20 - Mineral or chemical fertilisers containing the three fertilising elements nitrogen, phosphorus and potassium

3105.30 - Diammonium hydrogenorthophosphate (diammonium phosphate)

3105.40 - Ammonium dihydrogenorthophosphate (monoammonium phosphate) and mixtures thereof with diammonium hydrogenorthophosphate (diammonium phosphate)

- Other mineral or chemical fertilisers containing the two fertilising elements nitrogen and phosphorus :

3105.51 -- Containing nitrates and phosphates

3105.59 -- Other

3105.60 - Mineral or chemical fertilisers containing the two fertilising elements phosphorus and potassium

3105.90 - Other

This heading covers :

(A) **Ammonium dihydrogenorthophosphate (monoammonium phosphate) and diammonium hydrogenorthophosphate (diammonium phosphate), whether or not pure, and intermixtures thereof, whether or not for use as fertilisers.**

It should be noted that the heading **does not include** other chemically defined compounds not specified in headings 31.02 to 31.04 even if they could be used as fertilisers (e.g., potassium nitrate (**heading 28.34**), potassium phosphate (**heading 28.35**)).

(B) **Composite and complex fertilisers (other than separate chemically defined compounds), i.e., mineral or chemical fertilisers containing two or three of the fertilising elements nitrogen, phosphorus and potassium. They are obtained by :**

(1) **Mixing** together two or more fertilising products (even if those products, taken alone, are not classified in headings 31.02 to 31.04). Such mixtures include :

(a) Calcined natural phosphates and potassium chloride.

(b) Superphosphates and potassium sulphate.

- (c) Calcium cyanamide and basic slag.
 - (d) Ammonium sulphate, superphosphates and potassium phosphate.
 - (e) Ammonium nitrate, superphosphates and potassium sulphate or chloride.
- (2) **Chemical processes**, e.g., fertilisers obtained by treating natural calcium phosphates with nitric acid, removing the resulting calcium nitrate by cooling and centrifugation and, after separation, neutralising the solution with ammonia, adding potassium salts and finally evaporating to dryness. (This fertiliser is sometimes improperly referred to as potassium nitrophosphate, but is not in fact a separate chemically defined compound.)

(3) **Both mixing and chemical processes.**

It should be noted that headings 31.02, 31.03 and 31.04 include fertilisers containing as **impurities** very small quantities of a fertilising element other than that specified in the respective heading (nitrogen, phosphorus or potassium); such goods should **not** therefore be regarded as composite or complex fertilisers classifiable in this heading.

- (C) **All other fertilisers (other than separate chemically defined compounds)**, for example :
- (1) Mixtures of fertilising substances (i.e., those containing nitrogen, phosphorus or potassium) with non-fertilising substances, e.g., sulphur. Many of those containing nitrogen or phosphorus are classified in **heading 31.02** or **31.03** (see the Explanatory Notes to those headings) but the others are classified in this heading.
 - (2) Natural potassic sodium nitrate fertiliser, a natural mixture of sodium nitrate and potassium nitrate.
 - (3) Mixtures of animal or vegetable fertilisers with chemical or mineral fertilisers.

The heading **excludes** :

- (a) Separate chemically defined compounds not specified in Notes 2 to 5 to this Chapter but which might be used as fertilisers, e.g., ammonium chloride which falls in **heading 28.27**.
- (b) Spent oxide (**heading 38.25**).

The heading also covers the goods of this Chapter if put up in tablets or similar forms or in packages of a gross weight not exceeding 10 kg.

Chapter 32

Tanning or dyeing extracts; tannins and their derivatives; dyes, pigments and other colouring matter; paints and varnishes; putty and other mastics; inks

Notes.

- 1.- This Chapter does not cover :
 - (a) Separate chemically defined elements or compounds (except those of heading 32.03 or 32.04, inorganic products of a kind used as luminophores (heading 32.06), glass obtained from fused quartz or other fused silica in the forms provided for in heading 32.07, and also dyes and other colouring matter put up in forms or packings for retail sale, of heading 32.12);
 - (b) Tannates or other tannin derivatives of products of headings 29.36 to 29.39, 29.41 or 35.01 to 35.04; or
 - (c) Mastics of asphalt or other bituminous mastics (heading 27.15).
- 2.- Heading 32.04 includes mixtures of stabilised diazonium salts and couplers for the production of azo dyes.
- 3.- Headings 32.03, 32.04, 32.05 and 32.06 apply also to preparations based on colouring matter (including, in the case of heading 32.06, colouring pigments of heading 25.30 or Chapter 28, metal flakes and metal powders), of a kind used for colouring any material or used as ingredients in the manufacture of colouring preparations. The headings do not apply, however, to pigments dispersed in non-aqueous media, in liquid or paste form, of a kind used in the manufacture of paints, including enamels (heading 32.12), or to other preparations of heading 32.07, 32.08, 32.09, 32.10, 32.12, 32.13 or 32.15.
- 4.- Heading 32.08 includes solutions (other than collodions) consisting of any of the products specified in headings 39.01 to 39.13 in volatile organic solvents when the weight of the solvent exceeds 50 % of the weight of the solution.
- 5.- The expression “ colouring matter ” in this Chapter does not include products of a kind used as extenders in oil paints, whether or not they are also suitable for colouring distempers.
- 6.- The expression “ stamping foils ” in heading 32.12 applies only to thin sheets of a kind used for printing, for example, book covers or hat bands, and consisting of :
 - (a) Metallic powder (including powder of precious metal) or pigment, agglomerated with glue, gelatin or other binder; or
 - (b) Metal (including precious metal) or pigment, deposited on a supporting sheet of any material.

GENERAL

This Chapter covers preparations used in the tanning and bating of hides and skins (tanning extracts of vegetable origin, synthetic tanning substances, whether or not mixed with natural tanning materials, and artificial bates).

It also includes colouring matter of vegetable, animal or mineral origin and synthetic organic colouring matter and most of the preparations obtained from these colouring matters (paints, ceramic colours, inks, etc.). Various other preparations such as varnishes, driers and putty are also included.

Except as regards the goods covered by headings 32.03 or 32.04, inorganic products of a kind used as luminophores (heading 32.06), glass obtained from fused quartz or other fused silica in the forms provided for in heading 32.07 and also the dyes or other colouring matter put up in forms or packings for retail sale (heading 32.12), products consisting of chemically defined elements or compounds are **excluded** from this Chapter, and in general fall in **Chapter 28 or 29**.

In the case of certain paints and varnishes of headings 32.08 to 32.10 or mastics of heading 32.14, the intermixture of the various constituents, or the addition of certain constituents (e.g., hardeners) must be carried out at the time of use. Such products remain classified in these headings **provided** the constituents are :

- (i) having regard to the method in which they are put up, clearly identifiable as being intended to be used together without first being repacked;
- (ii) presented together; and
- (iii) identifiable, whether by their nature or by the relative proportions in which they are present, as being complementary one to another.

However, in the case of products to which a hardener has to be added at the time of use, the absence of the hardener does not exclude these products from these headings, **provided** they are, by their composition or packing, clearly identifiable as intended to be used in the preparation of paints, varnishes or mastics.

32.01 - Tanning extracts of vegetable origin; tannins and their salts, ethers, esters and other derivatives.

3201.10 - Quebracho extract

3201.20 - Wattle extract

3201.90 - Other

(A) Tanning extracts of vegetable origin.

These are vegetable extracts used mainly for the tanning of hides or skins. They are generally prepared by extraction with warm water (sometimes acidulated) from the vegetable material (wood, barks, leaves, fruits, roots, etc.) previously ground or shredded. The liquid obtained is filtered or centrifuged and then concentrated and sometimes treated with sulphites, etc. The extracts thus obtained are liquid but may be further concentrated to paste or solid forms. All these extracts contain varying proportions of tannin as well as other substances such as sugar, mineral salts, organic acids, etc. They are generally brown, yellow or reddish in colour.

The principal tanning extracts are those from oak, chestnut, quebracho, pines, wattle (mimosa), sumach, myrobalans, vallonia, gambier, mangrove or divi-divi.

The heading **does not include** :

- (a) Raw vegetable materials, whether dried, shredded, powdered or not, of a kind used primarily in the production of tanning extracts (**heading 14.04**).
- (b) Tanning extracts mixed with synthetic tanning substances (**heading 32.02**).
- (c) Residual lyes from the manufacture of wood pulp, whether or not concentrated (**heading 38.04**).

(B) Tannins and their salts, ethers, esters and other derivatives.

Tannins (tannic acids) are the main active constituents of vegetable tanning materials. They are obtained by extraction with ether or alcohol from the raw vegetable materials of heading 14.04 or from the extracts covered by Part (A) above. The heading also covers gall-nut extracts (water-extracted gall-nut tannins) which are of lesser strength than those extracted with organic solvents.

The heading covers tannins (pyrogallol and catechol tannins) whether or not containing impurities from the extraction process.

The most common variety is gall-nut tannin (gallotannic acid).

Other tannins include oak bark tannin (quercitannic acid), chestnut wood tannin (castaneotannic acid), quebracho tannin, mimosa tannin, etc.

All these tannins are generally in the form of white or yellowish amorphous powders which turn brown on exposure to air. They may sometimes be in the form of scales or needle-like crystals, etc. They are used principally as mordants in dyeing, in the manufacture of inks, for the clarification of wines or beers, in pharmacy and photography.

The tannates classified in this heading include those of aluminium, bismuth, calcium, iron, manganese, zinc, hexamethylenetetramine, phenazone or orexine. Other derivatives of tannins include acetyl tannin and methylene deditannin. These derivatives are usually employed in medicine.

The heading **does not include** :

- (a) Precious metal tannates or other precious metal compounds (**heading 28.43**) or tannin derivatives of **headings 28.44 to 28.46** and **28.52**.
- (b) Gallic acid (**heading 29.18**).
- (c) Tannates and other tannin derivatives of products of **headings 29.36 to 29.39** or **29.41**.
- (d) Synthetic tanning substances, whether or not mixed with natural tanning materials (**heading 32.02**).
- (e) Tannates and other tannin derivatives of proteins of **headings 35.01 to 35.04**, for example, casein tannate (**heading 35.01**), albumin tannate (**heading 35.02**), gelatine tannate (**heading 35.03**).

32.02 - Synthetic organic tanning substances; inorganic tanning substances; tanning preparations, whether or not containing natural tanning substances; enzymatic preparations for pre-tanning.

3202.10 - Synthetic organic tanning substances

3202.90 - Other

This heading includes :

(I) **Tanning products.**

Provided they do **not** constitute separate chemically defined compounds of **Chapter 28 or 29**, the tanning products of this heading include :

(A) **Synthetic organic tanning substances (sometimes known as “ syntans ”).**

These are products which, though they can be used alone to tan leather to a pale colour, are more frequently mixed or used in conjunction with natural tanning materials to assist their penetration into the skins. They include :

- (1) Aromatic syntans such as condensation products of formaldehyde with phenol-, cresol- or naphthalenesulphonic acids; sulphonated aromatic hydrocarbons of high molecular weight; polysulphonamides and polyhydroxy-polyarylsulphone-sulphonic acids.
- (2) Alkylsulphonylchlorides (sometimes known as “ oilbased synthetic tanning substances ”).
- (3) Resinic tanning products, wholly or almost wholly water-soluble. These products include certain condensation products of formaldehyde with dicyandiamide, with urea or with melamine.

(B) **Inorganic tanning products or “ mineral tannings ”** (e.g., based on chromium, aluminium, iron or zirconium salts).

The tanning products described in paragraphs (A) and (B) above remain classified in this heading even if intermixed (e.g., organic syntans mixed with chromium or aluminium salts) or if mixed with natural tanning substances.

The heading further includes products which, in addition to their principal use as synthetic tanning substances, also serve subsidiary purposes (e.g., dye levelling or bleaching).

(II) Artificial bates.

These are complex preparations used to facilitate the removal of the interfibrillary protein and generally also the lime in the scraped skins, softening them and rendering them more susceptible to the subsequent action of the tanning substances. They are usually based on selected enzymes, on pancreatin, etc., and may be mixed with certain deliming products, or with an extender such as bran or wood flour.

The heading **excludes** :

- (a) Residual lyes from the manufacture of wood pulp, whether or not concentrated (**heading 38.04**).
- (b) Finishing agents, dye carriers to accelerate the dyeing or fixing of dyestuffs and other products and preparations (for example, dressings and mordants) of a kind used in the leather industry, **provided** they are not principally used as tanning materials (**heading 38.09**).

32.03 - Colouring matter of vegetable or animal origin (including dyeing extracts but excluding animal black), whether or not chemically defined; preparations as specified in Note 3 to this Chapter based on colouring matter of vegetable or animal origin.

This heading covers the greater part of the products of vegetable or animal origin used **mainly** as colouring substances. These products are generally extracted from materials of vegetable origin (wood, barks, roots, seeds, flowers, lichens, etc.) or of animal origin, by steeping them in water or in weak acid or ammonia solution or, in the case of certain vegetable materials, by fermentation. They are relatively complex materials and generally contain one or more colouring principles with small quantities of other substances (sugars, tannins, etc.) originating either from the raw materials or resulting from the extraction process. They are included in this heading whether or not they are chemically defined compounds.

The heading includes :

- (1) **Colouring matter and dyeing extracts of vegetable origin** obtained from logwood (haematein, haematoxylin, etc.), yellow woods (fustic, Cuba and Tampico woods, etc.), red woods (Pernambuco, Lima, Brazil wood, etc.), sandalwood, quercitron wood, black cutch (acacia catechu), annatto, madder, alkenna, henna, turmeric, Persian berries, safflower, saffron, etc. The heading also includes orchil and litmus, prepared from certain lichens; oenin from the skins of various kinds of grapes; chlorophyll extracted from nettles and from various other plants, as well as sodium-chlorophyll, copper-chlorophyll and xanthophyll; an imitation Vandyke brown prepared by the partial decomposition of vegetable material such as beechwood bark or cork; and natural indigo obtained from plants of the genus *Indigofera* (mainly *Indigofera tinctoria*). It is generally in the form of dark blue powder, paste, cakes, lumps, etc.
- (2) **Colouring matter of animal origin**, e.g., cochineal extract obtained by extraction generally with acidified water or ammonia solution, from cochineal insects; kermes, a red colouring extract from kermes insects; sepia, a brown colour obtained from the ink sac of a species of cuttle fish; colouring extracts prepared from shellac, the main one being known as lac-dye; natural nacreous (pearl) pigment obtained from fish scales and consisting essentially of guanine and hypoxanthine, in crystal form.

The heading also covers preparations based on colouring matter of vegetable or animal origin, of a kind used for colouring any material or used as ingredients in the manufacture of colouring preparations. These include :

- (i) Solutions of annatto in vegetable oil used in some countries for colouring butter.
- (ii) Natural nacreous (pearl) pigment dispersed in a medium consisting of water or a mixture of water and a water-soluble solvent. This product is sometimes called "pearl essence" and is used in the manufacture of aqueous coatings or cosmetic preparations.

However, the preparations referred to in the last sentence of Note 3 to this Chapter are **excluded**.

This heading also **excludes** :

- (a) Carbon black (**heading 28.03**).
- (b) Substances which in practice are not used for their dyeing properties such as morin, haematin and haemin (**Chapter 29**).
- (c) Synthetic organic colouring matter (**heading 32.04**).
- (d) Colour lakes obtained by fixation of a natural colour of animal or vegetable origin on to a base (e.g., carmine lake, logwood lake, yellow wood, redwood lakes) (**heading 32.05**).
- (e) Dyes and other colouring matter put up in forms or packings for retail sale (**heading 32.12**).
- (f) Ivory black and other animal black (**heading 38.02**).

32.04 - Synthetic organic colouring matter, whether or not chemically defined; preparations as specified in Note 3 to this Chapter based on synthetic organic colouring matter; synthetic organic products of a kind used as fluorescent brightening agents or as luminophores, whether or not chemically defined (+).

- Synthetic organic colouring matter and preparations based thereon as specified in Note 3 to this Chapter :

3204.11 -- Disperse dyes and preparations based thereon

3204.12 -- Acid dyes, whether or not premetallised, and preparations based thereon; mordant dyes and preparations based thereon

3204.13 -- Basic dyes and preparations based thereon

3204.14 -- Direct dyes and preparations based thereon

3204.15 -- Vat dyes (including those usable in that state as pigments) and preparations based thereon

3204.16 -- Reactive dyes and preparations based thereon

3204.17 -- Pigments and preparations based thereon

3204.19 -- Other, including mixtures of colouring matter of two or more of the subheadings 3204.11 to 3204.19

3204.20 - Synthetic organic products of a kind used as fluorescent brightening agents

3204.90 - Other

**(I) SYNTHETIC ORGANIC COLOURING MATTER,
WHETHER OR NOT CHEMICALLY DEFINED;
PREPARATIONS AS SPECIFIED IN NOTE 3 TO THIS CHAPTER BASED
ON SYNTHETIC ORGANIC COLOURING MATTER**

Synthetic organic colouring matter is generally obtained from oils or other products of the distillation of coal tar.

This heading applies, *inter alia*, to :

(A) Unmixed synthetic organic colouring matter (whether or not chemically defined compounds) and synthetic organic colouring matter diluted with substances which have no dyeing properties (e.g., anhydrous sodium sulphate, sodium chloride, dextrin, starch) to decrease or standardise their colouring power. The addition of small quantities of surface-active products to encourage penetration and fixation of the dye does not affect the classification of colouring matter. Colouring matter of these descriptions is usually in the form of powder, crystals, pastes, etc.

Synthetic organic colouring matter put up in forms or packings for retail sale is classified in **heading 32.12** (see Part (C) of the Explanatory Note to that heading).

- (B) Different types of synthetic organic colouring matter mixed together.
- (C) Concentrated dispersions of synthetic organic colouring matter in plastics, natural rubber, synthetic rubbers, plasticisers or other media. These dispersions are usually in the form of small plates or lumps and are used as raw materials for colouring rubber, plastics, etc., in the mass.
- (D) Mixtures of synthetic organic colouring matter with relatively large quantities of surface-active products, or with organic binders, which are used for colouring in the mass plastics, etc., or as ingredients in preparations for printing textiles. They are normally in the form of pastes.
- (E) Other preparations based on synthetic organic colouring matter of a kind used for colouring any material or used as ingredients in the manufacture of colouring preparations. However, the preparations referred to in the last sentence of Note 3 to this Chapter are **excluded**.

The various types of synthetic organic colouring matter classified here (whether as dyes or pigments) include :

- (1) Nitroso or nitro compounds.
- (2) Mono- or polyazo compounds.
- (3) Stilbenes.
- (4) Thiazoles (e.g., thioflavine).
- (5) Carbazoles.
- (6) Quinoneimines, e.g., azines (indulines, nigrosines, eurhodines, safranines, etc.), oxazines (gallocyanines, etc.) and thiazines (methylene blue, etc.); also indophenols or indamines.
- (7) Xanthenes (pyronine, fluorescein, eosins, rhodamines, etc.).
- (8) Acridines, quinolines (e.g., cyanines, isocyanines, cryptocyanines).
- (9) Di- or triphenylmethanes, e.g., auramine and fuchsine.
- (10) Hydroxyquinones and anthraquinones, e.g., alizarin.
- (11) Sulphonated indigoids.

- (12) Other vat dyes or pigments (e.g., synthetic indigo), other sulphur dyes or pigments, indigosols, etc.
- (13) Phosphotungstic greens, etc. (see third paragraph of the Explanatory Note to heading 32.05).
- (14) Phthalocyanines (even if crude) and their metallic compounds, including their sulphonated derivatives.
- (15) Carotenoids obtained by synthesis (e.g., β -carotene, 8'-apo- β -carotenal, 8'-apo- β -carotenic acid, ethyl 8'-apo- β -carotenate, methyl 8'-apo- β -carotenate and canthaxanthin).

Certain azo colouring matters are often put up in the form of mixtures of stabilised diazonium salts and couplers which produce an insoluble azo dye on the fibre itself. These mixtures are also classified in this heading.

The heading **excludes**, however, separate diazonium salts (whether or not stabilised or diluted to standard strengths) which may be applied to the fibre separately from the coupler in the course of dyeing to produce the same colouring matter (**Chapter 29**).

This heading also **excludes** the intermediate products, which are not themselves dyes, obtained at different stages in the production of colouring matter. These intermediate products (e.g., monochloroacetic acid, benzenesulphonic or naphthol-sulphonic acids, resorcinol, chloronitrobenzenes, nitro- or nitrosophenols, nitrosoamines, aniline, nitrated or sulphonated amine derivatives, benzidine, aminonaphtholsulphonic acids, anthraquinone, methylanilines) are classified in **Chapter 29**. They are quite different from certain crude products classified here, such as phthalocyanines which are chemically "finished" and require only simple physical processing to obtain their optimum tinting power.

Synthetic organic colouring matter may be soluble or insoluble in water. It has almost completely replaced natural organic colouring matter, particularly for dyeing or printing textiles, dyeing hides or skins, paper or wood. It is also used to prepare colour lakes (heading 32.05), colours of headings 32.08 to 32.10, 32.12 and 32.13, inks of heading 32.15, and for colouring plastics, rubber, waxes, oils, photographic emulsions, etc.

Certain of these substances are also used as laboratory reagents or for medical purposes.

Substances which in practice are not used for their dyeing properties are **excluded**, e.g., azulenes (**heading 29.02**); trinitrophenol (picric acid) and dinitro-ortho-cresol (**heading 29.08**); hexanitrodiphenylamine (**heading 29.21**); methyl orange (**heading 29.27**); bilirubin, biliverdin and porphyrins (**heading 29.33**); acriflavine (**heading 38.24**).

**(II) SYNTHETIC ORGANIC PRODUCTS OF A KIND USED
AS FLUORESCENT BRIGHTENING AGENTS OR AS LUMINOPHORES,
WHETHER OR NOT CHEMICALLY DEFINED**

- (1) **Organic products of a kind used as fluorescent brightening agents** are synthetic organic products which absorb ultraviolet rays and give off visible blue radiations, thus intensifying the apparent whiteness of white articles. They generally consist of stilbene derivatives.
- (2) **Organic products of a kind used as luminophores** are synthetic products which, under the action of light rays, produce a luminescent or fluorescent effect.

Some of these products also have the character of colouring matter. An example of these luminophores is rhodamine B in plastics, which produces a red fluorescence. It is generally in the form of powder.

Most organic products of a kind used as luminophores (e.g., diethyl dihydroxyterephthalate and salicylaldazine) are not colouring matter. They are added to colouring pigments to increase their brilliance. These products remain in this heading even when chemically defined but the same chemicals in a non-luminescent form (e.g., less pure, different crystalline structure) are **excluded (Chapter 29)**. Thus salicylaldazine of the kind used as a blowing agent for rubber falls in **heading 29.28**.

Organic products of a kind used as luminophores mixed together or with synthetic organic colouring matter fall in this heading. When mixed with inorganic pigments they are **excluded (heading 32.06)**.

○
○ ○

Subheading Explanatory Note.

Subheadings 3204.11 to 3204.19

Synthetic organic colouring matter and preparations based thereon as specified in Note 3 to this Chapter are subdivided on the basis of their application or use. The products of these subheadings are described below.

Disperse dyes are substantially water-insoluble, non-ionic dyes which are applied to hydrophobic fibres from aqueous dispersion. They are used on polyester, nylon or other polyamides, cellulose acetate or acrylic fibres and for surface-dyeing of certain thermoplastics.

Acid dyes are water-soluble anionic dyes which are applied to nylon, wool, silk, modacrylic fibres or leather.

Mordant dyes are water-soluble dyes which require the use of a mordant (for example, chromium salts) to bind them to textile fibres.

Basic dyes are water-soluble cationic dyes which are applied to modacrylic, modified nylon or modified polyester fibres or to unbleached paper. Their original use was for dyeing silk, wool or tannin-mordanted cotton, where brightness of shade was more important than colour-fastness. Some basic dyes show biological activity and are used in medicine as antiseptics.

Direct dyes are water-soluble anionic dyes which, in aqueous solution in the presence of electrolytes, are substantive to cellulosic fibres. They are used for dyeing cotton, regenerated cellulose, paper, leather and, to a lesser extent, nylon. In order to improve their colour-fastness, direct-dyed fabrics are often subjected to an after treatment, such as diazotisation and coupling *in situ*, chelation with metal salts or treatment with formaldehyde.

Vat dyes are water-insoluble dyes which are reduced in an alkaline bath to the water-soluble leuco form and in that form are applied, mainly to cellulosic fibres, after which they are reoxidised to the insoluble coloured keto form.

Reactive dyes are dyes that attach themselves to the fibres, usually cotton, wool or nylon, by reacting with functional groups on the fibre molecules to form a covalent bond.

Pigments are synthetic organic colours which retain their crystalline or particulate form throughout the application process (in contrast to dyes, which lose their crystalline structure by dissolution or vaporisation, although they may regain it during a later stage of the dyeing process). They include insoluble metal salts of some of the above-mentioned dyes.

Subheading 3204.19 covers *inter alia* :

- mixtures described in Note 2 to this Chapter;
- **solvent dyes**, which are dissolved in organic solvents and applied to synthetic fibres, for example, nylon, polyester or acrylic fibres, or used in gasoline, varnishes, stains, inks, waxes, etc.

Some of these synthetic organic colouring matters belong to two or more application classes falling in different subheadings. They are classified as follows :

- Those which, in the state in which they are presented, are usable both as vat dyes and as pigments are to be classified as vat dyes in subheading 3204.15.
- Others which are potentially classifiable in two or more of the specific subheadings 3204.11 to 3204.17 are to be classified in the latest applicable subheading.
- Those which are potentially classifiable in one of the specific subheadings 3204.11 to 3204.17 and in the residual subheading 3204.19 are to be classified in the specific subheading.

Mixtures of synthetic organic colouring matter and preparations based on such mixtures are classified as follows :

- Mixtures of two or more products of the same subheading are to be classified in that subheading.
- Mixtures of two or more products of different subheadings (3204.11 to 3204.19) are to be classified in the residual subheading 3204.19.

Fluorescent brightening agents, sometimes called "white dyes", are excluded from subheadings 3204.11 to 3204.19, being more specifically provided for in subheading 3204.20.

32.05 - Colour lakes; preparations as specified in Note 3 to this Chapter based on colour lakes.

Colour lakes are preparations insoluble in water, obtained by **fixation** of natural colouring matter (animal or vegetable) or synthetic organic colouring matter (whether or not soluble in water), on a base, generally mineral (barium sulphate, calcium sulphate, aluminium oxide, China clay, talc, silica, siliceous fossil earth, calcium carbonate, etc.).

The **fixation** of the colouring matter on the base is usually obtained by :

- (1) Precipitating the colouring matter on the base with precipitating agents (tannin, barium chloride, etc.), or by co-precipitation of the colouring matter and the base.
- (2) Dyeing the base with a solution of the colouring matter.
- (3) Intimate mechanical mixing of an insoluble colouring matter with the inert base.

Colour lakes should not be confused with certain other products such as synthetic organic colouring matter, insoluble in water, in which the mineral elements are a constituent part of the molecule, for instance synthetic organic colouring matter rendered insoluble in the form of their metal salts (e.g., the calcium salts of sulphonated dyes, and the salts of basic dyes with complex acids of phosphorus, molybdenum and tungsten) (**heading 32.04**).

Colour lakes are mostly prepared from synthetic organic colouring matter (heading 32.04) with a high resistance to oxidation, such as azo dyes, vat dyes derived from anthraquinone, or alizarin dyes. These lakes are used mainly for manufacturing printing inks, wallpaper and oil paints.

Colour lakes may also be prepared from organic colouring matter of animal or vegetable origin (i.e., those of heading 32.03). They include, *inter alia*, cochineal carmine lake, generally obtained by treating an aqueous solution of cochineal extract with alum, and used mostly in the manufacture of water colours, and for colouring syrups, confectionery or liqueurs; logwood, yellow wood and redwood lakes, etc.

These products are often in the form of powders.

The heading includes concentrated dispersions of colour lakes in plastics, rubber, plasticisers or other media. These dispersions are usually in the form of small plates or lumps and are used as raw materials for dyeing rubber, plastics, etc., in the mass.

The heading also includes certain other preparations based on colour lakes of a kind used for colouring any material or used as ingredients in the manufacture of colouring preparations. However, the preparations referred to in the last sentence of Note 3 to this Chapter are **excluded**.

The heading **does not cover** Japan (or Chinese) lacquer (**heading 13.02**).

32.06 - Other colouring matter; preparations as specified in Note 3 to this Chapter, other than those of heading 32.03, 32.04 or 32.05; inorganic products of a kind used as luminophores, whether or not chemically defined (+).

- Pigments and preparations based on titanium dioxide :

3206.11 -- Containing 80 % or more by weight of titanium dioxide calculated on the dry matter

3206.19 -- Other

3206.20 - Pigments and preparations based on chromium compounds

- Other colouring matter and other preparations :

3206.41 -- Ultramarine and preparations based thereon

3206.42 -- Lithopone and other pigments and preparations based on zinc sulphide

3206.49 -- Other

3206.50 - Inorganic products of a kind used as luminophores

(A) OTHER COLOURING MATTER; PREPARATIONS AS SPECIFIED IN NOTE 3 TO THIS CHAPTER, OTHER THAN THOSE OF HEADING 32.03, 32.04 OR 32.05

This heading covers inorganic colouring matter or colouring matter of mineral origin.

The heading **excludes**, however :

- (a) Natural micaceous iron oxides; earth colours, whether or not calcined or mixed together (see Explanatory Note to **heading 25.30**).
- (b) Separate chemically defined inorganic colouring matters (e.g., basic lead carbonate; oxides of iron, lead, chromium or zinc; sulphides of zinc or mercury; lead chromate (**Chapter 28**)); Schweinfurt green (copper acetoarsenite) (**heading 29.42**).
- (c) Metallic flakes and powders (**Section XIV** or **XV**).

The colouring matter of this heading includes :

- (1) **Pigments based on titanium dioxide.** These include titanium dioxide which is surface-treated or mixed with calcium or barium sulphate or other substances. These also include titanium dioxide to which compounds have been intentionally added during the production process in order to obtain certain physical properties rendering it suitable for use as a pigment. Other specially produced titanium dioxide which is not suitable for use as a pigment because of its particular properties falls under other headings (e.g., **headings 38.15, 38.24**). Titanium dioxide which is unmixed and not surface-treated is classified in **heading 28.23**.
- (2) **Pigments based on chromium compounds.** These include yellows consisting of mixtures of lead chromate and other inorganic products such as lead sulphate, and green pigments consisting of chromium oxide mixed with other substances.

- (3) **Ultramarine.** Ultramarine blue is a complex compound formerly obtained from lapis lazuli, but now prepared artificially by treating mixtures of various silicates, aluminates, sodium carbonate, sulphur, etc. Green, pink and violet ultramarines are also covered by this heading, but certain unmixed chromates, sometimes known as yellow ultramarine, are excluded (heading 28.41).
- (4) **Lithopone and other pigments based on zinc sulphide**, such as white pigments consisting of mixtures in varying proportions of zinc sulphide and barium sulphate.
- (5) **Pigments based on cadmium compounds**, e.g., yellow pigments consisting of mixtures of cadmium sulphide and barium sulphate, and cadmium red consisting of a mixture of cadmium sulphide and cadmium selenide.
- (6) **Prussian blue (Berlin blue) and other pigments based on hexacyanoferrates (ferrocyanides and ferricyanides).** Prussian blue consists of a ferric ferrocyanide, not chemically defined. It is obtained by precipitating an alkali ferrocyanide with a ferrous salt and then oxidising with a hypochlorite. It is an amorphous blue solid, used in the preparation of numerous pigments which are also classified in this heading. These include mineral blue (with barium sulphate and kaolin), milori green or English green (with chrome yellow and sometimes also barium sulphate) and zinc green (with zinc chromate), and compounds for coloured inks (with oxalic acid). **Turnbull's blue** consists of a ferrous ferricyanide, not chemically defined, alone or in mixtures.
- (7) **Mineral blacks (other than the blacks included in heading 25.30 or 28.03)**, for example :
- Shale black**, a mixture of various silicates and carbon obtained by partial calcination of bituminous shales.
 - Silica black** obtained by calcination of mixtures of coal and kieselguhr.
 - The product known as "**alu black**", a mixture of aluminium oxide and carbon obtained by the calcination of a mixture of bauxite and coal tar pitch or grease.
- (8) **Coloured earths** brightened with very small quantities of synthetic organic dyestuffs. (Coloured earths, whether or not mixed together, but not brightened, generally fall in heading 25.30 - see relative Explanatory Note.)
- (9) **Soluble Vandyke brown** and similar products generally obtained by treatment of the earth colours of heading 25.30 (Vandyke brown, Cologne earth or Cassel earth, etc.) with ammonia or potassium hydroxide solutions.
- (10) **Pigments based on cobalt compounds**, e.g., cerulean blue.
- (11) **Pigments consisting of finely ground ores**, e.g., ilmenite.
- (12) **Zinc grey** (very impure zinc oxide).

(13) **Synthetic nacreous (pearl) pigments**, i.e., inorganic pearlescent pigments, such as :

- (a) bismuth chloride oxide, with the addition of a small quantity of an organic surface-active agent;
- (b) mica coated with bismuth chloride oxide, titanium dioxide or titanium dioxide and ferric oxide.

These products are used in the manufacture of various cosmetic preparations.

Inorganic pigments with added organic colouring matter are also classified in this heading.

These products are primary materials used principally for the manufacture of the colours or pigments for the ceramic industries (see the Explanatory Note to heading 32.07), the colours, paints, enamels and lacquers of headings 32.08 to 32.10 and 32.12, artists' students' or amusement colours of heading 32.13 and printing inks (classified in heading 32.15).

This heading further includes preparations based on the colouring matters referred to above, and also the colouring pigments of heading 25.30 or of Chapter 28 and metallic flakes and powders, of a kind used for colouring any material or used as ingredients in the manufacture of colouring preparations in the form of :

- (I) Concentrated dispersions in plastics, natural rubber, synthetic rubbers, plasticisers or other media. These dispersions are used as raw materials for colouring plastics, rubber, etc., in the mass.
- or (II) Mixtures with relatively large quantities of surface-active products or with organic binders. These are used for colouring in the mass plastics, etc., or as ingredients in preparations for printing textiles. They are normally in the form of pastes.

However, the preparations referred to in the last sentence of Note 3 to this Chapter are **excluded**.

The heading also **excludes** :

Products of a kind used as extenders in oil paints, whether or not also suitable for colouring distempers, for example :

- (a) Kaolin (**heading 25.07**).
- (b) Calcium carbonate (**heading 25.09 or 28.36**).
- (c) Barium sulphate (**heading 25.11 or 28.33**).
- (d) Diatomaceous earth (**heading 25.12**).
- (e) Slate (**heading 25.14**).
- (f) Dolomite (**heading 25.18**).
- (g) Magnesium carbonate (**heading 25.19 or 28.36**).

- (h) Gypsum (**heading 25.20**).
- (ij) Asbestos (**heading 25.24**).
- (k) Mica (**heading 25.25**).
- (l) Talc (**heading 25.26**).
- (m) Calcite (Iceland spar) (**heading 25.30**).
- (n) Aluminium hydroxide (**heading 28.18**).
- (o) Mixtures of two or more of the products mentioned in (a) to (n) above (usually **heading 38.24**).

(B) INORGANIC PRODUCTS OF A KIND USED AS LUMINOPHORES, WHETHER OR NOT CHEMICALLY DEFINED

Inorganic products of a kind used as luminophores are products which, under the action of visible or invisible radiations (solar rays, ultra-violet rays, cathode rays, X-rays, etc.), produce a luminescent effect (fluorescent or phosphorescent).

Most of these products consist of metal salts activated by the presence in very small quantities of "activating" products such as silver, copper or manganese. For example, zinc sulphide activated by silver or copper, zinc sulphate activated by copper, and zinc-beryllium silicate activated by manganese.

Others are metal salts which owe their luminescent properties not to the presence of activating agents but to a treatment giving them a very special crystalline structure. These products, which are chemically defined compounds and contain no other substances, include calcium tungstate and magnesium tungstate. The same chemicals in a non-luminescent form (e.g., less pure, different crystalline structure) are **excluded (Chapter 28)**. Thus "amorphous" calcium tungstate used as a reagent falls in **heading 28.41**.

Inorganic products of a kind used as luminophores sometimes contain traces of added radioactive salts which render them self-luminescent. They must be considered as mixtures containing radioactive substances and classified in **heading 28.44** if the level of radioactivity exceeds 74 Bq/g (0.002 µCi/g).

Inorganic products of a kind used as luminophores mixed together (e.g., zinc sulphide activated by copper mixed with zinc-cadmium sulphide activated by copper) or with inorganic colouring pigments (of Chapter 28 or Part (A) above) remain classified in this heading.

Luminophores are used in the preparation of luminous paints and for coating screens for television, oscilloscope, radiography, radioscopy or radar apparatus, or fluorescent lighting tubes.

The heading **does not cover** products answering to descriptions in **headings 28.43 to 28.46 and 28.52** (e.g., a mixture of yttrium oxide and europium oxide), however put up and whatever their intended use.

Subheading Explanatory Note.

Subheading 3206.19

Preparations containing less than 80 % titanium dioxide include concentrated dispersions in plastics, natural rubber, synthetic rubbers or plasticisers, generally known as master-batches, used for colouring plastics, rubber, etc., in the mass.

32.07 - Prepared pigments, prepared opacifiers and prepared colours, vitrifiable enamels and glazes, engobes (slips), liquid lustres and similar preparations, of a kind used in the ceramic, enamelling or glass industry; glass frit and other glass, in the form of powder, granules or flakes.

3207.10 - Prepared pigments, prepared opacifiers, prepared colours and similar preparations

3207.20 - Vitrifiable enamels and glazes, engobes (slips) and similar preparations

3207.30 - Liquid lustres and similar preparations

3207.40 - Glass frit and other glass, in the form of powder, granules or flakes

This heading covers a range of preparations used in the ceramic industry (china, earthenware, etc.), in the glass industry or for colouring or finishing metal articles.

- (1) **Prepared pigments, prepared opacifiers and prepared colours** are dry mixtures formed by the heat treatment of oxides (of antimony, silver, arsenic, copper, chromium, cobalt, etc.) or salts (fluorides, phosphates, etc.) with or without fluxes or other substances, and are fired at high temperatures, generally above 300 °C, after application. The goods are used to produce a coloured or opaque surface in the course of ceramic firing. They may be incorporated in the glaze or enamel, or be applied as a coating before glazing.
- (2) **Vitrifiable enamels and glazes** are mixtures of silica with other products (feldspar, kaolin, alkalies, sodium carbonate, alkaline-earth metal compounds, lead oxide, boric acid, etc.) giving a smooth surface, either matt or glossy, by vitrification under heat. In most cases some of the constituents have been fused together in a preliminary process and are present in the mixture in the form of powdered frit (see below).

They may be transparent (whether or not coloured) or rendered opaque by the addition of opacifiers or pigments; sometimes substances (e.g., titanium or zinc oxides) are added which produce decorative crystalline effects on cooling after the firing. These vitrifiable enamels and glazes are generally in the form of powders or granules.

- (3) **Engobes (slips)** are semi-fluid pastes with a basis of clay, whether or not coloured, used to coat ceramic ware, either completely or in the form of a pattern. They are applied either before firing or after a preliminary first firing.
- (4) **Liquid lustres** are solutions or suspensions of metal compounds in spirits of turpentine or other organic solvents, used for decorating ceramics or glassware. The most widely used are gold, silver, aluminium or chromium lustres.
- (5) **Glass frit** and all other varieties of glass (including vitrite and glass obtained from fused quartz or other fused silica) in the form of powder, granules or flakes, whether or not coloured or silvered.

These products are used in the preparation of coatings for ceramic, glass or metal articles as well as for other purposes. For example, frit is used in the preparation of the vitrifiable products referred to in paragraph (2) above. Glass powder and granules are sometimes sintered to form discs, plates, tubes, etc. for laboratory use.

Vitrite is generally used for insulating electrical parts (e.g., contact terminals for electric lamp caps).

Other varieties of powdered glass are used as abrasives, for decorating postcards, Christmas tree decorations, for obtaining coloured glass articles, etc.

When the products referred to in paragraph (5) above are in forms other than powder, granules or flakes, they are **excluded**, and generally fall in **Chapter 70**. This applies in particular to " vitrite " and " enamel " glass in the mass (**heading 70.01**), to " enamel " glass put up in the form of bars, rods or tubes (**heading 70.02**) and to small regular spherical grains (microspheres) used for coating cinematograph screens, road signs, etc. (**heading 70.18**).

32.08 - Paints and varnishes (including enamels and lacquers) based on synthetic polymers or chemically modified natural polymers, dispersed or dissolved in a non-aqueous medium; solutions as defined in Note 4 to this Chapter.

3208.10 - Based on polyesters

3208.20 - Based on acrylic or vinyl polymers

3208.90 - Other

(A) PAINTS (INCLUDING ENAMELS)

Paints of this heading are dispersions of insoluble colouring matter (chiefly mineral or organic pigments, or colour lakes), or metallic flakes or powders, in a vehicle consisting of a binder dispersed or dissolved in a non-aqueous medium. The binder, which is the film-producing agent, consists of synthetic polymers (such as phenolic resins, amino-resins, thermosetting or other acrylic polymers, alkyds and other polyesters, vinyl polymers, silicones, epoxide resins and synthetic rubber) or of chemically modified natural polymers (such as chemical derivatives of cellulose or natural rubber).

Varying quantities of other products, such as driers (mainly based on cobalt, manganese, lead or zinc compounds), thickening agents (aluminium soaps and zinc soaps), surface-active agents, diluents or fillers (barium sulphate, calcium carbonate, talc, etc.) and anti-skimming agents (e.g., butanone oxime) may be added to the vehicle for specific purposes.

In **solvent-thinned paints** the solvent and the thinner are volatile liquids (such as white spirit, toluene, gum, wood or sulphate turpentine, mixtures of synthetic solvents, etc.) added to dissolve a solid binder and to give the paint the proper flowing consistency for ease of application.

When the vehicle consists of a varnish, the paint is known as an enamel; on drying it gives a particularly smooth hard film, which may be glossy or matt.

The formulation of solvent-thinned paints and enamels depends on the specific use for which they are made and such products normally contain several pigments and several binders. They form, after drying, a non-sticky, opaque, coloured film, glossy or matt, on the surfaces to which they are applied.

(B) VARNISHES (INCLUDING LACQUERS)

Varnishes and lacquers of this heading are **liquid** preparations for protecting or decorating surfaces. They are based on synthetic polymers (including synthetic rubber) or chemically modified natural polymers (such as cellulose nitrate or other cellulose derivatives, novolacs or other phenolic resins, amino-resins, silicones, etc.) with added solvents and thinners. They form a dry, water-insoluble, relatively hard, more or less transparent or translucent, smooth, continuous film which may be glossy, matt or satiny.

They may be coloured by the addition of colouring matter of a kind soluble in the composition. (In paints and enamels the colouring matter is called the "pigment" and is insoluble in the media - see Part (A) above.)

* * *

The more common methods of applying paints, varnishes and lacquers are by use of a brush or roller. The main industrial methods used include spraying, dipping and machine-coating.

This heading also includes :

- (1) **Varnishes intended to be diluted** at the time of their application. They consist of resin dissolved in a small quantity of solvent and of ingredients such as anti-skimming agents and certain third thixotropic or drying agents which make them suitable for use solely as varnishes. Varnishes of this description, in which the secondary ingredients are also in solution, can be distinguished from the solutions defined in Note 4 to the Chapter on the basis of the difference in the chemical nature of their respective secondary ingredients and the consequent differences in the functions performed by those ingredients in the two types of solutions.
- (2) **Radiation-curable varnishes**, which consist of oligomers (i.e., polymers comprising 2, 3 or 4 monomer units) and cross-linking monomers, in volatile solvents, with or without photo-initiators. These varnishes are cured by the action of ultra-violet light, infra-red light, X-rays, electron beams or other radiation to form cross-linked, solvent-insoluble network structures (a hard, dry film). Products of this type do not fall in this heading unless they are clearly identifiable as being intended for use solely as varnishes. Similar products of a kind used as photographic emulsions fall in **heading 37.07**.
- (3) **Varnishes being solutions of the polymers described in (C) below**, i.e., those of headings 39.01 to 39.13, whatever the weight of the solvent, containing added substances **other than** those necessary for the manufacture of products specified in headings 39.01 to 39.13, such as anti-skimming agents and certain thixotropic or drying agents, which make them suitable for use solely as varnishes.

This part **excludes** solutions covered by Note 4 to the present Chapter (see Part (C) below).

(C) SOLUTIONS AS DEFINED IN NOTE 4 TO CHAPTER 32

By virtue of Note 4 to this Chapter, solutions (other than collodions) of the following compositions are classified in this heading :

- one or more of the products specified in headings 39.01 to 39.13 and any dissolved ingredients necessary for the manufacture of these products, such as accelerators, retarders, cross-linking agents (excluding, therefore, soluble ingredients such as colourants and insoluble ingredients such as fillers or pigments, as well as all products which might be included in these headings by the effect of other Nomenclature provisions) in volatile organic solvents, if the weight of the solvent exceeds 50 % of the weight of the solution;

- one or more of the above products and a plasticiser in volatile organic solvents if the weight of the solvent exceeds 50 % of the weight of the solution.

Such solutions fall in **Chapter 39** if the weight of the volatile organic solvent does not exceed 50 % of the weight of the solution.

The expression " volatile organic solvents " also includes solvents having a relatively high boiling point, e.g., turpentine.

*
* *

Glues of similar composition to the preparations described in the penultimate paragraph of Part (B) above, or glues put up for retail sale and not exceeding a net weight of 1 kg are **excluded (heading 35.06)**.

The heading also **excludes** :

- Surfacing preparations for walls, floors, etc., based on plastics with the addition of a high proportion of fillers and which, like conventional mastics, are applied with a spatula, trowel, etc. (**heading 32.14**).
- Printing inks which though having a similar qualitative composition to paint, are not suitable for painting applications (**heading 32.15**).
- Varnishes, of the nail varnish type, put up in the forms described in Explanatory Note to **heading 33.04**.
- Correcting fluids consisting essentially of pigments, binders and solvents, put up in packings for retail sale for use for masking errors or other unwanted marks in typescripts, manuscripts, photocopies, offset printing masters or the like and cellulose varnishes put up in packings for retail sale as stencil correcting preparations (**heading 38.24**).
- Collodions, irrespective of the proportion of solvent (**heading 39.12**).

32.09 - Paints and varnishes (including enamels and lacquers) based on synthetic polymers or chemically modified natural polymers, dispersed or dissolved in an aqueous medium.

3209.10 - Based on acrylic or vinyl polymers

3209.90 - Other

Paints of this heading are composed of dispersions or solutions of a binder based on synthetic polymers or chemically modified natural polymers, in an aqueous medium, blended with dispersions of insoluble colouring matter (chiefly mineral or organic pigments, or colour lakes) and fillers. Surfactants and protective colloids are added to stabilise the products. Varnishes of this heading are similar to paints except that they do not contain a pigment; however, they may contain colouring matter which is soluble in the binder.

The binder, which is the film-producing agent, consists of polymers, such as polyacrylic esters, poly(vinyl acetate) and poly(vinyl chloride), or copolymerisation products of butadiene and styrene.

The expression "aqueous medium" means any medium consisting of water or a mixture of water and a water-soluble solvent.

This heading **does not cover** :

- (a) Surfacing preparations for walls, floors, etc., based on plastics with the addition of a high proportion of fillers and which, like conventional mastics, are applied with a spatula, trowel, etc. (**heading 32.14**).
- (b) Printing inks which though having a similar qualitative composition to paint, are not suitable for painting applications (**heading 32.15**).

32.10 - Other paints and varnishes (including enamels, lacquers and distempers); prepared water pigments of a kind used for finishing leather.

(A) PAINTS (INCLUDING ENAMELS)

The paints (including enamels) of this heading include :

- (1) Drying oils (e.g., linseed oil), whether or not modified, or natural resins, dispersed or dissolved in an aqueous or non-aqueous medium, with added pigment.
- (2) Any liquid binder (including synthetic or chemically modified natural polymers) containing a hardener and pigments but not containing any solvent or other medium.
- (3) Rubber (other than synthetic rubber) based paints whether dispersed or dissolved in non-aqueous media, or dispersed in aqueous media, with added pigment. Paints of this type are to be applied in thin layers to give flexible coatings.

(B) VARNISHES (INCLUDING LACQUERS)

Varnishes of this heading include :

- (1) **Oil varnishes** in which the film-producing agent is a drying oil (e.g., linseed oil) or a mixture of drying oil with lac, natural gums or resins.
- (2) **Varnishes and lacquers based on lac, natural gums or resins**, consisting mainly of solutions or dispersions of lac, natural gums or resins (shellac, copal, rosin, damar, etc.) in alcohol (spirit varnishes), gum, wood or sulphate turpentine, white spirit, acetone, etc.
- (3) **Varnishes based on bitumen, pitch or similar products** (sometimes known as black japans, black varnishes, etc.). (As regards the distinction between varnishes based on bitumen, etc., and certain mixtures of heading 27.15, see exclusion (e) in the Explanatory Note to that heading.)
- (4) **Liquid varnishes containing no solvent**, which may consist of :
 - (a) liquid plastics (usually epoxide resins or polyurethanes) and a film-producing agent called in this instance a "hardener". For certain varnishes the hardener must be added at the time of use in which case the two components are packed in separate containers. These containers may be put up together in one package;
 - (b) a single resin, the formation of a film at the time of use depending not on the addition of a hardener but on the effect of heat or atmospheric moisture; or

- (c) oligomers (i.e., polymers comprising 2, 3 or 4 monomer units) and cross-linking monomers, with or without photo-initiators. These varnishes are cured by the action of ultra-violet light, infra-red light, X-rays, electron beams or other radiation to form cross-linked, solvent-insoluble network structures (a hard, dry film).

Products of the types described in this item do not fall in this heading unless they are clearly identifiable as being intended for use solely as varnishes. When this condition is not met the types described in (a) and (b) fall in **Chapter 39**. Products similar to the type described in (c) and of a kind used as photographic emulsions fall in **heading 37.07**.

- (5) **Varnishes and lacquers based on rubber** (other than synthetic rubber) dispersed or dissolved in non-aqueous media or dispersed in aqueous media, possibly with added colouring material soluble in the binder material. Varnishes of this description must contain other ingredients which make them suitable for use solely as varnishes. When this condition is not met, these products generally fall in **Chapter 40**.

(C) DISTEMPERS (INCLUDING WHITENING FOR CLEANING FOOTWEAR) AND PREPARED WATER PIGMENTS OF A KIND USED FOR FINISHING LEATHER

- (1) **Distempers** are essentially composed of colouring pigment or of mineral substances (e.g., whiting) with certain quantities, usually very small, of binders such as skin glue or casein. Fillers, insecticides or antiseptics are incorporated in some types.

Distempers include gelatinous white, casein distempers and silicate distempers. They are usually in powder form, but may be presented as pastes or emulsions.

- (2) **Whitening for cleaning footwear** consists of whiting agglomerated in tablets by means of a binder (e.g., dextrin or skin glue). They are varieties of distempers. They may also be in the form of paste or dispersion.
- (3) **Prepared water pigments of a kind used for finishing leather** are preparations similar to ordinary distempers, consisting of mixtures of mineral or organic pigments and certain quantities of binders (e.g., caseinates). They are in the form of powders or pastes or dispersions in water, and sometimes incorporate products designed to give a brilliance to leather.

The heading also **excludes** :

- (a) Surfacing preparations for walls, floors, etc., based on plastics or rubber with the addition of a high proportion of fillers and which, like conventional mastics, are applied with a spatula, trowel, etc. (**heading 32.14**).
- (b) Printing inks which though having a similar qualitative composition to paint, are not suitable for painting applications (**heading 32.15**).
- (c) Powder paints consisting principally of plastics and containing additives and pigments, used for application to objects by the effect of heat with or without application of static electricity (**Chapter 39**).

32.11 - Prepared driers.

Prepared driers are mixtures used to accelerate the drying of certain paints or varnishes by facilitating the oxidation of the drying oil. These products usually consist of a chemical drier (lead borate, zinc naphthenate, zinc oleate, manganese dioxide, cobalt resinate, etc.) with a filler, e.g., gypsum (solid driers), or of the concentrated solutions of these substances in gum, wood or sulphate turpentine, white spirit, etc., (e.g., calcium naphthenate or cobalt naphthenate in white spirit) with or without drying oil (liquid or paste driers).

This heading **does not cover** :

- (a) Boiled or otherwise chemically modified oils of **heading 15.18**.
- (b) Separate chemically defined compounds (generally **Chapter 28 or 29**).
- (c) Resinates (**heading 38.06**).

32.12 - Pigments (including metallic powders and flakes) dispersed in non-aqueous media, in liquid or paste form, of a kind used in the manufacture of paints (including enamels); stamping foils; dyes and other colouring matter put up in forms or packings for retail sale.

3212.10 - Stamping foils

3212.90 - Other

**(A) PIGMENTS (INCLUDING METALLIC POWDERS AND FLAKES)
DISPERSED IN NON-AQUEOUS MEDIA, IN LIQUID OR PASTE FORM
OF A KIND USED IN THE MANUFACTURE
OF PAINTS (INCLUDING ENAMELS)**

These are concentrated dispersions of pigments (including aluminium or other metal powders and flakes) in a non-aqueous medium (e.g., drying oils, white spirit, gum, wood or sulphate turpentine or varnish), in liquid or paste form, of a kind used in the manufacture of paints or enamels.

This group also includes concentrated dispersions, sometimes called "pearl essence", of :

- natural nacreous (pearl) pigment containing guanine and hypoxanthine and obtained from the scales of certain fish, or
- a synthetic nacreous (pearl) pigment (e.g., mica coated with bismuth chloride oxide or titanium dioxide),

in a varnish or lacquer (e.g., nitrocellulose lacquer) or in a solution of synthetic polymers.

These products are used in the manufacture of imitation pearls, nail enamels or other paints and enamels.

(B) STAMPING FOILS

These products (also known as blocking foils) consist of thin sheets of either :

- Metallic powder (including powder of precious metal), or pigment, agglomerated with glue, gelatin or other binder, or
- Metal (including precious metal) or pigment, deposited by vaporisation, cathodic sputtering, etc., on a supporting sheet of any material (e.g., paper, plastics).

They are used, with the application of pressure (and generally of heat), for printing book covers, hat bands, etc., by hand or machine.

Metallic foils produced by rolling or hammering are classified according to the constituent metal (e.g., gold foil in **heading 71.08**, copper foil in **heading 74.10**, aluminium foil in **heading 76.07**).

(C) DYES AND OTHER COLOURING MATTER PUT UP IN FORMS OR PACKINGS FOR RETAIL SALE

These are non-film forming products which normally consist of mixtures of colouring matter with other substances (e.g., inert diluents, surface-active products which encourage the penetration and fixation of the colouring matter). Mordants are also sometimes added.

They fall here **only** if :

- (1) In packings for retail sale (e.g., sachets of powder, bottles of liquid) put up for use as dyes, or
- (2) In forms (e.g., balls, tablets or the like) clearly designed for retail sale.

The dyes covered by this heading are mainly those used for domestic purposes and usually sold as "household dyes" (e.g., dyes for clothes, for shoes, for furniture). The heading also includes special dyes used in laboratories, e.g., to colour microscopic preparations.

The heading **does not cover** :

- (a) Artists', students' or signboard painters' colours, modifying tints, amusement colours and the like, in tablets, tubes, jars, bottles, pans or in similar forms or packings (**heading 32.13**).
- (b) Printing inks (**heading 32.15**).
- (c) Theatrical grease paints and other make-up (**heading 33.04**).
- (d) The hair "dyes" of **heading 33.05**.
- (e) Coloured crayons and pastels (**heading 96.09**).

32.13 - Artists', students' or signboard painters' colours, modifying tints, amusement colours and the like, in tablets, tubes, jars, bottles, pans or in similar forms or packings.

3213.10 - Colours in sets

3213.90 - Other

This heading covers prepared colours and paints of a kind used by artists, students or signboard painters, modifying tints, amusement colours and the like (water colours, gouache colours, oil paints, etc.), **provided** they are in the form of tablets or put up in tubes, small jars or bottles, pans or in similar forms or packings.

The heading also includes those sold in sets or outfits, with or without brushes, palettes, palette knives, stumps, pans, etc.

The heading **does not include** printing inks (or colours), Indian ink, whether liquid or solid, or other products classified under **heading 32.15**, nor crayons, pastels or similar articles (**heading 96.09**).

32.14 - Glaziers' putty, grafting putty, resin cements, caulking compounds and other mastics; painters' fillings; non-refractory surfacing preparations for façades, indoor walls, floors, ceilings or the like.

3214.10 - Glaziers' putty, grafting putty, resin cements, caulking compounds and other mastics; painters' fillings

3214.90 - Other

The products of this heading are preparations of widely differing composition which are essentially characterised by the uses to which they are put.

These preparations are usually put up in a more or less pasty form and in general they harden or cure after application. However, some are in solid or powder forms which are made pasty at the time of use by heating (e.g., by melting) or by addition of a liquid (e.g., water).

The products of this heading are usually applied with a caulking gun, a spatula, a trowel, a plasterer's float or similar tools.

**(I) GLAZIERS' PUTTY, GRAFTING PUTTY, RESIN CEMENTS,
CAULKING COMPOUNDS AND OTHER MASTICS**

These preparations are mainly used to stop, seal or caulk cracks and, in certain cases, to bond or firmly join components together. They are distinguished from glues and other adhesives by the fact that they are applied in thick coatings or layers. It should be noted, however, that this group of products also covers mastics used on the skin of patients around stomas and fistulas.

This group includes :

- (1) **Mastics based on oil.** These are composed essentially of drying oils, fillers (whether they react with the oils or are inert) and hardeners. The best known product of this type is glaziers' putty.
- (2) **Mastics based on wax (luting wax).** These consist of waxes (of all kinds) to which resins, shellac, rubber, resin esters, etc., are often added to increase the adhesive effect. Mastics in which wax is wholly or partly replaced by products such as cetyl alcohol or stearyl alcohol are also considered as mastics based on wax. Mastics of this paragraph include grafting putties and sealants for coating barrels, casks, etc.
- (3) **Resin mastics and cements.** These consist of natural resins (shellac, damar, rosin) or plastics (alkyd resins, polyesters, coumarone-indene resins, etc.), intermixed and usually with the addition of other materials (e.g., waxes, oils, bitumens, rubber, brick powder, lime, cements or any other mineral fillers). It should be noted that certain of these mastics are also covered by the types described below (e.g., those based on plastics or on rubber). The mastics and cements of this group serve many purposes, for example, as fillers in the electrotechnical industry or for sealing glass, metal or porcelain objects. They are generally applied after they have been made fluid by melting.

- (4) **Mastics based on water-glass.** These are generally prepared at the time of application by mixing together two components. One of these consists of an aqueous solution of sodium silicate and potassium-sodium silicate and the other of fillers (quartz powder, sand, asbestos fibres, etc.). They are mainly used to seal sparking plugs, engine blocks and sumps, exhaust pipes, radiators, etc., and to fill or stop certain joints.
- (5) **Mastics based on zinc oxychloride.** These are obtained from zinc oxide and zinc chloride to which retarding agents and, in certain cases, fillers are added. They are used for filling holes or cracks in wood, ceramics, etc.
- (6) **Mastics based on magnesium oxychloride.** These are obtained from magnesium chloride and magnesium oxide, to which fillers (e.g., wood flour) are added. They are mainly used to stop or seal cracks in wooden articles.
- (7) **Mastics based on sulphur.** These are composed of sulphur mixed with inert fillers. They are put up as solids, and are used to produce hard, waterproof, acid-resistant stoppings, and also to bond or fix pieces in place.
- (8) **Mastics based on plaster.** These are put up as fibrous and flocculent powders, composed of a mixture of about 50 % plaster with other materials such as asbestos fibres, wood cellulose, glass fibres or sand. They are made pasty by the addition of water, and used to secure screws, gudgeon pins, dowels, hooks, etc.
- (9) **Mastics based on plastics** (e.g., polyesters, polyurethanes, silicones and epoxide resins) whether or not containing a high added proportion (up to 80 %) of various fillers (e.g., clay, sand and other silicates, titanium dioxide, metallic powders). Some of these mastics are used after the addition of hardeners. Some mastics do not harden and remain tacky after application (e.g., acoustic sealants). Others harden by the evaporation of solvents, by solidification (hot-melt mastics), by curing after exposure to the atmosphere or by the reaction of different components mixed together (multi-component mastics).

Products of this nature are to be classified in this heading only if they are fully formulated for use as mastics. Mastics may be used to seal certain joints in construction or home repair, for sealing or repairing glass, metal or porcelain articles, as fillers or sealants for coachwork or, in the case of adhesive sealants, to bond various surfaces together.

- (10) **Mastics based on zinc oxide and glycerol.** These are used to make acid-resistant coatings, to bond iron pieces to porcelain ware, and for joining tubes.
- (11) **Mastics based on rubber.** These may be composed, for example, of a thioplast with the addition of fillers (graphite, silicates, carbonates, etc.) and in certain cases of an organic solvent. They are used, sometimes after the addition of a hardener, to give flexible protective coatings (resistant to chemical agents and to solvents), and also for caulking. These mastics may also be composed of aqueous dispersions of rubber, containing added colouring matter, plasticisers, fillers, binders or anti-oxidants, used for hermetically sealing metal cans.

- (12) **Mastics of a kind used on the skin.** These may be composed, e.g., of sodium carboxymethylcellulose, pectin, gelatin and polyisobutylene in an organic solvent such as isopropyl alcohol. They are used, for example, on the skin of patients around stomas and fistulas as sealants to form a leakproof contact between the skin and waste collection bags. They have neither therapeutic nor prophylactic properties.
- (13) **Sealing waxes.** They consist essentially of a mixture of resinous materials (e.g., shellac, rosin), together with a (usually high) proportion of mineral fillers and colouring matters. They are used to fill holes, for the watertight sealing of glass apparatus, for sealing documents, etc.

**(II) PAINTERS' FILLINGS;
NON-REFRACTORY SURFACING PREPARATIONS
FOR FAÇADES, INDOOR WALLS, FLOORS,
CEILINGS OR THE LIKE**

These products differ from the mastics, etc., described above in that they are generally applied to larger surfaces. They are distinguished from paints, varnishes and similar products by their high content of fillers and (if present) of pigments; this content is generally much higher than that of the binders and solvents or dispersing liquids.

(A) PAINTERS' FILLINGS.

Painters' fillings are used to prepare surfaces (e.g., indoor walls) for painting by levelling out irregularities and, if necessary, filling in cracks, holes or porous surfaces. Paint is applied on them after they have hardened and been sanded.

This category also includes fillings based on oil, rubber, glue, etc. Fillings based on plastics with a composition similar to that of certain mastics of the same kind are also used for coachwork, etc.

(B) NON-REFRACTORY SURFACING PREPARATIONS.

Non-refractory surfacing preparations are used on façades, indoor walls, floors and ceilings, swimming pool walls and floors, etc., to make them waterproof and improve their appearance. Generally they remain visible as the final surfacing.

This group includes :

- (1) Powdered preparations consisting of equal parts of plaster and sand with plasticisers.
- (2) Preparations in powder form based on quartz and cement with small quantities of added plasticisers, used for instance, after adding water, for setting wall or floor tiles.
- (3) Pasty preparations made by coating mineral fillers (ground marble, quartz, or a mixture of quartz and silicate, for instance) with a binder (plastics or resins), with added pigments and, where appropriate, water or solvent.

- (4) Liquid preparations consisting, for instance, of synthetic rubber or acrylic polymers, asbestos fibres mixed with a pigment, and water. These are applied on façades with a paint brush or spray gun and form a much thicker layer than paint.

* * *

In the case of certain of the products described above, the intermixture of the various constituents, or the addition of certain constituents, must be carried out at the time of use. Such products remain classified in this heading **provided** the constituents are :

- (i) having regard to the method in which they are put up, clearly identifiable as being intended to be used together without first being repacked;
- (ii) presented together; **and**
- (iii) identifiable, whether by their nature or by the relative proportions in which they are present, as being complementary one to another.

However, in the case of products to which a hardener has to be added at the time of use, the absence of the hardener does not exclude these products from this heading, **provided** they are, by their composition or packing, clearly identifiable as intended to be used in the preparation of putties, mastics, fillings or surfacing preparations.

The heading **excludes** :

- (a) Natural resins known in certain countries as " mastics " (**heading 13.01**).
- (b) Plasters, lime and cements covered by **heading 25.20, 25.22 or 25.23**.
- (c) Mastics of asphalt and other bituminous mastics (**heading 27.15**).
- (d) Dental cements and other dental fillings (**heading 30.06**).
- (e) Brewers' pitch, and other products of **heading 38.07**.
- (f) Refractory cements and mortars (**heading 38.16**).
- (g) Prepared binders for foundry moulds or cores (**heading 38.24**).

32.15 - Printing ink, writing or drawing ink and other inks, whether or not concentrated or solid.

- Printing ink :

3215.11 -- Black

3215.19 -- Other

3215.90 - Other

(A) **Printing inks (or colours)** are pastes of varying consistency, obtained by mixing a finely divided black or coloured pigment with a vehicle. The pigment is usually carbon black for black inks and may be organic or inorganic for coloured inks. The vehicle consists of either natural resins or synthetic polymers, dispersed in oils or dissolved in solvents, and contains a small quantity of additives to impart desired functional properties.

(B) **Ordinary writing or drawing inks** are solutions or suspensions of a black or coloured material in water, usually with the addition of gum and other products (e.g., preservatives). These include inks based on iron salts, inks based on logwood extracts or on synthetic organic colours. Indian ink, used mainly for drawing, consists usually of carbon black in suspension in water (with the addition of gum Arabic, shellac, etc.), or in certain animal glues.

(C) **Other inks in this heading include :**

- (1) Copying and hectographic inks (ordinary inks thickened with glycerol, sugar, etc.).
- (2) Inks for ball point pens.
- (3) Inks for duplicating machines or for impregnating ink-pads or typewriter ribbons.
- (4) Marking inks (e.g., based on silver nitrate).
- (5) Metallic inks (finely divided metals or alloys in suspension in a solution of gum, e.g., gold, silver or bronze inks).
- (6) Prepared sympathetic or invisible inks (e.g., based on cobalt chloride).

These products are generally in the form of liquids or pastes, but they are also included in this heading when concentrated or solid (i.e., powders, tablets, sticks, etc.) to be used as inks after simple dilution or dispersion.

This heading **does not include** :

- (a) Developers consisting of a toner (a mixture of carbon black and thermoplastic resins) compounded with a carrier (grains of sand coated with ethylcellulose), used in photocopying machines (**heading 37.07**).
 - (b) Refills for ball point fountain pens comprising the ball point and ink-reservoir (**heading 96.08**). On the other hand, mere ink-filled cartridges for ordinary fountain pens remain in this heading.
 - (c) Inked ribbons for typewriters or ink-pads (**heading 96.12**).
-

Chapter 33

Essential oils and resinoids; perfumery, cosmetic or toilet preparations

Notes.

- 1.- This Chapter does not cover :
 - (a) Natural oleoresins or vegetable extracts of heading 13.01 or 13.02;
 - (b) Soap or other products of heading 34.01; or
 - (c) Gum, wood or sulphate turpentine or other products of heading 38.05.
- 2.- The expression “odoriferous substances” in heading 33.02 refers only to the substances of heading 33.01, to odoriferous constituents isolated from those substances or to synthetic aromatics.
- 3.- Headings 33.03 to 33.07 apply, *inter alia*, to products, whether or not mixed (other than aqueous distillates and aqueous solutions of essential oils), suitable for use as goods of these headings and put up in packings of a kind sold by retail for such use.
- 4.- The expression “perfumery, cosmetic or toilet preparations” in heading 33.07 applies, *inter alia*, to the following products : scented sachets; odoriferous preparations which operate by burning; perfumed papers and papers impregnated or coated with cosmetics; contact lens or artificial eye solutions; wadding, felt and nonwovens, impregnated, coated or covered with perfume or cosmetics; animal toilet preparations.

GENERAL

The **essential oils** and **extracted oleoresins** of heading 33.01 are all extracted from plant materials. The method of extraction used determines the type of product obtained. For example, according to whether the steam distillation or an organic solvent process is employed, certain plants (e.g., cinnamon) can give either an essential oil or an extracted oleoresin.

Headings 33.03 to 33.07 include products, whether or not mixed (other than aqueous distillates and aqueous solutions of essential oils), suitable for use as goods of these headings and put up in packings of a kind sold by retail for such use (see Note 3 to this Chapter).

The products of headings 33.03 to 33.07 remain in these headings whether or not they contain subsidiary pharmaceutical or disinfectant constituents, or are held out as having subsidiary therapeutic or prophylactic value (see Note 1 (e) to Chapter 30). However, prepared room deodorisers remain classified in heading 33.07 even if they have disinfectant properties of more than a subsidiary nature.

Preparations (e.g., varnish) and **unmixed products** (e.g., unperfumed powdered talc, fuller's earth, acetone, alum) which are suitable for other uses in addition to those described above are classified in these headings **only** when they are :

- (a) In packings of a kind sold to the consumer and put up with labels, literature or other indications that they are for use as perfumery, cosmetic or toilet preparations, or as room deodorisers; or
- (b) Put up in a form clearly specialised to such use (e.g., nail varnish put up in small bottles furnished with the brush required for applying the varnish).

This Chapter **does not cover** :

- (a) Petroleum jelly, **other than** that suitable for use for the care of the skin put up in packings of a kind sold by retail for such use (**heading 27.12**).
- (b) Medicinal preparations having a subsidiary use as perfumery, cosmetic or toilet preparations (**heading 30.03** or **30.04**).
- (c) Gel preparations designed to be used in human or veterinary medicine as a lubricant for parts of the body for surgical operations or physical examinations or as a coupling agent between the body and medical instruments (**heading 30.06**).
- (d) Soaps and paper, wadding, felt and nonwovens, impregnated, coated or covered with soap or detergent (**heading 34.01**).

33.01 - Essential oils (terpeneless or not), including concretes and absolutes; resinoids; extracted oleoresins; concentrates of essential oils in fats, in fixed oils, in waxes or the like, obtained by enfleurage or maceration; terpenic by-products of the deterpenation of essential oils; aqueous distillates and aqueous solutions of essential oils (+).

- Essential oils of citrus fruit :

3301.12 -- Of orange

3301.13 -- Of lemon

3301.19 -- Other

- Essential oils other than those of citrus fruit :

3301.24 -- Of peppermint (*Mentha piperita*)

3301.25 -- Of other mints

3301.29 -- Other

3301.30 - Resinoids

3301.90 - Other

(A) Essential oils, including concretes and absolutes; resinoids; extracted oleoresins.

Essential oils, which serve as raw materials in the perfumery, food and other industries, are of vegetable origin. They are generally of complex composition and contain alcohols, aldehydes, ketones, phenols, esters, ethers and terpenes in varying proportions. These oils remain in the heading whether or not their fragrance has been modified by removal of their terpenes. Most of these oils are volatile, and the stain which they leave on paper usually disappears rapidly.

They are obtained by various processes, such as :

- (1) Expression (e.g., lemon oil from lemon peel).
- (2) Steam distillation.
- (3) Extraction from fresh materials of vegetable origin by means of organic solvents (such as petroleum ether, benzene, acetone or toluene) or super-critical fluids (such as carbon dioxide gas under pressure).
- (4) Extraction from the concentrates obtained by *enfleurage* or maceration (see Part (B) below).

The heading also covers **concretes** obtained by the processes referred to in subparagraph (3) above. Concretes are solid or semi-solid due to the presence of plant waxes. By removal of these waxes, **absolutes** are obtained; these are also classified in this heading.

Resinoids are products used mainly as fixatives in the perfume, cosmetic, soap or surfactant industries. They are composed essentially of non-volatile materials and are obtained by the organic solvent or super-critical fluid extraction of the following exudates :

- (i) dried natural non-cellular vegetable resinous materials (e.g., natural oleoresins or oleo-gum resins);
- (ii) dried natural animal resinous materials (e.g., castoreum, civet or musk).

Extracted oleoresins, also known in trade as “ prepared oleoresins ” or “ spice oleoresins ”, are obtained from natural cellular raw plant materials (usually spices or aromatic plants), either by organic solvent extraction or by super-critical fluid extraction. These extracts contain volatile odoriferous principles (e.g., essential oils) and non-volatile flavouring principles (e.g., resins, fatty oils, pungency constituents), which define the characteristic odour or flavour of the spice or aromatic plant. The essential oil content of these extracted oleoresins varies considerably depending on the spice or aromatic plant. These products are used principally as flavouring agents in the food industry.

The heading **excludes** :

- (a) Natural oleoresins (**heading 13.01**).
- (b) Vegetable extracts, not elsewhere specified or included (e.g., water-extracted oleoresins), which contain volatile ingredients and generally (apart from odoriferous substances) a far higher proportion of other plant substances (**heading 13.02**).
- (c) Colouring matter of vegetable or animal origin (**heading 32.03**).

Essential oils, resinoids and extracted oleoresins sometimes contain small quantities of solvent used in their extraction (e.g., ethyl alcohol), but this does not remove them from the scope of the heading.

Essential oils, resinoids and extracted oleoresins which have been merely standardised by the removal or addition of a portion of the principal ingredients remain classified in this heading **provided** the composition of the standardised product remains within the normal range found in that kind of product in its natural state. However, an essential oil, resinoid or extracted oleoresin which has been fractionated or otherwise modified (other than by the removal of terpenic hydrocarbons), so that the composition of the resulting product is significantly different from that of the original product, is **excluded** (generally **heading 33.02**). The heading further **excludes** products put up with added diluents or carriers such as vegetable oil, dextrose or starch (generally **heading 33.02**).

The principal essential oils, resinoids and extracted oleoresins are listed in the Annex to the Explanatory Notes to this Chapter.

(B) Concentrates of essential oils in fats, in fixed oils, or in waxes or the like.

These concentrates are obtained when essential oils are extracted from plants or flowers by means of fats, fixed oils, petroleum jelly, paraffin wax, etc., either in the cold or with the application of heat (*enfleurage*, maceration or digestion). They therefore take the form of concentrates of essential oils in fats, fixed oils, etc. The concentrates in fats are known in trade as "flower pomades". Preparations for use on the hair, which are also known as "pomades", are **excluded (heading 33.05)**.

(C) Terpenic by-products.

This heading applies to terpenic by-products separated from essential oils by fractional distillation or other processes. These by-products are often used for the perfuming of certain toilet soaps or for the flavouring of certain foodstuffs.

(D) Aqueous distillates and aqueous solutions of essential oils.

Aqueous distillates are obtained as the aqueous portions of the distillates resulting when essential oils are extracted from plants by steam distillation. After the essential oils have been decanted, the aqueous distillates still retain a fragrance due to the presence of small quantities of essential oils. Certain distillates obtained by the distillation of vegetable products which have been preserved in alcohol still contain small quantities of alcohol; others may contain the quantity of alcohol necessary to ensure their preservation (e.g., witch hazel distillate).

The heading also covers solutions of essential oils in water.

These products remain in this heading even when mixed among themselves without the addition of other materials, or when, as is usually the case, they are put up as perfumery or as medicaments.

The more common aqueous distillates and solutions are those of orange flowers, rose, melissa, mint, fennel, cherry-laurel, lime-blossom, witch hazel, etc.

In addition to the exclusions referred to above this heading also **excludes** :

- (a) Vanilla oleoresin (sometimes erroneously known as “vanilla resinoid” or “vanilla extract”) (**heading 13.02**).
 - (b) Separate chemically defined compounds isolated from essential oils (e.g., isolated terpenes) or from resinoids (natural isolates), or prepared synthetically (**Chapter 29**).
 - (c) Mixtures of essential oils, mixtures of resinoids, mixtures of extracted oleoresins, mixtures of essential oils with resinoids or extracted oleoresins or any combination thereof, and mixtures with a basis of essential oils, resinoids or extracted oleoresins (see the Explanatory Note to **heading 33.02**).
 - (d) Gum, wood or sulphate turpentine and other terpenic oils produced by the distillation or other treatment of coniferous woods (**heading 38.05**).

Three small circles arranged in a triangular pattern, with one circle at the top and two at the bottom.

Subheading Explanatory Note.

Subheading 3301.12

For the purposes of subheading 3301.12 the term "orange" does not apply to mandarins (including tangerines and satsumas) clementines, wilkins or similar citrus hybrids.

33.02 - Mixtures of odoriferous substances and mixtures (including alcoholic solutions) with a basis of one or more of these substances, of a kind used as raw materials in industry; other preparations based on odoriferous substances, of a kind used for the manufacture of beverages.

3302.10 - Of a kind used in the food or drink industries

3302.90 - Other

This heading covers the following mixtures **provided** they are of a kind used as raw materials in the perfumery, food or drink industries (e.g., in confectionery, food or drink flavourings) or in other industries (e.g., soap-making) :

- (1) Mixtures of essential oils.
- (2) Mixtures of resinoids.
- (3) Mixtures of extracted oleoresins.
- (4) Mixtures of synthetic aromatics.
- (5) Mixtures consisting of two or more odoriferous substances (essential oils, resinoids, extracted oleoresins or synthetic aromatics).
- (6) Mixtures of one or more odoriferous substances (essential oils, resinoids, extracted oleoresins or synthetic aromatics) combined with added diluents or carriers such as vegetable oil, dextrose or starch.
- (7) Mixtures, whether or not combined with a diluent or carrier or containing alcohol, of products of other Chapters (e.g., spices) with one or more odoriferous substances (essential oils, resinoids, extracted oleoresins or synthetic aromatics), **provided** these substances form the basis of the mixture.

Products obtained by the removal of one or more of the ingredients of an essential oil, resinoid or extracted oleoresin so that the composition of the resulting product is significantly different from that of the original product are also mixtures of this heading. Examples of such products are menthone oil (obtained by freezing peppermint oil, followed by treatment with boric acid, to remove most of the menthol and containing, *inter alia*, 63 % menthone and 16 % menthol), white camphor oil (obtained from camphor oil by freezing and distilling to remove camphor and safrole and containing 30 to 40 % cineole plus dipentene, pinene, camphene, etc.) and geraniol (obtained by fractional distillation of citronella oil and containing 50 to 77 % geraniol together with varying amounts of citronellol and nerol).

In particular, the heading covers **perfume bases** consisting of mixtures of essential oils and fixatives, not ready for use until after the addition of alcohol. The heading also includes solutions in alcohol (e.g., ethyl alcohol, isopropyl alcohol) of one or more odoriferous substances **provided** these solutions are of a kind used as raw materials in the perfumery, food, drink or other industries.

The heading also includes **other preparations based on odoriferous substances, of a kind used for the manufacture of beverages**. These preparations may be either alcoholic or non-alcoholic and may be used to produce either alcoholic or non-alcoholic beverages. They must have a basis of one or more odoriferous substances, as described in Note 2 to this Chapter, which are used primarily to impart a fragrance and secondarily to give a flavour to beverages. Such preparations generally contain a relatively small quantity of odoriferous substances which characterize a particular beverage; they may also contain juices, colouring matter, acidulants, sweeteners, etc., provided that they retain their character of odoriferous substances. As presented, these preparations are not intended for consumption as beverages and thus can be distinguished from the beverages of Chapter 22.

The heading **excludes** compound alcoholic and non-alcoholic preparations of a kind used for the manufacture of beverages, with a basis of substances other than odoriferous substances as described in Note 2 to this Chapter (**heading 21.06**, unless they are more specifically provided for elsewhere in the Nomenclature).

33.03 - Perfumes and toilet waters.

This heading covers perfumes in liquid, cream or solid form (including sticks), and toilet waters, designed to give fragrance primarily to the human body.

Perfumes and scents generally consist of essential oils, floral concretes, absolutes or mixtures of synthetic odoriferous substances, dissolved in highly concentrated alcohol. They are usually compounded with slightly perfumed adjuvants and a fixative or stabiliser.

Toilet waters, e.g., lavender water, eau de Cologne (not to be confused with the aqueous distillates and solutions of essential oils of **heading 33.01**) contain smaller proportions of essential oils, etc., generally in less concentrated alcohol than the perfumes described above.

The heading **does not cover** :

- (a) Toilet vinegars (**heading 33.04**).
- (b) After-shave lotions and personal deodorants (**heading 33.07**).

33.04 - Beauty or make-up preparations and preparations for the care of the skin (other than medicaments), including sunscreen or sun tan preparations; manicure or pedicure preparations.

3304.10 - Lip make-up preparations

3304.20 - Eye make-up preparations

3304.30 - Manicure or pedicure preparations

- Other :

3304.91 -- Powders, whether or not compressed

3304.99 -- Other

(A) BEAUTY OR MAKE-UP PREPARATIONS AND PREPARATIONS FOR THE CARE OF THE SKIN, INCLUDING SUNSCREEN OR SUN TAN PREPARATIONS

This part covers :

- (1) Lipsticks and other lip make-up preparations.
- (2) Eye shadow, mascara, eyebrow pencils and other eye make-up preparations.
- (3) Other beauty or make-up preparations and preparations for the care of the skin (other than medicaments), such as : face powders (whether or not compressed), baby powders (including talcum powder, not mixed, not perfumed, put up for retail sale), other powders and grease paints; beauty creams, cold creams, make-up creams, cleansing creams, skin foods (including those containing bees' royal jelly) and skin tonics or body lotions; petroleum jelly, put up in packings of a kind sold by retail for the care of the skin; barrier creams to give protection against skin irritants; injectable intracutaneous gels for wrinkle elimination and lip enhancement (including those containing hyaluronic acid); anti-acne preparations (**other than** soaps of **heading 34.01**) which are designed primarily to cleanse the skin and which do not contain sufficiently high levels of active ingredients to be regarded as having a primary therapeutic or prophylactic effect against acne; toilet vinegars which are mixtures of vinegars or acetic acid and perfumed alcohol.

Sunscreen or sun tan preparations are also included.

(B) MANICURE OR PEDICURE PREPARATIONS

This part covers nail polishes, nail varnishes, nail varnish removers, cuticle removers and other preparations for use in manicure or pedicure.

The heading **does not cover** :

- (a) Medicinal preparations used to treat certain skin complaints, e.g., creams for the treatment of eczema (**heading 30.03 or 30.04**).
- (b) Foot deodorants and preparations for treating nails or claws on animals (**heading 33.07**).

33.05 - Preparations for use on the hair.

- 3305.10 - Shampoos
- 3305.20 - Preparations for permanent waving or straightening
- 3305.30 - Hair lacquers
- 3305.90 - Other

This heading covers :

- (1) **Shampoos**, containing soap or other organic surface-active agents (see Note 1 (c) to Chapter 34), and other shampoos. All these shampoos may contain subsidiary pharmaceutical or disinfectant constituents, even if they have therapeutic or prophylactic properties (see Note 1 (e) to Chapter 30).
- (2) **Preparations for permanent waving or straightening.**
- (3) **Hair lacquers** (sometimes known as "hair sprays").
- (4) **Other** hair preparations, such as brilliantines; hair oils, creams ("pomades") and dressings; hair dyes and bleaches used on the hair; cream-rinses.

Preparations applied to hair on parts of the human body other than the scalp are **excluded (heading 33.07)**.

33.06 - Preparations for oral or dental hygiene, including denture fixative pastes and powders; yarn used to clean between the teeth (dental floss), in individual retail packages.

3306.10 - Dentifrices

3306.20 - Yarn used to clean between the teeth (dental floss)

3306.90 - Other

This heading covers preparations for oral or dental hygiene such as :

(I) **Dentifrices** of all types :

(1) Toothpastes and other preparations for teeth. These are substances or preparations used with a toothbrush, whether for cleaning or polishing the accessible surfaces of teeth or for other purposes such as anticaries prophylactic treatment.

Toothpastes and other preparations for teeth remain classified in this heading, whether or not they contain abrasives and whether or not they are used by dentists.

(2) Denture cleaners, i.e., preparations for cleaning or polishing dentures, whether or not they contain agents with abrasive properties.

(II) Mouth washes and oral perfumes.

(III) Denture fixative pastes, powders and tablets.

The heading also covers yarn used to clean between the teeth, in individual retail packages (dental floss).

33.07 - Pre-shave, shaving or after-shave preparations, personal deodorants, bath preparations, depilatories and other perfumery, cosmetic or toilet preparations, not elsewhere specified or included; prepared room deodorisers, whether or not perfumed or having disinfectant properties.

3307.10 - Pre-shave, shaving or after-shave preparations

3307.20 - Personal deodorants and antiperspirants

3307.30 - Perfumed bath salts and other bath preparations

- Preparations for perfuming or deodorising rooms, including odoriferous preparations used during religious rites :

3307.41 -- "Agarbatti" and other odoriferous preparations which operate by burning

3307.49 -- Other

3307.90 - Other

This heading covers :

(I) **Pre-shave, shaving or after-shave preparations**, such as shaving creams and foams containing soaps or other organic surface-active agents (see Note 1 (c) to Chapter 34); "after-shave" lotions, alum blocks and styptic pencils.

Shaving soap in blocks is excluded (heading 34.01).

(II) **Personal (body) deodorants and antiperspirants.**

(III) Bath preparations, such as **perfumed bath salts and preparations for foam baths**, whether or not containing soap or other organic surface-active agents (see Note 1 (c) to Chapter 34).

Preparations for washing the skin, in which the active component consists wholly or partly of synthetic organic-surface active agents (which may contain soap in any proportion), in the form of liquid or cream and put up for retail sale, are classified in heading 34.01. Such preparations not put up for retail sale are classified in heading 34.02.

(IV) Preparations for perfuming or deodorising rooms, including odoriferous preparations used during religious rites.

(1) **Preparations for perfuming rooms and odoriferous preparations used during religious rites.** They usually operate by evaporation or burning, e.g., "Agarbatti", and may be put up as liquids, powders, cones, impregnated papers, etc. Certain of these preparations may be used for masking an odour.

Perfumed candles are excluded (heading 34.06).

(2) **Prepared room deodorisers, whether or not perfumed or having disinfectant properties.**

Prepared room deodorisers consist essentially of substances (such as lauryl methacrylate) which act chemically on the odours to be overcome or other substances designed to physically absorb odours by, for example, Van der Waal's bonds. When for retail sale they are generally put up in aerosol cans.

Products, such as activated carbon, put up in packings for retail sale as deodorisers for refrigerators, cars, etc. are also classified in this heading.

(V) **Other products**, such as :

- (1) **Depilatories.**
- (2) **Scented sachets containing parts of aromatic plants** used for perfuming linen cupboards.
- (3) **Perfumed papers and papers impregnated or coated with cosmetics.**
- (4) **Contact lens or artificial eye solutions.** These may be for cleaning, disinfecting, soaking or enhancing comfort during wear.
- (5) **Wadding, felt and nonwovens** impregnated, coated or covered with perfume or cosmetics.
- (6) **Animal toilet preparations**, such as dog shampoos, and plumage-improving washes for birds.
- (7) **Sodium chloride solutions** put up for hygiene use in packings for retail sale, other than medical or pharmaceutical, whether or not sterile.

*

ANNEX

List of the principal essential oils, resinoids and extracted oleoresins of heading 33.01

Esential oils

Angelica	Gardenia	Oak Moss
Anise seed	Garlic	Onion
Badian	Geranium	Origanum
Basil	Ginger	Oris
Bay	Grapefruit	Palmarosa
Benzoin	Guaiacwood	Parsley
Bergamot	Ho (Shiu)	Patchouli
Birch	Hop	Pennyroyal
Bitter almond	Hyacinth	Pepper, black
Bitter orange	Hyssop	Peppermint
Bois de rose	Jasmine	Petitgrain
Broom	Jonquil	Pimento
Cajuput	Juniper	(Allspice)
Calamus	Kuromoji	Pine needle (but not pinewood -
Camphor	Laurel	heading 38.05)
Cananga	Lavandin	Rose
Canella	Lavender	Rosemary
Caraway	Lemon	Rue
Cassia	Lemongrass	Sage
Cassie	Lime (Limette)	Sandalwood
Cedar	Linaloe	Sassafras
Cedrat	Mace	Savin
Celery	Mandarin (Tangerine)	Spearmint
Chamomile	Marjoram	Spike lavender
Chenopodium (Wormseed)	Mawah (Kenya geranium)	Sweet orange
Cinnamon	Melissa	Tansy
Citronella	Mimosa	Tarragon
Clove	Mint	Thuja
Copaiba	Mustard	Thyme
Coriander	Myrrh	Tolu
Cumin	Myrtle	Valerian
Cypress	Narcissus	Verbena
Dill	Neroli	Vetiver
Eucalyptus	(Orange flower)	Violet
Fennel	Naiouli	Wintergreen
Galangal	Nutmeg	Wormwood
		Ylang-ylang

Resinoids

Asafoetida	Galbanum	Myrrh
Benzoin	Labdanum	Olibanum
Castoreum	Mastic	Opopanax
Civet	Mecca balsam (Balm of Gilthead)	Peru balsam
Copaiba		Styrax
Elemi	Musk	Tolu

Extracted Oleoresins

Anise seed	Cubeb	Mustard
Badian	Cumin	Nutmeg
Basil	Deertongue	Oregano
Bay	Dill	Origanum
Canella	Fennel	Paprika
Capsicum	Foenugreek	Paradise seed
Caraway	Galangal	Pepper, black
Cardamon	Ginger	Pimento (Allspice)
Carrot	Hop	Rosemary
Cassia	Horseradish	Sage
Celery	Juniper	Savory
Cinnamon	Laurel	Tarragon
Clove	Lovage	Thyme
Copaiba	Mace	Turmeric
Coriander	Marjoram	

Chapter 34

Soap, organic surface-active agents, washing preparations, lubricating preparations, artificial waxes, prepared waxes, polishing or scouring preparations, candles and similar articles, modelling pastes, “dental waxes” and dental preparations with a basis of plaster

Notes.

- 1.- This Chapter does not cover :
 - (a) Edible mixtures or preparations of animal or vegetable fats or oils of a kind used as mould release preparations (heading 15.17);
 - (b) Separate chemically defined compounds; or
 - (c) Shampoos, dentifrices, shaving creams and foams, or bath preparations, containing soap or other organic surface-active agents (heading 33.05, 33.06 or 33.07).
 - 2.- For the purposes of heading 34.01, the expression “soap” applies only to soap soluble in water. Soap and the other products of heading 34.01 may contain added substances (for example, disinfectants, abrasive powders, fillers or medicaments). Products containing abrasive powders remain classified in heading 34.01 only if in the form of bars, cakes or moulded pieces or shapes. In other forms they are to be classified in heading 34.05 as scouring powders and similar preparations”.
 - 3.- For the purposes of heading 34.02, organic surface-active agents are products which when mixed with water at a concentration of 0.5 % at 20 °C and left to stand for one hour at the same temperature :
 - (a) give a transparent or translucent liquid or stable emulsion without separation of insoluble matter; and
 - (b) reduce the surface tension of water to 4.5×10^{-2} N/m (45 dyne/cm) or less.
 - 4.- In heading 34.03 the expression “petroleum oils and oils obtained from bituminous minerals” applies to the products defined in Note 2 to Chapter 27.
 - 5.- In heading 34.04, subject to the exclusions provided below, the expression “artificial waxes and prepared waxes” applies only to :
 - (a) Chemically produced organic products of a waxy character, whether or not water-soluble;
 - (b) Products obtained by mixing different waxes;
 - (c) Products of a waxy character with a basis of one or more waxes and containing fats, resins, mineral substances or other materials.
- The heading does not apply to :
- (a) Products of heading 15.16, 34.02 or 38.23, even if having a waxy character;
 - (b) Unmixed animal waxes or unmixed vegetable waxes, whether or not refined or coloured, of heading 15.21;
 - (c) Mineral waxes or similar products of heading 27.12, whether or not intermixed or merely coloured; or
 - (d) Waxes mixed with, dispersed in or dissolved in a liquid medium (headings 34.05, 38.09, etc.).

GENERAL

This Chapter covers products mainly obtained by the industrial treatment of fats, oils or waxes (e.g., soap, certain lubricating preparations, prepared waxes, certain polishing or scouring preparations, candles). It also includes certain artificial products, e.g., surface-active agents, surface-active preparations and artificial waxes.

The Chapter **does not cover** separate chemically defined compounds, or natural products not mixed or prepared.

34.01 - Soap; organic surface-active products and preparations for use as soap, in the form of bars, cakes, moulded pieces or shapes, whether or not containing soap; organic surface-active products and preparations for washing the skin, in the form of liquid or cream and put up for retail sale, whether or not containing soap; paper, wadding, felt and nonwovens, impregnated, coated or covered with soap or detergent.

- Soap and organic surface-active products and preparations, in the form of bars, cakes, moulded pieces or shapes, and paper, wadding, felt and nonwovens, impregnated, coated or covered with soap or detergent :

3401.11 -- For toilet use (including medicated products)

3401.19 -- Other

3401.20 - Soap in other forms

3401.30 - Organic surface-active products and preparations for washing the skin, in the form of liquid or cream and put up for retail sale, whether or not containing soap

(I) SOAP

Soap is an alkaline salt (inorganic or organic) formed from a fatty acid or a mixture of fatty acids containing at least eight carbon atoms. In practice, part of the fatty acids may be replaced by rosin acids.

The heading covers only soap soluble in water, that is to say true soap. Soaps form a class of anionic surface-active agents, with an alkaline reaction, which lather abundantly in aqueous solutions.

There are three categories of soap :

Hard soaps, which are usually made with sodium hydroxide or sodium carbonate and comprise the bulk of the ordinary soaps. They may be white, coloured or mottled.

Soft soaps, which are made with potassium hydroxide or potassium carbonate. They are viscous and generally green, brown or pale yellow in colour. They may contain small quantities (generally not exceeding 5 %) of synthetic organic surface-active products.

Liquid soaps, which are solutions of soap in water, in some cases with a small quantity (generally not exceeding 5 %) of alcohol or glycerol added, but not containing synthetic organic surface-active products.

This part covers in particular :

(1) **Toilet soaps** frequently coloured and perfumed, which include : floating soaps and deodorant soaps, as well as glycerin soaps, shaving soaps, medicated soaps and certain disinfectant or abrasive soaps, as described below.

(a) **Floating soaps and deodorant soaps.**

(b) **Glycerin soaps**, which are translucent and are made by treating white soap with alcohol, glycerol or sugar.

- (c) **Shaving soaps** (shaving creams fall in **heading 33.07**).
 - (d) **Medicated soaps** containing boric acid, salicylic acid, sulphur, sulphonamides or other medicinal substances.
 - (e) **Disinfectant soaps**, containing small quantities of phenol, cresol, naphthol, formaldehyde or other bactericidal, bacteriostatic, etc., substances. These soaps should not be confused with disinfecting preparations of **heading 38.08** containing the same constituents, the difference lying in the proportions of the constituents (soap, on the one hand, and phenol, cresol, etc., on the other). The disinfecting preparations of heading 38.08 contain a substantial proportion of phenol, cresol, etc., and are liquid whereas disinfectant soaps are usually solid.
 - (f) **Abrasive soaps**, consisting of soap to which sand, silica, pumice powder, slate powder, sawdust or any similar product has been added. The heading covers abrasive soaps **only** in the form of bars, cakes or moulded pieces or shapes. Abrasive scouring pastes and powders, whether or not containing soap, fall in **heading 34.05**.
- (2) **Household soaps**, which may be coloured or perfumed, abrasive or disinfectant.
- (3) **Rosin, tall oil or naphthenate soaps** containing not only alkaline salts of fatty acids, but also alkaline resinate of heading 38.06 or alkaline naphthenates of heading 34.02.
- (4) **Industrial soaps**, prepared for special purposes, such as those used for wire-drawing, for polymerising synthetic rubber, or in laundries.

Subject to the exception in paragraph 1 (f) above, the soaps of this heading are generally in the following forms : bars, cakes, moulded pieces or shapes, flakes, powder, paste or aqueous solution.

(II) ORGANIC SURFACE-ACTIVE PRODUCTS AND PREPARATIONS FOR USE AS SOAP, IN THE FORM OF BARS, CAKES OR MOULDED PIECES OR SHAPES, WHETHER OR NOT CONTAINING SOAP

This part includes toilet or washing products and preparations, in which the active component consists wholly or partly of synthetic surface-active agents (which may contain soap in any proportion), **provided** they are put up in the form of bars, cakes or moulded pieces or shapes, that is to say, the ordinary forms of soaps intended for the same uses.

This part also includes such products and preparations which have been rendered abrasive by adding sand, silica, pumice powder, etc., **provided** they are put up in the forms described above.

**(III) ORGANIC SURFACE-ACTIVE PRODUCTS AND PREPARATIONS FOR
WASHING THE SKIN, IN THE FORM OF LIQUID OR CREAM AND
PUT UP FOR RETAIL SALE, WHETHER OR NOT CONTAINING SOAP**

This part includes preparations for washing the skin, in which the active component consists wholly or partly of synthetic organic-surface active agents (which may contain soap in any proportion), **provided** they are in the form of liquid or cream and put up for retail sale. Such preparations not put up for retail sale are classified in **heading 34.02**.

**(IV) PAPER, WADDING, FELT AND NONWOVENS, IMPREGNATED,
COATED OR COVERED WITH SOAP OR DETERGENT**

This part covers paper, wadding, felt and nonwovens, impregnated, coated or covered with soap or detergent, whether or not perfumed or put up for retail sale. These products are generally used for washing the hands or the face.

Apart from the exclusions referred to above, the heading **excludes** :

- (a) Soap-stocks (**heading 15.22**).
- (b) Products and preparations insoluble in water, which are "soaps" only in the chemical sense, such as calcium or other metallic "soaps" (**Chapters 29, 30, 38**, etc., as the case may be).
- (c) Paper, wadding, felt and nonwovens, simply perfumed (**Chapter 33**).
- (d) Shampoos and dentifrices (**headings 33.05** and **33.06** respectively).
- (e) Organic surface-active agents (other than soap), surface-active preparations and washing preparations (whether or not containing soap) and solutions or dispersions of soap in an organic solvent, of **heading 34.02**.
- (f) Cellular plastics, cellular rubber, textile materials (other than wadding, felt and nonwovens) and metal pads, impregnated, coated or covered with soap or detergent (these generally fall in the heading appropriate to the supporting material).

34.02 - Organic surface-active agents (other than soap); surface-active preparations, washing preparations (including auxiliary washing preparations) and cleaning preparations, whether or not containing soap, other than those of heading 34.01.

- Organic surface-active agents, whether or not put up for retail sale :

3402.11 -- Anionic

3402.12 -- Cationic

3402.13 -- Non-ionic

3402.19 -- Other

3402.20 - Preparations put up for retail sale

3402.90 - Other

**(I) ORGANIC SURFACE-ACTIVE AGENTS
(OTHER THAN SOAP)**

The organic surface-active agents of this heading are chemical compounds, not chemically defined, which contain one or more hydrophilic or hydrophobic functional groups in such a proportion that, when mixed with water at a concentration of 0.5 % at 20 °C and left to stand for one hour at the same temperature, they give a transparent or translucent liquid or stable emulsion without separation of insoluble matter (see Note 3 (a) to this Chapter). For the purposes of this heading, an emulsion should not be considered as having a stable character if, after being left to stand for one hour at 20 °C, (1) solid particles are visible to the naked eye, (2) it has separated into visually distinguishable phases or (3) it has separated into a transparent part and a translucent part, visible to the naked eye.

Organic surface-active agents are capable of adsorption at an interface; in this state they display a number of physico-chemical properties, particularly surface activity (e.g., reduction of surface tension, foaming, emulsifying, wetting), which is why they are usually known as "surfactants".

However, products which are not capable of reducing the surface tension of distilled water to 4.5×10^{-2} N/m (45 dyne/cm) or less at a concentration of 0.5 % at 20 °C are **not** regarded as surface-active agents and are therefore **excluded** from this heading.

Organic surface-active agents may be :

- (1) **Anionic**, in which case they ionise in aqueous solution to produce negatively charged organic ions responsible for the surface activity. Examples are: sulphates and sulphonates of fats, vegetable oils (triglycerides) or resin acids; sulphates and sulphonates derived from fatty alcohols; petroleum sulphonates, e.g., of alkali metals (including those containing a proportion of mineral oils), of ammonium or of ethanolamines; alkylpolyethersulphates; alkylsulphonates or alkylphenylethersulphonates; alkylsulphates, alkylarylsulphonates (e.g., technical dodecylbenzenesulphonates).

These surface-active agents may contain, as impurities resulting from the manufacturing process, small quantities of fatty alcohols, alkylates or other hydrophobic raw materials which have escaped sulphation or sulphonation. They may also contain sodium sulphate or other residual inorganic salts in a proportion generally not exceeding 15 %, when expressed as the anhydrous salts.

- (2) **Cationic**, in which case they ionise in aqueous solution to produce positively charged organic ions responsible for the surface activity. Examples are : salts of fatty amines and of quaternary ammonium bases.
- (3) **Non-ionic**, in which case they do not produce ions in an aqueous solution. Their solubility in water is due to the presence in the molecules of functional groups which have a strong affinity for water. Examples are : products of the condensation of fatty alcohols, fatty acids or alkylphenols with ethylene oxide; ethoxylates of fatty acid amides.
- (4) **Amphotytic**, in which case, depending on the conditions of the medium, they can be ionised in an aqueous solution and give to the compound the characteristics of an anionic or a cationic surface-active agent.

This ionic behaviour is similar to that of amphoteric compounds in the broadest sense. These are, for example, alkylbетaine or sulphobetaine proteins, their decomposition products and substitution compounds of amino-carboxylic, amino-sulphonic, amino-sulphuric and amino-phosphoric acids.

(II) SURFACE-ACTIVE PREPARATIONS, WASHING PREPARATIONS (INCLUDING AUXILIARY WASHING PREPARATIONS) AND CLEANING PREPARATIONS, WHETHER OR NOT CONTAINING SOAP, OTHER THAN THOSE OF HEADING 34.01

This group comprises three categories of preparations :

(A) Surface-active preparations.

These include :

- (1) Intermixtures of the surface-active agents of Part (I) above (e.g., sulphoricinoleates mixed with sulphonated alkylnaphthalenes or sulphated fatty alcohols).
- (2) Solutions or dispersions of the surface-active agents of Part (I) above in an organic solvent (e.g., a solution of a sulphated fatty alcohol in cyclohexanol or in tetrahydronaphthalene).
- (3) Other mixtures based on a surface-active agent of Part (I) above (e.g., surface-active preparations containing a proportion of soap, such as alkylbenzenesulphonate with sodium stearate).
- (4) Solutions or dispersions of soap in an organic solvent such as cyclohexanol. (Solutions of soap in water, which may have a small quantity (generally not exceeding 5 %) of alcohol or glycerol added, are liquid soaps of **heading 34.01**).

Surface-active preparations are used for their cleansing, wetting, emulsifying or dispersing properties in many industrial applications, for example as :

- (i) Detergents for the textile industry, to eliminate fats and soiling matter on textiles during manufacture and finishing.

- (ii) Wetting agents, emulsifying agents, fulling assistants and brightening agents, for the textile industry.
- (iii) Soaking agents (for raw hides), de-greasing agents, wetting agents (for use in dyeing), levelling agents or toners for the leather or fur industries.
- (iv) Basic materials for the manufacture of washing preparations of Part (B) below (e.g., anionic surface-active preparations which may contain, either as a residue or as a result of deliberate additions, a considerable quantity of sodium sulphate or other inorganic salts of the type arising during the manufacture of the surface-active agent).
- (v) Dispersing agents for the paper or synthetic rubber industries.
- (vi) Flotation aids for the mining industry.
- (vii) Emulsifying agents used in the preparation of pharmaceutical or cosmetic products.

This group **does not include** organic surface-active products and preparations for washing the skin, in which the active component consists wholly or partly of synthetic organic-surface active agents (which may contain soap in any proportion), in the form of liquid or cream and put up for retail sale (**heading 34.01**).

(B) Washing preparations (including auxiliary washing preparations) and cleaning preparations, having a basis of soap or other organic surface-active agents.

This category covers washing preparations, auxiliary washing preparations and certain cleaning preparations. These various preparations generally contain **essential** constituents and one or more **subsidiary** constituents. The presence of these latter constituents distinguishes, in particular, these preparations from those described in Part (A) above.

The **essential** constituents are synthetic organic surface-active agents or soaps or mixtures thereof.

The **subsidiary** constituents are :

- (1) Builders (e.g., sodium polyphosphates, carbonates, silicate or borate, salts of nitrilotriacetic acid (NTA)).
- (2) Boosters (e.g., alkanolamides, fatty acid amides, fatty amine oxides).
- (3) Fillers (e.g., sodium sulphate or chloride).
- (4) Ancillaries (e.g., chemical or optical bleaches, antiredeposition agents, corrosion inhibitors, antielectrostatic agents, colouring matter, perfumes, bactericides, enzymes).

These preparations act on surfaces by bringing the soil on the surface into a state of solution or dispersion.

Washing preparations based on surface-active agents are also known as **detergents**. This type of preparation is used for washing clothes and also dishes or kitchen utensils.

They may be liquids, powders or pastes and are used for household or industrial purposes. Toilet and washing products in the form of bars, cakes, moulded pieces or shapes fall in **heading 34.01**.

Auxiliary washing preparations are used for soaking (pre-washing), rinsing or bleaching clothes, household linen, etc.

Cleaning preparations serve for cleaning floors, windows or other surfaces. They may also contain small quantities of odoriferous substances.

(C) **Cleaning or de-greasing preparations, not having a basis of soap or other organic surface-active agents.**

These include :

- (i) Acid or alkaline cleaners specially formulated for cleaning sanitary ware, frying-pans, etc., e.g., those containing sodium hydrogen sulphate or a mixture of sodium hypochlorite and trisodium orthophosphate.
- (ii) Degreasing or cleaning preparations, used, e.g., in dairies or breweries, and with a basis of :
 - alkaline substances such as sodium carbonate or caustic soda, or
 - solvents and emulsifiers.

This group of products may contain small quantities of soap or other surface-active agents.

This heading **does not cover** :

- (a) Shampoos or preparations for foam baths, whether or not containing soap or other surface-active agents (**Chapter 33**).
- (b) Paper, wadding, felt and nonwovens, impregnated, coated or covered with detergent (**heading 34.01**).
- (c) Preparations, containing surface-active agents where the surface-active function is either not required or is only subsidiary to the main function of the preparation (**headings 34.03, 34.05, 38.08, 38.09, 38.24**, etc., as the case may be).
- (d) Abrasive preparations containing surface-active agents (scouring pastes and powders) (**heading 34.05**).
- (e) Water-insoluble naphthenates, petroleum sulphonates and other water-insoluble surface-active products and preparations. They fall in **heading 38.24**, provided they are not included in a more specific heading.

34.03 - Lubricating preparations (including cutting-oil preparations, bolt or nut release preparations, anti-rust or anti-corrosion preparations and mould release preparations, based on lubricants) and preparations of a kind used for the oil or grease treatment of textile materials, leather, furskins or other materials, but excluding preparations containing, as basic constituents, 70 % or more by weight of petroleum oils or of oils obtained from bituminous minerals.

- Containing petroleum oils or oils obtained from bituminous minerals :

3403.11 -- Preparations for the treatment of textile materials, leather, furskins or other materials

3403.19 -- Other

- Other :

3403.91 -- Preparations for the treatment of textile materials, leather, furskins or other materials

3403.99 -- Other

Provided they do not contain, as basic constituents, 70 % or more by weight of petroleum oils or oils obtained from bituminous minerals (see **heading 27.10**), this heading includes, *inter alia*, prepared mixtures of the following types :

(A) **Lubricating preparations designed to reduce friction** between the moving parts of machinery, vehicles, aircraft or other appliances, apparatus or instruments. Such lubricants usually consist of, or are based on, mixtures of animal, vegetable or mineral oils, fats or greases, often with additives (e.g., graphite, molybdenum disulphide, talc, carbon blacks, calcium or other metallic soaps, pitch, or rust, oxidation, etc., inhibitors). However, the heading also includes synthetic lubricating preparations based on, for example, dioctyl or dinonyl sebacates, phosphoric esters, polychlorobiphenyls, poly(oxyethylene) (polyethylene glycol) or poly(oxypropylene) (polypropylene glycol). These synthetic lubricants, which include "greases" based on silicones or jet lube oils (or synthetic ester lubes), are designed to operate under specially exacting conditions (e.g., fire-resistant lubricants, lubricants for precision instrument bearings or jet engines).

(B) **Lubricating preparations used in wire-drawing** to ensure that the wire rod slides easily through the dies. These include : certain aqueous emulsions of tallow and sulphuric acid; mixtures of sodium soap, aluminium stearate, mineral oils and water; mixtures of oils, fats and sulphonated soaps; mixtures, in powder form, of calcium soaps and lime.

(C) **Cutting-oil preparations.** These are usually based on animal, vegetable or mineral oils, often with the addition of surface-active agents.

Preparations (e.g., those with a basis of petroleum sulphonates or other surface-active products) for making cutting oils, **but generally unsuitable for direct use as cutting oils**, are **excluded (heading 34.02)**.

(D) **Bolt or nut release preparations.** These are preparations intended for loosening bolts, nuts or other parts. They generally consist principally of lubricating oils and may also contain solid lubricants, solvents, surface-active agents, rust removers, etc.

- (E) **Anti-rust or anti-corrosion preparations** consisting principally of lubricants.
- (F) **Mould release preparations based on lubricants**, used in various industries (e.g., plastics, rubber, construction, foundry), such as :
 - (1) Mineral, vegetable or animal oils or other fatty substances (including those sulphonated, oxidised or hydrogenated) mixed or emulsified with waxes, lecithin or anti-oxidants.
 - (2) Mixtures containing silicone greases or oils.
 - (3) Mixtures of powdered graphite, talc, mica, bentonite or aluminium with oils, fatty substances, waxes, etc.

However, the heading **excludes** edible mixtures or preparations of animal or vegetable fats or oils of a kind used as mould release preparations (e.g., demoulding oils for bakery) (**heading 15.17**).

- (G) **Preparations for the lubricating, oiling or greasing of textiles, leather, hides, furskins, etc.** These may be used to lubricate or soften textile fibres during spinning, to "stuff" leather, etc. They include, for example : mixtures of mineral oil or fatty substances with surface-active agents (e.g., sulphorcinoleates); water-dispersible textile lubricating preparations containing a high proportion of surface-active agents together with mineral oils and other chemicals.

The heading also covers :

- (1) **Stabilised suspensions of molybdenum disulphide in mineral oil**, containing by weight 70 % or more of mineral oil, for adding, in small quantities, solely by reason of their special lubricating properties, to lubricating oils for engines, etc., the molybdenum disulphide being the basic constituent.
- (2) **Anti-rust preparations** based on lanolin and dissolved in white spirit, even if the content of white spirit is 70 % or more by weight.
- (3) **Non-hardening pastes** consisting of petroleum jelly and calcium soaps, and used for lubricating and sealing joints and threads when assembling vacuum power brake units.

The heading also **excludes** :

- (a) Artificial degras (**heading 15.22**).
- (b) Gel preparations designed to be used in human or veterinary medicine as a lubricant for parts of the body for surgical operations or physical examinations or as a coupling agent between the body and medical instruments (**heading 30.06**).
- (c) Colloidal or semi-colloidal graphite or graphite pastes, of **heading 38.01**.
- (d) Anti-slip transmission belt preparations (**heading 38.24**) and anti-rust preparations of **heading 38.24**.

34.04 - Artificial waxes and prepared waxes.

3404.20 - Of poly(oxyethylene) (polyethylene glycol)

3404.90 - Other

This heading covers artificial waxes (sometimes known in industry as "synthetic waxes") and prepared waxes, as defined in Note 5 to this Chapter, which consist of or contain relatively high molecular weight organic substances and which are **not** separate chemically defined compounds. These waxes are :

- (A) Chemically produced organic products of a **waxy character**, whether or not water-soluble. Waxes of **heading 27.12**, produced synthetically or otherwise (e.g., Fischer-Tropsch waxes consisting essentially of hydrocarbons) are, however, **excluded**. Water-soluble waxy products having surface-active properties are also **excluded** (**heading 34.02**).
- (B) Products obtained by mixing two or more different animal waxes, different vegetable waxes or different waxes of other classes or by mixing waxes of different classes (animal, vegetable or other) (for example, mixtures of different vegetable waxes and mixtures of a mineral wax with a vegetable wax). Mixtures of mineral waxes are, however, **excluded** (**heading 27.12**).
- (C) Products of a **waxy character** with a basis of one or more waxes and containing fats, resins, mineral substances or other materials. Unmixed animal or vegetable waxes, whether or not refined or coloured, are, however, **excluded** (**heading 15.21**). Unmixed mineral waxes or mixtures of mineral waxes, whether or not coloured, are also **excluded** (**heading 27.12**).

The products described in (A), (B) and (C) above, when mixed with, dispersed (suspended or emulsified) in or dissolved in a liquid medium, are however **excluded** from this heading (**headings 34.05, 38.09**, etc.).

The waxes of paragraphs (A) and (C) above must have :

- (1) a dropping point above 40 °C; and
- (2) a viscosity, when measured by rotational viscometry, not exceeding 10 Pa.s (or 10,000 cP) at a temperature of 10 °C above their dropping point.

In addition, such products generally display the following properties :

- (a) they take a polish when gently rubbed;
- (b) their consistency and solubility depend largely on temperature;
- (c) at 20 °C :
 - (i) some are soft and kneadable (but not sticky or liquid) (soft waxes), others are brittle (hard waxes);
 - (ii) they are not transparent but may be translucent;
- (d) at temperatures above 40 °C, they melt without decomposing;
- (e) just above their melting point they cannot easily be drawn into threads;
- (f) they are poor conductors of heat and electricity.

The waxes of this heading vary in chemical composition. Such waxes include :

- (1) Polyalkylene waxes (e.g., polyethylene wax). They are used in packaging materials, textile lubricants, polishes, etc.
- (2) Waxes obtained by partial oxidation of hydrocarbon waxes (such as synthetic or natural paraffin wax). They are used extensively in polishes, coatings, lubricants, etc.
- (3) Waxes composed of mixtures of chloroparaffins, polychlorobiphenyls or polychloronaphthalenes. They are used in flame-proofing, as insulators, capacitor impregnators, lubricants, wood preservatives, etc.
- (4) Poly(oxyethylene) (polyethylene glycol) waxes. They are water-soluble and are used in cosmetics or pharmaceuticals, as binding agents, softeners, preservatives and in adhesives for textiles or paper, in inks or rubber compositions, etc.
- (5) Waxes composed of mixtures of fatty ketones, fatty esters (such as propylene glycol monostearate modified with small quantities of soap, and mixed glycerol mono- and distearate esterified by tartaric acid and acetic acid), fatty amines or fatty amides. They are used in cosmetics, polishes, paints, etc.
- (6) Waxes obtained by partial or complete chemical modification of natural waxes such as lignite wax.
- (7) Waxes composed of two or more different waxes (**except** mixtures of mineral waxes which fall in **heading 27.12**) or one or more waxes with other material, for example, wax consisting of paraffin wax and polyethylene, used as coating material, wax composed of paraffin wax and stearic acid, used as raw material for making candles, wax composed of oxidised hydrocarbon wax and emulsifier; sealing wax and waxes of similar composition, however they are put up, **other than** products of **heading 32.14**.

The above waxes, if coloured, are also classified here.

Apart from the exclusions mentioned above, the heading **does not cover** :

- (a) Lanolin alcohols, even if having the character of waxes (**heading 15.05**).
- (b) Hydrogenated oils, even if having the character of waxes (**heading 15.16**).
- (c) Separate chemically defined organic compounds (**Chapter 29**).
- (d) “Dental wax” and “dental impression compounds”, put up in sets, in packings for retail sale or in plates, horseshoe shapes, sticks or similar forms (**heading 34.07**).
- (e) Industrial monocarboxylic fatty acids and industrial fatty alcohols, even if having the character of waxes (**heading 38.23**).
- (f) Mixtures of mono-, di- and tri-, fatty acid esters of glycerol, not having the character of waxes (**heading 38.24**).
- (g) Mixed polychlorobiphenyls and mixed chloroparaffins, not having the character of waxes (**heading 38.24**).
- (h) Poly(oxyethylene) (polyethylene glycol) not having the character of waxes (e.g., **heading 38.24** or **39.07**).
- (ij) Polyethylenes not having the character of waxes (e.g., **heading 39.01**).

34.05 - Polishes and creams, for footwear, furniture, floors, coachwork, glass or metal, scouring pastes and powders and similar preparations (whether or not in the form of paper, wadding, felt, nonwovens, cellular plastics or cellular rubber, impregnated, coated or covered with such preparations), excluding waxes of heading 34.04.

3405.10 - Polishes, creams and similar preparations for footwear or leather

3405.20 - Polishes, creams and similar preparations for the maintenance of wooden furniture, floors or other woodwork

3405.30 - Polishes and similar preparations for coachwork, other than metal polishes

3405.40 - Scouring pastes and powders and other scouring preparations

3405.90 - Other

This heading covers polishes and creams for footwear, furniture, floors, coachwork, glass or metal (silverware, copper, etc.) and prepared pastes or powders for scouring cooking utensils, sinks, tiles, stoves, etc., and similar preparations such as polishes and creams for leather. The heading also includes polishing preparations with preservative properties.

These preparations may have a basis of wax, abrasives or other substances. Examples of such preparations are :

- (1) Waxes and polishes consisting of waxes impregnated with spirits of turpentine or emulsified in an aqueous medium and frequently containing added colouring matter.
- (2) Metal polishes and polishes for glass consisting of very soft polishing materials such as chalk or kieselguhr in suspension in an emulsion of white spirit and liquid soap.
- (3) Metal, etc., polishing, finishing or fine-grinding products containing diamond powder or dust.
- (4) Scouring powders consisting of mixtures of very finely ground sand with sodium carbonate and soap. Scouring pastes are obtained by binding these powders with, for example, a solution of waxes in a lubricating mineral oil.

These preparations, which are often put up for retail sale and are usually in the form of liquids, pastes, powders, tablets, sticks, etc., may be used for household or industrial purposes. The heading also covers paper, wadding, felt, nonwovens, cellular plastics or cellular rubber, impregnated, coated or covered with such preparations, but textile dusters and metal pot scourers similarly impregnated, coated or covered are **excluded** (**Sections XI and XV** respectively).

The heading also **excludes** :

- (a) Abrasive powders, when not mixed (generally **Chapter 25 or 28**).
- (b) Whitewashings for footwear, in tablets, and prepared liquid dyes for chamois-leather footwear (**heading 32.10**).

- (c) Degras and artificial degras (**heading 15.22**); other oils and greases for leather dressing (**Chapter 15, headings 27.10, 34.03, 38.24**, etc.).
- (d) Dry-cleaning fluids and stain removers, for cleaning clothing, which are classified according to their composition (usually as petroleum spirit, **heading 27.10**, or as products of **heading 38.14** or **38.24**).

34.06 - Candles, tapers and the like.

Candles, tapers (including ball or coiled tapers), etc., are usually made of tallow, stearin, paraffin wax or other waxes.

The heading covers these goods whether or not coloured, perfumed, decorated, etc.

The heading also covers night lights fitted with a float.

The heading **excludes** :

- (a) Anti-asthmatic candles (**heading 30.04**).
- (b) Wax matches or vestas (**heading 36.05**).
- (c) Sulphur-treated bands, wicks and candles (**heading 38.08**).

34.07 - Modelling pastes, including those put up for children's amusement; preparations known as "dental wax" or as "dental impression compounds", put up in sets, in packings for retail sale or in plates, horseshoe shapes, sticks or similar forms; other preparations for use in dentistry, with a basis of plaster (of calcined gypsum or calcium sulphate).

(A) Modelling pastes.

These are plastic preparations generally used by artists or goldsmiths for making models and also by children for amusement purposes.

The most common are those with a basis of zinc oleate. These also contain waxes, white oil and kaolin and are slightly greasy to the touch.

Others are mixtures of cellulose pulp and kaolin with binders.

These pastes are usually coloured and are presented in bulk or in cakes, sticks, plates, etc.

Assorted modelling pastes, including those put up in sets for the amusement of children, are also covered by this heading.

(B) Preparations known as "dental wax" or as "dental impression compounds".

These are preparations of varying composition used in dentistry for taking dental impressions. They consist generally of wax, plastics or gutta-percha, mixed with products such as rosin, shellac and fillers (e.g., powdered mica) and are usually coloured. They may be hard or slightly soft.

These preparations are classified here **only** if put up in sets, in packings for retail sale or in plates, horseshoe shapes (solid or hollowed), sticks or similar forms. When **put up otherwise** (e.g., in bulk), they are classified according to their composition (**headings 34.04, 38.24, etc.**).

(C) Other preparations for use in dentistry, with a basis of plaster (of calcined gypsum or calcium sulphate).

This heading includes preparations for use in dentistry with a basis of plaster, usually containing more than 2% of additives by weight. Possible additives are titanium dioxide as a white pigment, colouring agents, kieselguhr, dextrins and melamine resin. They also contain setting accelerators or retarders.

Such products for use in dentistry generally contain 25% or more by weight of α -calcium sulphate hemihydrate or almost exclusively α -calcium sulphate hemihydrate, a form that does not occur naturally and that can be produced, e.g., by dehydration of gypsum deposits with a high calcium sulphate dihydrate content.

The products are used for taking dental impressions, for making models or for other dental uses and are classified here regardless of form or presentation.

Such preparations should not be confused with the plasters which contain small quantities of accelerators or retarders only (**heading 25.20**).

The heading **excludes** dental cements and other dental fillings (**heading 30.06**).

Chapter 35

Albuminoidal substances; modified starches; glues; enzymes

Notes.

- 1.- This Chapter does not cover :
 - (a) Yeasts (heading 21.02);
 - (b) Blood fractions (other than blood albumin not prepared for therapeutic or prophylactic uses), medicaments or other products of Chapter 30;
 - (c) Enzymatic preparations for pre-tanning (heading 32.02);
 - (d) Enzymatic soaking or washing preparations or other products of Chapter 34;
 - (e) Hardened proteins (heading 39.13); or
 - (f) Gelatin products of the printing industry (Chapter 49).
- 2.- For the purposes of heading 35.05, the term “dextrins” means starch degradation products with a reducing sugar content, expressed as dextrose on the dry substance, not exceeding 10 %. Such products with a reducing sugar content exceeding 10 % fall in heading 17.02.

35.01 - Casein, caseinates and other casein derivatives; casein glues.

3501.10 - Casein

3501.90 - Other

(A) Casein and casein derivatives.

- (1) **Casein** is the main protein constituent of milk. It is obtained from skimmed milk by precipitation (curdling), generally with acids or rennet. The heading covers various types of casein which differ according to the method of curdling, e.g., acid casein, caseinogen and rennet casein (paracasein).

Casein is usually a yellowish-white granular powder, soluble in alkalis but not in water. It is used mainly in the preparation of glues, paints or distempers, for the coating of papers, and in the manufacture of casein plastics (hardened casein), man-made fibres, dietary or pharmaceutical products.

- (2) **Caseinates** (salts of casein) include the sodium and ammonium salts known as “soluble caseins”; these salts are normally used to prepare concentrated foods and pharmaceutical products. Calcium caseinate is used in the preparation of foodstuffs or as a glue, according to its character.
- (3) **Other casein derivatives** include, in particular, chlorinated casein, brominated casein, iodised casein and casein tannate. They are used in pharmacy.

(B) Casein glues.

These consist of calcium caseinate (see Note on caseinates above), or of mixtures of casein and chalk with the addition of, for example, small quantities of borax or ammonium chloride. They are usually in the form of powders.

The heading **does not include** :

- (a) Precious metal caseinates (**heading 28.43**) or caseinates of **headings 28.44 to 28.46** and **28.52**.
- (b) Products incorrectly described as “vegetable casein” (**heading 35.04**).
- (c) Casein glues put up for retail sale, not exceeding a net weight of 1 kg (**heading 35.06**).
- (d) Hardened casein (**heading 39.13**).

35.02 - Albumins (including concentrates of two or more whey proteins, containing by weight more than 80% whey proteins, calculated on the dry matter), albuminates and other albumin derivatives.

- Egg albumin :

3502.11 -- Dried

3502.19 -- Other

3502.20 - Milk albumin, including concentrates of two or more whey proteins

3502.90 - Other

- (1) **Albumins** are animal or vegetable proteins. The former are the more important and include egg white (ovalbumin), blood albumin (serum albumin), milk albumin (lactalbumin) and fish albumin. Unlike casein, they are soluble in water as well as in alkalis and the solutions coagulate on heating.

The heading also includes whey protein concentrates which contain two or more whey proteins and have a whey protein content of more than 80% by weight, calculated on the dry matter. The whey protein content is calculated by multiplying the nitrogen content by a conversion factor of 6.38. Whey protein concentrates containing 80% or less by weight of whey proteins, calculated on the dry matter, are classified in **heading 04.04**.

Albumins are usually in the form of viscous liquids, transparent yellow flakes or amorphous white, reddish or yellowish powders.

They are used in the preparation of glues, foodstuffs, pharmaceutical products, for leather finishing, for treating textiles or paper (especially photographic papers), for clarification of wine or other beverages, etc.

- (2) **Albuminates (salts of albumin) and other albumin derivatives**, in particular iron albuminate, brominated albumins, iodised albumins and albumin tannate.

This heading also **excludes** :

- (a) Dried blood, sometimes incorrectly described as "blood albumin" (**heading 05.11**).
- (b) Precious metal albuminates (**heading 28.43**) or albuminates of **headings 28.44 to 28.46** and **28.52**.
- (c) Blood albumin prepared for therapeutic or prophylactic uses and human plasma (**Chapter 30**).

35.03 - Gelatin (including gelatin in rectangular (including square) sheets, whether or not surface-worked or coloured) and gelatin derivatives; isinglass; other glues of animal origin, excluding casein glues of heading 35.01.

Gelatin and the glues of this heading are water-soluble protein substances obtained by treating skins, cartilage, bones, tendons or similar animal materials, usually with warm water with or without addition of acids.

- (A) **Gelatin** is less glutinous and more refined than glues, forming a clear jelly with water. It is used in the preparation of foodstuffs, pharmaceutical products and photographic emulsions, for bacteriological culture and for clarifying beers and wines. It is also used for sizing paper or textiles, in the printing industry, for preparing plastics (hardened gelatin) and for manufacturing into articles.

Gelatin is usually in the form of thin, transparent, almost colourless and odourless sheets still bearing the impressions of the nets on which it was dried, but it is also marketed in slabs, plates, sheets, flakes, powders, etc.

Sheets of gelatin are classified in this heading provided they are in the form of rectangles (including squares), and whether or not they are surface-worked or coloured (e.g., embossed, metallised, printed - **other than** gelatin postcards and other products printed as described in **Chapter 49**). If cut otherwise than in rectangles or squares (e.g., discs) they are classified in **heading 96.02**. Moulded or carved unhardened gelatin is also classified in **heading 96.02**.

- (B) **Gelatin derivatives** include in particular gelatin tannate and gelatin bromotannate.
- (C) **Izinglass** is obtained by mechanical treatment of the air bladders of certain fish, particularly the sturgeon. It is presented in a solid state, generally in the form of semi-transparent thin sheets. It is used principally as a clarifying agent for beer, wine or other alcoholic beverages, and in pharmacy.
- (D) **The other glues of animal origin** covered by this heading are the impure forms of gelatin used as glues. They may contain additives such as preservatives, pigments or viscosity control agents.

The principal glues are :

- (1) **Bone glues, hide glues, nerve glues, sinew glues.** These glues are yellow to brown in colour with a strong odour and are generally in thicker, harder, more brittle sheets than raw gelatin. They may also be in the form of beads, flakes, etc.
- (2) **Fish glues** (other than isinglass). These glues are obtained by the action of hot water on fish waste (skin, cartilage, bones, fins, etc.), and are usually in a gelatinous liquid state.

The heading **does not cover** :

- (a) Casein glues (**heading 35.01**).
- (b) Glues put up for retail sale, not exceeding a net weight of 1 kg (**heading 35.06**).
- (c) Copying pastes (duplicating jellies) with a basis of gelatin (**heading 38.24**).
- (d) Hardened gelatin (**heading 39.13**).

35.04 - Peptones and their derivatives; other protein substances and their derivatives, not elsewhere specified or included; hide powder, whether or not chromed.

This heading covers :

(A) Peptones and their derivatives.

- (1) **Peptones** are soluble substances obtained when proteins are hydrolysed or submitted to the action of certain enzymes (pepsin, papain, pancreatin, etc.). They are usually white or yellowish powders and, being very hygroscopic, they are normally packed in airtight containers. Peptones may also be in solution. The main varieties are meat peptones, yeast peptones, blood peptones and casein peptones.

They are used in pharmacy, in food preparations, for bacterial cultures, etc.

- (2) **Peptonates** are derivatives of peptones. They are used principally in pharmacy; the most important are iron peptonates and manganese peptonates.

(B) Other protein substances and their derivatives, not covered by a more specific heading in the Nomenclature, including in particular :

- (1) **Glutelins** and **prolamins** (e.g., gliadins extracted from wheat or rye, and zein extracted from maize), being cereal proteins.

- (2) **Globulins**, e.g., lactoglobulins and ovoglobulins (but see exclusion (d) at the end of the Explanatory Note).

- (3) **Glycinin**, the main soya protein.

- (4) **Keratins** obtained from hair, nails, horns, hoofs, feathers, etc.

- (5) **Nucleoproteids**, being proteins combined with nucleic acids, and their derivatives. Nucleoproteids are isolated, for example, from brewer's yeast, and their salts (of iron, copper, etc.) are used mainly in pharmacy.

However, nucleoproteids of mercury answering to a description in **heading 28.52** are **excluded**.

- (6) **Protein isolates** obtained by extraction from a vegetable substance (e.g., defatted soya bean flour) and consisting of a mixture of proteins contained therein. The protein content of these isolates is generally not less than 90%.

(C) Hide powder, whether or not chromed. Hide powder is used for the determination of tannin in natural tanning materials and in vegetable tanning extracts. It is virtually pure collagen and is obtained by careful preparation from fresh skins. The powder may contain a small quantity of added chrome alum (chromed hide powder), or it may be presented unchromed requiring addition of the chrome alum immediately prior to use. Hide powder so treated must not be confused with chrome leather dust, powder and flour of **heading 41.15** which are not suitable for the determination of tannin and are of less value.

The heading **does not include** :

- (a) Protein hydrolysates consisting mainly of a mixture of amino-acids and sodium chloride, and concentrates obtained by the elimination of certain constituents of defatted soya-bean flour, used as additives in food preparations (**heading 21.06**).
- (b) Precious metal proteinates (**heading 28.43**) or proteinates of **headings 28.44 to 28.46** and **28.52**.
- (c) Nucleic acid and its salts (nucleates) (**heading 29.34**).
- (d) Fibrinogen, fibrin, blood globulins and serum globulins, human normal immunoglobulin and antisera (specific immunoglobulins) and other blood fractions (**heading 30.02**).
- (e) Products described in this heading when put up as medicaments (**heading 30.03** or **30.04**).
- (f) Enzymes (**heading 35.07**).
- (g) Hardened proteins (**heading 39.13**).

35.05 - Dextrins and other modified starches (for example, pregelatinised or esterified starches); glues based on starches, or on dextrins or other modified starches

3505.10 - Dextrins and other modified starches

3505.20 - Glues

This heading covers :

(A) **Dextrins and other modified starches**, i.e., products obtained by the transformation of starches through the action of heat, chemicals (e.g., acids, alkalis) or diastase, and starch modified, e.g., by oxidation, esterification or etherification. Cross-linked starches (e.g., distarch phosphate) are an important group of modified starches.

(1) **Dextrins**, obtained :

- either by the degradation of starch by hydrolysis with acids or enzymes, the resulting product being termed maltodextrin. However products of this kind are classified here as dextrins only if their reducing sugar content, expressed as dextrose on the dry substance, does not exceed 10%;
- or by roasting starch, with or without small quantities of chemical reagents. If no reagents are used, the resulting product is known as roasted starch.

Dextrins are white, yellowish or brown powders, depending on manufacturing process and the kind of starch used. They are soluble in water (suitably heated, if necessary) but not in alcohol.

(2) **Soluble starch (amylogen)** : an intermediate product obtained in the transformation of starches into dextrins, prepared by boiling starch in water, or by keeping starch for a long while in contact with cold dilute acid. The heading also includes soluble starches containing very small quantities of kaolin, mainly used for adding to cellulose pulp during the manufacture of paper.

(3) **Pregelatinised or “swelling” starch**, obtained by moistening starch with water and heat-treating it to obtain a more or less gelatinous mass, which is then dried and ground to a powder. This product can also be obtained by extrusion, followed by grinding to a powder. It is used in paper manufacture, in the textile industry, in metallurgy (for the preparation of foundry core binders), in the food industries and for animal feed, etc.

(4) **Etherified or esterified starches** (starches modified by etherification or esterification). Etherified starches include those containing hydroxyethyl, hydroxypropyl or carboxymethyl groups. Esterified starches include starch acetates used principally in the textile or paper industries, and starch nitrates (nitrostarch) used in the manufacture of explosives.

(5) **Other modified starches**, for example :

- (i) **Dialdehyde starch**, and

- (ii) **Starch treated with formaldehyde or epichlorohydrin**, used, for example, as surgical glove powder.

In general, modified starches of this heading may be distinguished from unmodified starches of Chapter 11 on the basis of changes in their properties, for example, solution and gel clarity, tendency to gel or to crystallise, water binding capacity, freeze-thaw stability, gelatinisation temperature or peak viscosity.

(B) Glues based on starches, or on dextrins or other modified starches.

- (1) **Dextrin glues** consisting of dextrin in aqueous solution or mixed with other substances (e.g., magnesium chloride).
- (2) **Starch glues**, obtained by treating starch with an alkali (e.g., sodium hydroxide).
- (3) **Glues** consisting of untreated starch, borax and water-soluble cellulose derivatives or consisting of untreated starch, borax and starch ethers.

The above-mentioned products are usually in the form of white, yellow or brownish amorphous powders or gum-like masses, hence the application of the names "British gum" and "Starch gum" to certain of these products. They are mainly used as glues, in the colour industry, in the textile or paper industries, and in metallurgy.

The heading **does not cover** :

- (a) Starches, not prepared (**heading 11.08**).
- (b) Starch degradation products with a reducing sugar content, expressed as dextrose on the dry substance, exceeding 10% (**heading 17.02**).
- (c) Glues put up for retail sale, not exceeding a net weight of 1 kg (**heading 35.06**).
- (d) Prepared glazings and dressings (based on starches or dextrins) of a kind used in the paper, textile, leather or like industries (**heading 38.09**).

35.06 - Prepared glues and other prepared adhesives, not elsewhere specified or included; products suitable for use as glues or adhesives, put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg.

3506.10 - Products suitable for use as glues or adhesives, put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg

- Other :

3506.91 -- Adhesives based on polymers of headings 39.01 to 39.13 or on rubber

3506.99 -- Other

This heading covers :

(A) **Products suitable for use as glues or adhesives and put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg.**

This group covers the prepared glues and adhesives of (B) below and other products suitable for use as glues or adhesives, **provided** they are put up for retail sale as glues or adhesives in packages the content of which does not exceed 1 kg.

The packages in which glues or adhesives are usually put up for retail sale include glass bottles or jars, metal boxes, collapsible metal tubes, cartons, paper bags, etc.; sometimes the “packaging” is merely a paper band wrapped round, for example, a slab of bone glue. A small brush of the appropriate type is sometimes packed with glues or adhesives (e.g., those put up in jars or tins ready for direct use). Such brushes are classified with the glues or adhesives if packed therewith.

Products having other uses in addition to use as glues or adhesives (e.g., dextrins, methyl cellulose in granules) are classified in this heading **only** if there is some indication on the packages that they are intended for sale as glues or adhesives.

(B) **Prepared glues and other prepared adhesives, not covered by a more specific heading in the Nomenclature, for example :**

(1) **Gluten glues** (“Vienna glues”) normally obtained from gluten rendered soluble by partial fermentation. These glues are usually in the form of flakes or powders and vary in colour from yellowish to brown.

(2) **Glues or other adhesives obtained by chemically treating natural gums.**

(3) **Adhesives based on silicates, etc.**

(4) **Preparations specially formulated for use as adhesives**, consisting of polymers or blends thereof of headings 39.01 to 39.13 which, apart from any permitted additions to the products of Chapter 39 (fillers, plasticisers, solvents, pigments, etc.), contain other added substances not falling in that Chapter (e.g., waxes, rosin esters, unmodified natural shellac).

(5) **Adhesives consisting of a mixture** of rubber, organic solvents, fillers, vulcanising agents and resins.

Except when they comply with the provisions of paragraph (A) above, the heading **excludes** products covered by a more specific heading in the Nomenclature, for example :

- (a) Casein glues (**heading 35.01**), glues of animal origin (**heading 35.03**) and glues based on starches, or on dextrins or other modified starches (**heading 35.05**).
- (b) Other products, which can be used as glues or other adhesives either directly or after treatment, for example, bird lime (**heading 13.02**), silicates, not mixed (**heading 28.39**), calcium caseinate (**heading 35.01**), dextrin (**heading 35.05**), dispersions or solutions of polymers of headings 39.01 to 39.13 (**Chapter 39** or **heading 32.08**) and dispersions or solutions of rubber (**Chapter 40**).

It is to be noted that certain of the products included in this heading are usable as glues or adhesives in the form in which they are sold, while others must be dissolved or dispersed in water before use.

The heading **does not cover** prepared glazings and dressings for textiles, etc. (**heading 38.09**) or foundry core binders (**heading 38.24**); in certain countries, these substances are sometimes called “glues”, but they are not used for their adhesive properties.

The heading also **excludes** products having the character of mastics, fillings, etc., of **heading 32.14**.

35.07 - Enzymes; prepared enzymes not elsewhere specified or included.

3507.10 - Rennet and concentrates thereof

3507.90 - Other

Enzymes are organic substances produced by living cells; they have the property of causing and regulating specific chemical reactions inside or outside living cells, without themselves undergoing any change in their chemical structure.

Enzymes may be referred to as follows :

(I) According to their chemical constitution, e.g. :

- (a) Enzymes in which the molecule consists solely of a protein (e.g., pepsin, trypsin, urease).
- (b) Enzymes in which the molecule consists of a protein combined with a non-protein compound of low molecular weight, acting as a cofactor. The cofactor may be either a metal ion (e.g., copper in ascorbate oxidase, zinc in human placental alkaline phosphatase) or a complex organic molecule called a coenzyme (e.g., thiamine diphosphate in pyruvate decarboxylase, pyridoxal phosphate in glutamine-oxo-acid aminotransferase). Sometimes both are required.

(II) According to :

- (a) **their chemical activity** as oxidoreductases, transferases, hydrolases, lyases, isomerases, ligases; or
- (b) **their biological activity** as amylases, lipases, proteases, etc.

*
* *

This heading includes :

(A) “Pure” (isolated) enzymes.

These are generally in crystalline form, and are mainly intended for use in medicine or in scientific research. They are not as important in international trade as enzymatic concentrates and prepared enzymes.

(B) Enzymatic concentrates.

These concentrates are generally obtained from either aqueous or solvent extracts of animal organs, of plants, of micro-organisms or of culture-broths (the latter derived from bacteria, moulds, etc.). These products, which may contain several enzymes in various proportions, can be standardised or stabilised.

It should be noted that certain standardising or stabilising agents may already exist in the concentrates in variable quantities, deriving either from the fermentation liquor or from the clarifying or precipitating processes.

The concentrates can be obtained, for example, in powder form by precipitation or freeze-drying or in granular form by using granulating agents or inert supports or carriers.

(C) Prepared enzymes not elsewhere specified or included.

Prepared enzymes are obtained by further dilution of the concentrates mentioned in Part (B) above or by intermixing isolated enzymes or enzymatic concentrates. Preparations with substances added, which render them suitable for specific purposes, are also included in this heading, **provided** they are **not** covered by a more specific heading in the Nomenclature.

This group includes, *inter alia* :

- (i) Enzymatic preparations for tenderising meat, such as those consisting of a proteolytic enzyme (e.g., papain) with added dextrose or other foodstuffs.
- (ii) Enzymatic preparations for clarifying beer, wine or fruit juice (e.g., pectic enzymes containing added gelatin, bentonite, etc.).
- (iii) Enzymatic preparations for desizing textiles such as those with a basis of bacterial α -amylases or proteases.

This heading **excludes**, *inter alia*, the following preparations :

- (a) Medicaments (**heading 30.03 or 30.04**).
- (b) Enzymatic preparations for pre-tanning (**heading 32.02**).
- (c) Enzymatic soaking or washing preparations and other products of **Chapter 34**.

* * *

The following are the most important among the enzymes found in trade :

(1) Rennet (lab-ferment, chymosin, rennin).

Rennet is obtained either from the fresh or dried fourth stomach of calves or by the cultivation of certain micro-organisms. It is a proteolytic enzyme which curdles milk by coagulating its casein. It is available in liquid, powder or tablet form. It may contain salts (e.g., sodium chloride, calcium chloride, sodium sulphate), remaining from the manufacturing process or added for standardisation, and preserving agents (e.g., glycerol).

Rennet is mainly used in the cheese industry.

(2) Pancreatic enzymes.

The most important enzymes produced by the pancreas are **trypsin** and **chymotrypsin** (which break down proteins), α -**amylase** (which breaks down starches) and **lipase** (which breaks down fatty substances). They are mainly used in medicine and pharmacy for treating digestive disturbances.

Enzymatic concentrates of the pancreas are normally obtained from fresh or dried pancreas. They may contain highly absorbent salts (added to take up part of the water of crystallisation) and certain protective colloids (to facilitate storage or transport). They are used in the manufacture of preparations for desizing, washing, hair-removal or tanning.

The enzymatic preparations of the pancreas classified in this heading include those used for de-sizing textiles.

(3) Pepsin.

Pepsin is obtained from the stomach mucosa of hogs or cattle. For the purposes of stabilisation, it is sometimes preserved in a saturated solution of magnesium sulphate or is mixed with sucrose or lactose (powdered pepsin).

Pepsin is used mainly for medicinal purposes, combined with hydrochloric acid or betaine hydrochloride, or as pepsin wine.

(4) Malt enzymes.

This group covers **only malt amylases**.

Malt extracts are classified in **heading 19.01**.

(5) Papain, bromelains, ficin.

The term **papain** is used to describe both the dried latex of the papaya tree (*Carica papaya*) and the two fractions obtained from this product, viz., **papain** (in the more limited sense of this term) and **chymopapain**.

Papain is used, for example, for the manufacture of chillproof beer, in the preparation of meat tenderisers (see paragraph (C) (i) above) and in medicine.

Papain as the dried latex which is only partly water-soluble, falls in **heading 13.02**.

Bromelains are obtained from pineapple plants.

Ficin is obtained from the latex of certain varieties of fig trees.

(6) Amylases and proteases obtained from micro-organisms.

Certain micro-organisms, when grown in appropriate culture media, secrete a considerable quantity of amylases and proteases.

After removal of the cells and other impurities, the solutions are either concentrated by low temperature vacuum evaporation or the enzymes are precipitated by the addition of inorganic salts (e.g., sodium sulphate) or organic, water-miscible solvents (e.g., acetone).

Examples of microbial amylases and proteases are :

(a) Bacterial α -amylases.

Bacterial α -amylases (obtained, for example, by use of *Bacillus subtilis*) are starch-liquefying enzymes, used for the production of adhesives and of starch-based paper coatings, in bakeries and other food industries and for desizing textiles.

(b) Fungal amylases.

Fungal amylases are essentially α -amylases derived from mould cultures, mainly of the genus *Rhizopus* or the genus *Aspergillus*.

Although their liquefying power is marked, it is much less than that of bacterial amylases.

Fungal amylases have many uses in the food industry.

It should be noted that fungal amylases sometimes contain proteases, glucose oxidase and invertase.

(c) **Amyloglucosidases.**

These enzymes, obtained, for example, from moulds of the genus *Rhizopus* or the genus *Aspergillus* are strong saccharifying agents but have no liquefying properties. They are used to obtain a high yield of dextrose from starchy materials.

Their main applications are in the production of glucose syrups and dextrose, and as saccharifying agents for grain alcohol fermentation mashes.

(d) **Proteases.**

Bacterial proteases (obtained by use of, for example, *Bacillus subtilis*) are proteolytic enzymes used to prepare textile desizing agents, as ingredients in certain washing preparations and in beer-making. Proteases produced from moulds are used for medicinal and pharmaceutical purposes.

(7) **β -Amylases.**

These enzymes are obtained from vegetable materials, such as malted barley, wheat and soya beans. They produce maltose from starch and dextrans.

(8) **Pectic enzymes.**

These enzymes are manufactured by cultivating various mould types, mainly of the genus *Rhizopus* or the genus *Aspergillus*. They are used in the manufacture (in order to facilitate the pressing operation and increase the juice recovery) and processing of fruit and vegetable juices.

(9) **Invertase (β -fructofuranosidase).**

Invertase is usually derived from low fermentation brewer's yeast.

This enzyme splits sucrose into glucose and fructose. It is used in the manufacture of golden syrup, chocolate and marzipan.

(10) **Glucose isomerase.**

This enzyme is manufactured by culture of certain micro-organisms, mainly of the genus *Streptomyces* or the genus *Bacillus*. It is used for the partial conversion of glucose to fructose in the production of syrups with a high degree of sweetness.

In addition to the other exclusions referred to above, this heading **does not cover** :

- (a) Yeasts (**heading 21.02**).
- (b) Coenzymes such as cocarboxylase (aneurine pyrophosphate) and cozymase (nicotinamide-adenine dinucleotide) (**Chapter 29**).
- (c) Dried glands and other products of **heading 30.01**.
- (d) Cultures of micro-organisms, blood enzymes (e.g., thrombin), blood fractions and truncated variants (parts) thereof with enzymatic properties/activity and other products of **heading 30.02..**

Chapter 36

Explosives; pyrotechnic products; matches; pyrophoric alloys; certain combustible preparations

Notes.

- 1.- This Chapter does not cover separate chemically defined compounds other than those described in Note 2 (a) or (b) below.
- 2.- The expression “articles of combustible materials” in heading 36.06 applies only to :
 - (a) Metaldehyde, hexamethylenetetramine and similar substances, put up in forms (for example, tablets, sticks or similar forms) for use as fuels; fuels with a basis of alcohol, and similar prepared fuels, in solid or semi-solid form;
 - (b) Liquid or liquefied-gas fuels in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³; and
 - (c) Resin torches, firelighters and the like.

GENERAL

This Chapter includes **propellant powders and prepared explosives**, *viz.*, **mixtures** characterised by the fact that they contain the oxygen necessary for their combustion and that in combustion they produce a large volume of gas at a high temperature.

It also covers certain accessory products required for their ignition (percussion or detonating caps, detonators, etc.).

Articles prepared from explosive, pyrophoric, inflammable or combustible products for producing light, sound, smoke, flame or sparks (e.g., pyrotechnic products, matches, ferro-cerium and certain combustible preparations) are also classified here.

This Chapter **does not cover** separate chemically defined compounds (usually classified in **Chapter 28** or **29**), **except** certain fuels described in Parts (II) (A), (II) (B) (1) and (II) (B) (2) of the Explanatory Note to heading 36.06. It also **excludes** ammunition of **Chapter 93**.

36.01 - Propellant powders.

These powders are mixtures, the combustion of which produces a large volume of hot gases. These gases generate a propellant effect.

In the case of propellant powders for firearms, combustion takes place in a confined space of virtually constant volume and the pressure created in the barrel of the firearm gives high velocity to a projectile.

In the case of propellant powders for rockets, combustion produces a constant pressure and the escape of gases through a nozzle gives the propellant effect.

The propellant powders of this heading contain combustible ingredients and ingredients which support combustion. They may also contain ingredients whose purpose is to control the rate of combustion.

The heading includes :

(1) Black powder (gunpowder)

Black powder consists of an intimate mixture of potassium nitrate or sodium nitrate, sulphur and charcoal.

This powder, the colour of which varies from black to brown, is slightly hygroscopic and is used as a sporting powder and as a blasting powder. In the first case, it is presented in the form of round and calibrated grains; in the second case, the grains are of various sizes or may be crushed (blasting powder for use in mining).

(2) Propellant powders for firearms (other than black powder)

(a) Smokeless powders

These are based on nitrocellulose (cellulose nitrates), usually gun-cotton or blasting grade nitrocellulose, together with other products and, in particular, with stabilisers such as diphenylamine. These powders may be manufactured either from nitrocellulose and solvents, or from nitrocellulose to which barium nitrate or potassium nitrate, alkaline dichromates, etc., and solvents have been added, or again by the association of nitroglycerol (glycerol trinitrate) with nitrocellulose (ballistites, cordites, etc.).

Smokeless powders are generally presented in the form of sticks, tubes, discs, flakes or grains.

(b) Composite powders

In composite powders, additives such as nitroguanidine, hexogen (1,3,5-trinitro-1,3,5-triazinane), or octogene (1,3,5,7-tetranitro-1,3,5,7-tetrazocane) may be added to the basic products (nitrocellulose, nitroglycerol) to improve their combustion characteristics.

Polymeric binders associated with the same constituents (but not containing any nitrocellulose) may also be used to obtain a propellant powder.

(3) Propellant powders for rockets

(a) Homogeneous propellant powders

These are composed essentially of nitrocellulose and organic nitrates with the addition of other products (stabilisers, ballistic catalysts, etc.). They are presented as charges, generally cylindrical, which are loaded into the combustion chamber in the form of a cartridge.

(b) Composite propellant powders

These are products composed of a substance supporting combustion (ammonium perchlorate, ammonium nitrate, etc.) and a reducing agent (generally synthetic rubber), and possibly a further metallic reducing agent (aluminium, etc.).

The heading **excludes** :

- (a) Separate chemically defined compounds (usually **Chapter 28 or 29**).
- (b) Prepared explosives of **heading 36.02**.
- (c) Nitrocellulose (cellulose nitrates) e.g., gun-cotton (**heading 39.12**).

36.02 - Prepared explosives, other than propellant powders.

This heading covers mixtures of chemical substances the combustion of which produces a more violent reaction than that produced by propellant powders. Combustion produces an extremely large release of gas at a high temperature, creating an enormous pressure within a very short period. Phlegmatising agents are often added to these products to reduce their sensitivity to shock or friction.

The heading includes :

- (1) **Explosives consisting of mixtures based on nitrates of glycerol and ethylene glycol** (nitroglycerol) and (nitroglycol). These products are commonly called dynamites and often contain other substances such as nitrocellulose (gun-cotton), ammonium nitrate, peat, wood flour, sodium chloride or granulated aluminium.
- (2) **Explosives consisting of mixtures based on other organic nitrates or on nitro-compounds**, such as compositions based on TNT (2,4,6-trinitrotoluene), hexogen, octogen, tetryl (N-methyl-N,2,4,6-tetranitroaniline), pentrite (pentaerythritol tetranitrate, PETN) or TATB (1,3,5-triamino-2,4,6-trinitrobenzene).

The TNT-based mixtures include hexolites (TNT + hexogen) and pentolites (TNT + PETN) phlegmatised either by a wax or by a polymeric binder.

- (3) **Explosives consisting of mixtures based on ammonium nitrate** sensitised by products other than a nitrate of glycerol or of a glycol. Together with the dynamites referred to in Item (1) above, these are widely used in mines, quarries and on civil engineering sites.

This group includes :

- (a) Ammonals, amatols and ammonium nitrate fuel oil (ANFO);
- (b) Specifically cartridge, nitrated explosives;
- (c) Slurry explosives, consisting of a mixture of alkali nitrates and water, sensitised with an amino nitrate or finely powdered aluminium;
- (d) "Emulsion" explosives, consisting of an aqueous solution of alkali nitrates, emulsified in mineral oils.
- (4) **Explosives consisting of mixtures based on chlorates or perchlorates**, for example the cheddites used in mines and quarries.
- (5) **Primary or initiating compositions**, which are much more sensitive in the dry state to shock and friction than the explosives of the types mentioned in the previous four groups. They are mixtures based mainly on lead azide or the trinitroresorcinate (or styphnate) of lead, and tetrazene. These explosives are generally used in the preparation of percussion, friction or flame primers for propellant charges or of detonators for explosives.

All these explosives may be presented as powders, granules, pastes, slurries, emulsions or as more or less dry gels, either in bulk or in the form of charges or cartridges.

This heading **does not cover** separate chemically defined compounds even though they may be explosive. These chemicals are usually included in **Chapter 28 or 29**, e.g., inorganic nitrates (**heading 28.34**), mercury fulminate (**heading 28.52**), trinitrotoluene (**heading 29.04**) and trinitrophenol (**heading 29.08**).

36.03 - Safety fuses; detonating fuses; percussion or detonating caps; igniters; electric detonators.

These products, which are generally called blasting accessories, are required to ignite powders and explosives.

The heading covers :

(A) Safety fuses and detonating fuses

Safety fuses (slow fuses or Bickford fuses) are devices designed to transmit a flame towards an ordinary igniter or detonator. They consist generally of a thin envelope of textile material, tarred or impregnated with rubber or plastics, containing a linear charge of black powder.

Detonating fuses serve to transmit one or more detonations, and generally comprise a core of pentrite or other explosive in a waterproofed covering of textile material or plastics (flexible fuses) or in a sheath of lead or tin (leaded or tinned fuses). In certain cases the explosive charge is placed, in a thin layer only, on the inner surface of a tube of plastics.

They are most frequently used in mines and quarries and on civil engineering sites.

(B) Percussion or detonating caps.

- (1) **Percussion caps** (percussion primers) consist of a small container, generally metallic, usually containing a mixture based on lead trinitroresorcinate (styphnate) with the addition of tetrazene and various oxidising and reducing agents; charges of this explosive mixture usually weigh between 10 and 200 mg. These caps are intended for fixing in the bases of cartridge cases and are used to ignite propellant powder.
- (2) **Friction percussion caps or firing tubes** consist generally of two concentric metal or cardboard tubes containing different charges. The explosive charge in the inner tube is ignited by the tearing out of a saw-toothed wire and thus fires the charge of powder between the two tubes which transmits the ignition. Like the caps described in (1) above, firing tubes are used for firing propellant powders.
- (3) **Detonating caps** (detonators) consist of a small charge of primary explosive plus a charge of, e.g., pentrite, hexogen or tetryl, in a tube of metal or plastics under a protective capsule. They are used for igniting prepared explosives other than propellant powders and are generally fired by the flame from the safety fuse which leads into them.

(C) Igniters

This group includes :

- (1) **Electric igniters** consisting of an electric fuse head and a small charge of igniting powder, generally black powder.

An electric fuse head consists of two insulated conductors to the ends of which a conducting metal filament is soldered to form an electrically resistant bridge; this filament is embedded in an igniter bead. It is used to ignite a powder charge or to initiate a primary explosive.

- (2) **Chemical igniters** such as those consisting of a cylinder containing a glass ampoule filled with a chemical product (e.g., sulphuric acid) and a charge of potassium chlorate, the two being separated by a metal diaphragm. When the ampoule is broken the acid eats away the metal diaphragm (which serves as a delay element) and reacts with the potassium chlorate, producing intense heat capable of igniting a powder charge or safety fuse.

(D) Electric detonators

Electric detonators consist of an electric fuse head, as described in Item (C) (1) above, in a tube of metal (or possibly plastics), a small charge of primary explosive (50 to 500 mg of a composition based usually on lead azide) and a somewhat larger charge of another explosive (e.g., pentrite, hexogen or tetryl).

This group also includes certain electric detonators known as **electric primers**. These are often miniaturised, and the fuse head may be replaced by the incorporation, in the primary composition, of additives to make the composition conductive and enable it to be fired by induction.

This heading **does not include** :

- (a) The paraffined amorce strips or rolls used in miners' lamps, nor caps for toy pistols (**heading 36.04**).
- (b) Articles not containing any explosive or inflammable charge (small caps, tubes, electrical apparatus, etc.) which are classified according to their nature under their respective headings.
- (c) Shell fuses and cartridge cases with or without caps (**heading 93.06**).

36.04 - Fireworks, signalling flares, rain rockets, fog signals and other pyrotechnic articles.

3604.10 - Fireworks

3604.90 - Other

This heading covers pyrotechnic articles capable of producing luminous, acoustic, gaseous, smoke-producing or incendiary effects, including :

(1) Pyrotechnic articles for amusement :

- (a) **Fireworks** (bombs, fuses, maroons, jets, candles, luminous torches, Bengal matches and lights, etc.) the purpose of which is to provide entertainment through the acoustic, luminous or smoke-producing effects of their combustion. Firing is ensured by a firing powder, such as black powder, integrated into the article and fired by an electric fuse head or a primer fuse.
- (b) **Pyrotechnic toys**, such as caps for toy pistols (prepared in tapes, sheets, rolls or circular plastic rings), magic candles, and snaps for Christmas crackers. The combustion of these pyrotechnic toys causes only limited effects.

(2) Technical devices :

- (a) **Sound or light signalling** devices, such as distress rockets for use at sea, photo-flash cartridges for the equipment of aircraft, Very flares, fog signals and torches for railways, individual distress rockets, lighting effects for cinema or television, etc., lighting devices, guide devices, pyrotechnic decoys, and smoke-producing devices (possibly coloured). Their general property is to produce a relatively long-lasting effect by light, sound or smoke.
- (b) **Devices for agricultural or industrial use**, such as anti-hail rockets, anti-hail cartridges, agricultural smoke-producers, thunder-flashes to scare animals, and smoke-producing devices to test for leaks in pipelines.

This heading also includes other **pyrotechnic devices** not specified in the previous groups (e.g., life-line rockets, lead-coated detonating cord for cutting and not for transmitting a detonation).

The heading **does not include** :

- (a) Photographic flashlight materials (**heading 37.07**).
- (b) Articles producing a lighting effect by the phenomenon of chemiluminescence (**heading 38.24**).
- (c) Blank cartridges, containing an explosive charge, for riveting tools or for starting compression ignition internal combustion piston engines (**heading 93.06**).

36.05 - Matches, other than pyrotechnic articles of heading 36.04

This heading covers matches producing a flame on being rubbed on a rough surface (sometimes specially prepared for that purpose). They generally consist of a stem of wood, cardboard, textile yarn impregnated with stearin wax, paraffin wax, etc. (wax matches or vestas), and of a head made of various inflammable chemical products.

The heading **excludes** Bengal matches and other pyrotechnic products, though ignited by friction and having the shape of matches (**heading 36.04**).

36.06 - Ferro-cerium and other pyrophoric alloys in all forms; articles of combustible materials as specified in Note 2 to this Chapter.

3606.10 - Liquid or liquefied-gas fuels in containers of a kind used for filling or refilling cigarette or similar lighters and of a capacity not exceeding 300 cm³

3606.90 - Other

**(I) FERRO-CERIUM AND OTHER PYROPHORIC ALLOYS
IN ALL FORMS**

Pyrophoric alloys are alloys which when rubbed on rough surfaces give off sufficient sparks to ignite gas, petrol, tinder or other inflammable material. They are usually combinations of cerium and other metals, the most common being ferro-cerium.

These alloys are included in this heading whether in bulk or in the form of small rods or bars for mechanical lighters (lighter flints), and whether or not put up in small containers for retail sale.

(II) ARTICLES OF COMBUSTIBLE MATERIALS

This group covers **only** :

(A) **Liquid or liquefied-gas fuels** (e.g., petrol, liquid butane) in containers (ampoules, bottles, cans, etc.) of a kind used for filling or refilling cigarette or similar lighters and of a capacity **not exceeding** 300 cm³.

Refill cartridges or other receptacles (filled or unfilled) which constitute parts of cigarette or similar lighters are **excluded** (**heading 96.13**).

(B) **The following solid fuels :**

(1) Metaldehyde (meta fuel) and hexamethylenetetramine (hexamine) put up as tablets, sticks or in similar forms for use as fuels. When put up in other forms (e.g., powder or crystals) these substances are **excluded** from this heading and fall, respectively, in **heading 29.12 or 29.33**.

(2) Similar chemical substances (whether or not chemically defined) put up as tablets, sticks or in similar forms for use as fuels.

(C) **The following solid or semi-solid fuels :**

Fuels with a basis of alcohol and containing such products as soap, gelatinous substances, cellulose derivatives (these fuels are often sold as "solidified alcohol"), and other similar prepared fuels, in solid or semi-solid form.

An example of a solid prepared fuel of this latter kind is a stick of powdered charcoal with very small proportions of sodium nitrate, as a combustion supporter, and carboxymethylcellulose as a binder, intended for burning slowly within a virtually airtight container which can be carried in clothing as a source of warmth.

However this heading **does not cover** disposable hand or foot warmers which generate heat by an exothermic reaction that does not produce light or a flame (e.g., by oxidation of iron powder through an oxidation catalyst) (**heading 38.24**).

(D) **Resin torches, firelighters and the like.**

This group includes :

- (i) **Resin torches**, which provide light for a relatively long period, composed of combustible materials impregnated with resin, asphalt, pitch, etc., and generally mounted on sticks or handles, or enveloped in paper, textile or other material.
- (ii) **Firelighters**, which burn fiercely for a short time so that fuel (e.g., wood, coal, coke, fuel oil) is ignited. These articles may consist, for example, of urea-formaldehyde resins with the addition of kerosene and water, or of paper impregnated with mineral oil or paraffin wax.

However, this description **does not cover** fuels such as briquettes of agglomerated sawdust (**heading 44.01**).

Chapter 37

Photographic or cinematographic goods

Notes.

- 1.- This Chapter does not cover waste or scrap.
- 2.- In this Chapter the word "photographic" relates to the process by which visible images are formed, directly or indirectly, by the action of light or other forms of radiation on photosensitive surfaces.

GENERAL

The photographic plates, film, paper, paperboard and textiles of Chapter 37 are those with one or more layers of any emulsion sensitive to light or other forms of radiation having sufficient energy to cause the necessary reaction in photon (or photo) sensitive materials, i.e., radiation of wavelength no longer than approximately 1,300 nanometers in the electromagnetic spectrum (including gamma-rays, X-rays, ultra-violet and near-infrared radiation), as well as particle (or nuclear) radiation, whether for reproduction in monochrome or colour. Certain plates are, however, not coated with an emulsion but consist wholly or essentially of photosensitive plastics which may be affixed to a support.

The most common emulsions are based on silver halides (silver bromide, silver bromide-iodide, etc.) or on salts of other precious metals, but certain other materials may be used, e.g., potassium ferricyanide or other iron compounds for blue-prints, potassium or ammonium dichromate for photomechanical engraving, diazonium salts for diazo emulsions, etc.

(A) **Plates and film** fall in the Chapter whether :

- (1) Unexposed, i.e., not yet submitted to the action of light or other forms of radiation; or
- (2) Exposed, whether or not developed (that is, chemically treated to render the image visible).

Plates and film remain in the Chapter whether negative (i.e., with lights and shades reversed), positive (including lavender positives used for the duplication of further positives), or reversible (i.e., with special emulsions which permit the direct production of positives).

(B) **Photographic paper, paperboard and textiles** are included in the Chapter **only** when unexposed or exposed (negative or positive) but **not** developed; after development, they are proper to **Chapter 49 or Section XI**.

Subject to special conditions explained in the Explanatory Note to heading 37.07, the Chapter also includes chemical products and flashlight materials of a kind used in photography.

This Chapter **does not cover** waste and scrap. Photographic or cinematographic waste and scrap containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal, is classified in **heading 71.12**. Other photographic or cinematographic waste and scrap is classified according to constituent material (e.g., if of plastics, **heading 39.15**, if of paper, **heading 47.07**).

37.01 - Photographic plates and film in the flat, sensitised, unexposed, of any material other than paper, paperboard or textiles; instant print film in the flat, sensitised, unexposed, whether or not in packs.

3701.10 - For X-ray

3701.20 - Instant print film

3701.30 - Other plates and film, with any side exceeding 255 mm

- Other :

3701.91 -- For colour photography (polychrome)

3701.99 -- Other

This heading covers :

(A) **Photographic plates and film in the flat, of any material other than paper, paperboard or textiles.**

Such plates and film **in the flat** (i.e., not in rolls), including film put up in disc form, are **unexposed** and are generally coated with a **sensitising** photographic emulsion. These may be made of any material **except** paper (e.g., paper "plates" used to produce negatives), paperboard or textiles (**heading 37.03**). The materials commonly used are glass and cellulose acetate, poly(ethylene terephthalate) or other plastics (for film packs or cut films), and metal or stone (for photomechanical processes). Certain plates, which when exposed and processed will be used for printing, are not coated with an emulsion but consist wholly or essentially of photosensitive plastics. They may be affixed to a support of metal or other material. Some of these plates must have their degree of sensitivity enhanced prior to exposure.

These goods are put to many uses such as :

- (1) Plates, cut film and film packs for amateur or professional use.
- (2) X-ray plates and flat film including those for dental radiography. These goods are generally sensitised on both sides.
- (3) Photomechanical process plates of the type used for photoengraving, photolithography, etc.
- (4) Special plates and film for use in microphotography, photomicrography, astronomy, cosmic ray photography, aerial photography, etc.

(B) Instant print film in the flat.

This is also **sensitised**, **unexposed** and **in the flat**. Instant print film consists of a sensitised sheet of any material (the negative), a sheet of specially treated paper (the positive), and a developer, for instant production of finished positive photographs. Instant print film may be presented as a pack (a cartridge or canister containing several sheets of instant print film) designed to be loaded directly into a camera, or a box containing a number of individually usable sheets.

However, instant print film in rolls, sensitised, unexposed, is **excluded (heading 37.02)**.

The heading also **excludes** :

- (a) Non-sensitised plates and film in the flat (classified according to their constituent material).
- (b) Unexposed rolled film (**heading 37.02**).

37.02 - Photographic film in rolls, sensitised, unexposed, of any material other than paper, paperboard or textiles; instant print film in rolls, sensitised, unexposed.

3702.10 - For X-ray

- Other film, without perforations, of a width not exceeding 105 mm :

3702.31 -- For colour photography (polychrome)

3702.32 -- Other, with silver halide emulsion

3702.39 -- Other

- Other film, without perforations, of a width exceeding 105 mm :

3702.41 -- Of a width exceeding 610 mm and of a length exceeding 200 m, for colour photography (polychrome)

3702.42 -- Of a width exceeding 610 mm and of a length exceeding 200 m, other than for colour photography

3702.43 -- Of a width exceeding 610 mm and of a length not exceeding 200 m

3702.44 -- Of a width exceeding 105 mm but not exceeding 610 mm

- Other film, for colour photography (polychrome) :

3702.52 -- Of a width not exceeding 16 mm

3702.53 -- Of a width exceeding 16 mm but not exceeding 35 mm and of a length not exceeding 30 m, for slides

3702.54 -- Of a width exceeding 16 mm but not exceeding 35 mm and of a length not exceeding 30 m, other than for slides

3702.55 -- Of a width exceeding 16 mm but not exceeding 35 mm and of a length exceeding 30 m

3702.56 -- Of a width exceeding 35 mm

- Other :

3702.96 -- Of a width not exceeding 35 mm and of a length not exceeding 30 m

3702.97 -- Of a width not exceeding 35 mm and of a length exceeding 30 m

3702.98 -- Of a width exceeding 35 mm

This heading covers :

(A) Photographic film in rolls, of any material other than paper, paperboard or textiles.

Photographic film **in rolls** (i.e., other than flat), **sensitised, unexposed** is usually of poly(ethylene terephthalate), cellulose acetate or similar flexible materials and normally provides for a number of exposures. The heading **does not cover** such film of paper (e.g., paper "films" used to make negatives), paperboard or textiles (**heading 37.03**).

Film in rolls falls in this heading with or without perforations; it must be protected from the light by paper backing or other suitable packing.

The heading includes :

- (1) Cinematographic film, the normal width of which is 35, 16, 9.5 or 8 mm.
- (2) " Still " camera film in roll form.

Photographic film not cut to usable sizes remains classifiable in this heading.

Like the photographic plates of heading 37.01, this film may be used for amateur, professional photomechanical, scientific, radiographic, etc., purposes. X-ray film in rolls is generally sensitised on both sides.

Sensitised film for photoelectric sound recording is also classified here.

(B) Instant print film in rolls.

Instant print film in rolls permits instant production of finished positive photographs. Such film consists of a sensitised film of any material, such as cellulose acetate, poly(ethylene terephthalate) or other plastics, paper, paperboard or textiles (negative), a specially treated strip of paper (positive) and a developer.

However, instant print film in the flat, sensitised, unexposed, is **excluded (heading 37.01)**.

The heading **does not cover** :

- (a) Unexposed photographic plates and film in the flat (**heading 37.01**).
- (b) Unsensitised film of plastics (**Chapter 39**).
- (c) Prepared unrecorded film for mechanical sound recording (**heading 85.23**).

37.03 - Photographic paper, paperboard and textiles, sensitised, unexposed.

3703.10 - In rolls of a width exceeding 610 mm

3703.20 - Other, for colour photography (polychrome)

3703.90 - Other

This heading covers all **sensitised, unexposed** photographic paper, paperboard and textiles, flat or rolled.

It therefore includes :

- (1) Paper and textiles for the production of positive photographic prints. These may be used in amateur, professional, X-ray, electro-cardiographic, recording, photocopying, etc., work.
- (2) The so-called paper "plates" and "films" used to produce negatives by exposure in a camera.
- (3) Ferricyanide, ferro-gallate, etc., paper used to produce blue-prints, etc.

The heading **does not include** :

- (a) Instant print film in the flat or in rolls, sensitised, unexposed (**heading 37.01 or 37.02**).
- (b) Exposed but not developed, photographic paper, paperboard or textiles (**heading 37.04**).
- (c) Prepared but unsensitised paper, paperboard or textiles, e.g., paper coated with albumin, gelatin, barium sulphate, zinc oxide, etc. (**Chapter 48** or **Section XI**).
- (d) Developed photographic paper, paperboard or textiles (**Chapter 49** or **Section XI**).

37.04 - Photographic plates, film, paper, paperboard and textiles, exposed but not developed.

This heading covers the photographic plates, film, paper, paperboard and textiles referred to in heading 37.01, 37.02 or 37.03, provided they are **exposed but not developed**. These goods may be negative or positive (whether reversible or not).

Developed plates, film, paper, paperboard and textiles are **excluded (heading 37.05, 37.06, Chapter 49 or Section XI)**.

37.05 - Photographic plates and film, exposed and developed, other than cinematographic film..

This heading covers the photographic plates and film of heading 37.01 or 37.02 after **exposure and development, provided** that, if with perforations, they are of a kind used for the reproduction or projection of still images. The heading covers both negatives and positives; the latter are sometimes called diapositives because they are transparent.

The heading also covers microcopies on transparent bases (microfilms).

The heading includes graduated (or “ shade-off ”) contact halftone film screens comprising a multitude of dots usually in checker-board pattern and other screens obtained by photography, for use in the graphic arts.

The heading **excludes** :

- (a) Developed film of a kind used in a cinematographic projector to produce motion pictures (**heading 37.06**).
- (b) Developed photographic paper, paperboard or textiles (**Chapter 49 or Section XI**).
- (c) Developed plates for printing purposes (e.g., offset), ready for use (**heading 84.42**).

37.06 - Cinematographic film, exposed and developed, whether or not incorporating sound track or consisting only of sound track.

3706.10 - Of a width of 35 mm or more

3706.90 - Other

This heading covers developed standard or substandard width cinematographic film for the projection of motion pictures, negative or positive, containing related visual images only, or both related visual images and sound track (whether photographically or non-photographically, e.g., magnetically, recorded).

This heading also covers **developed** standard or substandard width cinematographic film, whether negative or positive, containing no visual images, but **consisting solely** of one or more sound tracks. The track on film containing only a single sound track must be photoelectrically recorded. Film containing more than one sound track may include magnetically recorded track but at least one track must be photoelectrically recorded. The photoelectrically recorded tracks appear as narrow printed bands which reproduce the sound vibrations.

Sound track film produced solely by processes other than photoelectric (e.g., by mechanical engraving or magnetic recording) is **excluded** (**heading 85.23**).

37.07 - Chemical preparations for photographic uses (other than varnishes, glues, adhesives and similar preparations); unmixed products for photographic uses, put up in measured portions or put up for retail sale in a form ready for use.

3707.10 - Sensitising emulsions

3707.90 - Other

Subject to the conditions specified at (A) and (B) below, this heading covers products of a kind used directly in the production of photographic images. Such products include :

- (1) **Emulsions** (see the General Explanatory Note to this Chapter).
- (2) **Developers** to render latent photographic images visible (e.g., hydroquinone, catechol, pyrogallol, phenidone, *p*-N-methylaminophenolsulphate and their derivatives). The heading also includes developers used for electrostatic document reproduction.
- (3) **Fixers** to make the developed image permanent (e.g., sodium thiosulphate (hypo), sodium metabisulphite, ammonium thiosulphate, ammonium or sodium or potassium thiocyanate).
- (4) **Intensifiers and reducers** to increase or diminish the intensity of the image (e.g., potassium dichromate, ammonium persulphate).

It should be noted, however, that mercuric chloride remains classified **in heading 28.52** even if presented for photographic uses and put up in measured portions or for retail sale in a form ready for use.

- (5) **Toners** to modify the colour of the image (e.g., sodium sulphide).
- (6) **Clearing agents** to remove stains caused during development, fixation, etc. (e.g., potash alum).

The heading also covers, subject to (A) and (B) below, **flashlight materials**, usually consisting of aluminium or magnesium, in powder, tablets, foil, etc., and sometimes mixed with other substances to promote combustion.

All the products cited above fall within the heading **only** when they are :

(A) Single substances which are :

- (i) Put up in measured portions, that is uniformly divided up into the quantities in which they will be used, e.g., tablets, small envelopes put up containing the measured amount of powder for one developing bath; or
- (ii) In packings for retail sale and put up with any indication that they are ready for use in photography, whether by label, literature or otherwise (e.g., instructions for use, etc.).

Single substances put up other than as above, **are classified according to their nature** (e.g., as chemical products in **Chapter 28** or **29**, as metallic powders in **Section XV**, etc.).

- or (B) Preparations obtained by mixing or compounding together two or more substances for photographic use. Such preparations remain within the heading whether put up in bulk or small quantities, and whether or not presented for retail sale.

The heading **does not cover** :

- (a) Auxiliary products not used directly in the production of photographic images, blue-prints, etc. (e.g., glue for mounting photographs, varnishes to protect and glaze negatives or positives, retouching paints, pencils, etc.).
 - (b) Photographic flashbulbs of **heading 90.06**.
 - (c) Products answering to descriptions in **headings 28.43 to 28.46 and 28.52** (e.g., salts and other products of precious metals), however put up and whatever their intended use.
-

Chapter 38

Miscellaneous chemical products

Notes.

- 1.- This Chapter does not cover :
 - (a) Separate chemically defined elements or compounds with the exception of the following :
 - (1) Artificial graphite (heading 38.01);
 - (2) Insecticides, rodenticides, fungicides, herbicides, anti-sprouting products and plant-growth regulators, disinfectants and similar products, put up as described in heading 38.08;
 - (3) Products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades (heading 38.13);
 - (4) Certified reference materials specified in Note 2 below;
 - (5) Products specified in Note 3 (a) or 3 (c) below;
 - (b) Mixtures of chemicals with foodstuffs or other substances with nutritive value, of a kind used in the preparation of human foodstuffs (generally heading 21.06);
 - (c) Slag, ash and residues (including sludges, other than sewage sludge), containing metals, arsenic or their mixtures and meeting the requirements of Note 3 (a) or 3 (b) to Chapter 26 (heading 26.20);
 - (d) Medicaments (heading 30.03 or 30.04); or
 - (e) Spent catalysts of a kind used for the extraction of base metals or for the manufacture of chemical compounds of base metals (heading 26.20), spent catalysts of a kind used principally for the recovery of precious metal (heading 71.12) or catalysts consisting of metals or metal alloys in the form of, for example, finely divided powder or woven gauze (Section XIV or XV).
- 2.- (A) For the purpose of heading 38.22, the expression “certified reference materials” means reference materials which are accompanied by a certificate which indicates the values of the certified properties, the methods used to determine these values and the degree of certainty associated with each value and which are suitable for analytical, calibrating or referencing purposes.
(B) With the exception of the products of Chapter 28 or 29, for the classification of certified reference materials, heading 38.22 shall take precedence over any other heading in the Nomenclature.
- 3.- Heading 38.24 includes the following goods which are not to be classified in any other heading of the Nomenclature :
 - (a) Cultured crystals (other than optical elements) weighing not less than 2.5 g each, of magnesium oxide or of the halides of the alkali or alkaline-earth metals;
 - (b) Fusel oil; Dippel’s oil;
 - (c) Ink removers put up in packings for retail sale;
 - (d) Stencil correctors, other correcting fluids and correction tapes (other than those of heading 96.12), put up in packings for retail sale; and
 - (e) Ceramic firing testers, fusible (for example, Seger cones).

- 4.- Throughout the Nomenclature, “municipal waste” means waste of a kind collected from households, hotels, restaurants, hospitals, shops, offices, etc., road and pavement sweepings, as well as construction and demolition waste. Municipal waste generally contains a large variety of materials such as plastics, rubber, wood, paper, textiles, glass, metals, food materials, broken furniture and other damaged or discarded articles. The term “municipal waste”, however, does not cover :
- (a) Individual materials or articles segregated from the waste, such as wastes of plastics, rubber, wood, paper, textiles, glass or metals and spent batteries which fall in their appropriate headings of the Nomenclature;
 - (b) Industrial waste;
 - (c) Waste pharmaceuticals, as defined in Note 4 (k) to Chapter 30; or
 - (d) Clinical waste, as defined in Note 6 (a) below.
- 5.- For the purposes of heading 38.25, “sewage sludge” means sludge arising from urban effluent treatment plant and includes pre-treatment waste, scourings and unstabilised sludge. Stabilised sludge when suitable for use as fertiliser is excluded (Chapter 31).
- 6.- For the purposes of heading 38.25, the expression “other wastes” applies to :
- (a) Clinical waste, that is, contaminated waste arising from medical research, diagnosis, treatment or other medical, surgical, dental or veterinary procedures, which often contain pathogens and pharmaceutical substances and require special disposal procedures (for example, soiled dressings, used gloves and used syringes);
 - (b) Waste organic solvents;
 - (c) Wastes of metal pickling liquors, hydraulic fluids, brake fluids and anti-freezing fluids; and
 - (d) Other wastes from chemical or allied industries.
- The expression “other wastes” does not, however, cover wastes which contain mainly petroleum oils or oils obtained from bituminous minerals (heading 27.10).
- 7.- For the purposes of heading 38.26, the term “biodiesel” means mono-alkyl esters of fatty acids of a kind used as a fuel, derived from animal or vegetable fats and oils whether or not used.

◦
◦ ◦

Subheading Notes.

- 1.- Subheadings 3808.52 and 3808.59 cover only goods of heading 38.08, containing one or more of the following substances : alachlor (ISO); aldicarb (ISO); aldrin (ISO); azinphosmethyl (ISO); binapacryl (ISO); camphechlor (ISO) (toxaphene); captafol (ISO); chlordane (ISO); chlordimeform (ISO); chlorobenzilate (ISO); DDT (ISO) (clofenotane (INN), 1,1,1-trichloro-2,2-bis(p-chlorophenyl)ethane); dieldrin (ISO, INN); 4,6-dinitro-o-cresol (DNOC (ISO)) or its salts; dinoseb (ISO), its salts or its esters; endosulfan (ISO); ethylene dibromide (ISO) (1,2-dibromoethane); ethylene dichloride (ISO) (1,2-dichloroethane); fluoroacetamide (ISO); heptachlor (ISO); hexachlorobenzene (ISO); 1,2,3,4,5,6-hexachlorocyclohexane (HCH (ISO)), including lindane (ISO, INN); mercury compounds; methamidophos (ISO); monocrotophos (ISO); oxirane (ethylene oxide); parathion (ISO); parathion-methyl (ISO) (methyl-parathion); penta- and octabromodiphenyl ethers; pentachlorophenol (ISO), its salts or its esters; perfluorooctane sulphonic acid and its salts; perfluorooctane sulphonamides; perfluorooctane sulphonyl fluoride; phosphamidon (ISO); 2,4,5-T (ISO) (2,4,5-trichlorophenoxyacetic acid), its salts or its esters; tributyltin compounds.

Subheading 3808.59 also covers dustable powder formulations containing a mixture of benomyl (ISO), carbofuran (ISO) and thiram (ISO).

- 2.- Subheadings 3808.61 to 3808.69 cover only goods of heading 38.08, containing alphacypermethrin (ISO), bendiocarb (ISO), bifenthrin (ISO), chlорfenapyr (ISO), cyfluthrin (ISO), deltamethrin (INN,

ISO), etofenprox (INN), fenitrothion (ISO), lambda-cyhalothrin (ISO), malathion (ISO), pirimiphos-methyl (ISO) or propoxur (ISO).

- 3.- Subheadings 3824.81 to 3824.88 cover only mixtures and preparations containing one or more of the following substances : oxirane (ethylene oxide), polybrominated biphenyls (PBBs), polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs), tris(2,3-dibromopropyl) phosphate, aldrin (ISO), campechchlor (ISO) (toxaphene), chlordane (ISO), chlordanone (ISO), DDT (ISO) (clofenotane (INN), 1,1,1-trichloro-2,2-bis(pchlorophenyl)ethane), dieldrin (ISO, INN), endosulfan (ISO), endrin (ISO), heptachlor (ISO), mirex (ISO), 1,2,3,4,5,6-hexachlorocyclohexane (HCH (ISO)), including lindane (ISO, INN), pentachlorobenzene (ISO), hexachlorobenzene (ISO), perfluorooctane sulphonic acid, its salts, perfluorooctane sulphonamides, perfluorooctane sulphonyl fluoride or tetra-, penta-, hexa-, hepta- or octabromodiphenyl ethers.
- 4.- For the purposes of subheadings 3825.41 and 3825.49, "waste organic solvents" are wastes containing mainly organic solvents, not fit for further use as presented as primary products, whether or not intended for recovery of the solvents.

GENERAL

This Chapter covers a large number of chemical and related products.

It **does not cover** separate chemically defined elements or compounds (usually classified in Chapter 28 or 29), **with the exception** of the following :

- (1) Artificial graphite (heading 38.01).
- (2) Insecticides, rodenticides, fungicides, herbicides, anti-sprouting products and plant-growth regulators, disinfectants and similar products, put up as described in heading 38.08.
- (3) Products put up as charges for fire-extinguishers or put up in fire-extinguishing grenades (heading 38.13).
- (4) Cultured crystals (other than optical elements) weighing not less than 2.5 g each, of magnesium oxide or of the halides of the alkali or alkaline-earth metals (heading 38.24).
- (5) Ink removers put up in packings for retail sale (heading 38.24).

For the purposes of Note 1 (b) to the Chapter, the expression " foodstuffs or other substances with nutritive value " principally includes edible products of Sections I to IV.

The expression " foodstuffs or other substances with nutritive value " also includes certain other products, for example, products of Chapter 28 used as mineral supplements in food preparations, sugar alcohols of heading 29.05, essential amino acids of heading 29.22, lecithin of heading 29.23, provitamins and vitamins of heading 29.36, sugars of heading 29.40, animal blood fractions of heading 30.02 for use in food preparations, casein and caseinates of heading 35.01, albumins of heading 35.02, edible gelatin of heading 35.03, edible protein substances of heading 35.04, dextrans and other edible modified starches of heading 35.05, sorbitol of heading 38.24, edible products of Chapter 39 (such as amylopectin and amylose of heading 39.13). It should be noted that this list of products is simply illustrative and should not be taken to be exhaustive.

The mere presence of " foodstuffs or other substances with nutritive value " in a mixture would not suffice to exclude the mixture from Chapter 38, by application of Note 1 (b). Substances having a nutritive value that is merely incidental to their function as chemical products, e.g., as food additives or processing aids, are not regarded as " foodstuffs or substances with nutritive value " for the purpose of this Note. The mixtures which are excluded from Chapter 38 by virtue of Note 1 (b) are those which are of a kind used in the preparation of human foodstuffs and which are valued for their nutritional qualities.

38.01 - Artificial graphite; colloidal or semi-colloidal graphite; preparations based on graphite or other carbon in the form of pastes, blocks, plates or other semi-manufactures.

3801.10 - Artificial graphite

3801.20 - Colloidal or semi-colloidal graphite

3801.30 - Carbonaceous pastes for electrodes and similar pastes for furnace linings

3801.90 - Other

- (1) **Artificial graphite** (electro-graphite) is a variety of carbon, usually prepared in an electric furnace by heating a mixture of finely ground coke (normally petroleum coke, but sometimes anthracite coke, retort coke, pitch coke, etc.) and carbonaceous binders (e.g., pitch or tar), to a sufficiently high temperature (2500 to 3200 °C) to ensure its "graphitisation" under the catalytic action of substances present in the mixture (e.g., silica or iron oxide). The mixture is first extruded or moulded under pressure into "green" blocks of square or circular cross-section; these blocks may either be pre-fired (baked) at about 1000 °C and then graphitised, or they may be submitted directly to the graphitisation process.

In this way, a product is obtained with an apparent specific gravity of about 1.5 to 1.6 and a homogeneous microcrystalline structure which X-ray examination shows to be that of graphite. Chemical analysis confirms that the substance is graphite (precipitation of graphitic acid).

In addition to ordinary grades of artificial graphites, the heading includes :

- (a) **Nuclear grade artificial graphite**, that is, specially prepared artificial graphite which has a boron content of not more than one part per million, and a total thermal neutrons absorption microscopic cross-section of not more than 5 millibarns per atom. This grade has a very low ash content (not exceeding 20 parts per million), and is used as a moderator or reflector in nuclear reactors.
- (b) **Impregnated or impervious artificial graphite**, that is, artificial graphite which, in order to increase its apparent specific gravity or its impermeability to gases, has first been impregnated in a vacuum with tars or resins or with solutions of sugars or other organic products, and re-fired to graphitise the carbonaceous residues of these additives.

The impregnation process may be repeated several times to obtain a higher apparent specific gravity (1.9 or more) or high degree of impermeability. Impregnated graphite may also be of nuclear grade.

Artificial graphite of this heading is usually in the form of powder, flakes, blocks, plates, bars, rods, etc. The blocks and plates are used, after cutting and high-finish machining (fine tolerances and appropriate surface finish), to make the brushes or other electrical carbon articles of heading 85.45 or parts of nuclear reactors.

The heading also includes scrap, waste and worn-out articles, suitable only for the recovery of artificial graphite.

The heading does not cover :

- (a) Natural graphite (**heading 25.04**).

- (b) Retort carbon (or gas carbon), sometimes incorrectly called " artificial graphite " (**heading 27.04**).
- (c) Artificial graphite surface-worked, surface-finished, cut to special shapes, lathe-worked, drilled, milled, etc., or transformed into articles. If of a kind used for non-electrical purposes these usually fall in **heading 68.15** (e.g., filters, discs, bearings, moulds, acid-resistant bricks, etc.); those of a kind used for electrical purposes fall in **heading 85.45**.
- (d) Refractory goods, fired as ceramics, with a basis of artificial graphite (**heading 69.02** or **69.03**).
- (e) Blocks, plates, bars and similar semi-manufactures, of artificial graphite which also contain powders of silver (**heading 71.06**).

(2) Colloidal or semi-colloidal graphite.

- (a) **Colloidal graphite** consists of finely divided natural or artificial graphite in colloidal suspension in water or in other media (e.g., alcohol, mineral oil), to which may be added small quantities of other products such as tannin or ammonia for the purpose of stabilising the suspension. Colloidal graphite is usually semi-liquid, and is mainly used for the manufacture of lubricating preparations or for its high electrical conductivity.
- (b) **Semi-colloidal graphite** (i.e., graphite in semi-colloidal suspension in water or in other media). Semi-colloidal graphite may be used for the preparation of graphited oils or for forming graphited surfaces.

This category covers only graphite in colloidal or semi-colloidal suspension in any media, the graphite being the basic constituent.

(3) Preparations based on graphite or other carbon in the form of pastes, blocks, plates or other semi-manufactures.

(a) " Carbon " blocks, plates, bars and similar semi-manufactures of metallo-graphitic or other grades.

These terms cover a group of semi-manufactures such as blocks, plates, etc., of the kind used to make " carbon " brushes for electrical or electrotechnical machinery or appliances, and which are based on carbonaceous materials (alone or compounded with other substances). They are generally of the following types :

- (i) **" Carbons "** obtained by the firing, at a temperature (1000 to 1200 °C) insufficient to produce true " graphitisation ", of mixtures of finely ground coke or lamp black and powdered natural or artificial graphite with carbonaceous binders such as pitches or tars.

The structure of the products thus obtained is not homogeneous; microscopic examination shows a mixture of grains of graphite with grains of amorphous carbon and, on chemical analysis, the graphitic acid precipitate is weaker than that obtained from artificial graphite.

- (ii) **Metallo-graphitic grade compositions** obtained, by a process akin to sintering (agglomeration, moulding and firing), from mixtures of powdered graphite with powders of base metals (copper, cadmium or their alloys). Their metal content ranges from 10 to 95 %.
- (iii) Grades obtained by moulding natural or artificial **graphite powder mixed with plastics**.

The blocks and plates, in particular, as obtained from the materials described above are generally in sizes about 200 x 100 x 35 mm or 150 x 70 x 30 mm. They are mainly used, after cutting and high-finishing machining (fine tolerances and appropriate surface finish) to make the electrical brushes of heading 85.45.

The above-mentioned semi-manufactures, when they contain powdered silver, are classified in **heading 71.06**. The heading also **excludes** blocks which have been cut to special shapes, surface-worked, surface finished, etc. (generally **heading 68.15** or **85.45**) and refractory goods, fired as ceramics, based on amorphous carbon or natural graphite (**heading 69.02** or **69.03**).

- (b) **Carbonaceous pastes for electrodes.** These products consist mainly of a mixture of anthracite and coal tar pitch (which acts as a binder). They are usually put up in the form of small blocks, which are inserted in the upper part of a metal container, where they soften when exposed to heat. They are thus moulded inside the container to form an endless electrode for use in the furnaces, which no longer needs to be stopped to change worn-out pre-fabricated electrodes. The best known composition of this kind is "Soderberg paste".

Similar pastes are used to make furnace linings which then harden *in situ*.

This category also covers **graphite in paste form**, consisting of a mixture of graphite in the form of particles (mostly exceeding 5 micrometres (microns)) with mineral oils, and equally suitable for use for treating the surfaces of heavy machinery or for the manufacture of graphited greases.

38.02 - Activated carbon; activated natural mineral products; animal black, including spent animal black.

3802.10 - Activated carbon

3802.90 - Other

**(A) ACTIVATED CARBON;
ACTIVATED NATURAL MINERAL PRODUCTS**

Carbon and mineral substances are said to be activated when their superficial structure has been modified by appropriate treatment (with heat, chemicals, etc.) in order to make them suitable for certain purposes, such as decolourising, gas or moisture adsorption, catalysis, ion-exchange or filtering.

These products fall in two groups :

- (I) Products generally characterised by a very large specific surface (of the order of hundreds of square metres per gram), and by the presence of van der Waal's bonds (physical adsorption) or free chemical bonds saturable by organic or inorganic molecules (chemical adsorption).

These products are obtained by chemical or heat treatment of certain vegetable or mineral substances (clay, bauxite, etc.) in the presence of natural impurities or added foreign matter. This treatment causes a change in the structure of the basic substance, accompanied by an increase in the specific surface, and, in the case of crystalline substances, distortions in the lattice due to the insertion or substitution of atoms with different valencies. The valencies which thus remain free can cause the condensation of protons or electrons on the surface, rendering the product active as a chemical adsorbent, a catalyst or an ion-exchanger.

- (II) Products which generally have a fairly small specific surface (of the order of 1 to 100 m²/g). Although they generally have a high electrical charge density, these products have no marked capacity for adsorption and therefore are not decolourising agents. On the other hand, in aqueous suspension they establish powerful electrostatic interactions with colloids, facilitating or inhibiting their coagulation, and are therefore suitable for use as filtering agents.

Products of this type are also generally obtained by appropriate heat treatment. The presence of alkaline substances during the calcining process sometimes encourages the formation of surface charges.

The heading includes :

- (a) **Activated carbon.** This is usually obtained by treating vegetable, mineral or other carbon (wood charcoal, coconut shell carbon, peat, lignite, coal, anthracite, etc.) at a high temperature in the presence of steam, carbon dioxide or other gases (gas activation), or by dry calcination of cellulosic materials impregnated with solutions of certain chemicals (chemical activation).

Activated carbon is used as a fine powder for decolourising liquids in many industries (sugar or glucose manufacture, oil or wine industry, medicaments, etc.). In the form of grains, it is used for adsorbing vapours (for example, in recovering volatile solvents during dry-cleaning processes, removing benzene from coal gas), for purifying water or air, as a protection against toxic gases, in catalysis, or for eliminating the accumulation of gas at the electrodes during electrolysis (depolarisation).

(b) **Other activated natural mineral products such as :**

- (1) **Activated diatomite.** This consists of kieselguhr or other selected siliceous fossil earths, decalcified if necessary by means of acids, calcined in contact with sintering agents such as sodium chloride or sodium carbonate and then ground and graded by appropriate means. Diatomite calcined without the addition of sintering agents is, however, **excluded (heading 25.12).**
- (2) **Certain volcanic minerals,** such as perlite, which, after grinding, are subjected to a thermal "shock" in a very hot flame (1000 °C or over), and then re-ground and graded. Activated perlite is in the form of a very light shiny powder. On microscopic examination it is seen to consist of very thin, transparent flakes having curved surfaces.

The two types of products cited at (1) and (2) above are of very low apparent specific gravity and are filter media chiefly used in the preparation of chemical or pharmaceutical products (especially antibiotics), in sugar or glucose manufacture, in processing beverages, for filtering water, etc.

- (3) **Activated clays and activated earths.** These consist of selected colloidal clays or clayey earths activated, according to their intended use, by means of an acid or an alkali, dried and then ground. When activated by means of an alkali, they are emulsifiers, suspension agents and agglomerating agents; these are used, in particular, in the manufacture of polishing or cleaning preparations, and, because of their swelling properties, for improving foundry sands and drilling sludge. When activated by means of an acid, they are mainly used for decolourising animal, vegetable or mineral oils, fats or waxes.
- (4) **Activated bauxite.** Bauxite is usually activated by means of alkalis or by suitable thermal treatment. It is chiefly used as a catalyst, a desiccant and a decolourising agent.

The heading also **excludes :**

- (a) Naturally active mineral products (e.g., fuller's earth), which have not undergone any treatment modifying their superficial structure (**Chapter 25**).
- (b) Activated chemical products such as activated alumina (**heading 28.18**), activated silica gel (**heading 28.11** or **38.24**), artificial zeolite ion-exchangers (**heading 28.42** or, if containing binders, **heading 38.24**) and sulphonated coal ion-exchangers (**heading 38.24**).
- (c) Activated carbons having the character of medicaments (**heading 30.03** or **30.04**) or put up in packings for retail sale as deodorisers for refrigerators, cars, etc. (**heading 33.07**).
- (d) Catalysts consisting of a chemical product (e.g., a metallic oxide) fixed on a support of an active material (e.g., activated carbon or diatomite) (**heading 38.15**).
- (e) Expanded perlite in the form of light-weight spheroidal granules (**heading 68.06**).

(B) ANIMAL BLACK, INCLUDING SPENT ANIMAL BLACK

This group covers the different varieties of black obtained by carbonising materials of animal origin, in particular :

- (1) **Bone black** obtained by calcining defatted bones in a closed vessel. It is a porous black product containing only a low content of pure carbon (about 10 to 20 % of its weight unless treated with acid, in which case the carbon content is much higher). It is in the form of powder, grains, paste, or pieces having the shape of the bones or pieces of bone used for its preparation. Bone black is a decolourising agent widely used in many industries, especially the sugar industry, and is also employed as a black pigment, for example, in the manufacture of polishes and certain inks.

Spent bone black is used as a fertiliser and also for the manufacture of black pigments.

- (2) **Blood black** obtained by calcining dried blood in a closed vessel. It is generally used as a decolourising agent.
- (3) **Ivory black** obtained by calcining ivory waste. This product, usually presented as a very fine, velvety black powder or small, irregularly-shaped cones, is used in artists' colours.

(The term "ivory black" is sometimes used to describe special grades of bone black.)

- (4) **Leather black, horn black, hoof black, tortoise-shell black, etc.**

38.03 - Tall oil, whether or not refined.

Tall oil (sometimes known as liquid rosin) is obtained from the black liquor left over from the manufacture of wood pulp by an alkali process or, more particularly, by the sulphate process. When this liquor is poured into settling-vats, a frothy mass forms on its surface. Crude tall oil is obtained when this frothy mass is heated and acidified, usually with dilute sulphuric acid.

Crude tall oil is a dark brown, semi-fluid mixture of fatty acids (mainly oleic and linoleic acids and their isomers), resin acids (especially the abietic types), and a smaller quantity of non-saponifiable products (sterols, higher alcohols and various impurities), in proportions varying according to the nature of the wood.

Refined tall oil may be obtained by distilling crude tall oil under very low pressure (distilled tall oil) or by other processes (e.g., treatment with selective solvents or activated earths). It is a yellowish liquid consisting essentially of fatty acids and resin acids.

Tall oil is used, *inter alia*, for the preparation of emulsions for road-surfacing, of common soap, metallic soaps, wetting agents and emulsifiers for the textile or paper industry, drying oils used in the manufacture of varnishes, paints or linoleum, oils for metal-working, disinfectants, mastics, etc.; it is also used as a plasticiser for rubber and increasingly as a source of tall oil fatty acids and tall oil resin acids.

The heading does not include :

- (a) Saponified tall oil, obtained by neutralising distilled tall oil by means of an alkali (sodium or potassium hydroxide) (**heading 34.01**).
- (b) Residual liquor from the manufacture of wood pulp by the soda or sulphate processes, whether or not concentrated, and the frothy mass separated from these liquors in the settling-vats (**heading 38.04**).
- (c) Tall oil resin acids, essentially composed of a mixture of resin acids separated from fatty acids of the tall oil (**heading 38.06**).
- (d) Sulphate pitch (tall oil pitch), residue of the distillation of tall oil (**heading 38.07**).
- (e) Tall oil fatty acids containing by weight 90 % or more (calculated on the weight of the dry product) of fatty acids, separated from most of the resin acids of the tall oil by vacuum fractional distillation or otherwise (**heading 38.23**).

38.04 - Residual lyes from the manufacture of wood pulp, whether or not concentrated, desugared or chemically treated, including lignin sulphonates, but excluding tall oil of heading 38.03.

This heading covers :

- (1) **Residual lyes from the manufacture of wood pulp by the sulphite process**, whether or not concentrated, desugared or chemically treated. Concentrated sulphite lye consists mainly of salts of lignosulphonic acids mixed with sugars and other products. It is usually in the form of a viscous liquid, a sticky brownish paste, a blackish mass with a vitreous fracture (in this case, it is sometimes known as sulphite pitch or cellulose pitch), or of a dry powder.

Concentrated sulphite lye is used as a binder for compressed blocks of fuel or for foundry cores, in the preparation of glues, impregnants, fungicides or tannins, for the production of alcohol, etc.

This group also covers **lignin sulphonates**, usually obtained by precipitation from sulphite lye. Lignin sulphonates are used as an ingredient in adhesives, as dispersants, as concrete admixtures or as drilling-mud additives.

- (2) **Residual lyes from the manufacture of wood pulp by the soda or sulphate processes**, whether or not concentrated, desugared or chemically treated (including the frothy mass which forms on the surface of these lyes in the settling-vats). These lyes, which are usually black, are the source of tall oil and are sometimes used to produce sodium hydroxide.

The heading excludes :

- (a) Sodium hydroxide (**heading 28.15**).
- (b) Tall oil (**heading 38.03**).
- (c) Sulphate pitch (tall oil pitch) (**heading 38.07**).

38.05 - Gum, wood or sulphate turpentine and other terpenic oils produced by the distillation or other treatment of coniferous woods; crude dipentene; sulphite turpentine and other crude para-cymene; pine oil containing alpha-terpineol as the main constituent.

3805.10 - Gum, wood or sulphate turpentine oils

3805.90 - Other

This heading covers mainly products rich in terpenes (pinene, beta-pinene, limonenes, etc.) obtained from the exudations or the resinous wood of conifers.

These products are :

(1) The **volatile products** of the distillation (usually by steam extraction) of the oleoresins (turpentines) exuded from pines or other coniferous trees (firs, larches, etc.). In some countries, these products are known as "gum spirits of turpentine". In others, however, the term "spirits of turpentine" is reserved exclusively to volatile products within a certain range of boiling point and density, obtained by the distillation of the fresh oleoresins exuded from living pine trees.

They are all mobile, colourless liquids, insoluble in water, highly refractive and with a penetrating odour. They are used as solvents, particularly in the manufacture of varnishes, paints or polishes, in the preparation of medicaments, and in the manufacture of synthetic camphor, terpin hydrate, terpineol, etc.

(2) **Wood turpentine, sulphate turpentine and other terpenic oils** produced by the distillation or other treatment of coniferous woods.

(a) *Wood turpentine* is the most volatile product obtained by steam or destructive distillation of the stumps or other sufficiently resinous parts of pine trees.

(b) *Sulphate turpentine* is a volatile terpenic by-product obtained during the manufacture of wood pulp from resinous woods by the sulphite process.

The products described in this paragraph are liquids rich in terpenes, and are used for the same purposes as spirits of turpentine from exuded oleoresins, particularly as solvents in the preparation of varnishes, paints, etc.

(3) **Crude dipentene** is a terpenic oil (containing up to about 80 % of dipentene) obtained by fractionating wood turpentine or as a by-product from the manufacture of synthetic camphor. Pure or commercially pure dipentene is classified in **heading 29.02**.

(4) **Sulphite turpentine** is a volatile yellow liquid obtained as a by-product of the manufacture of wood pulp by the sulphite process. It is a crude para-cymene containing small quantities of terpenes and other products. The heading also covers **all crude p-cymene**, regardless of source.

- (5) **Pine oil** is the fraction obtained, after wood turpentine, generally during the steam or destructive distillation of the oily stumps of pine trees. It is also obtained by chemical synthesis (e.g., chemical hydration of α -pinene). This heading covers **only** such pine oil containing α -terpineol as the main constituent. Pine oil is a colourless or amber coloured liquid, rich in α -terpineol, chiefly used in the textile industries as a wetting agent and solvent, for the manufacture of varnishes or paints, as a disinfectant, and in the concentration of metallic ores by flotation.

The heading **does not cover** :

- (a) Pure or commercially pure terpenic hydrocarbons or terpenes, terpineol and terpin hydrate (**Chapter 29**).
- (b) Pine needle oil, which is an essential oil of **heading 33.01**.
- (c) Rosin oils (**heading 38.06**).

38.06 - Rosin and resin acids, and derivatives thereof; rosin spirit and rosin oils; run gums.

3806.10 - Rosin and resin acids

3806.20 - Salts of rosin, of resin acids or of derivatives of rosin or resin acids, other than salts of rosin adducts

3806.30 - Ester gums

3806.90 - Other

(A) ROSIN AND RESIN ACIDS

Both **rosin and resin acids** consist essentially of complex mixtures of abietic acid and allied acids with small amounts of non-acidic components. They are solids, usually transparent and vitreous. Their colour may vary from pale yellow to dark brown according to the amount of the impurities present.

Rosin and resin acids are obtained by the following processes :

- (1) Separation of volatile terpenic products (spirits of turpentine and similar terpenic solvents) during the distillation of oleoresinous matter obtained in the form of an exudate from pine or other coniferous trees (pine resin, galipot, barras resin, etc.).
- (2) Solvent extraction from pine stump wood.
- (3) Fractional distillation of tall oil, a by-product of the pulp and paper industry.

Rosin and resin acids are used in the manufacture of certain soaps, for sizing paper, in the preparation of varnishes, polishes, mastics, inks, sealing-wax, binders for foundry cores, brewers' pitch, etc., and as raw material for the preparation of the derivatives and rosin oils described in Parts (B) to (D).

(B) SALTS OF ROSIN, OF RESIN ACIDS OR OF DERIVATIVES OF ROSIN OR RESIN ACIDS, OTHER THAN SALTS OF ROSIN ADDUCTS

Salts of this group cover salts of rosin, of resin acids or of derivatives of rosin or resin acids, other than salts of rosin adducts. Sodium or potassium resinate are usually obtained by boiling powdered rosin or resin acids in a solution of sodium or potassium hydroxides. The other inorganic resinate are generally prepared by precipitating a solution of sodium or potassium resinate with a solution of a metal salt (precipitated resinate), or by fusing a mixture of rosin or resin acids and a metal oxide (fused resinate). Examples of these products are resinate of aluminium, calcium, cobalt, copper, manganese, lead and zinc.

Resinates are used to increase the drying properties of the oils used in the manufacture of varnishes or paints, and in the preparation of fungicides, disinfectants, etc.

This group also includes hardened rosin which is obtained by treating rosin or resin acids with, for example, calcium hydroxide (in a proportion of about 6 %) which hardens it and renders it more suitable for use in the preparation of varnishes.

The heading **excludes** :

- (a) Precious metal resinate (heading 28.43) and the resinate of headings 28.44 to 28.46.
- (b) Prepared driers based on resinate (heading 32.11).
- (c) Resin soaps obtained by saponifying mixtures of higher fatty acids and rosin or resin acids (heading 34.01), and other washing preparations with a basis of resinate (heading 34.02).

(C) ESTER GUMS

Ester gums are obtained by esterification, with ethylene glycol, glycerol or other polyhydric alcohol, of rosin or resin acids or, of their oxidised, hydrogenated, disproportionated (dehydrogenated) or polymerised derivatives. These ester gums are more plastic than natural resins and this makes them suitable for mixing with pigments and other materials.

(D) OTHER

(I) Derivatives of rosin and resin acids

- (1) **Oxidised rosin and resin acids** are usually obtained as a residual product of the distillation of extracts of the stumps of coniferous trees which have been left in the ground for a long time resulting in natural oxidation of their resin acid content. Rosin or resin acids may also be oxidised artificially. Oxidised rosin and resin acids are used in the preparation of glues, emulsions, varnishes, paints, inks and for electrical insulation, etc.
- (2) **Hydrogenated rosin and resin acids** are obtained by treating rosin or resin acids with hydrogen in the presence of a catalyst. They are more resistant to oxidation than ordinary rosin and resin acids and discolour less readily under the action of light. They are used in the preparation of varnishes, soap, etc.
- (3) **Disproportionated (dehydrogenated) rosin and resin acids** are prepared, for example, by heating rosin or resin acids to a moderate temperature or, at high temperature, by the use of acid catalysis; sulphur and selenium are also useful catalysts. They are used in the preparation of varnishes, etc.
- (4) **Polymerised rosin and resin acids** are obtained by treating rosin or resin acids with sulphuric acid, and used, in particular, in the preparation of varnishes of high viscosity and stability. The degree of polymerisation is very low. Polymerised rosin and resin acids are generally composed of dimer and unpolymerised acids and may also be referred to as dimerised rosin.

- (5) **Monohydric alcohol esters of rosin or resin acids.** The esters classified here include those known as "resinates" or "abietates", e.g., the methyl, ethyl and benzyl esters and "methyl hydroabietate", which are used, in particular, as plasticisers for cellulose lacquers.
- (6) **Mixtures of dihydroabietyl, tetrahydroabietyl and dehydroabietyl alcohols ("abietyl alcohol").**
- (7) **Rosin adducts and derivatives thereof.** Rosin or resin acids modified with fumaric acid, maleic acid or its anhydride, used in the preparation of alkyd resin, rosin size and inks. These adducts may be subsequently esterified with ethylene glycol, glycerol or other polyhydric alcohols. This group also includes salts of rosin adducts such as salts of rosin-maleic or of rosin-fumaric adducts.

(II) Rosin spirit and rosin oils

These products are obtained, usually from rosin or resin acids, by distillation with superheated steam and a catalyst, or by destructive distillation. They are essentially complex mixtures of hydrocarbons and may contain organic acids in quantities varying according to distilling conditions.

- (1) **Rosin spirit**, which is the most volatile fraction, is a mobile, straw-coloured liquid with a pungent smell, used as a solvent for resins, in the manufacture of varnishes, paints, etc.
- (2) **Rosin oils** are more or less thick, varying in colour and quality (golden oils, white, green or brown oils) and have a smoky odour. They are chiefly used for the preparation of lubricants, cutting oils, printing inks, ointments, varnishes, paints, etc.

The heading does not cover :

- (a) Sulphonated rosin oils (**heading 34.02**).
- (b) The volatile constituents of the distillation of the oleoresinous exudates of living pine trees or other living coniferous trees (**heading 38.05**).
- (c) Rosin pitch (**heading 38.07**).

(III) Run gums

Run gums are obtained from the oleoresinous exudates of tropical forest trees by a process called "gum running" which involves heating the exudates to render them soluble in drying oils. The most common source of run gums is copal.

38.07 - Wood tar; wood tar oils; wood creosote; wood naphtha; vegetable pitch; brewers' pitch and similar preparations based on rosin, resin acids or on vegetable pitch.

This heading covers products of complex composition obtained during the distillation (or carbonisation) of resinous or non-resinous wood. Apart from gases, these processes give pyroligneous liquids, wood tar and wood charcoal in proportions varying according to the nature of the wood employed and the speed of the operation. Pyroligneous liquids (sometimes known as raw pyroligneous acid), which are not materials of international commerce, contain acetic acid, methanol, acetone, a little furfuraldehyde and allyl alcohol. This heading also covers vegetable pitch of all kinds, brewers' pitch and similar compounds based on rosin, resin acids or on vegetable pitch.

The products classified here are :

(A) Wood tar; wood tar oils whether or not decreosoted and wood creosote.

- (1) **Wood tar** is obtained by draining from wood (coniferous or other) during carbonisation in charcoal kilns (e.g., Swedish tar or Stockholm tar), or by distillation in retorts or ovens (distilled tars). The latter are obtained directly as a fraction settling out from the pyroligneous liquids (settled tars), or by distillation of the pyroligneous liquids - in which they have been partially dissolved (dissolved tars).

Partially distilled tars from which some of the volatile oils have been removed by further distillation are also classified in this heading.

All these tars are complex mixtures of hydrocarbons, phenols or their homologues, furfuraldehyde, acetic acid and various other products.

Tars obtained from resinous woods, which differ from those obtained from non-resinous woods in that they also contain products resulting from the distillation of the resin (terpenes, rosin oils, etc.), are viscous products ranging in colour from brownish-orange to brown. They are chiefly employed (as obtained, after simple dehydration or after partial distillation) for impregnating ships' cables, as plasticisers in the rubber industry, in the preparation of mastics, in medicine, etc.

Tars obtained from non-resinous woods are thick brownish-black liquids mainly used for the preparation, by distillation or other means, of a wide range of by-products (wood creosote, guaiacol, etc.).

Cade oil, also known as juniper tar oil, used in medicine and soap making, is also covered by this heading.

- (2) **Wood tar oils** are produced during the distillation of wood tar. The light oils (containing aliphatic hydrocarbons, terpenes and higher ketones) are used for the manufacture of sheep dips and horticultural sprays, and the heavy oils (containing aliphatic and aromatic hydrocarbons, higher ketones and higher phenols) serve for impregnating wood and for the extraction of wood creosote.

Decreasotes oils obtained after extraction of the creosote are used according to their characteristics for concentrating ores by flotation, for preparing fungicides, as solvents, as fuels, etc.

(3) **Wood creosote** is an essential constituent of wood tar. It is usually obtained by distilling tar obtained from non-resinous woods, separating it from the appropriate fraction with sodium hydroxide, re-acidification and re-distillation. It is a colourless liquid but takes on colour under the action of air and light, has an odour of smoke, is caustic and is used in particular as a disinfectant and antiseptic. It should not be confused with creosote oil or mineral creosote which are classified in **heading 27.07**.

(B) **Wood naphtha** is obtained by processing pyroligneous liquids. It is a yellowish liquid with an empyreumatic odour usually containing 70 to 90 % methanol (methyl alcohol) with varying proportions of acetone and other ketones (generally 8 to 20 %), as well as other impurities (methyl acetate, higher alcohols, tarry substances, etc.). Certain types of wood naphtha are used as denaturants for ethanol.

(C) **Vegetable pitch.**

These are residues of the distillation or other treatment of vegetable materials. They include :

- (1) **Wood pitch** (wood tar pitch), a residue of the distillation of wood tar.
- (2) **Rosin pitch**, a residue of the preparation of rosin spirit and rosin oil by distillation of rosin.
- (3) **Sulphate pitch**, a residue after the distillation of tall oil, etc.

These pitches are usually blackish-brown, reddish-brown or yellowish-brown. They generally soften with the heat of the hand. They are used, according to their type, for caulking ships, waterproof-coating of woven fabrics, impregnating woods, preparing anti-rust coatings, as binding materials, etc.

(D) **Brewers' pitch and similar preparations based on rosin, resin acids or on vegetable pitch.**

- (1) **Brewers' pitch** is used hot for coating beer-barrels. It is usually obtained by melting mixtures of rosin, paraffin wax and rosin oil, or mixtures of rosin and vegetable oils (such as linseed oil, cotton-seed oil or colza oil).
- (2) **Cobblers' wax** is used for waxing yarns and twine for sewing footwear and harness-makers' wares, and normally consists of a mixture of rosin, rosin oil, paraffin wax, ozokerite, etc., and contains powdered inorganic substances (such as talc or kaolin). It is usually in the form of blocks, sticks or discs.
- (3) **Caulking pitch** is used for caulking ships and is generally prepared by fusing a mixture of wood pitch, wood tar and rosin.

This heading **does not cover** :

- (a) Natural Burgundy pitch (also known as "Vosges pitch"), a natural resin obtained from certain coniferous trees, and yellow pitch which is natural Burgundy pitch purified by fusion and filtering (**heading 13.01**).
- (b) Stearin pitch (stearic pitch), wool grease pitch and glycerol pitch (**heading 15.22**).
- (c) Mineral pitch from coal, peat, petroleum, etc. (**Chapter 27**).

- (d) Methanol (methyl alcohol), pure or commercially pure, or other separate chemically defined products obtained by redistilling or further treating the primary products of wood distillation, e.g., acetic acid, acetone, guaiacol, formaldehyde, acetates, etc. (**Chapter 29**).
- (e) Sealing wax (**heading 32.14 or 34.04**).
- (f) Residual lyes from the manufacture of wood pulp (**heading 38.04**).
- (g) “Brais résineux” (**heading 38.06**).

38.08 - Insecticides, rodenticides, fungicides, herbicides, anti-sprouting products and plant-growth regulators, disinfectants and similar products, put up in forms or packings for retail sale or as preparations or articles (for example, sulphur-treated bands, wicks and candles, and fly-papers) (+).

- Goods specified in Subheading Note 1 to this Chapter :

3808.52 -- DDT (ISO) (clofenotane (INN)), in packings of a net weight content not exceeding 300 g

3808.59 -- Other

- Goods specified in Subheading Note 2 to this Chapter :

3808.61 -- In packings of a net weight content not exceeding 300 g

3808.62 -- In packings of a net weight content exceeding 300 g but not exceeding 7.5 kg

3808.69 -- Other

- Other :

3808.91 -- Insecticides

3808.92 -- Fungicides

3808.93 -- Herbicides, anti-sprouting products and plant-growth regulators

3808.94 -- Disinfectants

3808.99 -- Other

This heading covers a range of products (**other than** those having the character of medicaments, including veterinary medicaments - **heading 30.03 or 30.04**) intended to destroy pathogenic germs, insects (mosquitoes, moths, Colorado beetles, cockroaches, etc.), mosses and moulds, weeds, rodents, wild birds, etc. Products intended to repel pests or used for disinfecting seeds are also classified here.

These insecticides, disinfectants, herbicides, fungicides, etc., are applied by spraying, dusting, sprinkling, coating, impregnating, etc., or may necessitate combustion. They achieve their results by nerve-poisoning, by stomach-poisoning, by asphyxiation or by odour, etc.

The heading further covers anti-sprouting products and plant-growth regulators intended to inhibit or promote physiological processes in plants. Their modes of application vary and their effects range from destruction of the plant to enhanced growth-vigour and improved crop-yield.

These products are classified here in the following cases only :

(1) When they are put up in packings (such as metal containers or paperboard cartons) for retail sale as disinfectants, insecticides, etc., or in such forms (e.g., in balls, strings of balls, tablets or plates) that there can be no doubt that they will normally be sold by retail.

Products put up in these ways may or may not be mixtures. The unmixed products are mainly chemically defined products which would otherwise fall in Chapter 29, e.g., naphthalene, or 1,4-dichlorobenzene.

The heading also includes the following products, **provided** they are put up for retail sale as disinfectants, fungicides, etc. :

- (a) **Organic surface-active products and preparations**, with active cation (e.g., quaternary ammonium salts), having antiseptic, disinfectant, bactericidal or germicidal properties.
- (b) **Poly(vinyl pyrrolidone)-iodine**, being a reaction product of iodine and poly(vinyl pyrrolidone).
- (2) When they have the character of preparations, whatever the presentation (e.g., as liquids, washes or powders). These preparations consist of suspensions or dispersions of the active product in water or in other liquids (e.g., a dispersion of DDT (ISO) (clofenotane (INN), (1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane) in water), or of other mixtures. Solutions of active products in solvents **other than water** are also included here (e.g., solutions of pyrethrum extract (other than standardised pyrethrum extract), or copper naphthenate in a mineral oil).

Intermediate preparations, requiring further compounding to produce the ready-for-use insecticides, fungicides, disinfectants, etc., are also classified here, **provided** they already possess insecticidal, fungicidal, etc., properties.

Insecticidal, disinfecting, etc., preparations may have a basis of copper compounds (copper acetate, sulphate, acetoarsenite, etc.), of sulphur or sulphur compounds (calcium sulphide, carbon disulphide, etc.), of mineral creosote or anthracene oils, of DDT (ISO) (clofenotane (INN), (1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane), lindane (ISO, INN), parathion, of phenol or cresol derivatives, of arsenical products (calcium arsenate, lead arsenate, etc.), of materials of vegetable origin (nicotine, tobacco essences and powders, rotenone, pyrethrum, red squill, rape oil), of plant-growth regulators, natural or synthetic (e.g., 2,4-D), of cultures of micro-organisms, etc.

Poisoned bait composed of edible products (wheat grains, bran, molasses, etc.) mixed with poison is another example of the preparations included in this heading.

- (3) When they are put up in the form of **articles** such as sulphur-treated bands, wicks and candles (for disinfecting and fumigating vats, living quarters, etc.), fly-papers (including those coated with glue not containing poisonous matter), grease bands for fruit trees (including those not containing poisonous matter), papers impregnated with salicylic acid for preserving jams, papers or small wooden sticks coated with lindane (ISO, INN) and acting by combustion, etc.

* * *

The products of heading 38.08 can be divided into the following groups :

(I) **Insecticides**

Insecticides include not only products for killing insects, but also those having a repellent or attractant effect. The products may be in a variety of forms such as sprays or blocks (against moths), oils or sticks (against mosquitoes), powder (against ants), strips (against flies), cyanogen gas absorbed in diatomite or paperboard (against fleas and lice).

Many insecticides are characterised by their mode of action or method of use. Among these are :

- insect growth regulators : chemicals which interfere with biochemical and physiological processes in insects.
- fumigants : chemicals which are distributed in the air as gases.

- chemosterilants : chemicals used to sterilise segments of an insect population.
- repellents : substances which prevent insect attack by making their food or living conditions unattractive or offensive.
- attractants : used to attract insects to traps or poisoned baits.

(II) Fungicides

Fungicides are products which protect against the growth of fungi (e.g., preparations based on copper compounds) or which are designed to eradicate the fungi already present (e.g., preparations based on formaldehyde).

Fungicides can be characterised by their mode of action or method of use. Examples of this are :

- | | |
|---------------------|---|
| Systemic fungicides | - these chemicals are translocated in the sap stream from the site of application to other plant parts. |
| Fumigants | - chemicals which counteract fungi when they are applied to affected materials in a gaseous form. |

(III) Herbicides, anti-sprouting products, plant-growth regulators

Herbicides are chemicals which are used to control or destroy unwanted plants. Some herbicides are applied to dormant plant parts or seeds, while other herbicides are applied to the whole foliage. They can provide control which is **selective** (herbicides which affect specific plants) or **non-selective** (herbicides which result in the complete eradication of vegetation).

The group also includes defoliants, which are chemicals intended to cause the leaves or foliage of plants to drop prematurely.

Anti-sprouting products can be applied to seeds, bulbs, tubers or soils to inhibit or delay germination or sprouting.

Plant-growth regulators are applied to alter the life processes of a plant so as to accelerate or retard growth, enhance yield, improve quality or facilitate harvesting, etc. Plant hormones (phytohormones) are one type of plant-growth regulator (e.g., gibberellic acid). Synthetic organic chemicals are also used as plant-growth regulators.

(IV) Disinfectants

Disinfectants are agents which destroy or irreversibly inactivate undesirable bacteria, viruses or other micro-organisms, generally on inanimate objects.

Disinfectants are used, for example, in hospitals for cleaning walls, etc., or sterilising instruments. They are also used in agriculture for disinfecting seeds and in the manufacture of animal feeds to control undesirable micro-organisms.

The group includes sanitisers, bacteriostats and sterilisers.

The heading also includes products to control mites and ticks (acaricides), molluscs (molluscicides), nematodes (nematocides), rodents (rodenticides), birds (avicides), and other pests (e.g., lampreycides, predacides).

This heading **excludes** :

- (a) Products for disinfecting, insecticidal etc., uses, not answering to the description above. These products are classified according to their nature under the appropriate headings, for example :
 - (i) Ground pyrethrum flowers (**heading 12.11**).
 - (ii) Pyrethrum extract (whether or not standardised by the addition of mineral oil) (**heading 13.02**).
 - (iii) Creosote oil or mineral creosote (**heading 27.07**).
 - (iv) Naphthalene, DDT (ISO) (clogenotane (INN), (1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane) and other separate chemically defined compounds (including aqueous solutions) (**Chapter 28 or 29**).
 - (v) Cultures of micro-organisms used as a basis for rodenticides, etc. (**heading 30.02**).
 - (vi) Spent oxide (**heading 38.25**).
- (b) Preparations covered by more specific headings of the Nomenclature, or having subsidiary disinfecting, insecticidal, etc., properties, for example :
 - (i) Anti-fouling paints for ships' hulls, containing toxic materials (**heading 32.08, 32.09 or 32.10**).
 - (ii) Disinfectant soaps (**heading 34.01**).
 - (iii) DDT (ISO) (clogenotane (INN), (1,1,1-trichloro-2,2-bis(*p*-chlorophenyl)ethane) wax polishes (**heading 34.05**).
- (c) Disinfectants, insecticides, etc., having the essential character of medicaments, including veterinary medicaments (**heading 30.03 or 30.04**).
- (d) Prepared room deodorisers, whether or not having disinfectant properties (**heading 33.07**).

○
○ ○

Subheading Explanatory Note.

Subheadings 3808.91 to 3808.99

Products which have multiple uses, and are therefore *prima facie* classifiable in more than one subheading, are usually classified by application of General Interpretative Rule 3.

38.09 - Finishing agents, dye carriers to accelerate the dyeing or fixing of dyestuffs and other products and preparations (for example, dressings and mordants), of a kind used in the textile, paper, leather or like industries, not elsewhere specified or included.

3809.10 - With a basis of amylaceous substances

- Other :

3809.91 -- Of a kind used in the textile or like industries

3809.92 -- Of a kind used in the paper or like industries

3809.93 -- Of a kind used in the leather or like industries

This heading covers a wide range of products and preparations, of a kind generally used during processing or finishing of yarns, fabrics, paper, paperboard, leather or similar materials, not specified or included elsewhere in the Nomenclature.

They may be identified as falling in this heading because of their composition and presentation which give them a specific use in the industries cited in the heading and like industries, e.g., the textile floor carpeting industry, the vulcanised fibre manufacturing industry and the fur industry. Such products and preparations (e.g., textile softening agents) destined for domestic rather than industrial use are also covered by the heading.

Included here are :

(A) Products and preparations used in the textile or like industries :

(1) **Preparations to modify the feel of products**, for example : **stiffening agents**, generally based on natural starchy substances (such as starch of wheat, rice, maize (corn) or potato and dextrin), mucilaginous substances (lichens, alginates, etc.), gelatin, casein, vegetable gums (gum tragacanth, etc.) or rosin; **weighting agents**; **softening agents**, based on glycerol, imidazoline derivatives, etc.; **fillers**, based on natural or synthetic high molecular weight compounds.

In addition to the above-mentioned basic constituents some of the preparations may also contain wetting agents (soaps, etc.), lubricants (linseed oil, waxes, etc.), filling agents (kaolin, barium sulphate, etc.) and preservatives (particularly zinc salts, copper sulphate and phenol).

(2) **Agents to produce non-slip and anti-snag finishes**. These products are intended to reduce the slipping of fabrics to prevent the formation of snags in hosiery and knitwear. They are generally based on polymers, natural resins or silicic acid.

(3) **Agents to produce dirt-repellent finishes**. These are generally based on silicic acid, aluminium compounds or organic compounds.

(4) **Anti-crease and anti-shrink preparations** being mixtures of chemically defined compounds with at least two reactive groups (e.g., bis(hydroxymethyl) compounds, certain aldehydes and acetals).

(5) **Delustering agents** designed to reduce the lustre or gloss of textiles. They generally consist of suspensions of pigments (titanium oxide, zinc oxide, lithopone, etc.) stabilised by cellulose ethers, gelatin, glue, surface-active agents, etc.

The preparations classified here should not be confused with paints (**heading 32.08, 32.09** or **32.10**), nor with lubricating preparations for oiling or greasing wool (**heading 27.10** or **34.03**).

(6) **Flame-retardant preparations** based on ammonium salts, compounds of boron, nitrogen, bromine or phosphorus or on formulations based on chlorinated organic substances with antimony oxide or other oxides.

(7) **Lustering agents** intended to produce lustre or gloss on textiles. They are generally emulsions of paraffins, waxes, polyolefins or polyglycols.

(8) **Mordants** prepared for use in textile dyeing and printing processes to fix the dyestuffs. These preparations, which are soluble in water, are usually based on metallic salts (e.g., aluminium, ammonium, chromium or iron sulphates or acetates, potassium dichromate, antimony potassium tartrate) or tannin. (But see exclusion (d) at the end of this Explanatory Note.)

(9) **Dye carriers** which are used to accelerate dyeing and printing processes by causing swelling of the synthetic fibres. They include preparations based on biphenyl or on derivatives of benzene, phenol or hydroxytoluic acid, such as trichlorobenzenes, biphenyl-2-ol, methyl hydroxytoluates and mixtures thereof, whether or not containing surface-active agents.

(10) **Non-felting agents** designed to reduce the felting of animal fibres. They are often chlorinating or oxidising agents or specialised formulations of synthetic resin-forming substances.

(11) **Sizing agents** which are used to make yarns more resistant during weaving operations. These preparations are generally based on starch, starch derivatives or other natural or synthetic polymer binders. These may also contain wetting agents, softening agents, fats, waxes or other materials. This group also includes emulsified warp sizing waxes and emulsified fats prepared for sizing.

(12) **Oil-repellents** which are intended to produce an oil-repellent finish in textiles. They generally are emulsions or solutions of organic fluorine compounds such as perfluorinated carboxylic acids, and may contain modified resins (extenders).

(13) **Water-repellent agents**, generally consisting of aqueous emulsions of water-repellent products (such as waxes or lanolin) stabilised by cellulose ethers, gelatin, glue, organic surface-active agents, etc., and containing added soluble salts of, for example, aluminium or zirconium. This group of products also includes preparations based on silicones and on fluorine derivatives.

(B) Products and preparations used in the paper, paperboard or like industries :

- (1) **Binders** used to bind the pigment particles in the coating mixture. They are preparations based on natural products such as casein, starch, starch derivatives, soya protein, animal glue, alginates or cellulose derivatives.
- (2) **Sizing agents or sizing additives** used in paper processing to improve printability, smoothness and gloss and to impart writing properties to the paper. These preparations may be based on rosin soaps, fortified resins, wax dispersions, paraffin dispersions, acrylic polymers, starch and carboxymethylcellulose or vegetable gum.
- (3) **Wet-strengthening agents**. These preparations are used to increase tensile strength, tearing strength, bursting strength and resistance to abrasion of wet paper or nonwovens.

(C) Products and preparations used in the leather or like industries :

- (1) **Binders**. Preparations which are intended to anchor the pigment colours in leather. They are specially formulated, generally on a basis of protein substances, natural resins or waxes, etc.
- (2) **Seasons** which are specially formulated to be applied as the final surface seal in leather finishing. Their structure and composition is similar to that of the binders of (1) above.
- (3) **Waterproofing agents**. These usually consist of (i) chromium soaps, (ii) alkylsuccinic acid or citric acid derivatives, etc., in solvents (such as isopropyl alcohol) or (iii) fluorochemicals, either in solution or in dispersion.

In addition to the products excluded above, this heading **excludes** :

- (a) Preparations of a kind used for the oil or grease treatment of textile materials, leather, furskins or other materials (**heading 27.10 or 34.03**).
- (b) Separate chemically defined elements or compounds (usually **Chapter 28 or 29**).
- (c) Pigments, prepared colours, paints, etc. (**Chapter 32**).
- (d) Organic surface-active agents or preparations, e.g., dyeing adjuvants, of **heading 34.02**.
- (e) Dextrins and other modified starches, and glues based on starches or on dextrins or other modified starches (**heading 35.05**).
- (f) Insecticides and other preparations of **heading 38.08**.
- (g) Emulsions, dispersions or solutions of polymers (**heading 32.09 or Chapter 39**).

38.10 - Pickling preparations for metal surfaces; fluxes and other auxiliary preparations for soldering, brazing or welding; soldering, brazing or welding powders and pastes consisting of metal and other materials; preparations of a kind used as cores or coatings for welding electrodes or rods.

3810.10 - Pickling preparations for metal surfaces; soldering, brazing or welding powders and pastes consisting of metal and other materials

3810.90 - Other

- (1) **Pickling preparations for metal surfaces.** These are preparations used to remove oxides, scale, rust or tarnish from the surface of metals, or for roughening these surfaces to facilitate certain operations. The pickling process may be a finishing operation, or may be effected at an earlier stage (to prepare the metal for drawing or extruding operations, for example), or prior to coating the metal, e.g., by galvanising, metallising, tinning, cladding, electroplating, painting, etc.

Pickling preparations are usually based on dilute acids (hydrochloric, sulphuric, hydrofluoric, nitric, phosphoric, etc.), and sometimes contain inhibitors which restrict the corrosion of the metal. Some, however, have a basis of alkalis (e.g., sodium hydroxide).

The heading **does not include** cleaning preparations for metals (**heading 34.02**).

- (2) **Fluxes and other auxiliary preparations for soldering, brazing or welding.** Fluxes are used to facilitate the joining of the metals in the process of soldering, brazing or welding, by protecting the metal surfaces to be joined and the solder itself from oxidation. They have the property of dissolving the oxide which forms during the operation. Zinc chloride, ammonium chloride, sodium tetraborate, rosin and lanolin are the products most commonly used in these preparations.

This group also includes mixtures of aluminium granules or powder with various metallic oxides (e.g., iron oxide) used as intense heat-generators (alumino-thermic process) in welding operations, etc.

- (3) **Soldering, brazing or welding powders and pastes consisting of metal and other materials.** These preparations are used to make the metal surfaces to be joined adhere to each other. Their essential constituent is metal (usually alloys containing tin, lead, copper, etc.). These preparations are classified in the heading **only when** :

- They contain other constituents as well as metals. These constituents are the auxiliary preparations described in (2) above; and
- They are put up in the form of powders or pastes.

Soldering, brazing or welding preparations consisting solely of metallic powders, whether or not mixed together, are **excluded** (**Chapter 71 or Section XV** according to their constituents).

- (4) **Preparations of a kind used as cores or coatings for welding electrodes or rods.** These are mainly intended to eliminate, in the form of fusible slag, the oxides which form during welding operations. They usually consist of a refractory mixture containing, for example, lime and kaolin.

Electrodes, of base metal or of metal carbides, coated or cored with a flux, are excluded (**heading 83.11**).

38.11 - Anti-knock preparations, oxidation inhibitors, gum inhibitors, viscosity improvers, anti-corrosive preparations and other prepared additives, for mineral oils (including gasoline) or for other liquids used for the same purposes as mineral oils.

- Anti-knock preparations :

3811.11 -- Based on lead compounds

3811.19 -- Other

- Additives for lubricating oils :

3811.21 -- Containing petroleum oils or oils obtained from bituminous minerals

3811.29 -- Other

3811.90 - Other

The preparations of this heading are additives for mineral oils or for other liquids used for the same purposes to eliminate or reduce undesirable properties, or to impart or enhance desirable properties.

(A) Prepared additives for mineral oils.

1.- **Additives for crude oils.** This group includes anticorrosives which are added to crude oils to protect metal structures (in particular, distillation columns). Their active constituents are generally amino-type substances derived in particular from imidazoline.

2.- **Additives for gasoline (petrol).** This group includes :

- (a) **Anti-knock preparations** which increase the resistance of fuels to premature ignition and thus prevent knocking. They are usually based on tetraethyllead and tetramethyllead, and also contain, for example, 1,2-dibromoethane or monochloronaphthalene. The heading **does not include** leaded anti-knock compound sludges obtained from storage tanks for leaded anti-knock compounds and consisting essentially of lead, lead compounds and iron oxide (**heading 26.20**).
- (b) **Oxidation inhibitors.** The most important oxidation inhibitors are based on phenolic products (e.g., dimethyl-*tert*-butylphenol), and such derivatives of aromatic amines as alkyl *p*-phenylenediamines.
- (c) **Anti-icing preparations.** Products often based on alcohols (e.g., propan-2-ol (or isopropyl alcohol)), which are added to gasoline (petrol) to prevent the formation of ice in fuel systems.
- (d) **Detergents.** Preparations used to keep the carburettor and the inflow and outflow of the cylinders clean.
- (e) **Gum inhibitors.** These products are intended to prevent the formation of gum in the carburettor or engine intake.

3.- **Additives for lubricating oils.** This group includes :

- (a) **Viscosity improvers**, based on polymers such as polymethacrylates, polybutenes, polyalkylstyrenes.
- (b) **Pour-point depressants**, which prevent the aggregation of crystals at low temperatures. The products of this category are based on polymers of ethylene, on vinyl esters and ethers or on acrylic esters.
- (c) **Oxidation inhibitors** usually based on phenolic or amino compounds.
- (d) **Extreme pressure (EP) additives** based on organodithiophosphates of zinc, sulphurised oils, chlorinated hydrocarbons, aromatic phosphates and thiophosphates.
- (e) **Detergents and dispersants**, such as those based on alkyl phenoxides, naphthenates or petroleum sulphonates of certain metals, such as those of aluminium, calcium, zinc or barium.
- (f) **Rust preventatives** based on organic salts (sulphonates) of calcium or barium, on amines or on alkylsuccinic acids.
- (g) **Foam inhibitors**, usually based on silicones.

Those lubricating preparations intended to be added in small quantities to motor fuels or lubricants, for example, for reducing wear on engine cylinders, are **excluded (heading 27.10 or 34.03)**.

4.- **Additives for other mineral oils.** This group includes :

- (a) **Pour-point depressants**, similar to those used for lubricants as in 3 (b) above.
- (b) **Oxidation inhibitors**. These are similar to those used for gasoline (petrol).
- (c) **Cetane number improvers** for gas oil, for example those based on alkyl nitrates and alkyl nitrites.
- (d) **Additives with surface-active action, which eliminate or prevent the formation of sediment (asphaltenes)** in stored oil.
- (e) **Additives to prevent or reduce undesirable deposits** (e.g., ash, carbon black) in the combustion chambers or flues of furnaces, and **additives to reduce corrosion** by volatile products (e.g., SO₂ and SO₃) in heat transmission structures or chimneys.
- (f) Anti-icing preparations, added to prevent the formation of ice in fuel systems.

(B) Prepared additives for other liquids used for the same purposes as mineral oils.

Among the liquids used for the same purposes as mineral oils are :

- (a) Fuels based on alcohols (e.g., gasohol); and

(b) Synthetic lubricants :

- (1) based on esters of organic acids (adipates, azelates, neopentylpolyol esters) or of inorganic acids (triaryl phosphates);
- (2) based on polyethers (poly(oxyethylene) (polyethylene glycol) or poly(oxypropylene) (polypropylene glycol));
- (3) based on silicones.

The additives are the same as those used for the corresponding mineral oils.

This heading **does not apply** to separate chemically defined elements and compounds (usually **Chapter 28 or 29**), or to petroleum sulphonates not in the form of preparations.

The heading also **excludes** :

- (a) Lubricating preparations with a basis of molybdenum disulphide (**heading 34.03**).
- (b) Colloidal graphite in suspension in oil or other media and semi-colloidal graphite (**heading 38.01**).

38.12 - Prepared rubber accelerators; compound plasticisers for rubber or plastics, not elsewhere specified or included; anti-oxidising preparations and other compound stabilisers for rubber or plastics.

3812.10 - Prepared rubber accelerators

3812.20 - Compound plasticisers for rubber or plastics

- Anti-oxidising preparations and other compound stabilizers for rubber or plastics :

3812.31 -- Mixtures of oligomers of 2,2,4-trimethyl-1,2-dihydroquinoline (TMQ)

3812.39 -- Other

For the purpose of this heading, the terms "compound", "prepared" and "preparation" include :

- (i) deliberate mixtures and blends; and
- (ii) reaction mixtures including products produced from a homologous series such as fatty acids or fatty alcohols of heading 38.23.

(A) Prepared rubber accelerators.

This category covers products which are added to rubber prior to vulcanisation to give the vulcanised articles better physical properties and reduce the time and temperature required for the vulcanising process. They sometimes also serve as plasticisers. This heading covers **only** such products which are mixtures.

These preparations are generally based on organic products (diphenylguanidine, dithiocarbamates, thiuram sulphides, hexamethylenetetramine, mercaptobenzothiazole, etc.) often combined with inorganic activators (zinc oxide, magnesium oxide, lead oxide, etc.).

(B) Compound plasticisers for rubber or plastics, not elsewhere specified or included.

This category covers compound plasticisers which are used to provide a desired degree of flexibility to plastics or to increase the plasticity of the rubber mix. Examples of these types of products include deliberate mixtures of two or more phthalate esters as well as mixed dialkyl phthalates produced from mixed fatty alcohols of heading 38.23. Plasticisers are used extensively with poly(vinyl chloride) and with cellulose esters.

The heading **does not cover** products used as or sometimes called plasticisers, which are more specifically covered by some other heading of the Nomenclature (see the exclusions at the end of this Explanatory Note).

(C) Anti-oxidising preparations and other compound stabilisers for rubber or plastics.

This category covers anti-oxidising preparations for rubber or plastics (used, for example, in rubber manufacture to prevent hardening or ageing), such as mixtures of oligomers of 2,2,4-trimethyl-1,2-dihydroquinoline (TMQ), mixed alkylated diphenylamines and preparations based on N-naphthylaniline.

This category also covers other compound stabilisers for rubber or plastics. Examples of this type of product include deliberate mixtures of two or more stabilisers as well as reaction mixtures such as mixed organotin compounds obtained from mixed fatty alcohols of heading 38.23. The main use of compound stabilisers for plastics is to inhibit the dehydrochlorination of certain polymers such as poly(vinyl chloride). They may also be used as heat stabilisers for polyamides.

The heading **excludes** :

- (a) Petroleum oils, petroleum jelly, paraffin waxes and asphalts of **Chapter 27**.
- (b) Separate chemically defined compounds of **Chapter 28** or **29**, e.g., dioctyl phthalate.
- (c) Anti-oxidants prepared as additives for mineral oils or for other liquids used for the same purposes as mineral oils (**heading 38.11**).
- (d) Peptisers for rubber processing, though known as chemical plasticisers (generally **heading 38.24**).
- (e) Polymers of **Chapter 39**.

38.13 - Preparations and charges for fire-extinguishers; charged fire-extinguishing grenades.

This heading covers :

- (A) **Preparations for fire-extinguishers.** These include preparations with a basis of bicarbonates, sometimes containing, e.g., extracts of quillaia bark, extracts of liquorice or surface-active products to help produce a blanket of foam. These preparations may be liquid or dry.
- (B) **Charges for fire-extinguishers**, i.e., light-weight containers (of glass, thin sheet-metal, etc.) designed to be themselves incorporated into fire-extinguishers, whether they contain :
 - (1) Preparations of the kind described in paragraph (A).
 - or (2) Two or more unmixed products (e.g., a solution of aluminium sulphate and a solution of sodium hydrogencarbonate), separated by a partition and intended to be put into contact at the moment of use.
 - or (3) A single unmixed product (e.g., carbon tetrachloride, methyl bromide or sulphuric acid).
- (C) **Charged fire-extinguishing grenades**, i.e., containers charged with fire-extinguishing products (whether or not mixed), and used directly without incorporation in fire-extinguishing appliances. These are glass or pottery containers which are thrown into the heart of the fire and which break freeing their contents, or glass containers the end of which need only be broken between the fingers to project the extinguishing product.

Fire-extinguishers, whether or not portable and whether or not charged, which are operated by means of a pin, by upturning, striking a trigger, etc., fall in **heading 84.24**.

The heading also **excludes** unmixed chemical products with fire-extinguishing properties, when put up otherwise than as described in paragraphs (B) (2), (B) (3) and (C) above (generally **Chapter 28 or 29**).

38.14 - Organic composite solvents and thinners, not elsewhere specified or included; prepared paint or varnish removers.

This heading covers organic solvents and thinners (whether or not containing 70 % or more by weight of petroleum oil) **provided** that they are not separate chemically defined compounds and are not covered by a more specific heading. They are more or less volatile liquids which are used, *inter alia*, in the preparation of varnishes and paints or as degreasing preparations for machinery parts, etc.

Examples of the products classified in this heading are :

- (1) Mixtures of acetone, methyl acetate and methanol, and mixtures of ethyl acetate, butyl alcohol and toluene.
- (2) Degreasing preparations for machinery parts, etc., consisting of a mixture of :
 - (i) white spirit with trichloroethylene; or
 - (ii) petroleum spirit with chlorinated products and xylene.

The heading also covers paint or varnish removers consisting of the above mixtures with the addition of small quantities of paraffin wax (to retard evaporation of the solvents), emulsifiers, gelling agents, etc.

The heading **does not cover** :

- (a) Separate chemically defined solvent or thinning compounds (**Chapter 29** generally) and products of complex constitution used as solvents or thinners but covered by more specific headings of the Nomenclature, e.g., solvent naphtha (**heading 27.07**), white spirit (**heading 27.10**), gum, wood or sulphate turpentine (**heading 38.05**); wood tar oils (**heading 38.07**), inorganic composite solvents (generally **heading 38.24**).
- (b) Solvents for removing nail varnishes, put up for retail sale (**heading 33.04**).

38.15 - Reaction initiators, reaction accelerators and catalytic preparations, not elsewhere specified or included.

- Supported catalysts :

3815.11 -- With nickel or nickel compounds as the active substance

3815.12 -- With precious metal or precious metal compounds as the active substance

3815.19 -- Other

3815.90 - Other

This heading covers preparations which initiate or accelerate certain chemical processes. Products which retard these processes **are not included**.

These preparations fall broadly into two groups.

- (a) Those of the first group are, in general, composed either of one or more active substances deposited on a support (known as "supported catalysts") or of mixtures with a basis of active substances. In the majority of cases, these active substances are certain metals, metallic oxides, other metallic compounds or mixtures thereof. The metals most frequently used as such or as compounds are cobalt, nickel, palladium, platinum, molybdenum, chromium, copper or zinc. The support, sometimes activated, generally consists of alumina, carbon, silica gel, siliceous fossil meal or ceramic materials. Examples of "supported catalysts" are supported Ziegler or Ziegler-Natta types.
- (b) Those of the second group are mixtures with a basis of compounds whose nature and proportions vary according to the chemical reaction to be catalysed. These preparations include :
 - (i) "free radical catalysts" (e.g., organic solutions of organic peroxides or of azo compounds, redox mixtures);
 - (ii) "ionic catalysts" (e.g., alkylolithium);
 - (iii) "catalysts for polycondensation reactions" (e.g., mixtures of calcium acetate with antimony trioxide).

The preparations of the second group are generally used in the course of manufacture of polymers.

This heading **does not include** :

- (a) Spent catalysts of a kind used for the extraction of base metals or for the manufacture of chemical compounds of base metals (**heading 26.20**) and spent catalysts of a kind used principally for the recovery of precious metal (**heading 71.12**).
- (b) Separate chemically defined compounds (**Chapter 28 or 29**).
- (c) Catalysts consisting solely of metals or metal alloys in the form of finely divided powder, woven gauze, etc. (**Section XIV or XV**).
- (d) Prepared rubber accelerators for use in the vulcanisation of rubber (**heading 38.12**).

38.16 - Refractory cements, mortars, concretes and similar compositions, other than products of heading 38.01.

This heading covers certain preparations (e.g., for furnace linings) with a basis of such refractory materials as chamotte and dinas earths, crushed or ground corundum, powdered quartzites, chalk, calcined dolomite, with an added refractory binder (for example, sodium silicate, magnesium or zinc fluosilicates). Many of the products of this heading also contain non-refractory binders such as hydraulic binding agents.

The heading also covers refractory compositions with a basis of silica for the manufacture of dental or jewellery moulds by the lost wax process.

The heading further covers refractory concretes consisting of mixtures of heat-resistant hydraulic cements (e.g., aluminous cements) and refractory aggregates, used for the foundation of furnaces, coke ovens, etc., or for patching furnace linings as well as the following :

- (a) **Compositions known as refractory “plastics”**, which are products sold as a dampened mass often consisting of a refractory aggregate, clay and minor additives.
- (b) **Ramming mixes**, other than dolomite ramming mixes, which are similar in composition to the products mentioned in (a) above and which, when applied by hand-held pneumatic rammers, form a dense coating or filling.
- (c) **Gunning mixes**, which are refractory aggregates mixed with hydraulic setting or other binders, applied to furnace linings, sometimes even when these are hot, by special guns which project the mix through a nozzle using compressed air.

The heading **does not cover** :

- (a) Dolomite ramming mixes (**heading 25.18**).
- (b) Carbonaceous pastes of **heading 38.01**.

38.17 - Mixed alkylbenzenes and mixed alkylnaphthalenes, other than those of heading 27.07 or 29.02.

This heading covers **mixed alkylbenzenes** and **mixed alkylnaphthalenes** obtained by alkylation of benzene and naphthalene. They have fairly long side-chains and are not of the kind mentioned in the second part of the text of heading 27.07. Mixed alkylbenzenes are used, *inter alia*, as solvents, and in the manufacture of surface-active agents, lubricants and insulating oils. Mixed alkylnaphthalenes are mainly used for the manufacture of alkylnaphthalene sulphonic acids and their salts.

The heading **excludes** mixtures of isomers of **heading 29.02**.

38.18 - Chemical elements doped for use in electronics, in the form of discs, wafers or similar forms; chemical compounds doped for use in electronics.

This heading covers :

- (1) The chemical elements of Chapter 28 (for example, silicon and selenium) doped with, for example, boron or phosphorus, generally in a proportion of the order of one part per million, **provided** they are in the form of discs, wafers or similar forms. When in forms unworked as drawn, or in the form of cylinders or rods, they are classified in **Chapter 28**.
- (2) Chemical compounds such as cadmium selenide and sulphide, indium arsenide, etc., containing certain additives (e.g., germanium, iodine) generally in a proportion of a few per cent, with a view to their use in electronics, whether in the form of cylinders, rods, etc., or cut into discs, wafers or similar forms.

The heading covers such crystals, polished or not, whether or not coated with a uniform epitaxial layer.

Those more extensively worked (e.g., by selective diffusion) fall in **heading 85.41** as semiconductor devices.

38.19 - Hydraulic brake fluids and other prepared liquids for hydraulic transmission, not containing or containing less than 70 % by weight of petroleum oils or oils obtained from bituminous minerals.

This heading covers **hydraulic brake fluids and other prepared liquids for hydraulic transmission**, e.g., those consisting of mixtures of castor oil, 2-ethoxyethanol or ethylene diricinoleate and butyl alcohol, or those composed of 4-hydroxy-4-methylpentan-2-one (diacetone alcohol), diethyl phthalate and propane-1,2-diol as well as mixtures of glycols.

The heading also includes prepared hydraulic fluids based on polyglycols, silicones, or other polymers of Chapter 39.

Similar liquids containing 70 % or more by weight of petroleum oils or of oils obtained from bituminous minerals are, however, **excluded (heading 27.10)**.

38.20 - Anti-freezing preparations and prepared de-icing fluids.

This heading covers anti-freezing preparations and prepared de-icing fluids (e.g., mixtures with a basis of glycol derivatives).

Some anti-freezing preparations also act as coolants or as heat-exchange agents.

It **does not cover**, however, prepared additives for mineral oils or for other liquids used for the same purposes as mineral oils (**heading 38.11**).

38.21 - Prepared culture media for the development or maintenance of micro-organisms (including viruses and the like) or of plant, human or animal cells.

This heading covers various preparations in which bacteria, moulds, microbes, viruses, other micro-organisms and plant, human or animal cells required for medical purposes (e.g., for obtaining antibiotics) or for other scientific purposes or in industry (e.g., in the manufacture of vinegar, lactic acid, butyl alcohol) can find nourishment and multiply or in which they can be maintained.

They are usually prepared from meat extracts, fresh blood or blood serum, eggs, potatoes, alginates, agar-agar, peptones, gelatin, etc., and often contain additional ingredients such as glucose, glycerol, sodium chloride, sodium citrate or dyes. Acids, digestive ferments or alkalis may be added to bring them to the required degree of acidity or alkalinity, etc.

There are also other media, e.g., mixtures of sodium chloride, calcium chloride, magnesium sulphate, potassium hydrogensulphate, potassium aspartate and ammonium lactate in distilled water.

Certain culture media for viruses consist of living embryo.

They are usually in liquid form (broths), pastes or powders but may also be in tablets or granule form, and are sterilised and put up in sealed glass bottles, tubes, ampoules or tins.

The heading **does not cover** products not prepared as culture media, e.g. :

- (a) Agar-agar (**heading 13.02**).
- (b) Blood or egg albumin (**heading 35.02**).
- (c) Gelatin (**heading 35.03**).
- (d) Peptones (**heading 35.04**).
- (e) Alginates (**heading 39.13**).

38.22 - Diagnostic or laboratory reagents on a backing, prepared diagnostic or laboratory reagents whether or not on a backing, other than those of heading 30.02 or 30.06; certified reference materials.

This heading covers **diagnostic or laboratory reagents on a backing, prepared diagnostic or laboratory reagents, other than** diagnostic reagents of **heading 30.02** or diagnostic reagents designed to be administered to the patient and blood grouping reagents of **heading 30.06**. It also covers **certified reference materials**. Diagnostic reagents are used in the evaluation of physical, biophysical or biochemical processes and states in animals and humans; their function is based upon a measurable or observable change in the biological or chemical substances constituting the reagent. Prepared diagnostic reagents of this heading may be similar in function to those designed to be administered to patients (subheading 3006.30), with the exception that they are used for *in vitro*, rather than for *in vivo*, applications. Prepared laboratory reagents include not only diagnostic reagents, but also other analytical reagents used for purposes other than detection or diagnosis. Prepared diagnostic and laboratory reagents may be used in medical, veterinary, scientific or industrial laboratories, in hospitals, in industry, in the field or, in some cases, in the home.

Reagents of this heading are either on a backing or in the form of preparations and thus comprise more than a single constituent. For example, they may consist of admixtures of two or more reagents or of single reagents dissolved in solvents other than water. They may also be in the form of paper, plastics or other materials (used as backings or support), impregnated or coated with one or more diagnostic or laboratory reagents, such as litmus, pH or pole-finding papers or pre-coated immuno-assay plates. Reagents of this heading may also be put up in the form of kits, consisting of several components, even if one or more components are separate chemically defined compounds of Chapter 28 or Chapter 29, synthetic colouring matter of heading 32.04 or any other substance which, when presented separately, would be classifiable under another heading. Examples of such kits are those for testing glucose in blood, ketones in urine, etc., and those based on enzymes. However, diagnostic kits having the essential character of products of **heading 30.02 or 30.06** (e.g., those based on monoclonal or polyclonal antibodies) are **excluded**.

The reagents of this heading should be clearly identifiable as being for use only as diagnostic or laboratory reagents. This must be clear from their composition, labelling, instructions for *in vitro* or laboratory use, indication of the specific diagnostic test to be performed or physical form (e.g., presented on a backing or support).

With the **exception** of the products of **Chapter 28 or 29**, for the classification of certified reference materials, heading 38.22 shall take precedence over any other heading in the Nomenclature.

The certified reference materials of this heading are reference materials prepared for the calibration of an apparatus, the assessment of a measurement method or the assignment of values to a material. These reference materials may consist of the following :

- (a) Substrate materials containing added analytes, the concentration of which has been accurately determined;
- (b) Unmixed materials, the concentration of certain components of which has been accurately determined (e.g., the protein and fat content of milk powder);
- (c) Materials, whether natural or synthetic, certain properties of which have been accurately determined (e.g., tensile strength, specific gravity).

These reference materials must be accompanied by a certificate which indicates the values of the certified properties, the methods used to determine the values and the degree of certainty associated with each value, and the certifying authority.

The heading also **excludes** the following reagents, whether or not put up in forms for use as diagnostic or laboratory reagents :

- (a) Goods of **headings 28.43 to 28.46 and 28.52** (see Note 1 to Section VI);
- (b) Products covered by Note 1 to Chapter 28 or Note 1 to Chapter 29;
- (c) Colouring matter of **heading 32.04**, including preparations mentioned in Note 3 to Chapter 32;
- (d) Prepared culture media for the development or maintenance of micro-organisms (including viruses and the like) or of plant, human or animal cells (**heading 38.21**).

38.23 - Industrial monocarboxylic fatty acids; acid oils from refining; industrial fatty alcohols.

- Industrial monocarboxylic fatty acids; acid oils from refining :

3823.11 -- Stearic acid

3823.12 -- Oleic acid

3823.13 -- Tall oil fatty acids

3823.19 -- Other

3823.70 - Industrial fatty alcohols

**(A) INDUSTRIAL MONOCARBOXYLIC FATTY ACIDS;
ACID OILS FROM REFINING**

Industrial monocarboxylic fatty acids are generally manufactured by the saponification or hydrolysis of natural fats or oils. Separation of solid (saturated) and liquid (unsaturated) fatty acids is usually done by crystallisation either with or without solvent. The liquid part (commercially known as oleic acid or olein) consists of oleic acid and other unsaturated fatty acids (e.g., linoleic and linolenic acids) together with small amounts of saturated fatty acids. The solid part (commercially known as stearic acid or stearin) consists mainly of palmitic and stearic acids with a small proportion of unsaturated fatty acids.

This heading includes, *inter alia* :

- (1) **Commercial stearic acid** (stearin) which is a white solid material with a characteristic odour. It is relatively hard and rather brittle and is usually marketed in the form of beads, flakes or powder. It is also marketed in liquid form when transported hot in isothermal tanks.
- (2) **Commercial oleic acid** (olein) which is a colourless to brown oily liquid with a characteristic odour.
- (3) **Tall oil fatty acids** (TOFA) which consist primarily of oleic and linoleic acid. They are obtained by the distillation of crude tall oil and contain by weight 90 % or more (calculated on the weight of the dry product) of fatty acids.
- (4) **Distilled fatty acids** which are obtained after hydrolytic splitting of various fats and oils (e.g., coconut oil, palm oil, tallow) followed by a purification process (distillation).
- (5) **Fatty acid distillate**, obtained from fats and oils which have been subjected to vacuum distillation in the presence of steam as part of a refining process. Fatty acid distillate is characterised by a high free fatty acid (ffa) content.
- (6) **Fatty acids obtained by catalytic oxidation** of synthetic hydrocarbons of a high molecular weight.
- (7) **Acid oils from refining**, with a relatively high free fatty acid content, prepared by decomposing with mineral acid the soap-stock obtained during the refining of crude oils.

The heading **excludes** :

- (a) Oleic acid, of a purity of 85 % or more (calculated on the weight of the dry product) (**heading 29.16**).
- (b) Other fatty acids of a purity of 90 % or more (calculated on the weight of the dry product) (generally **heading 29.15, 29.16 or 29.18**).

(B) INDUSTRIAL FATTY ALCOHOLS

The fatty alcohols classified here are mixtures of acyclic alcohols obtained by catalytic reduction of the mixed fatty acids of this heading (see Part (A) above) or of their esters, by saponification of sperm oil, by catalytic reaction between olefins, carbon monoxide and hydrogen ("Oxo" process), by hydration of olefins, by oxidation of hydrocarbons or by other means.

Fatty alcohols are usually liquid but some are solid.

The principal fatty alcohols of this heading are :

- (1) **Lauryl alcohol** which is a mixture of saturated fatty alcohols obtained by catalytic reduction of the fatty acids from coconut oil. It is liquid at normal temperatures, but is semi-solid in cold weather.
- (2) **Cetyl alcohol** which is a mixture of cetyl and stearyl alcohols, the former greatly predominating, obtained from spermaceti and sperm oil. It is a crystalline, translucent solid at room temperature.
- (3) **Stearyl alcohol** which is a mixture of stearyl and cetyl alcohols obtained by reduction of stearin or oils rich in stearic acid, or from sperm oil by hydrogenation and hydrolysis followed by distillation. It is a white crystalline solid at room temperature.
- (4) **Oleyl alcohol** which is obtained by reduction of olein, or from alcohols derived from sperm oil by hydraulic pressure. It is liquid at room temperature.
- (5) **Mixtures of primary aliphatic alcohols** commonly comprising alcohols in the range from six to thirteen carbon atoms. They are liquids generally produced by the "Oxo" process.

The fatty alcohols referred to in paragraphs (1) to (4) are mainly used for the preparation of their sulphonated derivatives whose alkali salts are the organic surface-active agents of heading 34.02. The fatty alcohols of paragraph (5) are principally used for the manufacture of plasticisers for poly(vinyl chloride).

This heading also covers industrial fatty alcohols which have a waxy character.

The heading **does not include** chemically defined fatty alcohols, of a purity of 90 % or more (calculated on the weight of the dry product) (generally **heading 29.05**).

38.24 - Prepared binders for foundry moulds or cores; chemical products and preparations of the chemical or allied industries (including those consisting of mixtures of natural products), not elsewhere specified or included (+).

- 3824.10 - Prepared binders for foundry moulds or cores
- 3824.30 - Non-agglomerated metal carbides mixed together or with metallic binders
- 3824.40 - Prepared additives for cements, mortars or concretes
- 3824.50 - Non-refractory mortars and concretes
- 3824.60 - Sorbitol other than that of subheading 2905.44
 - Mixtures containing halogenated derivatives of methane, ethane or propane :
- 3824.71 -- Containing chlorofluorocarbons (CFCs), whether or not containing hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs) or hydrofluorocarbons (HFCs)
- 3824.72 -- Containing bromochlorodifluoromethane, bromotrifluoromethane or dibromotetrafluoroethanes
- 3824.73 -- Containing hydrobromofluorocarbons (HBFCs)
- 3824.74 -- Containing hydrochlorofluorocarbons (HCFCs), whether or not containing perfluorocarbons (PFCs) or hydrofluorocarbons (HFCs), but not containing chlorofluorocarbons (CFCs)
- 3824.75 -- Containing carbon tetrachloride
- 3824.76 -- Containing 1,1,1-trichloroethane (methyl chloroform)
- 3824.77 -- Containing bromomethane (methyl bromide) or bromochloromethane
- 3824.78 -- Containing perfluorocarbons (PFCs) or hydrofluorocarbons (HFCs), but not containing chlorofluorocarbons (CFCs) or hydrochlorofluorocarbons (HCFCs)
- 3824.79 -- Other
 - Goods specified in Subheading Note 3 to this Chapter :
- 3824.81 -- Containing oxirane (ethylene oxide)
- 3824.82 -- Containing polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs) or polybrominated biphenyls (PBBs)
- 3824.83 -- Containing tris(2,3-dibromopropyl) phosphate
- 3824.84 -- Containing aldrin (ISO), camphechlor (ISO) (toxaphene), chlordane (ISO), chlordecone (ISO), DDT (ISO) (clovefenotane (INN), 1,1,1-trichloro-2,2-bis(p-chlorophenyl)ethane), dieldrin (ISO, INN), endosulfan (ISO), endrin (ISO), heptachlor (ISO) or mirex (ISO)
- 3824.85 -- Containing 1,2,3,4,5,6-hexachlorocyclohexane (HCH (ISO)), including lindane (ISO, INN)
- 3824.86 -- Containing pentachlorobenzene (ISO) or hexachlorobenzene (ISO)

3824.87 - - Containing perfluorooctane sulphonic acid, its salts, perfluorooctane sulphonamides, or perfluorooctane sulphonyl fluoride

3824.88 - - Containing tetra-, penta-, hexa- hepta- or octabromodiphenyl ethers

- Other :

3824.91 - - Mixtures and preparations consisting mainly of (5-ethyl-2-methyl-2-oxido-1,3,2-dioxaphosphinan-5-yl)methyl methyl methylphosphonate and bis[(5-ethyl-2-methyl-2-oxido-1,3,2-dioxaphosphinan-5-yl)methyl] methylphosphonate

3824.99 - - Other

This heading covers :

(A) PREPARED BINDERS FOR FOUNDRY MOULDS OR CORES

The heading covers foundry core binders based on natural resinous products (e.g., rosin), linseed oil, vegetable mucilages, dextrin, molasses, polymers of Chapter 39, etc.

These are preparations for mixing with foundry sand to give it a consistency suitable for use in foundry moulds or cores, and to facilitate the removal of the sand after the piece has been cast.

However, dextrans and other modified starches, and glues based on starches or on dextrans or other modified starches are classified in **heading 35.05**.

(B) CHEMICAL PRODUCTS AND CHEMICAL OR OTHER PREPARATIONS

With only three exceptions (see paragraphs (7), (19) and (32) below), this heading **does not apply** to separate chemically defined elements or compounds.

The **chemical products** classified here are therefore products whose composition is not chemically defined, whether they are obtained as by-products of the manufacture of other substances (this applies, for example, to naphthenic acids) or prepared directly.

The **chemical or other preparations** are either mixtures (of which emulsions and dispersions are special forms) or occasionally solutions. Aqueous solutions of the chemical products of **Chapter 28** or **29** remain classified within those Chapters, but solutions of these products in solvents other than water are, apart from a few exceptions, excluded therefrom and accordingly fall to be treated as preparations of this heading.

The preparations classified here may be either wholly or partly of chemical products (this is generally the case) or wholly of natural constituents (see, for example, paragraph (24) below).

However, the heading **does not cover** mixtures of chemicals with foodstuffs or other substances with nutritive value, of a kind used in the preparation of certain human foodstuffs either as ingredients or to improve some of their characteristics (e.g., improvers for pastry, biscuits, cakes and other bakers' wares), provided that such mixtures or substances are valued for their nutritional content itself. These products generally fall in **heading 21.06**. (See also the General Explanatory Note to Chapter 38.)

This heading also **excludes** mercury compounds (**heading 28.52**).

Subject to the above conditions, the preparations and chemical products falling here include :

- (1) **Naphthenic acids** (by-products of the refining of certain petroleum oils and of certain oils obtained from bituminous minerals), **and their salts, other than** the water-soluble naphthenates of **heading 34.02**, and salts of **headings 28.43 to 28.46 and 28.52**. The heading covers, for example, calcium, barium, zinc, manganese, aluminium, cobalt, chromium, lead, etc., naphthenates, some of which are used for the preparation of driers or additives for mineral oils, and copper naphthenate used for the preparation of fungicides.
- (2) **Non-agglomerated metal carbides** (tungsten carbide, molybdenum carbide, etc.) mixed together or with metallic binders (such as cobalt), for the manufacture of the tips or the like for tools of heading 82.09.
- (3) **Prepared additives for cements, mortars or concretes**, for example, anti-acid additives with a basis of sodium or potassium silicate and sodium or potassium fluorosilicate, and waterproofing preparations (whether or not containing soap), e.g., based on calcium oxide, fatty acids, etc.
- (4) **Non-refractory mortars and concretes**.
- (5) **Sorbitol other than that of heading 29.05**.

This category covers, in particular, sorbitol (D-glucitol) syrups containing other polyols and in which the D-glucitol content normally ranges from 60 % to 80 % of the dry matter. Products of this kind are obtained by the hydrogenation of glucose syrups having a high disaccharide and polysaccharide content, without any separation process having taken place. They have the characteristic of being difficult to crystallise and are used in a wide variety of industries (e.g., food, cosmetics, pharmaceuticals, plastics, textiles).

Sorbitol meeting the requirements of Note 1 to Chapter 29 is classified in **heading 29.05**. Sorbitol of this kind is usually obtained by the hydrogenation of glucose or invert sugar.

- (6) **Mixtures of calcium carbide, calcium carbonate (limestone) and other materials** such as carbon or fluorspar, prepared for use as a desulphuriser in steel-making.
- (7) **Cultured crystals (other than optical elements)** weighing not less than 2.5 g each, of magnesium oxide or of the halides of the alkali or of the alkaline-earth metals (calcium or lithium fluoride, potassium or sodium chloride, potassium bromide, potassium bromiodide, etc.). Optical elements of cultured crystals are **excluded (heading 90.01)**.

Cultured crystals (**other than** optical elements) weighing less than 2.5 g each, are classified in **Chapter 28, heading 25.01** (sodium chloride crystals) or **heading 31.04** (potassium chloride crystals).

- (8) **Petroleum sulphonates**, not water-soluble, obtained from petroleum or petroleum fractions by sulphonation, for example, with sulphuric acid, oleum or sulphur trioxide dissolved in liquid sulphur dioxide, this process usually being followed by neutralisation. Water-soluble petroleum sulphonates, e.g., of alkali metals, of ammonium or of ethanolamines are, however, **excluded (heading 34.02)**.
- (9) **Polychlorobiphenyls** (mixtures of chlorinated derivatives of biphenyl) **and chloroparaffins**.

Solid polychlorobiphenyls and solid chloroparaffins having the character of artificial waxes are, however, **excluded (heading 34.04)**.

- (10) **Poly(oxyethylene) (polyethylene glycol)** with a very low molecular weight, e.g., mixtures of di-, tri- and tetra(oxyethylene) glycols.

All other types of poly(oxyethylene) (polyethylene glycol) are, however, excluded (**heading 39.07** or, if having the character of artificial waxes, **heading 34.04**).

(11) **Mixtures of mono-, di- and tri-, fatty acid esters of glycerol**, used as emulsifiers for fats.

Those which have the character of artificial waxes are, however, excluded (**heading 34.04**).

(12) **Fusel oil**, which is obtained in the rectification of crude ethyl alcohol.

(13) **Dippel's oil** (bone oil, animal oil, Jeppel's oil) obtained by destructive distillation of the bones or horns of ruminants. It is a blackish liquid, extremely viscous and with a fetid odour, chiefly used in the preparation of insecticides or pyridine bases.

(14) **Ion-exchangers** (including base or acid exchangers) **other than** polymers of **Chapter 39**. These are insoluble compounds which, when brought into contact with a solution of an electrolyte, exchange one of their own ions for one of those contained in a substance dissolved in that solution, this property being of value industrially, e.g., for removing the calcium or magnesium salts from hard water intended for boilers, for the textile or dyeing industries, for laundries, etc. They are also used to convert salt water into drinking water, etc. Artificial zeolites (whether or not chemically defined), except those containing binders are, however, excluded (**heading 28.42**).

(15) **Anti-scaling compounds** usually based on sodium carbonate, sodium silicate, tannin, etc. These compounds, added to hard water, precipitate most of the dissolved calcium and magnesium salts, thus preventing the formation of calcareous deposits in boilers, the tubes of steam generators and other apparatus through which water circulates.

(16) **Oxylith** (or oxygen stone), prepared by adding small quantities of products such as copper or nickel salts to sodium peroxide. This regulates the release of oxygen on immersion in water. Oxylith is often in the form of cubes or slabs.

(17) **Additives to harden varnish or glue**, e.g., mixtures of ammonium chloride and urea.

(18) **Getters for vacuum tubes**, with a basis of barium, zirconium, etc. These getters are usually put up in pastilles, tablets or similar forms, or on metal tubes or wires.

(19) **Ink-removers put up in packings for retail sale**. These are usually aqueous solutions of chemically defined compounds. In some cases a single compound may be used (e.g., an aqueous solution of chloramine), but in others, two with complementary functions may be necessary. In the latter case, two bottles may be provided in the same package, one containing, for example, an aqueous solution of sodium hydrogensulphite and the other an aqueous solution of potassium permanganate.

(20) **Stencil correctors put up in packings for retail sale**. These are usually pink cellulose varnishes and are put up in small bottles the caps of which are generally provided with a small brush.

These varnishes are excluded from this heading when not put up for retail sale as stencil correctors. Organic composite thinners for these varnishes fall in **heading 38.14**.

(21) **Correcting fluids put up in packings for retail sale**. These are opaque (white or otherwise coloured) fluids consisting essentially of pigments, binders, and solvents, used for masking errors or other unwanted marks in typescripts, manuscripts, photocopies, offset printing masters or the like. They are usually put up in small bottles (the cap of which is usually provided with a small brush), in tins or in the form of pens.

Organic composite thinners for these fluids fall in **heading 38.14**.

(22) **Correction tapes put up in packings for retail sale.** These are rolls of correction ribbons generally presented in a plastic dispenser, used for masking writing or typewriting errors or other unwanted marks in typescripts, manuscripts, photocopies, offset printing masters or the like. These products are available in different tape widths and lengths. The correction ribbon is composed of an opaque pigment coating which is applied on the surface of the ribbon. The coating is applied manually by pressing a transfer head on the part to be corrected.

The heading **excludes** :

- (a) Correction tapes composed of paper with an adhesive backing (**Chapter 48**)
- (b) Mixtures Typewriter or similar ribbons, inked or otherwise prepared for giving impressions

(23) **Preparations used mainly for clarifying wines and other fermented beverages.** These generally have a basis of poly(vinyl pyrrolidone) or gelatinous or albuminous substances such as isinglass, gelatin, carrageen moss or egg albumin. However, those containing enzymes are **excluded (heading 35.07)**.

(24) **Compounded extenders for paints.** These are prepared powders often added to paints (other than distempers) to reduce their cost and at the same time, in some cases, to improve certain properties (e.g., to facilitate the spreading of colouring pigments). They are also used in the manufacture of distempers, but in this case they act as pigments. These preparations consist of mixtures of two or more natural products (chalk, natural barium sulphate, slate, dolomite, natural magnesium carbonate, gypsum, asbestos, mica, talc, calcite, etc.), of mixtures of these natural products with chemical products, or of mixtures of chemical products (e.g., mixtures of aluminium hydroxide and barium sulphate).

This category also includes finely ground natural calcium carbonate ("Champagne white"), each particle being coated, by a special treatment, with a water-repellent film of stearic acid.

(25) **Preparations for the manufacture of certain ceramic articles** (artificial teeth, etc.), e.g., mixtures with a basis of kaolin, quartz and feldspar.

(26) **Fusible ceramic firing testers** (Seger cones, etc.). These are usually in the shape of small pyramids, formed of mixtures of substances similar to those in ceramic pastes and vitrifiable preparations. Their composition has been worked out so that they soften and collapse at a given temperature, and can thus be used for controlling the firing of articles such as ceramic ware.

(27) **Soda-lime**, prepared by impregnating pure lime with sodium hydroxide and used to absorb carbon dioxide in re-breathing anaesthesia systems, in submarines, etc. The heading **excludes** soda-lime put up as a laboratory reagent (**heading 38.22**).

(28) **Hydrated silica gel coloured with cobalt salts**, used as a desiccating agent which indicates by its colour when it is no longer operating.

(29) **Anti-rust preparations.** These may be preparations based on, for example, phosphoric acid which acts chemically in the prevention of rust.

Anti-rust preparations based on lubricants fall in **heading 27.10** or **34.03**, as the case may be.

(30) **Preparations (e.g., tablets), consisting of saccharin or its salts and substances such as sodium bicarbonate (sodium hydrogencarbonate) and tartaric acid, not being foodstuffs, used for sweetening purposes.**

- (31) **Salt for curing or salting**, consisting of sodium chloride with added sodium nitrite (nitrited salts) or sodium nitrate (nitrated salts).

The same products containing added sugar are classified in **heading 21.06**.

- (32) **Certain unmounted cut elements of piezo-electric materials (other than quartz, tourmaline, etc., of heading 71.03 or 71.04).**

The materials most commonly used for the production of the piezo-electric elements of this heading are :

- (a) Rochelle salt (or Seignette salt, i.e., potassium sodium tartrate tetrahydrate); ethylenediamine tartrate; orthophosphates of ammonium, rubidium or caesium or mixed crystals thereof.
- (b) Barium titanate; lead zirconate titanate; lead metaniobate; lead strontium titanate zirconate; calcium titanate; etc.

The elements are obtained by precision cutting, relative to their electrical axes, of high quality cultured crystals. Prior to cutting such crystals fall in their appropriate headings in **Chapter 28 or 29** if they constitute separate chemically defined compounds; otherwise they fall in this heading.

The heading also covers polycrystalline polarised elements of the products cited in subparagraph (b) above, **provided they are unmounted**.

- (33) **Anti-slip transmission belt preparations** consisting of fatty substances, abrasives, etc., even if containing 70 % or more by weight of petroleum oils or of oils obtained from bituminous minerals.

- (34) **Intermediate products of the manufacture of certain therapeutic substances (for example, antibiotics)**, obtained with the aid of micro-organisms by fermentation, filtration and first stage extraction, generally containing not more than 70 % of active substances; for example, "alkaline cakes", which are intermediate products of the manufacture of chlorotetracycline (aureomycin) and which consist of inactive mycelium, filter aids, and 10 % to 15 % of chlorotetracycline.

- (35) **Articles producing a lighting effect by the phenomenon of chemiluminescence**, e.g., lightsticks in which the lighting effect is obtained by a chemical reaction between oxalic acid type esters and hydrogen peroxide in the presence of a solvent and a fluorescent compound.

- (36) **Starting fluid for petrol engines**, consisting of diethyl ether, 70 % or more by weight of petroleum oils and also other constituents, the diethyl ether being the basic constituent.

- (37) **Modelling paste in powder form** (for use after mixing with water). The powder consists of about 30 % rye flour and about 30 % wood cellulose, together with cement, glue and chalk. The heading **does not include**, however, modelling pastes of **heading 34.07**.

- (38) "**Flattening pigment(s)**" consisting of the aluminium salt of a modified resinic acid, the particles being coated with a cellulose ether to protect them against solvents and to prevent sedimentation.

- (39) "**Fish-scale paste**" or "**fish guano**", consisting of a crude silvery paste obtained by treating fish scales with white spirit, and, because of its guanine content, used after refining to make pearl essence.

- (40) **Thallium bromoiodide crystals**, consisting of a solid solution of bromide and iodide, used for their optical properties (high transparency to infra-red radiation).

(41) **Gelling agent**, a non-chemically defined product, consisting of a montmorillonite which has been subjected to a special treatment rendering it organophilic, put up in the form of a creamy-white powder, used in the manufacture of many organic preparations (paints, varnishes, vinyl polymer dispersions, waxes, adhesives, mastic compounds, cosmetics, etc.).

(42) **Fatty acids, industrial** :

- (i) Dimerised.
- (ii) Trimerised.
- (iii) Esterified with amyl alcohol and subsequently epoxydised.

(43) **Agglomerated mixture** of technical molybdic oxide, carbon and boric acid, prepared for use as an alloying material in steel-making.

(44) **Powder described in trade as "grey oxide" or "black oxide" and sometimes improperly called "lead dust"**, being a specially prepared mixture of lead monoxide (65 to 80 %) and lead metal (the balance), obtained by controlled oxidation of pure lead in a ball mill process and used in the manufacture of storage battery plates.

(45) **Mixtures of isomers of two different organic compounds**, divinylbenzene isomer (typically 25 to 80 %) and ethylvinylbenzene isomers (typically 19 to 50 %), used as polymerizing agents in polystyrene resins in which only the divinylbenzene isomers take part in the cross-linking process.

(46) **Mixtures, used as thickeners and emulsion stabilisers in chemical preparations or as binders in the manufacture of abrasive grindstones**, consisting of products of either separate headings or the same heading of Chapter 25, whether or not with materials classified in other Chapters and having one of the following compositions :

- mixture of various clays;
- mixture of various clays and feldspar;
- mixture of clay, powdered feldspar and powdered natural borax (tincal);
- mixture of clay, feldspar and sodium silicate.

(47) **Mixtures used as plant growing media, such as potting soils**, consisting of products classifiable in Chapter 25 (earth, sand, clay), whether or not they contain small quantities of the fertilising elements nitrogen, phosphorus or potassium.

Mixtures of peat and sand or clay, the essential character of which is given by the peat, are, however, excluded (heading 27.03).

(48) **Copying pastes with a basis of gelatin**. These are used to duplicate drawings, to coat printing machine rollers, etc. The composition of these pastes varies, but the essential constituent is gelatin, to which is added, in varying proportions, dextrin and barium sulphate, or (if the pastes are to be used for the manufacture of inking rollers for printing machines) glycerol or sugar and fillers (kaolin, etc.)

These pastes are classified here whether presented in bulk (boxes, drums, etc.) or ready for use (generally on a paper or textile backing).

The heading excludes inking rollers for printing machines coated with copying paste (heading 84.43).

(49) **Diacetyl tartaric acid ester of mono- and diglycerides** mixed with tricalcium phosphate or calcium carbonate, used as emulsifiers.

The heading also **excludes**:

- (a) Finishing agents and other products or preparations, of a kind used in the textile, paper, leather or like industries (**heading 38.09**).
 - (b) Mixtures of heat- or sound-insulating or sound-absorbing mineral materials of **heading 68.06** or mixtures with a basis of asbestos or with a basis of asbestos and magnesium carbonate of **heading 68.12**.

3

Subheading Explanatory Notes

Subheadings 3824.71 to 3824.79

Subheadings 3824.71 to 3824.79 cover mixtures containing halogenated derivatives of methane, ethane or propane, including mixtures of such halogenated derivatives with other substances.

Trade in mixtures containing halogenated derivatives of methane, ethane and propane is controlled by the Montreal Protocol on Substances that Deplete the Ozone Layer.

Subheading 3824.91

Trade in mixtures and preparations described in subheading 3824.91 is controlled by the Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and on their Destruction (Chemical Weapons Convention).

38.25 - Residual products of the chemical or allied industries, not elsewhere specified or included; municipal waste; sewage sludge; other wastes specified in Note 6 to this Chapter.

3825.10 - Municipal waste

3825.20 - Sewage sludge

3825.30 - Clinical waste

- Waste organic solvents :

3825.41 -- Halogenated

3825.49 -- Other

3825.50 - Wastes of metal pickling liquors, hydraulic fluids, brake fluids and anti-freeze fluids

- Other wastes from chemical or allied industries :

3825.61 -- Mainly containing organic constituents

3825.69 -- Other

3825.90 - Other

(A) RESIDUAL PRODUCTS OF THE CHEMICAL OR ALLIED INDUSTRIES, NOT ELSEWHERE SPECIFIED OR INCLUDED

- (1) **Alkaline iron oxide** for the purification of gas (in particular, coal-gas) containing impure ferric oxide, obtained as a by-product from one of the processes of the extraction of aluminium from bauxite. These by-products also contain sodium carbonate, silica, etc.
- (2) **Residues from the manufacture of antibiotics** (called "cakes"), with a very low antibiotic content, suitable for use for the preparation of compound animal feeds.
- (3) **Ammoniacal gas liquors**, produced as an aqueous portion settling out from the crude coal tar condensed from coal gas, and also by the absorption of ammonia in the waters used for washing coal. They are usually concentrated before transportation. They are brownish liquids and are used for the manufacture of ammonium salts (particularly ammonium sulphate) and purified and concentrated aqueous solutions of ammonia gas.
- (4) **Spent oxide**. After the water-extraction of the greater part of its ammonia content, coal gas is chemically purified by passing it through a mass usually composed of bog iron ore or of hydrated iron(III)oxide, sawdust and calcium sulphate. This mass removes from the gas certain impurities (hydrogen sulphide, hydrocyanic acid, etc.). When spent, it contains a mixture of sulphur, Prussian blue, a small quantity of ammonium salts and other substances, and is known as spent oxide. It is usually in the form of powder or granules, greenish to brownish in colour, with a disagreeable odour, and is mainly used as a source of sulphur and cyanides (particularly Prussian blue) and as a fertiliser or an insecticide.

- (5) **Residues from the processing of power plant combustion off-gases** by so called limestone gypsum flue gas desulphurisation (LG FGD). These residues are solid or in the form of a slurry and can be further processed and used as a substitute for natural gypsum in plasterboard manufacture. However, purified calcium sulphate isolated from these residues, is **excluded (heading 28.33)**.

(B) MUNICIPAL WASTE

This heading also covers **municipal waste** of a kind collected from households, hotels, restaurants, hospitals, shops, offices, etc., and road and pavement sweepings, as well as construction and demolition waste. Municipal waste generally contains a large variety of materials such as plastics, rubber, wood, paper, textiles, glass, metals, food materials, broken furniture and other damaged or discarded articles.

Individual materials or articles segregated from the waste (such as wastes of plastics, rubber, wood, paper, textiles, glass or metals and spent batteries) and industrial waste are **excluded** and fall in their appropriate headings of the Nomenclature. (For industrial wastes from chemical or allied industries, see Part (D) below). Such waste materials or articles collected separately should also be classified in their appropriate headings.

(C) SEWAGE SLUDGE

Sewage sludge is sludge arising from urban effluent treatment plant and includes pre-treatment waste, scourings and unstabilised sludge.

The heading **does not include** stabilised sewage sludge when suitable for use as fertiliser (**Chapter 31**). However, those containing other materials harmful to agriculture (e.g., heavy metals), which make the stabilised sludge unfit for use as fertiliser, remain classified in this heading.

(D) OTHER WASTES SPECIFIED IN NOTE 6 TO THIS CHAPTER

The heading also covers a wide variety of other wastes specified in Note (6) to this Chapter. They include :

- (1) **Clinical waste** which is contaminated waste arising from medical research, diagnosis, treatment or other medical, surgical, dental or veterinary procedures. Such waste often contains pathogens, pharmaceutical substances and body fluids and requires special disposal procedures (e.g., soiled dressings, used gloves and used syringes).
- (2) **Waste organic solvents** generally derived from cleaning and washing processes and containing mainly organic solvents, not fit for further use as presented as primary products, whether or not intended for recovery of the solvents.

Wastes containing mainly petroleum oils or oils obtained from bituminous minerals are **excluded (heading 27.10)**.

- (3) **Wastes of metal pickling liquors, hydraulic fluids, brake fluids and anti-freezing fluids** not fit for further use as presented as primary products. They are generally used for recovery of the primary products.

However, the heading **excludes** ash and residues from waste of metal pickling liquors of a kind used for the recovery of metals or metal compounds (**heading 26.20**) and wastes of hydraulic fluids and brake fluids containing mainly petroleum oils or oils obtained from bituminous minerals (**heading 27.10**).

- (4) **Other wastes from the chemical or allied industries.** This group includes, *inter alia*, **wastes resulting from the production, formulation and use of inks, dyes, pigments, paints, lacquers and varnishes, other than municipal waste and waste organic solvents.** They are generally heterogeneous mixtures which can vary from liquid or semi-solid dispersions in aqueous or non-aqueous media, exhibiting a wide range of viscosity. They are not fit for further use as presented as primary products.

However, the heading **excludes** slag, ash and residues from wastes resulting from the production, formulation and use of inks, dyes, pigments, paints, lacquers and varnishes, of a kind used for the recovery of metals or their compounds (**heading 26.20**) and wastes containing mainly petroleum oils or oils obtained from bituminous minerals (**heading 27.10**).

The heading also **excludes** :

- (a) Slag, ash and residues containing metals, arsenic or their mixtures, of a kind used in industry for the recovery of arsenic or metals or for the manufacture of their compounds (**heading 26.20**).
- (b) Ash and residues from the incineration of municipal waste (**heading 26.21**).
- (c) Terpenic by-products of the deterpenation of essential oils (**heading 33.01**).
- (d) Residual lyes from the manufacture of wood pulp (**heading 38.04**).

38.26 - Biodiesel and mixtures thereof, not containing or containing less than 70 % by weight of petroleum oils or oils obtained from bituminous minerals.

Biodiesel consists of mono-alkyl esters of fatty acids of various chain lengths, immiscible with water, with a high boiling point, low vapour pressure and a viscosity similar to that of diesel oil produced from petroleum. Biodiesel is typically made by a chemical process called transesterification, whereby the fatty acids in oils or fats react with an alcohol (usually methanol or ethanol) in the presence of a catalyst to form the desired esters.

It can be obtained from vegetable oils (e.g., rapeseed, soya-bean, palm, sunflower, cotton-seed, jatropha), from animal fats (e.g., lard, tallow) or from used oils or fats (e.g., frying oils, recycled cooking grease).

Biodiesel itself contains neither petroleum oils nor oils obtained from bituminous minerals but can be mixed or blended with distillate fuels obtained from petroleum or bituminous minerals (e.g., diesel, kerosene, heating oil). Biodiesel can be used as fuel for compression-ignition internal combustion piston engines, production of thermal energy or similar uses.

This heading **excludes** :

- (a) Mixtures containing, by weight, 70 % or more of petroleum oils or of oils obtained from bituminous minerals (**heading 27.10**).
 - (b) Products derived from vegetable oils which have been fully deoxygenated and consist only of aliphatic hydrocarbon chains (**heading 27.10**).
-

Section VII

PLASTICS AND ARTICLES THEREOF; RUBBER AND ARTICLES THEREOF

Notes.

- 1.- Goods put up in sets consisting of two or more separate constituents, some or all of which fall in this Section and are intended to be mixed together to obtain a product of Section VI or VII, are to be classified in the heading appropriate to that product, provided that the constituents are :
 - (a) having regard to the manner in which they are put up, clearly identifiable as being intended to be used together without first being repacked;
 - (b) presented together; and
 - (c) identifiable, whether by their nature or by the relative proportions in which they are present, as being complementary one to another.
- 2.- Except for the goods of heading 39.18 or 39.19, plastics, rubber, and articles thereof, printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods, fall in Chapter 49.

GENERAL

Section Note 1.

This Note deals with the classification of goods put up in sets consisting of two or more separate constituents, some or all of which fall in Section VII. The Note is, however, limited to sets of which the constituents are intended to be mixed together to obtain a product of Section VI or VII. Such sets are to be classified in the heading appropriate to that product **provided** the constituents meet conditions (a) to (c) of the Note.

It should be noted that goods put up in sets consisting of two or more separate constituents, some or all of which fall in Section VII, intended to be used **successively without prior mixing**, are not covered by Note 1 to this Section. Such goods put up for retail sale are to be classified by application of the General Interpretative Rules (generally Rule 3 (b)); in the case of those not put up for retail sale the constituents are to be classified separately.

Section Note 2.

Goods of heading 39.18 (floor coverings and wall or ceiling coverings of plastics) and heading 39.19 (self-adhesive plates, etc., of plastics), even if printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods, do not fall in Chapter 49 but remain classified in the above-mentioned headings. However, all other goods of plastics or rubber of the kind described in this Section fall in Chapter 49 if the printing on them is not merely incidental to their primary use.

Chapter 39

Plastics and articles thereof

Notes.

- 1.- Throughout the Nomenclature the expression "plastics" means those materials of headings 39.01 to 39.14 which are or have been capable, either at the moment of polymerisation or at some subsequent stage, of being formed under external influence (usually heat and pressure, if necessary with a solvent or plasticiser) by moulding, casting, extruding, rolling or other process into shapes which are retained on the removal of the external influence.

Throughout the Nomenclature any reference to "plastics" also includes vulcanised fibre. The expression, however, does not apply to materials regarded as textile materials of Section XI.

- 2.- This Chapter does not cover :

- (a) Lubricating preparations of heading 27.10 or 34.03;
- (b) Waxes of heading 27.12 or 34.04;
- (c) Separate chemically defined organic compounds (Chapter 29);
- (d) Heparin or its salts (heading 30.01);
- (e) Solutions (other than collodions) consisting of any of the products specified in headings 39.01 to 39.13 in volatile organic solvents when the weight of the solvent exceeds 50 % of the weight of the solution (heading 32.08); stamping foils of heading 32.12;
- (f) Organic surface-active agents or preparations of heading 34.02;
- (g) Run gums or ester gums (heading 38.06);
- (h) Prepared additives for mineral oils (including gasoline) or for other liquids used for the same purposes as mineral oils (heading 38.11);
- (i) Prepared hydraulic fluids based on polyglycols, silicones or other polymers of Chapter 39 (heading 38.19);
- (k) Diagnostic or laboratory reagents on a backing of plastics (heading 38.22);
- (l) Synthetic rubber, as defined for the purposes of Chapter 40, or articles thereof;
- (m) Saddlery or harness (heading 42.01) or trunks, suitcases, handbags or other containers of heading 42.02;
- (n) Plaits, wickerwork or other articles of Chapter 46;
- (o) Wall coverings of heading 48.14;
- (p) Goods of Section XI (textiles and textile articles);
- (q) Articles of Section XII (for example, footwear, headgear, umbrellas, sun umbrellas, walking-sticks, whips, riding-crops or parts thereof);
- (r) Imitation jewellery of heading 71.17;

- (s) Articles of Section XVI (machines and mechanical or electrical appliances);
- (t) Parts of aircraft or vehicles of Section XVII;
- (u) Articles of Chapter 90 (for example, optical elements, spectacle frames, drawing instruments);
- (v) Articles of Chapter 91 (for example, clock or watch cases);
- (w) Articles of Chapter 92 (for example, musical instruments or parts thereof);
- (x) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings, illuminated signs, prefabricated buildings);
- (y) Articles of Chapter 95 (for example, toys, games, sports requisites); or
- (z) Articles of Chapter 96 (for example, brushes, buttons, slide fasteners, combs, mouthpieces or stems for smoking pipes, cigarette-holders or the like, parts of vacuum flasks or the like, pens, propelling pencils, and monopods, bipods, tripods and similar articles).

3.- Headings 39.01 to 39.11 apply only to goods of a kind produced by chemical synthesis, falling in the following categories :

- (a) Liquid synthetic polyolefins of which less than 60 % by volume distils at 300 °C, after conversion to 1,013 milibars when a reduced-pressure distillation method is used (headings 39.01 and 39.02);
- (b) Resins, not highly polymerised, of the coumarone-indene type (heading 39.11);
- (c) Other synthetic polymers with an average of at least 5 monomer units;
- (d) Silicones (heading 39.10);
- (e) Resols (heading 39.09) and other prepolymers.

4.- The expression " copolymers " covers all polymers in which no single monomer unit contributes 95 % or more by weight to the total polymer content.

For the purposes of this Chapter, except where the context otherwise requires, copolymers (including co-polycondensates, co-polyaddition products, block copolymers and graft copolymers) and polymer blends are to be classified in the heading covering polymers of that comonomer unit which predominates by weight over every other single comonomer unit. For the purposes of this Note, constituent comonomer units of polymers falling in the same heading shall be taken together.

If no single comonomer unit predominates, copolymers or polymer blends, as the case may be, are to be classified in the heading which occurs last in numerical order among those which equally merit consideration.

5.- Chemically modified polymers, that is those in which only appendages to the main polymer chain have been changed by chemical reaction, are to be classified in the heading appropriate to the unmodified polymer. This provision does not apply to graft copolymers.

6.- In headings 39.01 to 39.14, the expression " primary forms " applies only to the following forms :

- (a) Liquids and pastes, including dispersions (emulsions and suspensions) and solutions;
- (b) Blocks of irregular shape, lumps, powders (including moulding powders), granules, flakes and similar bulk forms.

- 7.- Heading 39.15 does not apply to waste, parings and scrap of a single thermoplastic material, transformed into primary forms (headings 39.01 to 39.14).
- 8.- For the purposes of heading 39.17, the expression "tubes, pipes and hoses" means hollow products, whether semi-manufactures or finished products, of a kind generally used for conveying, conducting or distributing gases or liquids (for example, ribbed garden hose, perforated tubes). This expression also includes sausage casings and other lay-flat tubing. However, except for the last-mentioned, those having an internal cross-section other than round, oval, rectangular (in which the length does not exceed 1.5 times the width) or in the shape of a regular polygon are not to be regarded as tubes, pipes and hoses but as profile shapes.
- 9.- For the purposes of heading 39.18, the expression "wall or ceiling coverings of plastics" applies to products in rolls, of a width not less than 45 cm, suitable for wall or ceiling decoration, consisting of plastics fixed permanently on a backing of any material other than paper, the layer of plastics (on the face side) being grained, embossed, coloured, design-printed or otherwise decorated.
- 10.- In headings 39.20 and 39.21, the expression "plates, sheets, film, foil and strip" applies only to plates, sheets, film, foil and strip (other than those of Chapter 54) and to blocks of regular geometric shape, whether or not printed or otherwise surface-worked, uncut or cut into rectangles (including squares) but not further worked (even if when so cut they become articles ready for use).
- 11.- Heading 39.25 applies only to the following articles, not being products covered by any of the earlier headings of sub-Chapter II:
- (a) Reservoirs, tanks (including septic tanks), vats and similar containers, of a capacity exceeding 300 l;
 - (b) Structural elements used, for example, in floors, walls or partitions, ceilings or roofs;
 - (c) Gutters and fittings thereof;
 - (d) Doors, windows and their frames and thresholds for doors;
 - (e) Balconies, balustrades, fencing, gates and similar barriers;
 - (f) Shutters, blinds (including Venetian blinds) and similar articles and parts and fittings thereof;
 - (g) Large-scale shelving for assembly and permanent installation, for example, in shops, workshops, warehouses;
 - (h) Ornamental architectural features, for example, flutings, cupolas, dovecotes; and
 - (i) Fittings and mountings intended for permanent installation in or on doors, windows, staircases, walls or other parts of buildings, for example, knobs, handles, hooks, brackets, towel rails, switch-plates and other protective plates.
- ◦ ◦

Subheading Notes.

1.- Within any one heading of this Chapter, polymers (including copolymers) and chemically modified polymers are to be classified according to the following provisions :

(a) Where there is a subheading named "Other" in the same series :

- (1) The designation in a subheading of a polymer by the prefix "poly" (for example, polyethylene and polyamide-6,6) means that the constituent monomer unit or monomer units of the named polymer taken together must contribute 95 % or more by weight of the total polymer content.
- (2) The copolymers named in subheadings 3901.30, 3901.40, 3903.20, 3903.30 and 3904.30 are to be classified in those subheadings, provided that the comonomer units of the named copolymers contribute 95 % or more by weight of the total polymer content.
- (3) Chemically modified polymers are to be classified in the subheading named "Other", provided that the chemically modified polymers are not more specifically covered by another subheading.
- (4) Polymers not meeting (1), (2) or (3) above, are to be classified in the subheading, among the remaining subheadings in the series, covering polymers of that monomer unit which predominates by weight over every other single comonomer unit. For this purpose, constituent monomer units of polymers falling in the same subheading shall be taken together. Only the constituent comonomer units of the polymers in the series of subheadings under consideration are to be compared.

(b) Where there is no subheading named "Other" in the same series :

- (1) Polymers are to be classified in the subheading covering polymers of that monomer unit which predominates by weight over every other single comonomer unit. For this purpose, constituent monomer units of polymers falling in the same subheading shall be taken together. Only the constituent comonomer units of the polymers in the series under consideration are to be compared.
- (2) Chemically modified polymers are to be classified in the subheading appropriate to the unmodified polymer.

Polymer blends are to be classified in the same subheading as polymers of the same monomer units in the same proportions.

2.- For the purposes of subheading 3920.43, the term "plasticisers" includes secondary plasticisers.

GENERAL

In general, this Chapter covers substances called polymers and semi-manufactures and articles thereof, **provided** they are not excluded by Note 2 to the Chapter.

Polymers

Polymers consist of molecules which are characterised by the repetition of one or more types of monomer units.

Polymers may be formed by reaction between several molecules of the same or of different chemical constitution. The process by which polymers are formed is termed polymerisation. In its broad sense, this term includes the following principal types of reactions:

- (1) **Addition polymerisation**, in which single molecules with ethylenic unsaturation react with each other by simple addition, without the formation of water or other by-products, to form a polymer chain containing only carbon-carbon bonds, e.g., production of polyethylene from ethylene or of ethylene-vinyl acetate copolymers from ethylene and vinyl acetate. This type of polymerisation is sometimes called simple polymerisation or copolymerisation, i.e., polymerisation or copolymerisation in the strict sense.
- (2) **Rearrangement polymerisation**, in which molecules with functional groups containing atoms such as oxygen, nitrogen or sulphur react with each other by intramolecular rearrangement and addition, without the formation of water or other by-products, to form a polymer chain in which the monomer units are held together by ether, amide, urethane or other linkages, e.g., production of poly(oxymethylene) (polyformaldehyde) from formaldehyde, of polyamide-6 from caprolactam, or of polyurethanes from a polyol and a di-isocyanate. This type of polymerisation is also called polyaddition.
- (3) **Condensation polymerisation**, in which molecules with functional groups containing atoms such as oxygen, nitrogen or sulphur react with each other by a condensation reaction, with the formation of water or other by-products, to form a polymer chain in which the monomer units are held together by ether, ester amide or other linkages, e.g., production of poly(ethylene terephthalate) from ethylene glycol and terephthalic acid, or of polyamide-6,6 from hexamethylenediamine and adipic acid. This type of polymerisation is also called condensation or polycondensation.

Polymers may be chemically modified as, for example, in the chlorination of polyethylene or poly(vinyl chloride), the chlorosulphonation of polyethylene, the acetylation or nitration of cellulose, or the hydrolysis of poly(vinyl acetate).

Abbreviations for polymers

Many polymers described in this Chapter are also known by their abbreviations. The following is a list of some of the more commonly used abbreviations :

ABS	Acrylonitrile-butadiene-styrene copolymer
CA	Cellulose acetate
CAB	Cellulose acetate butyrate
CP	Cellulose propionate
CMC	Carboxymethyl cellulose
CPE	Chlorinated polyethylene
EVA	Ethylene-vinyl acetate copolymer
HDPE	High-density polyethylene
LDPE	Low-density polyethylene
LLDPE	Linear low-density polyethylene
PBT	Poly(butylene terephthalate)
PDMS	Polydimethylsiloxane
PE	Polyethylene
PEOX	Poly(ethylene oxide) (polyoxyethylene)
PET	Poly(ethylene terephthalate)

PIB	Polyisobutylene
PMMA	Poly(methyl methacrylate)
PP	Polypropylene
PPO	Poly(phenylene oxide)
PPOX	Polypropylene oxide (polyoxypropylene)
PPS	Poly(phenylene sulphide)
PS	Polystyrene
PTFE	Polytetrafluoroethylene
PVAC	Poly(vinyl acetate)
PVAL	Poly(vinyl alcohol)
PVB	Poly(vinyl butyral)
PVC	Poly(vinyl chloride)
PVDF	Poly(vinylidene fluoride)
PVP	Poly(vinyl pyrrolidone)
SAN	Styrene-acrylonitrile copolymer

It should be noted that commercial polymers sometimes contain more monomer units than those represented by their abbreviations (e.g., linear low-density polyethylene (LLDPE), which is essentially a polymer of ethylene, containing small amounts (often more than 5 %) of alpha-olefin monomer units). Furthermore, the relative amounts of monomer units in a polymer need not be in the same order as that represented by its abbreviation (e.g., acrylonitrile-butadiene-styrene (ABS) copolymer containing styrene as the predominant monomer unit).

Polymer abbreviations should therefore be used only as a guide. Classification, in all cases, should be by application of the relevant Chapter Note and Subheading Note and on the basis of the relative composition of the monomer units in a polymer (see Note 4 and Subheading Note 1 to this Chapter).

Plastics

The expression "plastics" is defined in Note 1 to this Chapter as meaning those materials of headings 39.01 to 39.14 which are or have been capable, either at the moment of polymerisation or at some subsequent stage, of being formed under external influence (usually heat and pressure, if necessary with a solvent or plasticiser) by moulding, casting, extruding, rolling or other process into shapes which are retained on the removal of the external influence. Throughout the Nomenclature, the expression "plastics" also includes vulcanised fibre.

The expression, however, does not apply to materials regarded as textile materials of Section XI. It should be noted that this definition of "plastics" is applicable throughout the Nomenclature.

The term "polymerisation" is used in this definition in a wide sense and denotes any method of forming a polymer, including addition polymerisation, rearrangement polymerisation (polyaddition) and condensation polymerisation (polycondensation).

If material of this Chapter can be softened repeatedly by heat treatment and shaped into articles, e.g., by moulding, and then hardened by cooling, it is termed "thermoplastic". If it can be or has already been transformed into an infusible product by chemical or physical means (e.g., by heat), it is termed "thermosetting".

Plastics have almost unlimited applications but many articles made therefrom are classified elsewhere (see Note 2 to this Chapter).

General arrangement of the Chapter

The Chapter is divided into two sub-Chapters. Sub-Chapter I covers polymers in primary forms and sub-Chapter II covers waste, parings and scrap, and semi-manufactures and articles.

In sub-Chapter I, relating to primary forms, the products of headings 39.01 to 39.11 are obtained by chemical synthesis and those of headings 39.12 and 39.13 are either natural polymers or are obtained therefrom by chemical treatment. Heading 39.14 covers ion-exchangers based on polymers of headings 39.01 to 39.13.

In sub-Chapter II, heading 39.15 relates to waste, parings and scrap of plastics. Headings 39.16 to 39.25 cover semi-manufactures or specified articles of plastics. Heading 39.26 is a residual heading which covers articles, not elsewhere specified or included, of plastics or of other materials of headings 39.01 to 39.14.

Scope of headings 39.01 to 39.11

The scope of these headings is governed by Note 3 to this Chapter. These headings apply only to goods of a kind produced by chemical synthesis, falling in the following categories:

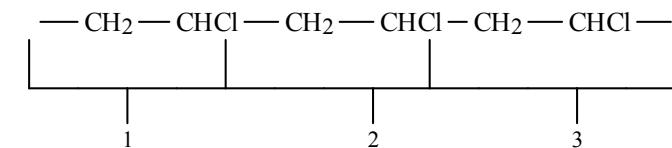

- (a) **Liquid synthetic polyolefins**, which are polymers obtained from ethylene, propene, butenes or other olefins. They are classified in heading 39.01 or 39.02 **provided** that less than 60 % by volume distils at 300 °C, after conversion to 1,013 millibars when a reduced-pressure distillation method is used.
- (b) **Resins**, not highly polymerised, of the **coumarone-indene type** obtained by the copolymerisation of mixed monomers (including coumarone or indene) derived from coal tar (heading 39.11).
- (c) **Other synthetic polymers with an average of at least 5 monomer units** which are structured in an uninterrupted sequence. These include plastics as defined in Note 1 to this Chapter.

For the purpose of calculating the average number of monomer units under Chapter Note 3 (c), polycondensates and certain rearrangement polymers may have more than one monomer unit, each having a different chemical constitution. A monomer unit is the largest constitutional unit contributed by a single monomer molecule in a polymerisation process. It should not be confused with the constitutional repeating unit, which is the smallest constitutional unit which, by repetition, describes the polymer, nor with the term monomer which is a single molecule from which polymers may be formed.

Examples :

(a) Poly(vinyl chloride)

The following chain represents three monomer units :

monomer
vinyl chloride
 $(\text{CH}_2=\text{CHCl})$

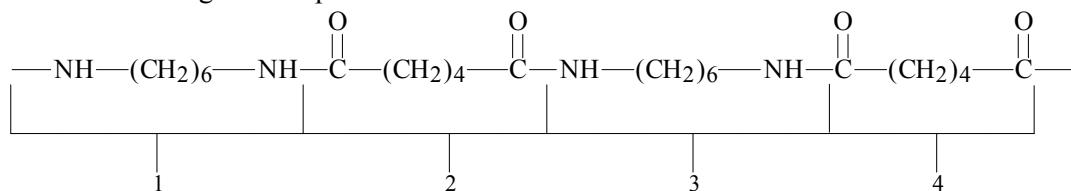

monomer unit
 $\text{---CH}_2\text{---CHCl---}$

constitutional repeating unit
 $\text{---CH}_2\text{---CHCl---}$

(In this case the monomer unit and the constitutional repeating unit are the same).

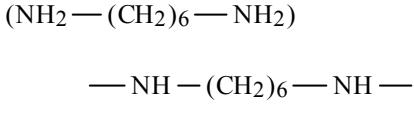

(b) Polyamide-6,6

The following chain represents four monomer units:

monomers
hexamethylenediamine
 $(\text{NH}_2\text{---}(\text{CH}_2)_6\text{---NH}_2)$

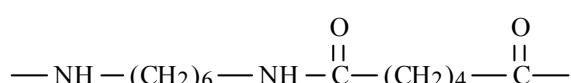

monomer units

and
and
adipic acid
 $(\text{HOOC---}(\text{CH}_2)_4\text{---COOH})$

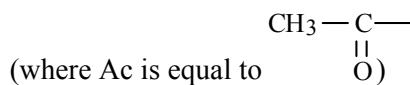

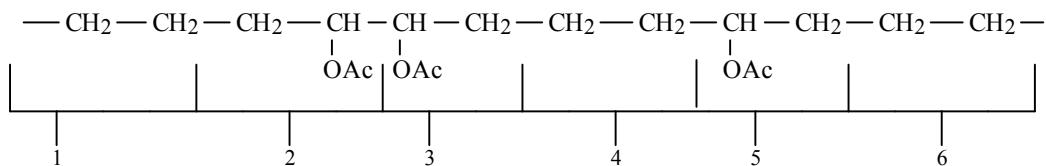

constitutional repeating unit

(In this case there are two different monomer units and the constitutional repeating unit is made up of one of each).

(c) Ethylene-vinyl acetate copolymer

The following chain represents six monomer units :

monomers ethylene	monomer units	constitutional repeating unit
$(\text{CH}_2=\text{CH}_2)$	$\text{---CH}_2\text{---CH}_2\text{---}$	
and vinyl acetate	and $\text{---CH}_2\text{---CH---OAc}$ $(\text{CH}_2=\text{CH---OAc})$	(*)

- (d) **Silicones** which are non-chemically defined products containing in the molecule more than one silicon-oxygen-silicon linkage, and containing organic groups connected to the silicon atoms by direct silicon-carbon bonds (heading 39.10).
- (e) **Resols** (heading 39.09) **and other prepolymers.** Prepolymers are products which are characterised by some repetition of monomer units although they may contain unreacted monomers. Prepolymers are not normally used as such but are intended to be transformed into higher molecular weight polymers by further polymerisation. Therefore the term **does not cover** finished products, such as di-isobutylenes (**heading 27.10**) or poly(oxyethylene) (polyethylene glycol) with very low molecular weight (**heading 38.24**). Examples of prepolymers are epoxides based on bisphenol-A or phenol-formaldehyde, epoxidised with epichlorohydrin, and polymeric isocyanates.

Copolymers and polymer blends

The term " copolymers " is defined in Note 4 to the Chapter as polymers in which no single monomer unit contributes 95 % or more by weight to the total polymer content.

(*) In this case, the monomer units are randomly oriented and the constitutional repeating unit concept does not apply.

Thus, for example, a polymer consisting of 96 % of the propylene monomer unit and 4 % other olefin monomer units is not regarded as a copolymer.

Copolymers include co-polycondensation products, co-polyaddition products, block copolymers and graft copolymers.

Block copolymers are copolymers composed of at least two connected polymeric sequence having different monomer unit compositions (e.g., a copolymer of ethylene and propylene containing alternating segments of polyethylene and polypropylene).

Graft copolymers are copolymers composed of main polymer chains which have side polymer chains with a different monomer unit composition. Examples are styrene-butadiene copolymer-graft-polystyrene (a polystyrene grafted to a styrene-butadiene copolymer) and polybutadiene-graft-styrene-acrylonitrile copolymer.

The classification of copolymers (including co-polycondensates, co-polyaddition products, block copolymers and graft copolymers) and polymer blends is governed by Note 4 to the Chapter. Unless the context otherwise requires, these products are to be classified in the heading covering polymers of that comonomer unit which predominates by weight over every other single comonomer unit. For this purpose, constituent comonomer units of polymers falling in the same heading are to be taken together, as if they were a single comonomer unit.

If no single comonomer unit (or group of constituent comonomer units whose polymers fall in the same heading) predominates, copolymers or polymer blends, as the case may be, are to be classified in the heading which occurs last in numerical order among those which equally merit consideration.

Thus, for example, a vinyl chloride-vinyl acetate copolymer containing 55 % of the vinyl chloride monomer unit falls in heading 39.04, but one which contains 55 % of the vinyl acetate monomer unit falls in heading 39.05.

Similarly, a copolymer consisting of 45 % ethylene, 35 % propylene and 20 % isobutylene monomer units is classified in heading 39.02 since the propylene and isobutylene monomer units, whose polymers fall in heading 39.02, constitute 55 % of the copolymer and, when taken together, predominate over the ethylene monomer unit.

A polymer blend composed of 55 % polyurethane based on toluene diisocyanate and a polyether polyol, and 45 % poly(oxyxylene) is to be classified in heading 39.09 since the monomer units of polyurethane predominate over those of the poly(oxyxylene) polyether. In the context of the definition of polyurethanes, all of the monomer units of a polyurethane, including those of the polyether polyol that form part of the polyurethane, are to be taken together as monomer units falling in heading 39.09.

Chemically modified polymers

Chemically modified polymers, that is those in which only appendages to the main polymer chain have been changed by chemical reaction, are to be classified in the heading appropriate to the unmodified polymer (see Note 5 to this Chapter). This provision does not apply to graft copolymers.

Thus, for example, chlorinated polyethylene and chlorosulphonated polyethylene are classified in heading 39.01.

Polymers that are chemically modified to form reactive epoxide groups such that they become epoxide resins (see the Explanatory Note to heading 39.07) are to be classified under heading 39.07. For example, phenolic resins chemically modified by epichlorohydrin would be classified as epoxide resins and not as chemically modified phenolic resins in heading 39.09.

A polymer blend in which any one of the constituent polymers has been chemically modified is considered to be chemically modified in its entirety.

Primary forms

Headings 39.01 to 39.14 cover goods in primary forms only. The expression "primary forms" is defined in Note 6 to this Chapter. It applies only to the following forms :

- (1) **Liquids and pastes.** These may be the basic polymer which requires "curing" by heat or otherwise to form the finished material, or may be dispersions (emulsions and suspensions) or solutions of the uncured or partly cured materials. In addition to substances necessary for "curing" (such as hardeners (cross-linking agents) or other co-reactants and accelerators), these liquids or pastes may contain other materials such as plasticisers, stabilisers, fillers and colouring matter, chiefly intended to give the finished products special physical properties or other desirable characteristics. The liquids and pastes are used for casting, extrusion, etc., and also as impregnating materials, surface coatings, bases for varnishes and paints, or as glues, thickeners, flocculants, etc.

When as a result of the addition of certain substances, the resultant products answer to the description in a more specific heading elsewhere in the Nomenclature, they are **excluded** from Chapter 39; this is, for example, the case with :

- (a) Prepared glues - see exclusion (b) at the end of this General Explanatory Note.
- (b) Prepared additives for mineral oils (**heading 38.11**).

It should also be noted that solutions (other than collodions) consisting of any of the products specified in headings 39.01 to 39.13 in volatile organic solvents, when the weight of the solvent exceeds 50 % of the weight of the solution, are **excluded** from this Chapter and fall in **heading 32.08** (see Note 2 (e) to this Chapter).

Liquid polymers without solvent, clearly identifiable as being intended for use solely as varnishes, (in which the formation of the film depends on heat, atmospheric humidity or oxygen and not on the addition of a hardener), are classified in **heading 32.10**. When not so identifiable, they fall in this Chapter.

Polymers in primary forms further formulated with additives, which make the products suitable for their expressed use as mastics, are to be classified in heading 32.14.

- (2) **Powder, granules and flakes.** In these forms they are employed for moulding, for the manufacture of varnishes, glues, etc. and as thickeners, flocculants, etc. They may consist of the unplasticised materials which become plastic in the moulding and curing process, or of materials to which plasticisers have been added; these materials may incorporate fillers (e.g., wood flour, cellulose, textile fibres, mineral substances, starch), colouring matter or other substances cited in Item (1) above. Powders may be used, for example, to coat objects by the application of heat with or without static electricity.

- (3) **Blocks of irregular shape, lumps and similar bulk forms**, whether or not containing fillers, colouring matter or other substances cited in Item (1) above. Blocks of regular geometric shape are not primary forms and are covered by the expression " plates, sheets, film, foil and strip " (see Note 10 to this Chapter).

Waste, parings and scrap of a single thermoplastic material transformed into primary forms are classified in headings 39.01 to 39.14 (according to the material) and **not** in heading 39.15 (see Note 7 to this Chapter).

Tubes, pipes and hoses

The expression " tubes, pipes and hoses ", used in heading 39.17, is defined in Note 8 to this Chapter.

Plates, sheets, film, foil and strip of heading 39.20 or 39.21

The expression " plates, sheets, film, foil and strip ", used in headings 39.20 and 39.21 is defined in Note 10 to the Chapter.

Such plates, sheets, etc., whether or not surface-worked (including squares and other rectangles cut therefrom), with ground edges, drilled, milled, hemmed, twisted, framed or otherwise worked or cut into shapes other than rectangular (including square), are generally classified in **headings 39.18, 39.19 or 39.22 to 39.26**.

Cellular plastics

Cellular plastics are plastics having many cells (either open, closed or both), dispersed throughout their mass. They include foam plastics, expanded plastics and microporous or microcellular plastics. They may be either flexible or rigid.

Cellular plastics are produced by a variety of methods. These include incorporating a gas into plastics (e.g., by mechanical mixing, evaporation of a low boiling point solvent, degradation of a gas producing material), mixing plastics with hollow micro-spheres (e.g., of glass or phenolic resin), sintering granules of plastics and mixing plastics with water or solvent-soluble material which are leached out of plastics leaving voids.

Plastics and textile combinations

Wall or ceiling coverings which comply with Note 9 to this Chapter are classified in heading 39.18. Otherwise, the classification of plastics and textile combinations is essentially governed by Note 1 (h) to Section XI, Note 3 to Chapter 56 and Note 2 to Chapter 59. The following products are also covered by this Chapter :

- (a) Felt impregnated, coated, covered or laminated with plastics, containing 50 % or less by weight of textile material or felt completely embedded in plastics;
- (b) Textile fabrics and nonwovens, either completely embedded in plastics or entirely coated or covered on both sides with such material, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour;

- (c) Textile fabrics, impregnated, coated, covered or laminated with plastics, which cannot, without fracturing, be bent manually around a cylinder of a diameter of 7 mm, at a temperature between 15 °C and 30 °C;
- (d) Plates, sheets and strip of cellular plastics combined with textile fabrics (as defined in Note 1 to Chapter 59), felt or nonwovens, where the textile is present merely for reinforcing purposes.

In this respect, unfigured, unbleached, bleached or uniformly dyed textile fabrics, felt or nonwovens, when applied to one face only of these plates, sheets or strip, are regarded as serving merely for reinforcing purposes. Figured, printed or more elaborately worked textiles (e.g., by raising) and special products, such as pile fabrics, tulle and lace and textile products of heading 58.11, are regarded as having a function beyond that of mere reinforcement.

Plates, sheets and strip of cellular plastics combined with textile fabric on both faces, whatever the nature of the fabric, are **excluded** from this Chapter (generally **heading 56.02, 56.03 or 59.03**).

Combinations of plastics and materials other than textiles

This Chapter also covers the following products, whether they have been obtained by a single operation or by a number of successive operations **provided** that they retain the essential character of articles of plastics :

- (a) Plates, sheets, etc., incorporating a reinforcement or a supporting mesh of another material (wire, glass fibres, etc.) embedded in the body of the plastics.
- (b) Plates, sheets, etc., of plastics, separated by a layer of another material such as metal foil, paper, paperboard.

Products consisting of paper or paperboard covered with a thin protective sheet of plastics on both faces are **excluded** from this Chapter **provided** they retain the essential character of paper or paperboard (generally **heading 48.11**).

- (c) Paper-reinforced stratified sheeting of plastics, and products consisting of one layer of paper or paperboard coated or covered with a layer of plastics, the latter constituting more than half the total thickness, **other than** wall coverings of **heading 48.14**.
- (d) Products consisting of glass fibres or sheets of paper, impregnated with plastics and compressed together, **provided** they have a hard, rigid character. (If having more the character of paper or of articles of glass fibres they are classified in **Chapter 48 or 70**, as the case may be.)

The provisions of the preceding paragraph also apply, *mutatis mutandis*, to monofilaments, rods, sticks, profile shapes, tubes, pipes and hoses and articles.

It should be noted that gauze and netting of base metal simply dipped in plastics are **excluded** (**Section XV**), even if the meshes are filled in by the dipping process.

In the case of plates or sheets composed of plies of wood and plastics, those in which the wood constitutes only a support or reinforcement of the plastics are classified in the present Chapter; those in which the plastics have a merely **subsidiary** function (e.g., when they form the foundation for a fine veneer) are **excluded** (**Chapter 44**). It should be noted in this regard that building panels composed of layers of wood and plastics are classified, as a general rule, in Chapter 44 (see the General Explanatory Note to that Chapter).

*
* *

In addition to the exclusions mentioned in Note 2, the Chapter **excludes** :

- (a) Concentrated dispersions of colouring matter in plastics having the character of products of **Chapter 32**; see, for example, the Explanatory Notes to **heading 32.04** (paragraph (I) (C) regarding concentrated dispersions of colouring matter in plastics, and paragraph (II) (2) concerning organic luminophores, e.g., rhodamine B in plastics), **heading 32.05** (seventh paragraph concerning concentrated dispersions of colour lakes in plastics) and **heading 32.06** (Part A), sixth paragraph, subparagraph (I) concerning concentrated dispersions of other colouring matter in plastics).
- (b) Preparations specially formulated for use as adhesives, consisting of polymers or blends thereof of headings 39.01 to 39.13 which, apart from any permitted additions to the products of this Chapter (fillers, plasticisers, solvents, pigments, etc.), contain other added substances not falling in this Chapter (e.g., waxes, rosin esters, unmodified natural shellac), and products of headings 39.01 to 39.13 put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg (**heading 35.06**).
- (c) Plastics and articles thereof (**other than** the goods of heading 39.18 or 39.19), printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods (**Chapter 49**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading Note 1

This Note governs the classification of polymers (including copolymers), chemically modified polymers and polymer blends at subheading level. Before these products can be classified at subheading level, however, they must first be classified in the proper heading under the provisions of Notes 4 and 5 to this Chapter (see the General Explanatory Note to this Chapter).

Classification of polymers (including copolymers) and chemically modified polymers

According to Subheading Note 1, polymers (including copolymers) and chemically modified polymers are to be classified in accordance with the provisions of **subparagraph (a)** of the Note or **subparagraph (b)** of the Note, depending upon whether or not there is a subheading named "Other" in the same series of subheadings.

A subheading named "Other" does not include subheadings such as "Other polyesters" and "Of other plastics".

The expression "in the same series" applies to subheadings of the same level, namely, one-dash subheadings (level 1) or two-dash subheadings (level 2) (see the Explanatory Note to General Interpretative Rule 6).

It should be noted that some headings (e.g., heading 39.07) contain both types of series of subheadings.

(A) Classification when there is a subheading named “ Other ” in the same series

- (1) **Subparagraph (a) (1)** of Subheading Note 1 defines polymers with the prefix “ poly ” (e.g., polyethylene and polyamide-6,6) as being those in which the constituent monomer unit or monomer units of the named polymer taken together contribute 95 % or more by weight of the total polymer content. In the case of named classes of polymers designated with the prefix “ poly ” (e.g., polyterpenes of subheading 3911.10), all of the monomer units falling in the same class (e.g., different terpene monomer units in the case of polyterpenes) must comprise 95 % or more by weight of the polymer.

It should be stressed that this definition applies **only** to polymers of subheadings which have a subheading named “ Other ” in the same series.

Thus, for example, a polymer consisting of 96 % of the ethylene monomer unit and 4 % of the propylene monomer unit and having a specific gravity of 0.94 or more (being a polymer of heading 39.01 by application of Note 4 to this Chapter), should be classified as polyethylene in subheading 3901.20 because the ethylene monomer unit contributes more than 95 % of the total polymer content and there is a subheading named “ Other ” in the same series.

The above definition of polymers with the prefix “ poly ”, when applied to poly(vinyl alcohol), does not require that 95 % or more by weight of the monomer units are the named “ vinyl alcohol ”. However, it does require that the vinyl acetate and vinyl alcohol monomer units taken together represent 95 % or more by weight of the polymer.

- (2) **Subparagraph (a) (2)** of Subheading Note 1 deals with the classification of the products of subheadings 3901.30, 3901.40, 3903.20, 3903.30 and 3904.30.

Copolymers classified in these four subheadings must have 95 % or more by weight of the constituent monomer units of the polymers named in the subheading.

Thus, for example, a copolymer consisting of 61 % vinyl chloride, 35 % vinyl acetate and 4 % maleic anhydride monomer units (being a polymer of heading 39.04) should be classified as a vinyl chloride-vinyl acetate copolymer of subheading 3904.30 because vinyl chloride and vinyl acetate monomer units taken together contribute 96 % of the total polymer content.

On the other hand, a copolymer consisting of 60 % styrene, 30 % acrylonitrile and 10 % vinyl toluene monomer units (being a polymer of heading 39.03) should be classified in subheading 3903.90 (named “ Other ”) and **not** in subheading 3903.20 because the styrene and acrylonitrile monomer units taken together contribute only 90 % of the total polymer content.

- (3) **Subparagraph (a) (3)** of Subheading Note 1 deals with the classification of chemically modified polymers. These polymers are to be classified in the subheading named “ Other ”, provided that the chemically modified polymers are not more specifically covered by another subheading. The consequence of this Note is that chemically modified polymers are not classified in the same subheading as unmodified polymer, unless the unmodified polymer itself is classifiable in a subheading named “ Other ”.

Thus, for example, chlorinated or chlorosulphonated polyethylene, being chemically modified polyethylene of heading 39.01, should be classified in subheading 3901.90 (“ Other ”).

On the other hand, poly(vinyl alcohol), which is obtained by the hydrolysis of poly(vinyl acetate), should be classified in subheading 3905.30 which specifically covers it.

- (4) **Subparagraph (a) (4)** : Polymers which cannot be classified according to the provisions of paragraphs (a) (1), (a) (2) or (a) (3) are classified in the subheading named “ Other ”, unless there is a **more specific subheading** in the series under consideration, which covers polymers of that monomer unit which predominates by weight over every other monomer unit. For this purpose, constituent monomer units of polymers falling in the same subheading shall be taken together. Only the constituent monomer units of the polymers in the same series of subheadings under consideration are to be compared.

The texts of **such specific subheadings** have the format “ polymers of x ”, “ x copolymers ” or “ x polymers ” (e.g., propylene copolymers (**subheading 3902.30**), fluoro-polymers (**subheadings 3904.61 and 3904.69**)).

To be classified in these subheadings it is only necessary for the monomer unit named in the subheading to predominate over every other single monomer unit in the series under consideration. That is, the monomer unit named in the subheading does not have to represent more than 50 % of the total polymer content of the series under consideration.

Thus, for example, an ethylene-propylene copolymer consisting of 40 % ethylene and 60 % propylene monomer units (being a polymer of heading 39.02) should be classified in subheading 3902.30 as a propylene copolymer because propylene is the only constituent monomer unit to be taken into consideration.

Likewise, a copolymer consisting of 45 % ethylene, 35 % propylene and 20 % isobutylene monomer units (being a polymer of heading 39.02) is to be classified in subheading 3902.30 because only the propylene and isobutylene monomer units are to be compared (the ethylene monomer unit being ignored) and the propylene monomer unit predominates over the isobutylene monomer unit.

On the other hand, a copolymer consisting of 45 % ethylene, 35 % isobutylene and 20 % propylene monomer units (being a polymer of heading 39.02) is to be classified in subheading 3902.90 because only the isobutylene and propylene monomer units are to be compared and the isobutylene monomer unit predominates over the propylene monomer unit.

(B) **Classification when there is no subheading named “ Other ” in the same series**

- (1) **Subparagraph (b) (1)** of Subheading Note 1 directs classification of polymers to the subheading covering polymers of that monomer unit which predominates by weight over every other single comonomer unit, when there is no subheading named “ Other ” in the same series. For this purpose, constituent monomer units of polymers falling in the same subheading are to be taken together.

This is similar to the method of classification specified in Note 4 to this Chapter for the classification of polymers at heading level.

The concept of predominance of one monomer unit applies, except when polymers contain monomer units falling outside the series of subheadings under consideration. In such circumstances, only the monomer units relating to the polymers in the series of subheadings under consideration are to be compared.

Thus, for example, copolycondensates of urea and phenol with formaldehyde (being polymers of heading 39.09) are to be classified in subheading 3909.10 if the urea monomer unit predominates over the phenol monomer unit, and in subheading 3909.40 if the phenol monomer unit predominates, since there is no subheading named “ Other ” in the same series of subheadings.

It should be remembered that the definition of polymers with the prefix “ poly ” under paragraph (a) (1) of Subheading Note 1 **does not** apply to the subheadings falling in this category.

Thus, for example, conolymers having constituent monomer units of both polycarbonate and poly(ethylene terephthalate) are to be classified in subheading 3907.40 if the former predominates and in subheading 3907.60 if the latter predominates, since there is no subheading named “ Other ” in the same series of subheadings.

- (2) **Subparagraph (b) (2)** of Subheading Note 1 deals with the classification of chemically modified polymers. These are to be classified in the same subheading as the unmodified polymer when there is no subheading named “ Other ” in the same series of subheadings under consideration.

Thus, for example, acetylated phenolic resins (being polymers of heading 39.09) are to be classified in subheading 3909.40 as phenolic resins, since there is no subheading named "Other" in the same series.

Classification of polymer blends

The last paragraph of Subheading Note 1 directs the classification of polymer blends. These are to be classified in the same subheading as if they were polymers of the same monomer units in the same proportions.

The following examples illustrate the classification of polymer blends :

- A polymer blend with a specific gravity of more than 0.94 consisting of 96 % polyethylene and 4 % polypropylene is to be classified in subheading 3901.20 as polyethylene because the ethylene monomer unit contributes more than 95 % of the polymer content.
 - A polymer blend consisting of 60 % polyamide-6 and 40 % polyamide-6,6 is to be classified in subheading 3908.90 ("Other") since the constituent monomer units of neither of the polymers contribute 95 % or more by weight of the total polymer content.
 - A blend of polypropylene (45 %), poly(butylene terephthalate) (42 %) and poly(ethylene isophthalate) (13 %) is to be classified in heading 39.07 since the constituent monomer units of the two polyesters together predominate over the propylene monomer unit. The monomer units of poly(butylene terephthalate) and poly(ethylene isophthalate) are to be considered without regard to how they may have been combined in individual polymers in the blend. In this example, one of the monomer units of poly(ethylene isophthalate) and another of poly(butylene terephthalate) are the **same** monomer units as the constituent monomer units of poly(ethylene terephthalate). However, the blend is to be classified in subheading 3907.99 since, considering the polyester monomer units only, the constituent monomer units of "other polyester", **in the correct stoichiometric ratio**, predominate over the monomer units of poly(ethylene terephthalate).
-

Sub-Chapter I

PRIMARY FORMS

39.01 - Polymers of ethylene, in primary forms

- 3901.10 - Polyethylene having a specific gravity of less than 0.94
- 3901.20 - Polyethylene having a specific gravity of 0.94 or more
- 3901.30 - Ethylene-vinyl acetate copolymers
- 3901.40 - Ethylene-alpha-olefin copolymers, having a specific gravity of less than 0.94
- 3901.90 - Other

This heading covers polyethylene and chemically modified polyethylene (for example, chlorinated polyethylene and chlorosulphonated polyethylene). It also covers ethylene copolymers (for example, ethylene-vinyl acetate copolymers and ethylene-propylene copolymers) in which ethylene is the predominant comonomer unit. For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

Polyethylene is a translucent material having a very wide range of applications. Low-density polyethylene (LDPE), i.e., polyethylene having a specific gravity at 20 °C of less than 0.94 (calculated on an additive-free polymer basis), is used largely as a packaging film especially for food products, as coating for paper, fibreboard, aluminium foil, etc., as an electric insulator, and for the manufacture of various household articles, toys, etc. High-density polyethylene (HDPE) is polyethylene having a specific gravity at 20 °C of 0.94 or more (calculated on an additive-free polymer basis). It is used in the manufacture of a variety of blow-moulded and injection-moulded articles, woven sacks, gasoline and oil containers, for the extrusion of pipes, etc. Applications of ethylene-vinyl acetate copolymers include snap-on caps, the lining of bag-in-box containers and stretch wrapping. The heading also includes linear low-density ethylene-alpha-olefin copolymers (LLDPE) as well as other copolymers (plastomers), having a specific gravity of less than 0.94 and with a content of alpha-olefin monomers of 25 % or more but less than 50 % by weight.

The heading **excludes** :

- (a) Liquid synthetic polyethylene not meeting the requirements of Note 3 (a) to the Chapter (**heading 27.10**).
- (b) Polyethylene waxes (**heading 34.04**).

39.02 - Polymers of propylene or of other olefins, in primary forms.

3902.10 - Polypropylene

3902.20 - Polyisobutylene

3902.30 - Propylene copolymers

3902.90 - Other

This heading covers polymers of all olefins (i.e. acyclic hydrocarbons having one or more double bonds) except ethylene. The important polymers of this heading are polypropylene, polyisobutylene and propylene copolymers. For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

The general physical properties of polypropylene are similar to those of high-density polyethylene. Polypropylene and propylene copolymers also have a very wide range of applications, for example, packaging film, moulded parts for automobiles, appliances, housewares, etc., wire and cable coating, food container closures, coated and laminated products, bottles, trays and containers for storing precision equipment, ducting, tank linings, piping for chemical plant, tufted carpet backing.

Polyisobutylene when sufficiently polymerised resembles rubber but is not classified in Chapter 40 as it does not conform to the definition of synthetic rubber. It is used for waterproof coatings and for modifying other plastics.

Polyisobutylene, slightly polymerised and meeting the requirements of Note 3 (a) to this Chapter, is also included in this heading. It is a viscous liquid used to modify the properties of lubricating oils.

The heading, however, **does not cover** liquid synthetic polyisobutylene or other liquid synthetic polyolefins **not meeting** the requirements of Note 3 (a) to this Chapter (**heading 27.10**).

39.03 - Polymers of styrene, in primary forms.

- Polystyrene :

3903.11 -- Expansible

3903.19 -- Other

3903.20 - Styrene-acrylonitrile (SAN) copolymers

3903.30 - Acrylonitrile-butadiene-styrene (ABS) copolymers

3903.90 - Other

This heading covers polystyrene and copolymers of styrene. The most important copolymers of styrene are styrene-acrylonitrile (SAN) copolymers, acrylonitrile-butadiene-styrene (ABS) copolymers and styrene-butadiene copolymers. Most of the styrene-butadiene copolymers with substantial amounts of butadiene comply with the requirements of Note 4 to Chapter 40 and are therefore classified in **Chapter 40** as synthetic rubber. For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

Unexpanded polystyrene is a colourless, transparent, thermoplastic material which finds extensive use in the electrical and radio industries. It also has packaging applications, for example, in the packaging of foodstuffs and cosmetics. It is also used in the manufacture of toys, clock cabinets and gramophone records.

Expanded (cellular) polystyrene contains gases from the expanding process and has a low bulk-density. It is extensively used as a thermal insulant for refrigerator doors, air-conditioner housings, cold storage facilities, freezer display cabinets, and in the construction industry. It is also used in disposable packaging and in food serving articles.

Certain chemically modified copolymers of styrene are ion-exchangers (**heading 39.14**).

Styrene-acrylonitrile (SAN) copolymers, which have high tensile strength, good mouldability and chemical resistance, are used for making cups, tumblers, typewriter keys, refrigerator parts, oil-filter bowls and certain kitchen equipment. Acrylonitrile-butadiene-styrene (ABS) copolymers, which have high shock and weather resistance, are used in the manufacture of parts and accessories of bodies for motor vehicles, of refrigerator doors, of telephones, of bottles, of shoe heels, of cases for machines, of water pipes, of building panels, of vessels, etc.

39.04 - Polymers of vinyl chloride or of other halogenated olefins, in primary forms.

3904.10 - Poly(vinyl chloride), not mixed with any other substances

- Other poly(vinyl chloride) :

3904.21 -- Non-plasticised

3904.22 -- Plasticised

3904.30 - Vinyl chloride-vinyl acetate copolymers

3904.40 - Other vinyl chloride copolymers

3904.50 - Vinylidene chloride polymers

- Fluoro-polymers :

3904.61 -- Polytetrafluoroethylene

3904.69 -- Other

3904.90 - Other

This heading covers poly(vinyl chloride) (PVC), vinyl chloride copolymers, vinylidene chloride polymers, fluoropolymers and polymers of other halogenated olefins. For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

PVC is a rigid colourless material with limited heat stability and with a tendency to adhere to metallic surfaces when heated. For these and other reasons, it is often necessary to add stabilisers, plasticisers, extenders, fillers, etc. to make useful plastics. In flexible sheet form PVC is used widely as a waterproof material for curtains, aprons, raincoats, etc., and as high grade imitation leather for upholstery and interior decoration in all types of passenger transportation. Rigid PVC sheets find application in the fabrication of covers, ducts, tank linings and many other items of chemical plant equipment. PVC floor tiles are also common.

The most important copolymers of vinyl chloride are vinyl chloride-vinyl acetate copolymers which are mainly used for gramophone records and flooring.

Copolymers of vinylidene chloride are used largely for packaging of food products, for upholstery, fibres, bristles and latex coatings and in the manufacture of pipes for chemical processing equipment.

Polytetrafluoroethylene (PTFE), one of the most important fluoro-polymers, has very wide-ranging applications in the electrical, chemical and engineering industries. Because of its high working temperature it is an excellent insulating material and due to its resistance to chemicals it is almost indestructible.

Other fluoro-polymers include polymers of chlorotrifluoroethylene, poly(vinylidene fluoride), etc.

39.05 - Polymers of vinyl acetate or of other vinyl esters, in primary forms; other vinyl polymers in primary forms.

- Poly(vinyl acetate) :

3905.12 -- In aqueous dispersion

3905.19 -- Other

- Vinyl acetate copolymers :

3905.21 -- In aqueous dispersion

3905.29 -- Other

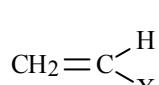

3905.30 - Poly(vinyl alcohol), whether or not containing unhydrolysed acetate groups

- Other :

3905.91 -- Copolymers

3905.99 -- Other

This heading covers all vinyl polymers **other than** those of **heading 39.04**. A vinyl polymer is one whose monomer has the formula

, where the C—X bond is neither a carbon-carbon bond nor a carbon-hydrogen bond. Polyvinyl ketones, where the C—X bond is a carbon-carbon bond are, therefore, **excluded (heading 39.11)**.

Polymers of vinyl acetate or of other vinyl esters, of which poly(vinyl acetate) is by far the most important, are not suitable for the manufacture of articles as they are too soft and elastic. They are generally used for the preparation of lacquers, paints, adhesives, finishing or impregnating agents for textiles, etc. Solutions and dispersions (emulsions and suspensions) of poly(vinyl acetate) are used, e.g., as adhesives.

Poly(vinyl alcohol) is usually prepared by the hydrolysis of poly(vinyl acetate). Poly(vinyl alcohol) is available in a number of grades depending upon the content of unhydrolysed vinyl acetate groups. These are excellent emulsifiers and dispersing agents and are used as protective colloids, adhesives, binders and thickeners in paints, pharmaceuticals and cosmetics and in textiles. Fibres produced from poly(vinyl alcohol) are suitable for making underwear, blankets, clothing, etc.

Polyvinyl acetals can be prepared by reacting poly(vinyl alcohol) with an aldehyde such as formaldehyde or butyraldehyde, or by reacting poly(vinyl acetate) with an aldehyde.

Other vinyl polymers include polyvinyl ethers, poly(vinyl carbazole) and poly(vinyl pyrrolidone).

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.06 - Acrylic polymers in primary forms.

3906.10 - Poly(methyl methacrylate)

3906.90 - Other

The expression " acrylic polymers " covers polymers of acrylic or methacrylic acid, of their salts or esters, or of the corresponding aldehydes, amides or nitriles.

Poly(methyl methacrylate) is the most important polymer of this category. It is used, because of its excellent optical properties and its physical strength, as a glazing material, in outdoor signs and other display articles, and in the manufacture of artificial eyes, contact lenses and artificial dentures.

Polymers of acrylonitrile may be used in the manufacture of synthetic fibres.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

This heading **excludes** :

- (a) Acrylic polymers which are ion-exchangers (**heading 39.14**).
- (b) Copolymers of acrylonitrile which comply with the requirements of Note 4 to Chapter 40 (**Chapter 40**).

39.07 - Polyacetals, other polyethers and epoxide resins, in primary forms; polycarbonates, alkyd resins, polyallyl esters and other polyesters, in primary forms.

3907.10 - Polyacetals

3907.20 - Other polyethers

3907.30 - Epoxide resins

3907.40 - Polycarbonates

3907.50 - Alkyd resins

- Poly(ethylene terephthalate) :

3907.61 -- Having a viscosity number of 78 ml/g or higher

3907.69 -- Other

3907.70 - Poly(lactic acid)

- Other polyesters :

3907.91 -- Unsaturated

3907.99 -- Other

This heading covers :

(1) **Polyacetals.** Polymers obtained from an aldehyde, normally formaldehyde, and characterised by the presence of acetalfunctions in the polymer chain. They are not to be confused with the polyvinyl acetals of **heading 39.05**, in which the acetal-functions are substituents on the polymer chain. This family of plastics includes acetal copolymers and is regarded as engineering plastics, being used for ring bearings, cams, automobile instrument housings, doorknobs, pump and air impellers, shoe heels, mechanical toys, plumbing fittings, etc.

(2) **Other polyethers.** Polymers obtained from epoxides, glycols or similar materials and characterised by the presence of ether-functions in the polymer chain. They are not to be confused with the polyvinyl ethers of **heading 39.05**, in which the ether-functions are substituents on the polymer chain. The most important members of this group are poly(oxyethylene) (polyethylene glycol), polyoxypolypropylene and polyphenylene oxide (PPO) (more correctly named poly(dimethylphenylene-oxide)). These products have a variety of uses, PPO being used, like the polyacetals, as engineering plastics, polyoxypolypropylene as an intermediate for polyurethane foam.

This heading also covers pegylated (polyethylene glycol (or PEGs) polymers) derivatives of products of Chapter 29 (Sub-Chapters I to X and headings 29.40 and 29.42).

Pegylated products whose non-pegylated forms are classified either in Chapter 29 (headings 29.36 to 29.39 and 29.41) or in Chapter 30 are excluded and in general remain classified in the same heading as their non-pegylated forms.

(3) **Epoxide resins.** Polymers made, for example, by condensing epichlorohydrin (1-chloro-2,3-epoxypropane) with bisphenol A (4,4'-isopropylidenediphenol), novolak (phenolic) resins or other polyhydroxy compounds or by epoxidising unsaturated polymers. Whatever the basic structure of the polymer, these resins are characterised by the presence of reactive epoxide groups which allow them to be readily cross-linked at the time of use,

e.g. by the addition of an amino compound, an organic acid or anhydride, a boron trifluoride complex or an organic polymer.

Epoxide resins range from low viscosity liquids to high melting solids; they are used as surface-coatings, as adhesives, as moulding or casting resins, etc.

Epoxidised animal or vegetable oils are classified in **heading 15.18**.

- (4) **Polycarbonates.** Polymers obtained, for example, by condensing bisphenol A with phosgene (carbonyl chloride) or diphenyl carbonate and characterised by the presence of carbonic ester-functions in the polymer chain. These have a number of industrial applications, particularly in moulded articles and as glazing.
- (5) **Polyesters.** These polymers are characterised by the presence of carboxylic ester functions in the polymer chain and are obtained, for example, by condensation of a polyhydric alcohol and a polycarboxylic acid. They are thus distinguished from polyvinyl esters of **heading 39.05** and polyacrylic esters of **heading 39.06**, in which the ester groups are substituents on the polymer chain. Polyesters include :
 - (a) **Alkyd resins.** Polycondensation products of polyfunctional alcohols and polyfunctional acids or their anhydrides, one of which at least must be partly or wholly tri- or higher functional, modified with other substances such as fatty acids or animal or vegetable oils, monofunctional acids or alcohols, rosin. They do not include oil-free alkyls (see Item (d) below). These resins are used mainly as coatings and in high grade varnishes and are supplied usually in viscous form or solution.
 - (b) **Polyallyl esters.** A special class of unsaturated polyesters (for the term "unsaturated" see Item (e) below) derived from esters of allyl alcohol with dibasic acids, for example, diallyl phthalate. They are used as laminating adhesives, coatings, varnishes and in applications requiring microwave transparency.
 - (c) **Poly(ethylene terephthalate) (PET).** Polymer generally formed by the esterification of terephthalic acid with ethylene glycol or obtained from the reaction of dimethyl terephthalate with ethylene glycol. Apart from its very important use in textiles, it finds application, for example, in packaging films, recording tapes, soft-drink bottles. Poly(ethylene terephthalate) having a viscosity number of 78 ml/g or higher is generally used for the production of bottles.

The viscosity number of 78 ml/g or higher corresponds to an intrinsic viscosity value of 0.7 dl/g or higher.

The viscosity number is calculated according to ISO Standard 1628-5.

- (d) **Poly(lactic acid),** also known as **polylactide.** It is usually produced from lactic acid obtained synthetically or by fermentation (this method uses raw materials consisting predominantly of hexoses or compounds which can be easily split into hexoses, e.g., sugars, molasses, sugar beet juice, sulphite liquors, whey or starches). The lactic acid is converted to a cyclic lactide dimer, the ring structure of which is opened during the final polymerisation step. Its applications include textile fibres, packaging materials and materials for medical use.

(e) **Other polyesters.** These may be unsaturated or saturated.

Unsaturated polyesters are those which possess sufficient ethylenic unsaturation that they can readily be (or already have been) cross-linked with monomers containing ethylenic unsaturation to form thermosetting products. Unsaturated polyesters include polyallyl esters (see Item (b) above) and other polyesters (including oil-free alkyds) based on an unsaturated acid, for example, maleic or fumaric acid. These products, which are usually in the form of liquid prepolymers, are mainly used for producing glass fibre reinforced laminates and cast transparent thermosetting products.

Saturated polyesters include polymers based on terephthalic acid, for example, poly(butylene terephthalate), and saturated oil-free alkyd resins. They are largely used for textile fibres and films.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.08 - Polyamides in primary forms.

3908.10 - Polyamide-6, -11, -12, -6,6, -6,9, -6,10 or -6,12

3908.90 - Other

This heading covers polyamides and copolymers thereof. Linear polyamides are known as nylons.

Polyamides are obtained by condensation polymerisation of dibasic organic acids (for example, adipic acid, sebatic acid) with diamines or of certain amino-acids (e.g., 11-aminoundecanoic acid) or by rearrangement polymerisation of lactams (e.g., epsilon-caprolactam).

Some of the important nylon type polyamides are polyamide-6, polyamide-11, polyamide-12, polyamide-6,6, polyamide-6,9, polyamide-6,10 and polyamide-6,12. Examples of non-linear polyamides are the condensation products of dimerised vegetable oil acids with amines.

Polyamides have a high tensile strength and resistance to shock. They also have excellent chemical resistance, especially to aromatic and aliphatic hydrocarbons, ketones and esters.

Apart from their use as textiles, polyamides have a wide application as thermoplastics in moulding. They are also used as coatings, adhesives, packaging films. In solvents, they have a specialised use as lacquers.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.09 - Amino-resins, phenolic resins and polyurethanes, in primary forms.

3909.10 - Urea resins; thiourea resins

3909.20 - Melamine resins

- Other amino-resins :

3909.31 - Poly(methylene phenyl isocyanate) (crude MDI, polymeric MDI)

3909.39 - Other

3909.40 - Phenolic resins

3909.50 - Polyurethanes

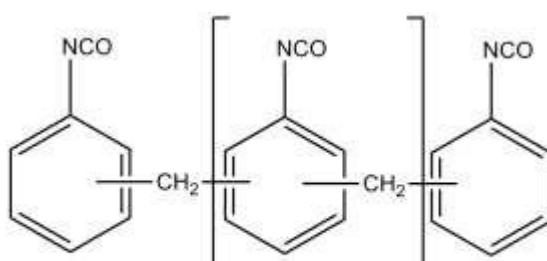

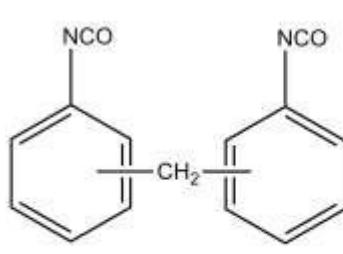

This heading covers :

(1) Amino-resins

These are formed by the condensation of amines or amides with aldehydes (formaldehyde, furfuraldehyde, etc.). The most important are urea resins (for example, urea-formaldehyde), thiourea resins (for example, thiourea-formaldehyde), melamine resins (for example, melamine-formaldehyde) and aniline resins (for example, aniline-formaldehyde).

These resins are used for the manufacture of transparent, translucent or brightly coloured articles of plastics and are much used for moulding table and fancy ware and electrical goods. In solutions and dispersions (emulsions and suspensions), (whether or not modified with oils, fatty acids, alcohols, or other synthetic polymers) they are employed as glues and as textile dressings, etc. (See the General Explanatory Note to this Chapter, exclusion (b), for the classification of glues.)

Poly(methylene phenyl isocyanate) (often referred to as "crude MDI", "polymeric MDI" or "poly(diphenylmethane) diisocyanate") is an opaque, dark brown to clear, light brown liquid and is synthesised by reaction of aniline and formaldehyde to form a mixture of (methylene phenylamine) oligomers, which is subsequently reacted with phosgene and heat to form free isocyanate functions. The product is a chemically modified polymer of aniline and formaldehyde (a chemically modified amino-resin). It contains pure MDI and MDI oligomer mixtures. See chemical structures below :

Polyamine resins, such as poly(ethyleneamines), are **not** amino-resins and fall in **heading 39.11** when complying with the requirements of Note 3 to this Chapter.

(2) Phenolic resins

This group comprises a wide range of resinous materials derived from the condensation of phenol or its homologues (cresol, xylenol, etc.), or substituted phenols, with aldehydes such as formaldehyde, acetaldehyde, furfuraldehyde, etc. The nature of the products varies according to the conditions under which the reaction is conducted and whether it is modified by the introduction of other substances.

Thus the group includes :

- (a) **Resins** (novolaks), which are permanently **fusible and soluble** in alcohol or other organic solvents, and which are produced under acid conditions. These are used in the preparation of varnishes and moulding powders, etc.
- (b) **Thermosetting phenolic resins**, which are obtained under alkaline conditions. In the processing, a continuous range of products is obtained. Firstly, the resols in the form of liquids, pastes or solids which are used as varnish bases, impregnants, etc. Secondly, the resitols which are in the form of moulding powders, and finally, after complete reaction, resites which are most often in finished forms such as plates, sheets, rods, tubes or other articles generally classified in headings 39.16 to 39.26.

Certain resins of this kind are ion-exchangers and fall in **heading 39.14**.

- (c) **Oil-soluble phenolic resins** (soluble in drying oils) prepared from butylphenol, amylphenol, parahydroxydiphenyl or other substituted phenols. They are used mainly in the preparation of varnishes.
- (d) **Products** based on the resins referred to at (a), (b) and (c) above **modified** by the incorporation of rosin or other natural resins, synthetic resins (especially alkyd resins), vegetable oils, alcohols, organic acids or other chemicals which affect their solubility in drying oils. These products are used in the preparation of varnishes and paints, as surface-coatings or impregnants.

(3) Polyurethanes

This class includes all polymers produced by the reaction of polyfunctional isocyanates with polyhydroxy compounds, such as, castor oil, butane-1,4-diol, polyether polyols, polyester polyols. Polyurethanes exist in various forms, of which the most important are the foams, elastomers, and coatings. They are also used as adhesives, moulding compounds and fibres. These products are often traded as one part of a multi-component system or set.”

This group also includes mixtures of polyurethane and unreacted polyfunctional diisocyanate (e.g., toluene diisocyanate).

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.10 - Silicones in primary forms.

The silicones of this heading are non-chemically defined products containing in the molecule more than one silicon-oxygen-silicon linkage, and containing organic groups connected to the silicon atoms by direct silicon-carbon bonds.

They have a high stability and may be either liquid, semi-liquid or solid. The products include silicone oils, greases, resins and elastomers.

- (1) Silicone oils and greases are used as lubricants remaining stable at high or low temperatures, as water-repellent impregnating products, as dielectric products, as foam inhibitors, as mould release agents, etc. Lubricating preparations consisting of mixtures containing silicone greases or oils fall in **heading 27.10** or **34.03** as the case may be (see corresponding Explanatory Notes).
- (2) Silicone resins are used mainly in the manufacture of varnishes, insulating or waterproof coatings, etc., where stability at high temperature is required. They are also used in the preparation of laminates with glass fibre, asbestos or mica as the reinforcing material, as flexible moulds and for electrical encapsulation.
- (3) Silicone elastomers, although not covered by the definition of synthetic rubber in Chapter 40, have some extensibility which is not changed by high or low temperatures. This property renders them suitable for manufacture into washers or other packings for appliances submitted to high or low temperatures. An application in the medical field is the manufacture of automatic brain valves used in cases of hydrocephalus.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

The heading **excludes** silicones complying with the conditions of Note 3 to Chapter 34 (**heading 34.02**).

39.11 - Petroleum resins, coumarone-indene resins, polyterpenes, polysulphides, polysulphones and other products specified in Note 3 to this Chapter, not elsewhere specified or included, in primary forms.

3911.10 - Petroleum resins, coumarone, indene or coumarone-indene resins and polyterpenes

3911.90 - Other

This heading covers the following products :

- (1) **Petroleum resins, coumarone, indene or coumarone-indene resins and polyterpenes** constitute a group of resins, not highly polymerised, made by polymerising more or less impure fractions obtained, respectively, from deeply cracked petroleum distillates, from coal tar or from turpentine or other sources of terpenes. They are used in adhesives and coatings and are often incorporated as softeners in rubber or plastics, for example, for use in floor tiles.
- (2) **Polysulphides** are polymers characterised by the presence of monosulphide linkages in the polymer chain, for example, poly(phenylene sulphide). In polysulphides each sulphur atom is bound on both sides by carbon atoms, as opposed to the thioplasts of Chapter 40, which contain sulphur-sulphur linkages. Polysulphides are used in coatings and in moulded articles, for example, aircraft and automobile parts, pump impellers.
- (3) **Polysulphones** are polymers characterised by the presence of sulphone linkages in the polymer chain, for example, the product obtained by reacting the sodium salt of bisphenol A (4,4'-isopropylidene-diphenol) with bis (4-chlorophenyl) sulphone. They are used in electrical parts, domestic appliances, etc.
- (4) **Polymers with isocyanate groups**, not elsewhere specified or included, such as :
 - (a) **Polyureas based on hexamethylene diisocyanate (HDI)**, synthesised by the reaction of HDI with water to produce prepolymers with an average number of monomer units of between 3 and 4. The products are used in the manufacture of paints and varnishes.
 - (b) **Polyisocyanurates based on hexamethylene diisocyanate (HDI)**, synthesised by the reaction of HDI to produce prepolymers with isocyanurate links between monomer units. The prepolymers have an average number of monomer units of between 3 and 5. The products are used in the manufacture of paints and varnishes.
- (5) **Other products specified in Note 3 to the Chapter** include polyxylene resins, poly (1,4-diisopropylbenzene), polyvinyl ketones, polyethyleneimines and polyimides.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.12 - Cellulose and its chemical derivatives, not elsewhere specified or included, in primary forms.

- Cellulose acetates :

3912.11 -- Non-plasticised

3912.12 -- Plasticised

3912.20 - Cellulose nitrates (including collodions)

- Cellulose ethers :

3912.31 -- Carboxymethylcellulose and its salts

3912.39 -- Other

3912.90 - Other

(A) CELLULOSE

Cellulose is a carbohydrate of high molecular weight, forming the solid structure of vegetable matter. It is contained in cotton in almost a pure state. Cellulose not elsewhere specified or included, in primary forms, falls in this heading.

Regenerated cellulose is a glossy, transparent material usually obtained by precipitation and coagulation when an alkaline solution of cellulose xanthate is extruded into an acid bath. It is usually in the form of thin, transparent sheets which are classified in **heading 39.20 or 39.21**, or of textile filaments of **Chapter 54 or 55**.

Vulcanised fibre, which is produced by treating paper or sheets of cellulose pulp with zinc chloride, is generally in the form of rods, tubes, sheets, plates or strip and is therefore also **excluded** (generally **heading 39.16, 39.17, 39.20 or 39.21**).

(B) CHEMICAL DERIVATIVES OF CELLULOSE

This group includes chemical derivatives of cellulose which serve as a basis in the manufacture of plastics as well as for other purposes.

The principal chemical derivatives of cellulose, whether or not plasticised, are :

- (1) **Cellulose acetates.** These are prepared by treating cellulose (usually cotton linters or dissolving grades of chemical wood pulp) with acetic anhydride and acetic acid in the presence of a catalyst (e.g., sulphuric acid). With the addition of plasticisers they can form plastics which are non-inflammable and suitable for injection moulding. They are commonly presented in the form of powders, granules or solutions. Cellulose acetates presented in the form of sheets, film, rods, tubes, etc., are **excluded** (generally **heading 39.16, 39.17, 39.20 or 39.21**).

- (2) **Cellulose nitrates (nitrocellulose).** These products are prepared by treating cellulose (usually cotton linters) with a mixture of nitric and sulphuric acids. They are highly inflammable and the more highly nitrated varieties (gun-cottons) are used in explosives; for safety reasons they must be transported damped with alcohol, generally ethyl, isopropyl or butyl alcohol, or dampened or plasticised with phthalate esters. Cellulose nitrate plasticised with camphor in the presence of alcohol forms **celluloid**. Celluloid is usually in the form of sheets, film, rods or tubes, or other extruded forms, and is then **excluded** from this heading (generally **heading 39.16, 39.17, 39.20 or 39.21**); it is not suitable for injection moulding and is therefore not put up as a moulding powder.

Cellulose nitrate mixed with other kinds of plasticisers is widely used as the basis for varnishes, and for this purpose may be presented in the form of dry or pasty extracts. Solutions consisting of nitrocellulose in a mixture of ether (diethyl ether) and alcohol (ethanol) are **collodions** which are also included here. If the solution is partly evaporated celloidin is obtained in a solid form.

- (3) **Cellulose acetate butyrate and cellulose propionate.** These are cellulose esters forming plastics of the same general character as those formed with cellulose acetate.
- (4) **Cellulose ethers.** The most important are carboxymethylcellulose, methylcellulose, and hydroxyethylcellulose. These are water-soluble and are used as thickeners or as glues (see the General Explanatory Note to this Chapter, exclusion (b), for the classification of glues). Other cellulose ethers of commercial importance include ethyl cellulose which is a lightweight plastics.

Plastics chemically derived from cellulose generally need the addition of plasticisers.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

39.13 - Natural polymers (for example, alginic acid) and modified natural polymers (for example, hardened proteins, chemical derivatives of natural rubber), not elsewhere specified or included, in primary forms.

3913.10 - Alginic acid, its salts and esters

3913.90 - Other

The following are some of the principal natural or modified natural polymers of this heading.

(1) Alginic acid, its salts and esters

Alginic acid, a poly(uronic acid), is extracted from brown algae (*Phaeophyta*) by maceration in an alkaline solution. It may be produced by precipitating the extract with a mineral acid or by treating the extract to obtain an impure calcium alginate which on treatment with a mineral acid is transformed into alginic acid of high purity.

Alginic acid is insoluble in water but its ammonium and alkali metal salts dissolve readily in cold water to form viscous solutions. The property of forming viscous solutions varies with the origin and degree of purity of the alginates. Water-soluble alginates are used as thickeners, stabilisers, gelling and film-forming agents in, for example, the pharmaceutical, food, textile and paper industries.

These products may contain preservatives (e.g., sodium benzoate) and be standardised by the addition of gelling agents (e.g., calcium salts), retarders (e.g., phosphates, citrates), accelerators (e.g., organic acids), and regulators (e.g., sucrose, urea). Any such additions should not render the product particularly suitable for specific use rather than for general use.

Among the esters is propylene glycol alginate which is used in foodstuffs, etc.

(2) Hardened proteins

Proteins are nitrogenous compounds of very high molecular weight of vegetable or animal origin. They are suitable for processing into plastics. The heading covers only proteins which have been chemically processed to harden them. Only a few are of commercial importance.

Hardened proteins are generally in the form of blocks of regular shape, sheets, rods or tubes. In these forms they are **excluded** from this heading (generally **heading 39.16, 39.17, 39.20 or 39.21**).

(3) Chemical derivatives of natural rubber

Natural rubber, which is a high polymer, forms, on chemical treatment, certain substances having the characteristic of plasticity.

These include :

- (a) **Chlorinated rubber.** This is usually produced in the form of small white granules. It is used in the preparation of paints and varnishes which after application form a film resistant to atmospheric and chemical deterioration.
- (b) **Rubber hydrochloride.** Generally used in packaging, and, when plasticised, for protective clothing.

- (c) **Oxidised rubber**, obtained by oxidising heated rubber in the presence of a catalyst. It is a resinous material used in certain types of varnishes.
- (d) **Cyclised rubber**, obtained by treating rubber with, e.g., sulphuric, chlorosulphuric or chlorostannic acids. This gives a range of products of varying hardness, used as a basis in the preparation of paints, for waterproof coatings, and to some extent in the manufacture of moulded products.

(4) Dextran, glycogen (“ animal starch ”) and chitin and plastics produced from lignin

This heading also includes isolated amylopectin and isolated amylose obtained by the fractionation of starch.

For the classification of polymers (including copolymers), chemically modified polymers and polymer blends, see the General Explanatory Note to this Chapter.

The heading **excludes** :

- (a) Unmodified natural resins (**heading 13.01**).
- (b) Etherified or esterified endosperm flour of locust beans or guar seeds (**heading 13.02**).
- (c) Linoxyne (**heading 15.18**).
- (d) Heparin (**heading 30.01**).
- (e) Starch ethers and esters (**heading 35.05**).
- (f) Rosin, resin acids and their derivatives (including ester gums and run gums) (**heading 38.06**).

39.14 - Ion-exchangers based on polymers of headings 39.01 to 39.13, in primary forms.

Ion-exchangers of this heading are cross-linked polymers, generally in granular form, containing active ionic groups (usually sulphonic, carboxylic, phenolic or amino groups). These active ionic groups enable the polymers, when brought into contact with a solution of an electrolyte, to exchange one of their own types of ions for one of those (of the same sign, positive or negative) contained in the solution. These are used in water-softening, milk-softening, chromatography, for recovery of uranium from acid solutions and of streptomycin from broths and for various other industrial purposes.

The most common ion-exchangers are chemically modified styrene-divinylbenzene copolymers, acrylic polymers or phenolic resins.

This heading **does not cover** ion-exchange columns filled with ion-exchangers of this heading (**heading 39.26**).

Sub-Chapter II

WASTE, PARINGS AND SCRAP; SEMI-MANUFACTURES; ARTICLES

39.15 - Waste, parings and scrap, of plastics.

3915.10 - Of polymers of ethylene

3915.20 - Of polymers of styrene

3915.30 - Of polymers of vinyl chloride

3915.90 - Of other plastics

The products of this heading may consist of broken or worn articles of plastics, clearly not usable for their original purposes, or of manufacturing waste (shavings, dust, trimmings, etc.). Some waste can be reused as moulding material, varnish base, fillers, etc.

The heading, however, **does not apply** to waste, parings and scrap of a single thermoplastic material, transformed into primary forms (**headings 39.01 to 39.14**).

Waste, parings and scrap of a single thermosetting material or of two or more thermoplastic materials mixed together, even if transformed into primary forms, are covered by the heading.

The heading **also excludes** waste, parings and scrap, of plastics, containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal (**heading 71.12**).

39.16 - Monofilament of which any cross-sectional dimension exceeds 1 mm, rods, sticks and profile shapes, whether or not surface-worked but not otherwise worked, of plastics.

3916.10 - Of polymers of ethylene

3916.20 - Of polymers of vinyl chloride

3916.90 - Of other plastics

This heading covers monofilament of which any cross-sectional dimension exceeds 1 mm, rods, sticks, and profile shapes. These are obtained in the length in a single operation (generally extrusion), and they have a constant or repetitive cross-section, from one end to the other. Hollow profile shapes have a cross-section different from that of tubes, pipes and hoses of heading 39.17 (see Note 8 to this Chapter).

The heading also includes such products which have been merely cut to a length exceeding the maximum cross-sectional dimension or surface-worked (polished, matt-finished, etc.), but not otherwise worked. Profile shapes with an adhesive surface, used for sealing window frames, are classified in this heading.

Products which have been cut down to the point where the length does not exceed the maximum cross-sectional dimension, or which have been otherwise worked (drilled, milled, assembled by glueing or sewing, etc.) are **excluded** from this heading. They are classified as articles in **headings 39.18 to 39.26** unless they are more specifically covered by some other heading in the Nomenclature.

For the classification of monofilament, rods, sticks and profile shapes of plastics combined with other materials, see the General Explanatory Note to this Chapter.

39.17 - Tubes, pipes and hoses, and fittings therefor (for example, joints, elbows, flanges), of plastics.

3917.10 - Artificial guts (sausage casings) of hardened protein or of cellulosic materials

- Tubes, pipes and hoses, rigid :

3917.21 -- Of polymers of ethylene

3917.22 -- Of polymers of propylene

3917.23 -- Of polymers of vinyl chloride

3917.29 -- Of other plastics

- Other tubes, pipes and hoses :

3917.31 -- Flexible tubes, pipes and hoses, having a minimum burst pressure of 27.6 MPa

3917.32 -- Other, not reinforced or otherwise combined with other materials, without fittings

3917.33 -- Other, not reinforced or otherwise combined with other materials, with fittings

3917.39 -- Other

3917.40 - Fittings

According to Note 8 to the Chapter, the expression "tubes, pipes and hoses" means :

- (i) hollow products, whether semi-manufactures or finished products, of a kind generally used for conveying, conducting or distributing gases or liquids (for example, ribbed garden hose, perforated tubes), provided that they have an internal cross-section which is round, oval, rectangular (in which the length does not exceed 1.5 times the width) or in the shape of a regular polygon; and
- (ii) sausage casings (whether or not tied or otherwise further worked) and other lay-flat tubing.

This heading also includes fittings of plastics for tubes, pipes and hoses (for example, joints, elbows, flanges).

Tubes, pipes and hoses and fittings therefor may be rigid or flexible and may be reinforced or otherwise combined with other materials. (For the classification of tubes, pipes, etc., of plastics combined with other materials, see the General Explanatory Note to this Chapter.)

39.18 - Floor coverings of plastics, whether or not self-adhesive, in rolls or in the form of tiles; wall or ceiling coverings of plastics, as defined in Note 9 to this Chapter.

3918.10 - Of polymers of vinyl chloride

3918.90 - Of other plastics

The first part of the heading covers plastics of the types normally used as floor coverings, in rolls or in the form of tiles. It should be noted that self-adhesive floor coverings are classified in this heading.

The second part of the heading, the scope of which is defined in Note 9 to this Chapter, covers wall or ceiling coverings of plastics, including those with a textile backing. Wallpaper or similar wall coverings of paper coated or covered with plastics are **excluded (heading 48.14)**.

It should be noted that this heading includes articles printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods (see Note 2 to Section VII).

39.19 - Self-adhesive plates, sheets, film, foil, tape, strip and other flat shapes, of plastics, whether or not in rolls.

3919.10 - In rolls of a width not exceeding 20 cm

3919.90 - Other

This heading covers all self-adhesive flat shapes of plastics, whether or not in rolls, **other than** floor, wall or ceiling coverings of **heading 39.18**. The heading is, however, limited to flat shapes which are pressure-sensitive, i.e., which at room temperature, without wetting or other addition, are permanently tacky (on one or both sides) and which firmly adhere to a variety of dissimilar surfaces upon mere contact, without the need for more than finger or hand pressure.

It should be noted that this heading includes articles printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods (see Note 2 to Section VII).

39.20 - Other plates, sheets, film, foil and strip, of plastics, non-cellular and not reinforced, laminated, supported or similarly combined with other materials (+).

3920.10 - Of polymers of ethylene

3920.20 - Of polymers of propylene

3920.30 - Of polymers of styrene

- Of polymers of vinyl chloride :

3920.43 -- Containing by weight not less than 6 % of plasticizers

3920.49 -- Other

- Of acrylic polymers :

3920.51 -- Of poly(methyl methacrylate)

3920.59 -- Other

- Of polycarbonates, alkyd resins, polyallyl esters or other polyesters :

3920.61 -- Of polycarbonates

3920.62 -- Of poly(ethylene terephthalate)

3920.63 -- Of unsaturated polyesters

3920.69 -- Of other polyesters

- Of cellulose or its chemical derivatives :

3920.71 -- Of regenerated cellulose

3920.73 -- Of cellulose acetate

3920.79 -- Of other cellulose derivatives

- Of other plastics :

3920.91 -- Of poly(vinyl butyral)

3920.92 -- Of polyamides

3920.93 -- Of amino-resins

3920.94 -- Of phenolic resins

3920.99 -- Of other plastics

This heading covers plates, sheets, film, foil and strip of plastics (which are **not** reinforced, laminated, supported or similarly combined with other materials), **other than** those of **heading 39.18 or 39.19.**

This heading also covers synthetic paper pulp consisting of sheets of non-coherent polyethylene or polypropylene fibres (fibrils) of an average length of about 1 mm and generally containing 50 % moisture.

This heading **does not cover** products which have been reinforced, laminated, supported or similarly combined with materials **other than plastics** (**heading 39.21**). For this purpose "similarly combined" must be combinations of plastics with materials, other than plastics, which enhance the strength of the plastic material (e.g., embedded metal mesh and woven glass fabric, as well as mineral fibres, whiskers and filaments).

However, products made out of plastics compounded with fillers in the form of powders, granules, spheres or flakes are classified in this heading. Further, minor surface treatments such as coloration, printing (subject to Note 2 to Section VII), vacuum deposition of metal are **not** to be regarded as reinforcements or similar combinations for the purposes of this heading.

This heading also **excludes** cellular products (**heading 39.21**) and strip of plastics, of an apparent width not exceeding 5 mm (**Chapter 54**).

According to Note 10 to this Chapter, the expression "plates, sheets, film, foil and strip" applies only to plates, sheets, film, foil and strip and to blocks of regular geometric shape, whether or not printed or otherwise surface-worked (for example, polished, embossed, coloured, merely curved or corrugated), uncut or cut into rectangles (including squares) but not further worked (even if when so cut they become articles ready for use, for example, tablecloths).

Plates, sheets, etc., whether or not surface-worked (including squares and other rectangles cut therefrom), with ground edges, drilled, milled, hemmed, twisted, framed or otherwise worked or cut into shapes other than rectangular (including square) are generally classified as articles of **headings 39.18, 39.19 or 39.22 to 39.26**

Three small circles are arranged in a triangular pattern: one at the top center, one at the bottom left, and one at the bottom right.

Subheading Explanatory Note.

Subheadings 3920.43 and 3920.49

Products of these subheadings are distinguished on the basis of their plasticiser content. For this purpose, primary plasticisers and secondary plasticisers must be taken together (see Subheading Note 2 to this Chapter).

Primary plasticisers are materials of low volatility which, when added to a polymer, generally cause an increase in its flexibility (e.g., phthalate esters, adipate esters, trimellitate esters, phosphate esters, sebacate esters, azelate esters).

Secondary plasticisers, also known as extenders, are seldom used alone as plasticisers. When present in combination with primary plasticisers, the primary plasticising action will be modified or enhanced. Secondary plasticisers also act as fire retardants, (e.g., chlorinated paraffins) or lubricants (e.g., epoxidised soybean oil, epoxidised linseed oil).

39.21 - Other plates, sheets, film, foil and strip, of plastics.

- Cellular :

- 3921.11 -- Of polymers of styrene
- 3921.12 -- Of polymers of vinyl chloride
- 3921.13 -- Of polyurethanes
- 3921.14 -- Of regenerated cellulose
- 3921.19 -- Of other plastics
- 3921.90 - Other

This heading covers plates, sheets, film, foil and strip, of plastics, **other than** those of **heading 39.18, 39.19 or 39.20** or of **Chapter 54**. It therefore covers only cellular products or those which have been reinforced, laminated, supported or similarly combined with other materials. (For the classification of plates, etc. combined with other materials, see the General Explanatory Note.)

According to Note 10 to this Chapter, the expression “ plates, sheets, film, foil and strip ” applies only to plates, sheets, film, foil and strip and to blocks of regular geometric shape, whether or not printed or otherwise surface-worked (for example, polished, embossed, coloured, merely curved or corrugated), uncut or cut into rectangles (including squares) but not further worked (even if when so cut they become articles ready for use).

Plates, sheets, etc., whether or not surface-worked (including squares and other rectangles cut therefrom), with ground edges, drilled, milled, hemmed, twisted, framed or otherwise worked or cut into shapes other than rectangular (including square) are generally classified as articles of **headings 39.18, 39.19 or 39.22 to 39.26**.

39.22 - Baths, shower-baths, sinks, wash-basins, bidets, lavatory pans, seats and covers, flushing cisterns and similar sanitary ware, of plastics.

3922.10 - Baths, shower-baths, sinks and wash-basins

3922.20 - Lavatory seats and covers

3922.90 - Other

This heading covers fittings designed to be permanently fixed in place, in houses, etc., normally by connection to the water or sewage systems. It also covers other sanitary ware of similar dimensions and uses, such as portable bidets, baby baths and camping toilets.

Flushing cisterns of plastics remain classified in this heading, whether or not equipped with their mechanisms.

However, the heading **excludes** :

- (a) Small portable sanitary articles such as bed pans and chamber-pots (**heading 39.24**).
- (b) Soap dishes, towel rails, tooth-brush holders, toilet paper holders, towel hooks and similar articles for bathrooms, toilets or kitchens; these articles fall in **heading 39.25** if intended for permanent installation in or on walls or other parts of buildings, otherwise in **heading 39.24**.

39.23 - Articles for the conveyance or packing of goods, of plastics; stoppers, lids, caps and other closures, of plastics.

3923.10 - Boxes, cases, crates and similar articles

- Sacks and bags (including cones) :

3923.21 - - Of polymers of ethylene

3923.29 - - Of other plastics

3923.30 - Carboys, bottles, flasks and similar articles

3923.40 - Spools, cops, bobbins and similar supports

3923.50 - Stoppers, lids, caps and other closures

3923.90 - Other

This heading covers all articles of plastics commonly used for the packing or conveyance of all kinds of products. The articles covered include :

- (a) Containers such as boxes, cases, crates, sacks and bags (including cones and refuse sacks), casks, cans, carboys, bottles and flasks.

The heading also covers :

- (i) Cups without handles having the character of containers used for the packing or conveyance of certain foodstuffs, whether or not they have a secondary use as tableware or toilet articles;
- (ii) Bottle preforms of plastics being intermediate products having tubular shape, with one closed end and one open end threaded to secure a screw type closure, the portion below the threaded end being intended to be expanded to a desired size and shape.
- (b) Spools, cops, bobbins and similar supports, including video or audio cassettes without magnetic tape.
- (c) Stoppers, lids, caps and other closures.

The heading **excludes**, *inter alia*, household articles such as dustbins, and cups which are used as tableware or toilet articles and do not have the character of containers for the packing or conveyance of goods, whether or not sometimes used for such purposes (**heading 39.24**), containers of **heading 42.02** and flexible intermediate bulk containers of **heading 63.05**.

39.24 - Tableware, kitchenware, other household articles and hygienic or toilet articles, of plastics.

3924.10 - Tableware and kitchenware

3924.90 - Other

This heading covers the following articles of plastics :

- (A) Tableware such as tea or coffee services, plates, soup tureens, salad bowls, dishes and trays of all kinds, coffee-pots, teapots, sugar bowls, beer mugs, cups, sauce-boats, fruit bowls, cruets, salt cellars, mustard pots, egg-cups, teapot stands, table mats, knife rests, serviette rings, knives, forks and spoons.
- (B) Kitchenware such as basins, jelly moulds, kitchen jugs, storage jars, bins and boxes (tea caddies, bread bins, etc.), funnels, ladles, kitchen-type capacity measures and rolling-pins.
- (C) Other household articles such as ash trays, hot water bottles, matchbox holders, dustbins, buckets, watering cans, food storage containers, curtains, drapes, table covers and fitted furniture dust-covers (slipcovers).
- (D) Hygienic and toilet articles (whether for domestic or non-domestic use) such as toilet sets (ewers, bowls, etc.), sanitary pails, bed pans, urinals, chamber-pots, spittoons, douche cans, eye baths; teats for baby bottles (nursing nipples) and finger-stalls; soap dishes, towel rails, tooth-brush holders, toilet paper holders, towel hooks and similar articles for bathrooms, toilets or kitchens, not intended for permanent installation in or on walls. However, such articles intended for permanent installation in or on walls or other parts of buildings (e.g., by screws, nails, bolts or adhesives) are **excluded (heading 39.25)**.

*
* *

The heading also covers cups (without handles) for table or toilet use, not having the character of containers for the packing or conveyance of goods, whether or not sometimes used for such purposes. It **excludes**, however, cups without handles having the character of containers used for the packing or conveyance of goods (**heading 39.23**).

39.25 - Builders' ware of plastics, not elsewhere specified or included (+).

- 3925.10 - Reservoirs, tanks, vats and similar containers, of a capacity exceeding 300 l
- 3925.20 - Doors, windows and their frames and thresholds for doors
- 3925.30 - Shutters, blinds (including Venetian blinds) and similar articles and parts thereof
- 3925.90 - Other

This heading applies only to the articles mentioned in Note 11 to this Chapter.

Subheading Explanatory Note.

Subheading 3925.20

Subheading 3925.20 covers doors which are hinged or sliding barriers of the type used for closing the entrance of buildings, rooms, etc. It **does not cover** barriers for closing the entrance of fields, gardens, courtyards, etc. (which are called "gates") (**subheading 3925.90**).

39.26 - Other articles of plastics and articles of other materials of headings 39.01 to 39.14.

3926.10 - Office or school supplies

3926.20 - Articles of apparel and clothing accessories (including gloves, mittens and mitts)

3926.30 - Fittings for furniture, coachwork or the like

3926.40 - Statuettes and other ornamental articles

3926.90 - Other

This heading covers articles, not elsewhere specified or included, of plastics (as defined in Note 1 to the Chapter) or of other materials of headings 39.01 to 39.14.

They include :

- (1) Articles of apparel and clothing accessories (**other than** toys) made by sewing or sealing sheets of plastics, e.g., aprons, belts, babies' bibs, raincoats, dress-shields, etc. Detachable plastic hoods remain classified in this heading if presented with the plastic raincoats to which they belong.
- (2) Fittings for furniture, coachwork or the like.
- (3) Statuettes and other ornamental articles.
- (4) Dust-sheets, protective bags, awnings, file-covers, document-jackets, book covers and reading jackets, and similar protective goods made by sewing or glueing together sheets of plastics.
- (5) Paperweights, paper-knives, blotting-pads, pen-rests, bookmarks, etc.
- (6) Screws, bolts, washers and similar fittings of general use.
- (7) Transmission, conveyor or elevator belts, endless, or cut to length and joined end to end, or fitted with fasteners.

Transmission, conveyor or elevator belts or belting of any kind, presented with the machines or apparatus for which they are designed, whether or not actually mounted, are classified with that machine or apparatus (e.g., **Section XVI**). In addition, this heading **does not cover** transmission or conveyor belts or belting, of textile material, impregnated, coated, covered or laminated with plastics (**Section XI**, e.g., **heading 59.10**).

- (8) Ion-exchange columns filled with polymers of heading 39.14.
- (9) Plastic containers filled with carboxymethylcellulose (used as ice-bags).
- (10) Tool boxes or cases, not specially shaped or internally fitted to contain particular tools with or without their accessories (see the Explanatory Note to heading 42.02).
- (11) Pacifiers (or "baby's dummies"); ice-bags; douche bags, enema bags, and fittings therefor; invalid and similar nursing cushions; pessaries; sheath contraceptives (prophylactics); bulbs for syringes.

- (12) Various other articles such as fasteners for handbags, corners for suit-cases, suspension hooks, protective cups and glides for placing under furniture, handles (of tools, knives, forks, etc.), beads, watch "glasses", figures and letters, luggage label-holders.
-

Chapter 40

Rubber and articles thereof

Notes.

- 1.- Except where the context otherwise requires, throughout the Nomenclature the expression "rubber" means the following products, whether or not vulcanised or hard : natural rubber, balata, gutta-percha, guayule, chicle and similar natural gums, synthetic rubber, factice derived from oils, and such substances reclaimed.
- 2.- This Chapter does not cover :
 - (a) Goods of Section XI (textiles and textile articles);
 - (b) Footwear or parts thereof of Chapter 64;
 - (c) Headgear or parts thereof (including bathing caps) of Chapter 65;
 - (d) Mechanical or electrical appliances or parts thereof of Section XVI (including electrical goods of all kinds), of hard rubber;
 - (e) Articles of Chapter 90, 92, 94 or 96; or
 - (f) Articles of Chapter 95 (other than sports gloves, mittens and mitts and articles of headings 40.11 to 40.13).
- 3.- In headings 40.01 to 40.03 and 40.05, the expression "primary forms" applies only to the following forms :
 - (a) Liquids and pastes (including latex, whether or not pre-vulcanised, and other dispersions and solutions);
 - (b) Blocks of irregular shape, lumps, bales, powders, granules, crumbs and similar bulk forms.
- 4.- In Note 1 to this Chapter and in heading 40.02, the expression "synthetic rubber" applies to :
 - (a) Unsaturated synthetic substances which can be irreversibly transformed by vulcanisation with sulphur into non-thermoplastic substances which, at a temperature between 18 °C and 29 °C, will not break on being extended to three times their original length and will return, after being extended to twice their original length, within a period of five minutes, to a length not greater than one and a half times their original length. For the purposes of this test, substances necessary for the cross-linking, such as vulcanising activators or accelerators, may be added; the presence of substances as provided for by Note 5 (B) (ii) and (iii) is also permitted. However, the presence of any substances not necessary for the cross-linking, such as extenders, plasticisers and fillers, is not permitted;
 - (b) Thioplasts (TM); and
 - (c) Natural rubber modified by grafting or mixing with plastics, depolymerised natural rubber, mixtures of unsaturated synthetic substances with saturated synthetic high polymers provided that all the above-mentioned products comply with the requirements concerning vulcanisation, elongation and recovery in (a) above.
- 5.- (A) Headings 40.01 and 40.02 do not apply to any rubber or mixture of rubbers which has been compounded, before or after coagulation, with :

- (i) vulcanising agents, accelerators, retarders or activators (other than those added for the preparation of pre-vulcanised rubber latex);
 - (ii) pigments or other colouring matter, other than those added solely for the purpose of identification;
 - (iii) plasticisers or extenders (except mineral oil in the case of oil-extended rubber), fillers, reinforcing agents, organic solvents or any other substances, except those permitted under (B);
- (B) The presence of the following substances in any rubber or mixture of rubbers shall not affect its classification in heading 40.01 or 40.02, as the case may be, provided that such rubber or mixture of rubbers retains its essential character as a raw material :
- (i) emulsifiers or anti-tack agents;
 - (ii) small amounts of breakdown products of emulsifiers;
 - (iii) very small amounts of the following : heat-sensitive agents (generally for obtaining thermosensitive rubber latexes), cationic surface-active agents (generally for obtaining electropositive rubber latexes), antioxidants, coagulants, crumbling agents, freeze-resisting agents, peptisers, preservatives, stabilisers, viscosity-control agents, or similar special-purpose additives.
- 6.- For the purposes of heading 40.04, the expression " waste, parings and scrap " means rubber waste, parings and scrap from the manufacture or working of rubber and rubber goods definitely not usable as such because of cutting-up, wear or other reasons.
- 7.- Thread wholly of vulcanised rubber, of which any cross-sectional dimension exceeds 5 mm, is to be classified as strip, rods or profile shapes, of heading 40.08.
- 8.- Heading 40.10 includes conveyor or transmission belts or belting of textile fabric impregnated, coated, covered or laminated with rubber or made from textile yarn or cord impregnated, coated, covered or sheathed with rubber.
- 9.- In headings 40.01, 40.02, 40.03, 40.05 and 40.08, the expressions " plates ", " sheets " and " strip " apply only to plates, sheets and strip and to blocks of regular geometric shape, uncut or simply cut to rectangular (including square) shape, whether or not having the character of articles and whether or not printed or otherwise surface-worked, but not otherwise cut to shape or further worked.

In heading 40.08 the expressions " rods " and " profile shapes " apply only to such products, whether or not cut to length or surface-worked but not otherwise worked.

GENERAL

Definition of rubber

The expression " rubber " is defined in Note 1 to this Chapter. Where this expression is used without qualification in this and other Chapters of the Nomenclature, it means the following products :

- (1) **Natural rubber, balata, gutta-percha, guayule, chicle and similar** (i.e., rubber-like) **natural gums** (see the Explanatory Note to heading 40.01).

- (2) **Synthetic rubber** as defined in Note 4 to this Chapter. For the purpose of the test required by Note 4, a sample of the unsaturated synthetic substance or a substance of a kind specified in Note 4 (c) (in the condition of unvulcanised raw material) is to be vulcanised with sulphur and then subjected to the elongation and recovery test (see the Explanatory Note to heading 40.02). Accordingly, in the case of substances containing materials not permitted by Note 4, such as mineral oil, the test is to be carried out on a sample which does not contain such materials or from which such materials have been removed. In the case of vulcanised rubber articles, which cannot be tested as such, it is necessary to obtain a sample of the unvulcanised raw material from which the articles are made, in order to perform the test. No test is, however, required for thioplasts which are regarded as synthetic rubber by definition.
- (3) **Factice derived from oils** (see the Explanatory Note to heading 40.02).
- (4) **Reclaimed rubber** (see the Explanatory Note to heading 40.03).

The expression "rubber" covers the foregoing products whether unvulcanised, vulcanised or hard.

The term "vulcanised" refers in general to rubber (including synthetic rubber) which has been cross-linked with sulphur or any other vulcanising agent (such as, sulphur chloride, certain oxides of polyvalent metals, selenium, tellurium, thiuram di- and tetrasulphides, certain organic peroxides and certain synthetic polymers), whether or not using heat or pressure, or by high energy, radiation so that it passes from a mainly plastic state to a mainly elastic one. It should be noted that the criterion concerning vulcanisation with sulphur is relevant only for the purposes of Note 4, i.e., for determining whether a substance is synthetic rubber or not. Once a substance has been determined to be synthetic rubber, products made therefrom are considered as vulcanised rubber products for the purpose of headings 40.07 to 40.17, whether they have been vulcanised with sulphur or with some other vulcanising agent.

For the purpose of vulcanisation, in addition to vulcanising agents, certain other substances are also normally added, such as accelerators, activators, retarders, plasticisers, extenders, fillers, reinforcing agents or any of the additives mentioned in Note 5 (B) to this Chapter. Such vulcanisable mixtures are regarded as compounded rubber and are classified in heading 40.05 or 40.06 depending upon the form in which they are presented.

Hard rubber, (for example, ebonite) is obtained by vulcanising rubber with a high proportion of sulphur to the point where it becomes practically inflexible and inelastic.

Scope of the Chapter

This Chapter covers rubber, as defined above, in the raw or semi-manufactured states, whether or not vulcanised or hard, and articles wholly of rubber or whose essential character derives from rubber, other than products excluded by Note 2 to this Chapter.

The general arrangement of the headings is as follows :

- (a) Subject to Note 5, headings 40.01 and 40.02 essentially cover raw rubber in primary forms or in plates, sheets or strip.

- (b) Headings 40.03 and 40.04 cover reclaimed rubber in primary forms or in plates, sheets or strip, and waste, parings and scrap of rubber (other than hard rubber) and powders and granules obtained therefrom.
- (c) Heading 40.05 covers compounded rubber, unvulcanised, in primary forms or in plates, sheets or strip.
- (d) Heading 40.06 covers other forms and articles of unvulcanised rubber, whether or not compounded.
- (e) Headings 40.07 to 40.16 cover semi-manufactures and articles of vulcanised rubber other than hard rubber.
- (f) Heading 40.17 covers hard rubber, in all forms, including waste and scrap and articles of hard rubber.

Primary forms (headings 40.01 to 40.03 and 40.05)

The expression "primary forms" is defined in Note 3 to this Chapter. It should be noted that pre-vulcanised latex is specifically included in the definition of "primary forms" and is therefore to be regarded as unvulcanised. Since headings 40.01 and 40.02 do not cover rubber or mixtures of rubbers to which an organic solvent has been added (see Note 5), the expression "other dispersions and solutions" in Note 3 applies to heading 40.05 only.

Plates, sheets and strip (headings 40.01, 40.02, 40.03, 40.05 and 40.08)

These expressions are defined in Note 9 to this Chapter and include blocks of regular geometric shape. Plates, sheets and strip may be surface-worked (printed, embossed, grooved, channelled, ribbed, etc.) or simply cut to rectangular (including square) shape, whether or not having the character of articles, but may not be otherwise cut to shape or further worked.

Cellular rubber

Cellular rubber is rubber having many cells (either open, closed, or both), dispersed throughout its mass. It includes sponge or foam rubber, expanded rubber and microporous or microcellular rubber. It may be either flexible or rigid (e.g., ebonite sponge).

Note 5

Note 5 to this Chapter provides criteria to distinguish rubber or mixtures of rubber in primary forms, plates, sheets or strip, which have not been compounded (headings 40.01 and 40.02) from those which have been compounded (heading 40.05). This Note does not make any distinction on the basis of whether compounding has been done before or after coagulation. It, however, permits the presence of certain substances in the rubber or mixtures of rubbers of headings 40.01 and 40.02 provided that the rubber or mixture of rubbers retains its essential character as a raw material. Such substances include mineral oil, emulsifiers or anti-tack agents, small amounts (generally not exceeding 5 %) of breakdown products of emulsifiers and very small amounts (generally less than 2 %) of special purpose additives.

Rubber and textile combinations

The classification of rubber and textile combinations is essentially governed by Note 1 (ij) to Section XI, Note 3 to Chapter 56 and Note 4 to Chapter 59, and as regards conveyor or transmission belts or belting by Note 8 to Chapter 40 and Note 6 (b) to Chapter 59. The following products are covered by this Chapter :

- (a) Felt impregnated, coated, covered or laminated with rubber, containing 50 % or less by weight of textile material, and felt completely embedded in rubber;
- (b) Nonwovens, either completely embedded in rubber or entirely coated or covered on both sides with such material, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour;
- (c) Textile fabrics (as defined in Note 1 to Chapter 59) impregnated, coated, covered or laminated with rubber, weighing more than 1,500 g/m² and containing 50 % or less by weight of textile material;
- (d) Plates, sheets or strip of cellular rubber, combined with textile fabrics (as defined in Note 1 to Chapter 59), felt or nonwovens, where the textile is present merely for reinforcing purposes.

*
* * *

This Chapter **does not cover** articles mentioned in Note 2 to this Chapter. Additional exclusions are referred to in the Explanatory Notes to certain headings of this Chapter.

40.01 - Natural rubber, balata, gutta-percha, guayule, chicle and similar natural gums, in primary forms or in plates, sheets or strip.

4001.10 - Natural rubber latex, whether or not pre-vulcanised

- Natural rubber in other forms :

4001.21 -- Smoked sheets

4001.22 -- Technically specified natural rubber (TSNR)

4001.29 -- Other

4001.30 - Balata, gutta-percha, guayule, chicle and similar natural gums

This heading includes :

(A) Natural rubber latex (whether or not pre-vulcanised).

Natural rubber latex is the liquid secreted principally by rubber trees and, in particular, by the species *Hevea brasiliensis*. This liquid consists of an aqueous solution of organic and mineral substances (proteins, fatty acids and their derivatives, salts, sugars and glycosides) containing in suspension 30 % to 40 % of rubber (i.e., polyisoprene of high molecular weight).

This part includes :

- (1) **Stabilised or concentrated natural rubber latex.** Rubber latex tends to coagulate spontaneously a few hours after tapping; it must therefore be stabilised in order to ensure preservation and to prevent putrefaction or coagulation. This is usually done by adding ammonia to latex in the proportion of 5 to 7 grams per litre of latex, which produces a product known as "full ammonia" or FA type. A second stabilising method which produces "low ammonia" or LA type is to add a very small quantity (1 to 2 grams per litre of latex) of a low concentration mixture of ammonia and substances such as tetramethylthiuramdisulphide and zinc oxide.

There are also **freeze-resistant natural rubber latexes** stabilised by the addition, in particular, of minute quantities of sodium salicylate or formaldehyde and intended for use in cold countries.

Natural rubber latexes are concentrated (mainly for transport purposes) by various methods (e.g., by centrifuging, evaporating, creaming).

The rubber content of commercial latexes is usually between 60 % and 62 %; higher concentrations are also found and in some cases the solid content may exceed 70 %.

- (2) **Thermosensitive (heat-sensitive) natural rubber latexes.** These are obtained by adding heat-sensitive agents. When heated these types of latexes gel faster than non-thermosensitive latex. They are generally used for the manufacture of dipped or moulded articles or for the production of foam or sponge rubber.

- (3) **Electropositive latexes.** These latexes are also known as “reversed electric charge latexes”, because they are obtained by reversing the charge of the particles of a normal concentrated latex. This is usually achieved by adding cationic surface-active agents.

The use of such latexes counters the tendency of most textile fibres to resist rubber impregnation (because like ordinary latex, the electrostatic charge of the fibres in an alkaline environment is negative).

- (4) **Pre-vulcanised natural rubber latex.** This is obtained by the reaction of vulcanising agents on latex under heat-treatment at a temperature generally below 100 °C.

The rubber particles contained in the latex are vulcanised by adding an excess of precipitated or colloidal sulphur, zinc oxide and accelerators (e.g., dithiocarbamate). The degree of vulcanisation of the finished product can be altered at will, by varying the temperature, the heating time or the proportions of the ingredients used. Normally, only the outer walls of the rubber particles are vulcanised. In order to avoid over-vulcanisation of the latex, excess ingredients are removed, by centrifugation, after heating.

The appearance of pre-vulcanised latex is the same as that of normal latex. Their combined sulphur content is usually of the order of 1 %.

The use of pre-vulcanised latex allows a number of operations (e.g., grinding, compounding) to be by-passed. It is used in the manufacture of dipped and cast articles (pharmaceutical and surgical goods) and, increasingly, in the textile industry and as an adhesive. It is also used in the manufacture of certain grades of paper and of composition leather, and gives a rubber having excellent electrical insulation properties (because of its low content of proteins and soluble substances).

Natural rubber latex is shipped either in internally coated drums (containing about 200 l) or in bulk.

(B) Natural rubber in other forms.

For the purpose of this heading, the term “natural rubber” applies to *Hevea* rubber as traditionally shipped from the place of production, generally after it has been treated in plantation factories either for the purposes of transport and preservation or to give the natural rubber certain special characteristics which will facilitate its subsequent use or improve the quality of the finished products. To remain classified here, the rubber so treated must not, however, have lost its essential character as a raw material; further, it must not contain any added carbon black, silica or any other substance of a kind forbidden by Note 5 (A).

Coagulation of natural rubber latex takes place in tanks of various shapes, which may be fitted with movable partitions. In order to separate the rubber globules from the aqueous serum, the latex is coagulated by slight acidification with, for example, 1 % acetic acid or 0.5 % formic acid. At the end of the coagulation process the coagulum is removed either as slabs or as a continuous strip.

Subsequent treatment differs according to whether smoked sheets or pale or brown crepes, re-agglomerated granules or free-flowing powders are being produced.

(1) Rubber sheets and crepes.

For the manufacture of sheets, the rubber strip is fed into a rolling mill in which the final set of embossed rolls leave the surface with characteristic markings (to facilitate drying by increasing the evaporation area). As the rubber strip (about 3 to 4 mm thick) emerges from the mill it is sliced into sheets. These are then placed in either a drying shed or a smoke house. The purpose of smoking is to dry the rubber and to impregnate it with creosotic substances which serve as anti-oxidants and antiseptics.

For the manufacture of pale crepe, the rubber coagulum is fed into a battery of creping machines. The first machines have grooved rollers whereas the last machines have smooth rollers, rotating at different speeds. This operation takes place under a constant stream of water so that the rubber is thoroughly washed. It is then dried, at room temperature or in hot air, in a ventilated drying shed. Two or more plies of crepe may be superimposed to form slabs of sole crepe.

Sheets are also made by the following process : after the latex has been coagulated in cylindrical tanks, the coagulum is sliced, by sawing, into a long strip which is cut into sheets and dried (generally without smoking).

Some types of rubber (in particular crepe other than pale crepe) are not manufactured directly by the coagulation of latex, but are produced by the subsequent re-agglomeration and washing in "creping machines" of the coagula obtained during tapping or factory processing. The resulting sheets, of varying thicknesses, are dried in the same way as pale crepe.

Natural rubber as described above is usually marketed according to its appearance in the forms and grades corresponding to international standards set up by the concerned international organisations.

The most common types are **smoked sheets and cuttings thereof, pale crepes and cuttings thereof, brown crepes and ribbed and air dried sheets.**

(2) Technically specified natural rubber (TSNR).

This is dry raw natural rubber which has been processed, tested and graded into five general grades (5L, 5, 10, 20 and 50) according to the specifications in the following table :

Table : Grade of TSNR and maximum allowable limits for each parameter

GRADE PARAMETER	5L	5	10	20	50
Dirt retained on 325 mesh (max. % wt.)	0.05	0.05	0.10	0.20	0.50
Ash content (max. % wt.)	0.60	0.60	0.75	1.00	1.50
Nitrogen content (max. % wt.)	0.70	0.70	0.70	0.70	0.70
Volatile matter (max. % wt.)	1.00	1.00	1.00	1.00	1.00
Wallace rapid plasticity - min. initial value (P_0)	30	30	30	30	30
Plasticity retention index, PRI (min. %)	60	60	50	40	30
Colour limit (Lovibond scale, max.)	6.00	-	-	-	-

TSNR must be accompanied by a test certificate, issued by the competent authorities of the producing country, specifying the grade, specifications and test results of the rubber. Certain producing countries may have grades with more stringent specifications than those stated in the table above. TSNR is packed in bales of 33 1/3 kg and wrapped in polyethylene. Normally 30 or 36 such bales are either palletised and covered by polyethylene liners on the inside or shrink-wrapped with polyethylene. Each bale or pallet has specific markings to show the grade, weight, producer code, etc.

(3) Re-agglomerated rubber granules.

The techniques used for processing granulated rubber are designed to give cleaner products with constant properties and a better appearance than rubber sheets or crepes.

The manufacturing process comprises granulation of the coagulum, particularly thorough cleaning, drying and compression into bales. A wide range of machines may be used for granulation, such as rotary blade choppers, cross hammer mills, pelleting machines and creping machines. The purely mechanical action of these may be reinforced by the addition of very small quantities (0.2 to 0.7 %) of castor oil, zinc stearate or other crumbling agents, incorporated in the latex before coagulation. These crumbling agents have no effect on the subsequent use or properties of the rubber.

The granules are dried in semi-continuous trolley-type dryers, conveyor belt tunnel dryers or extruder-dryers.

The dried granules are finally compressed, under high pressure, into parallelepipedal bales weighing from 32 to 36 kg. Re-agglomerated rubber granules are usually sold with guaranteed technical specifications.

(4) Free-flowing powders of natural rubber.

These are prepared as indicated in paragraph (3) above but without compression.

In order to prevent the granules from re-agglomerating under the action of their own weight, they are blended during preparation with powdered inert substances such as talc or other anti-tack agents.

Rubber powders can also be obtained by injecting into the drying chambers, with the latex, an inert substance, such as siliceous earth, expressly to prevent agglomeration of the particles.

(5) Special types of natural rubber.

Various special types of natural rubber can be obtained in the forms described in (1) to (4) above. The principal types are :

(a) CV (constant viscosity) rubber and LV (low viscosity) rubber.

CV rubber is obtained by adding a very small quantity (0.15 %) of hydroxylamine before coagulation and LV rubber by adding, also before coagulation, a small quantity of mineral oil.

The hydroxylamine prevents the spontaneous increase in the viscosity of the natural rubber during storage. Use of these rubbers enables manufacturers to forecast mastication periods.

(b) Peptised rubber.

This is obtained by adding to the latex, before coagulation, approximately 0.5 % of a peptising agent, which reduces the viscosity of the rubber during the drying operation. This rubber accordingly requires a shorter period of mastication.

(c) Superior processing rubber.

This is obtained either by coagulating a mixture of ordinary and pre-vulcanised latex or by mixing natural latex coagulum with pre-vulcanised latex coagulum; its use makes extrusion and calendering easier.

(d) Purified rubber.

This is obtained without addition of foreign substances, by a variation of the normal process of rubber production, for example, by centrifuging the latex.

It is used in the preparation of chlorinated rubber and in the manufacture of certain vulcanised goods (electric cables, etc.) whose properties would suffer from the presence of the impurities normally contained in rubber.

(e) Skim rubber.

This is obtained by coagulating the by-product of latex skim.

(f) **Anticrystallising rubber.**

This is obtained by adding thiobenzoic acid to latex before coagulation; it thus becomes freeze-resistant.

(C) **Balata.**

Balata gum, or balata, is extracted from the latex of certain plants of the *Sapotaceae* family, especially from the bullet-tree (*Manilkara bidentata*) found mainly in Brazil.

Balata is a reddish product, mostly shipped in blocks weighing up to 50 kg, but sometimes also in sheets from 3 to 6 mm thick.

It is mainly used for the manufacture of conveyor or transmission belts or belting. It is also used, mixed with gutta-percha, in the manufacture of submarine cables and of golf balls.

(D) **Gutta-percha.**

Gutta-percha is extracted from the latex of various trees of the *Sapotaceae* family (e.g., of the genus *Palaquium* and the genus *Payena*).

It is yellow or yellow-reddish. According to its origin, it is shipped either in cakes weighing 0.5 to 3 kg, or in blocks of 25 to 28 kg.

In addition to its uses, when mixed with balata, in the manufacture of submarine cables, golf balls and belting, it is also used for making sealing rings for pumps or valves, flax spinning rollers, linings for tanks, bottles for hydrofluoric acid, adhesives, etc.

(E) **Guayule gum.** This is extracted from the latex of the *Parthenium argentatum*, a shrub originating in Mexico.

Guayule rubber is generally shipped in cakes or sheets.

(F) **Chicle gum.** This is extracted from the latex contained in the bark of certain trees of the *Sapotaceae* family grown in the tropical regions of America.

This gum is reddish, and is generally shipped in cakes of various sizes or in blocks weighing about 10 kg.

It is mainly used for the manufacture of chewing-gum. It is also used for the manufacture of certain surgical tapes and of dental goods.

(G) **Similar natural gums**, for example, jelutong.

In order to be classified in this heading, these gums must be rubber-like in character.

(H) **Intermixtures** of any of the foregoing products.

This heading **excludes** :

- (a) Intermixtures of any product of this heading with any product of heading 40.02 (**heading 40.02**).
- (b) Natural rubber, balata, gutta-percha, guayule, chicle and similar natural gums, compounded, before or after coagulation, with substances forbidden by Note 5 (A) to this Chapter (**heading 40.05** or **40.06**).

40.02 - Synthetic rubber and factice derived from oils, in primary forms or in plates, sheets or strip; mixtures of any product of heading 40.01 with any product of this heading, in primary forms or in plates, sheets or strip.

- Styrene-butadiene rubber (SBR); carboxylated styrene-butadiene rubber (XSBR) :

4002.11 -- Latex

4002.19 -- Other

4002.20 - Butadiene rubber (BR)

- Isobutene-isoprene (butyl) rubber (IIR); halo-isobutene-isoprene rubber (CIIR or BIIR) :

4002.31 -- Isobutene-isoprene (butyl) rubber (IIR)

4002.39 -- Other

- Chloroprene (chlorobutadiene) rubber (CR) :

4002.41 -- Latex

4002.49 -- Other

- Acrylonitrile-butadiene rubber (NBR) :

4002.51 -- Latex

4002.59 -- Other

4002.60 - Isoprene rubber (IR)

4002.70 - Ethylene-propylene-non-conjugated diene rubber (EPDM)

4002.80 - Mixtures of any product of heading 40.01 with any product of this heading

- Other :

4002.91 -- Latex

4002.99 -- Other

This heading covers :

- (1) **Synthetic rubber** as defined in Note 4 to this Chapter (see below). This includes synthetic rubber latex, whether or not pre-vulcanised, and synthetic rubber in other primary forms or in plates, sheets or strip. The heading also covers synthetic rubber which has been treated for the purposes of transport and preservation or with a view to obtaining particular properties designed to facilitate its subsequent use or to improve the qualities of the end product. Such treatment must not, however, alter its essential character as a raw material. In particular it must not contain any substance forbidden by Note 5 (A) to this Chapter.

Among the products which have been compounded but which are not excluded from this heading by the provisions of Note 5 are the **oil-extended rubbers**; these contain up to approximately 50 % of oil.

- (2) **Factice derived from oils** - Factice is the product of the reaction of certain vegetable or fish oils (whether or not oxidised or partly hydrogenated) with sulphur or sulphur chloride.

Factice is physically weak and is used mainly compounded with natural or synthetic rubber, and also for the manufacture of erasers.

- (3) **Intermixtures** of any of the foregoing products.

- (4) **Mixtures of any product of heading 40.01 with any product of this heading.**

Note 4 (Definition of synthetic rubber)

This Note is in three parts. Whereas substances of Part (a) and (c) must comply with the vulcanisation, elongation and recovery criteria mentioned in Part (a), thioplasts of Part (b) are exempt from these requirements. It should be noted that the definition of **synthetic rubber** applies not only to heading 40.02 but also to Note 1. Consequently, wherever the term **rubber** is used in the Nomenclature, it includes synthetic rubber as defined in Note 4.

The expression " synthetic rubber " covers :

- (a) **Unsaturated synthetic substances**, which meet the requirements concerning vulcanisation, elongation and recovery as laid down in Part (a) of the Note. For the purposes of the test, substances necessary for the cross-linking, such as vulcanising activators, accelerators or retarders may be added. The presence of small amounts of breakdown products of emulsifiers (Note 5 (B) (ii)) and very small amounts of the special purpose additives mentioned in Note 5 (B) (iii) is also permitted. However, the presence of any substances not necessary for the cross-linking, such as pigments (other than those added solely for the purpose of identification), plasticisers, extenders, fillers, reinforcing agents, organic solvents is not permitted. Thus, the presence of mineral oil or dioctyl phthalate is not permitted for the purpose of the test.

Accordingly, in the case of substances containing materials not permitted by Note 4, such as mineral oil, the test is to be carried out on a sample which does not contain such materials or from which such materials have been removed. In the case of vulcanised articles, which cannot be tested as such, it is necessary to obtain a sample of the unvulcanised raw material from which the articles are made, in order to perform the test.

Such unsaturated synthetic substances include styrene-butadiene rubbers (SBR), carboxylated styrene-butadiene rubbers (XSBR), butadiene rubbers (BR), isobutene-isoprene (butyl) rubbers (IIR), halo-isobutene-isoprene rubbers (CIIR or BIIR), chloroprene (chlorobutadiene) rubbers (CR), acrylonitrile-butadiene rubbers (NBR), isoprene rubbers (IR), ethylene-propylene-non-conjugated diene rubbers (EPDM), carboxylated acrylonitrile-butadiene rubbers (XNBR) and acrylonitrile-isoprene rubbers (NIR). In order to be classified as synthetic rubber, all these substances must comply with the vulcanisation, elongation and recovery criteria mentioned above.

- (b) **Thioplasts (TM)** which are saturated synthetic substances, obtained by the reaction of aliphatic dihalides with a sodium polysulphide; they are generally vulcanisable with the classical-type vulcanising agents. The mechanical properties of certain types of thioplasts are inferior to those of the other grades of synthetic rubber but they have the advantage of being resistant to solvents. These should not be confused with the polysulphides of **heading 39.11** (see the Explanatory Note to that heading).
- (c) The products listed below, provided that they comply with the conditions described in paragraph (a) above in regard to vulcanisation, elongation and recovery :
 - (1) **Modified natural rubber**, obtained by grafting or mixing rubber with plastics.

Such rubber is usually obtained by fixing a polymerisable monomer onto the rubber by using a polymerisation catalyst or by co-precipitation of a natural rubber latex with a synthetic polymer latex.

The main characteristic of modified natural rubber is that it is to a certain extent "self-reinforcing", its properties in this respect being similar to those of a mixture of natural rubber and carbon black.

- (2) **De-polymerised natural rubber**, obtained by mechanical processing (pounding) at a given temperature.
- (3) **Mixtures of unsaturated synthetic substances with saturated synthetic high polymers** (e.g., mixtures of acrylonitrile-butadiene rubber and poly(vinyl chloride)).

This heading **excludes** :

- (a) Elastomers which do not comply with the conditions laid down in Note 4 to this Chapter (generally **Chapter 39**).
- (b) The products of this heading compounded, before or after coagulation, with substances forbidden by Note 5 (A) to this Chapter (**heading 40.05** or **40.06**).

40.03 - Reclaimed rubber in primary forms or in plates, sheets or strip.

Reclaimed rubber is obtained from used rubber articles, especially tyres, or from waste or scrap, of vulcanised rubber, by softening ("devulcanising") the rubber and removing some of the unwanted matter by various chemical or mechanical means. The product contains residues of sulphur or other vulcanising agents in combination and is inferior to virgin rubber, being more plastic and more tacky than virgin rubber. It may be put up in sheets dusted with talc or separated by polyethylene film.

This heading covers reclaimed rubber in primary forms or in plates, sheets or strip, whether or not mixed with virgin rubber or other added substances, provided that the product has the essential character of reclaimed rubber.

40.04 - Waste, parings and scrap of rubber (other than hard rubber) and powders and granules obtained therefrom.

The expression “ waste, parings and scrap ” is defined in Note 6 to this Chapter.

The heading covers :

- (1) **Rubber waste, parings and scrap from the manufacture or working of unvulcanised or vulcanised rubber (other than hard rubber).**
- (2) **Goods of rubber (other than hard rubber) definitely not usable as such because of cutting-up, wear or other reasons.**

This category includes worn-out rubber tyres not suitable for retreading and scrap obtained from such worn-out rubber tyres, usually by the following processes :

- (a) **Cutting the tyre**, with a special machine, as close as possible to the tringle bead wires or the heel.
- (b) **Splitting** to remove the tread.
- (c) **Cutting** into pieces.

The heading **excludes** used tyres suitable for retreading (**heading 40.12**).

- (3) **Powders and granules obtained from goods of (1) and (2) above.**

These consist of ground waste of vulcanised rubber. They may be used as a filler in road surfacing materials or in other rubber based compounds or for moulding directly into articles not requiring great strength.

The heading also **excludes** waste, parings, scrap, powders and granules of hard rubber (**heading 40.17**).

40.05 - Compounded rubber, unvulcanised, in primary forms or in plates, sheets or strip.

4005.10 - Compounded with carbon black or silica

4005.20 - Solutions; dispersions other than those of subheading 4005.10

- Other :

4005.91 -- Plates, sheets and strip

4005.99 -- Other

This heading covers compounded rubber which is unvulcanised and is in primary forms or in plates, sheets or strip.

The term " rubber " has the same meaning as in Note 1 to this Chapter. The heading therefore covers natural rubber, balata, gutta-percha, guayule, chicle and similar natural gums, synthetic rubber, factice derived from oils, and such substances reclaimed, provided they have been compounded with other substances.

According to Note 5 (A) to the Chapter, **headings 40.01 and 40.02 do not apply** to any rubber or mixture of rubbers which has been compounded, before or after coagulation, with vulcanising agents, accelerators, retarders or activators (other than those added for the preparation of pre-vulcanised rubber latex), pigments or other colouring matter (other than those added solely for the purpose of identification), plasticisers or extenders (except mineral oil in the case of oil-extended rubber), fillers, reinforcing agents, organic solvents or any other substances, except those permitted under Note 5 (B).

The heading includes :

(A) **Rubber compounded with carbon black or silica** (with or without mineral oil or other ingredients).

This category includes carbon black masterbatch consisting of approximately 40-70 parts of carbon black to 100 parts of dry rubber; it is usually marketed in bales.

(B) **Compounded rubbers not containing carbon black or silica.**

These contain substances such as organic solvents, vulcanising agents, accelerators, plasticisers, extenders, thickeners and fillers (other than carbon black or silica). Some of them may contain red clay or protein.

These two categories include the following types of product :

(1) Compounded rubber latex (including pre-vulcanised latex) provided that as a result of compounding it has not acquired the character of a preparation more specifically described in another heading of the Nomenclature.

Thus, the heading **excludes**, *inter alia*, latex varnishes and paints (**Chapter 32**).

(2) Dispersions and solutions of unvulcanised rubber in organic solvents, used for the manufacture of dipped articles or for coating finished articles.

- (3) Plates, sheets and strip, consisting of textile fabrics combined with compounded rubber, weighing more than 1,500 g/m² and containing not more than 50 % by weight of textile material.

Such products are obtained either by calendering or by "gumming" or by a combination of both processes. They are used mainly for the manufacture of tyres, tubes, pipes, etc.

- (4) Other plates, sheets and strip of compounded rubber which may be used, for example, for repairing tyres or inner tubes (hot process), for the manufacture of adhesive patches, washers for certain airtight seals, rubber granules, etc., for moulding rubber soles.
- (5) Compounded rubber in the form of granules, ready for vulcanisation, and used as such for moulding purposes (e.g., in the shoe-making industry).

The plates, sheets and strip (including blocks of regular geometric shape) of this heading may be surface-worked (printed, embossed, grooved, channelled, ribbed, etc.) or simply cut to rectangular (including square) shape, whether or not having the character of articles, but may not be otherwise cut to shape or further worked.

This heading also **excludes** :

- (a) Concentrated dispersions of colouring matter (including colour lakes) in rubber, used as raw materials for colouring rubber in the mass (**heading 32.04, 32.05 or 32.06**).
- (b) More or less pasty products, with a basis of latex or other rubber, used as mastics, painters' filling or non-refractory surfacing preparations (**heading 32.14**).
- (c) Prepared glues and other prepared adhesives consisting of rubber solutions or dispersions with added fillers, vulcanising agents and resins, and rubber solutions and dispersions put up for retail sale as glues or adhesives, not exceeding a net weight of 1 kg (**heading 35.06**).
- (d) Intermixtures of any product of heading 40.01 with any product of heading 40.02 (**heading 40.02**).
- (e) Reclaimed rubber mixed with virgin rubber or other added substances and having the essential character of reclaimed rubber (**heading 40.03**).
- (f) Plates, sheets and strip of unvulcanised rubber, worked otherwise than by surface-working or cut to shapes other than rectangular (including square) (**heading 40.06**).
- (g) Plates, sheets and strip composed of parallel textile yarns agglomerated with rubber (**heading 59.06**).

40.06 - Other forms (for example, rods, tubes and profile shapes) and articles (for example, discs and rings), of unvulcanised rubber.

4006.10 - " Camel-back " strips for retreading rubber tyres

4006.90 - Other

This heading covers unvulcanised rubber in forms not specified in the earlier headings of this Chapter and articles of unvulcanised rubber, whether or not compounded.

The heading includes :

- (A) **Unvulcanised rubber profile shapes**, for example, plates and strip of non-rectangular cross-section, generally made by extrusion. The heading covers, in particular, "camel-back" strips with a slightly trapezoidal cross-section, for retreading rubber tyres.
- (B) **Unvulcanised rubber tubes**, made by extrusion and used, in particular, to line the tubes of heading 59.09.
- (C) **Other articles** of unvulcanised rubber, for example :
 - (1) **Rubber thread** made by helicoidal cutting of unvulcanised rubber sheets or by extrusion of compounds with a basis of latex (including pre-vulcanised latex).
 - (2) **Rings, discs and washers** of unvulcanised rubber, used mainly for sealing certain kinds of airtight containers, or sealing the joints between two (usually rigid) parts.
 - (3) **Plates, sheets and strip** of unvulcanised rubber, worked otherwise than by surface-working or cut to shapes other than rectangular (including square).

This heading excludes :

- (a) Adhesive tapes, whatever the supporting material (classification according to that material, e.g., **heading 39.19, 40.08, 48.23, 56.03 or 59.06**).
- (b) Discs and rings of unvulcanised rubber, together with gaskets and similar joints of other materials, put up in pouches, envelopes or similar packings (**heading 84.84**).

40.07 - Vulcanised rubber thread and cord.

Rubber thread may be produced by cutting from sheets or plates of vulcanised rubber, or by vulcanising thread obtained by extrusion.

The heading includes :

- (1) **Thread** wholly of vulcanised rubber (single strand) of any cross-section **provided** that no cross-sectional dimension exceeds 5 mm. If it does, the thread is **excluded** (**heading 40.08**).
- (2) **Cord** (multiple strand), irrespective of the thickness of the strands of which it is composed.

The heading **does not cover** textile materials combined with rubber threads (**Section XI**). For example, textile-covered rubber thread and cord fall in **heading 56.04**.

40.08 - Plates, sheets, strip, rods and profile shapes, of vulcanised rubber other than hard rubber.

- Of cellular rubber :

4008.11 -- Plates, sheets and strip

4008.19 -- Other

- Of non-cellular rubber :

4008.21 -- Plates, sheets and strip

4008.29 -- Other

This heading covers :

- (1) **Plates, sheets and strip (having any cross-sectional dimension exceeding 5 mm) in the length, or merely cut to length or into rectangles (including squares).**
- (2) **Blocks of regular geometric shape.**
- (3) **Rods and profile shapes (including threads of any cross-sectional shape, of which any cross-sectional dimension exceeds 5 mm).** Profile shapes are obtained in the length in a single operation (generally extrusion), and they have a constant or repetitive cross-section, from one end to the other. They are classified in this heading, whether or not they are cut to length, but not cut to a length less than the greatest cross-sectional measurement.

The products of this heading may be surface-worked (e.g., printed, embossed, grooved, channelled, ribbed); they may also be plain or coloured (either in the mass or on the surface). Profile shapes with an adhesive surface, used for sealing window frames, are classified in this heading. The heading also covers rubber flooring material in the piece, and tiles, mats and other articles, obtained merely by cutting plates or sheets of rubber into rectangular (including square) shapes.

The classification of products made from vulcanised rubber (other than hard rubber) combined (either in the mass or on the surface) with textile materials is subject to the provisions of Note 3 to Chapter 56 and Note 4 to Chapter 59. Combinations of vulcanised rubber (other than hard rubber) with other materials remain classified in this heading **provided** they retain the essential character of rubber.

This heading thus includes :

- (A) Plates, sheets and strip of cellular rubber combined with textile fabrics (as defined in Note 1 to Chapter 59), felt or nonwovens, provided that these textile materials are present merely for reinforcing purposes.

In this respect, unfigured, unbleached, bleached or uniformly dyed textile fabrics, felt or nonwovens when applied to one face only of these plates, sheets or strip, are regarded as serving merely for reinforcing purposes. Figured, printed or more elaborately worked textiles and special products, such as pile fabrics, tulle and lace, are regarded as having a function beyond that of mere reinforcement.

Plates, sheets and strip of cellular rubber combined with textile fabric on both faces, whatever the nature of the fabric, are **excluded** from this heading (**heading 56.02, 56.03 or 59.06**).

- (B) Felt impregnated, coated, covered or laminated with vulcanised rubber (other than hard rubber) containing 50 % or less by weight of textile material or completely embedded in rubber.
- (C) Nonwovens, either completely embedded in rubber, or entirely coated or covered on both sides with rubber, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour.

The heading **excludes**, *inter alia* :

- (a) Conveyor or transmission belts or belting, of vulcanised rubber, whether or not cut to length (**heading 40.10**).
- (b) Plates, sheets and strip, whether or not surface-worked (including square or rectangular articles cut therefrom), with bevelled or moulded edges, or with rounded corners, openwork borders or otherwise worked, or cut into shapes other than rectangular (including square) (**heading 40.14, 40.15 or 40.16**).
- (c) Woven textile fabrics combined with rubber thread (**Chapters 50 to 55 or 58**).
- (d) The products of **heading 56.02** or **56.03**.
- (e) Textile carpets or carpeting, with a backing of cellular rubber (**Chapter 57**).
- (f) Tyre cord fabric (**heading 59.02**).
- (g) Rubberised textile fabrics as defined in Note 4 to Chapter 59 (**heading 59.06**).
- (h) Knitted or crocheted fabrics combined with rubber thread (**Chapter 60**).

40.09 - Tubes, pipes and hoses, of vulcanised rubber other than hard rubber, with or without their fittings (for example, joints, elbows, flanges).

- Not reinforced or otherwise combined with other materials :

4009.11 -- Without fittings

4009.12 -- With fittings

- Reinforced or otherwise combined only with metal :

4009.21 -- Without fittings

4009.22 -- With fittings

- Reinforced or otherwise combined only with textile materials :

4009.31 -- Without fittings

4009.32 -- With fittings

- Reinforced or otherwise combined with other materials :

4009.41 -- Without fittings

4009.42 -- With fittings

This heading covers tubes, pipes and hoses consisting wholly of vulcanised rubber (other than hard rubber), and vulcanised rubber tubes, pipes and hoses (including hose-piping) reinforced by stratification, consisting, for example, of one or more "plies" of textile fabric or one or more layers of parallelised textile threads, or metal threads, embedded in the rubber. Such tubes, pipes and hoses may also be covered with a sheath of thin fabric or with gimped or plaited textile yarns; they may also incorporate an internal or external spiral of wire.

The heading **excludes** tubes, pipes and hoses of textile materials, sometimes called "woven hoses", which have been waterproofed with an internal coating of rubber latex or into which a separate rubber sheath has been inserted. Such articles fall in **heading 59.09**.

Tubes, pipes and hoses remain classified in this heading even if presented with fittings (for example, joints, elbows, flanges), provided that they retain the essential character of piping or tubing.

The heading also covers tubing of vulcanised rubber, whether or not cut to length, but not cut to a length less than the greatest cross-sectional measurement, for example lengths of tubing for the manufacture of inner tubes.

40.10 - Conveyor or transmission belts or belting, of vulcanised rubber.

- Conveyor belts or belting :

4010.11 -- Reinforced only with metal

4010.12 -- Reinforced only with textile materials

4010.19 -- Other

- Transmission belts or belting :

4010.31 -- Endless transmission belts of trapezoidal cross-section (V-belts), V-ribbed, of an outside circumference exceeding 60 cm but not exceeding 180 cm

4010.32 -- Endless transmission belts of trapezoidal cross-section (V-belts), other than V-ribbed, of an outside circumference exceeding 60 cm but not exceeding 180 cm

4010.33 -- Endless transmission belts of trapezoidal cross-section (V-belts), V-ribbed, of an outside circumference exceeding 180 cm but not exceeding 240 cm

4010.34 -- Endless transmission belts of trapezoidal cross-section (V-belts), other than V-ribbed, of an outside circumference exceeding 180 cm but not exceeding 240 cm

4010.35 -- Endless synchronous belts, of an outside circumference exceeding 60 cm but not exceeding 150 cm

4010.36 -- Endless synchronous belts, of an outside circumference exceeding 150 cm but not exceeding 198 cm

4010.39 -- Other

This heading covers conveyor or transmission belts and belting, wholly of vulcanised rubber, or of textile fabric impregnated, coated, covered or laminated with rubber or made from textile yarn or cord impregnated, coated, covered or sheathed with rubber (see Note 8 to this Chapter). It also covers belts or belting of vulcanised rubber reinforced with glass fibre fabric or glass fibres or with cloth of metal wire.

Belts and belting (other than belts or belting wholly of vulcanised rubber) generally consist of a carcass made up of several layers of fabric, whether or not rubberised (e.g., warp and weft fabric, knitted or crocheted fabric, layers of parallelised yarns) or of steel cable or strip which is wholly covered with vulcanised rubber.

The heading includes belting in the length (for subsequent cutting to length) as well as belts already cut to length (whether or not joined end to end or fitted with fasteners); it also covers endless belts.

All these goods may be of rectangular, trapezoidal (V-belts and V-belting), circular or other cross-section.

Belts or belting of trapezoidal cross-section are those products having one or more "V" shapes in cross-section. The "V" surfaces are designed to provide good wedging action and minimum slippage along the sides of the sheave. The category includes, e.g., belts or belting having a cross-section with :

(A) A single trapezoidal shape

(B) Trapezoidal shapes on opposite sides.

(C) Two or more trapezoidal shapes on the same side (V-ribbed).

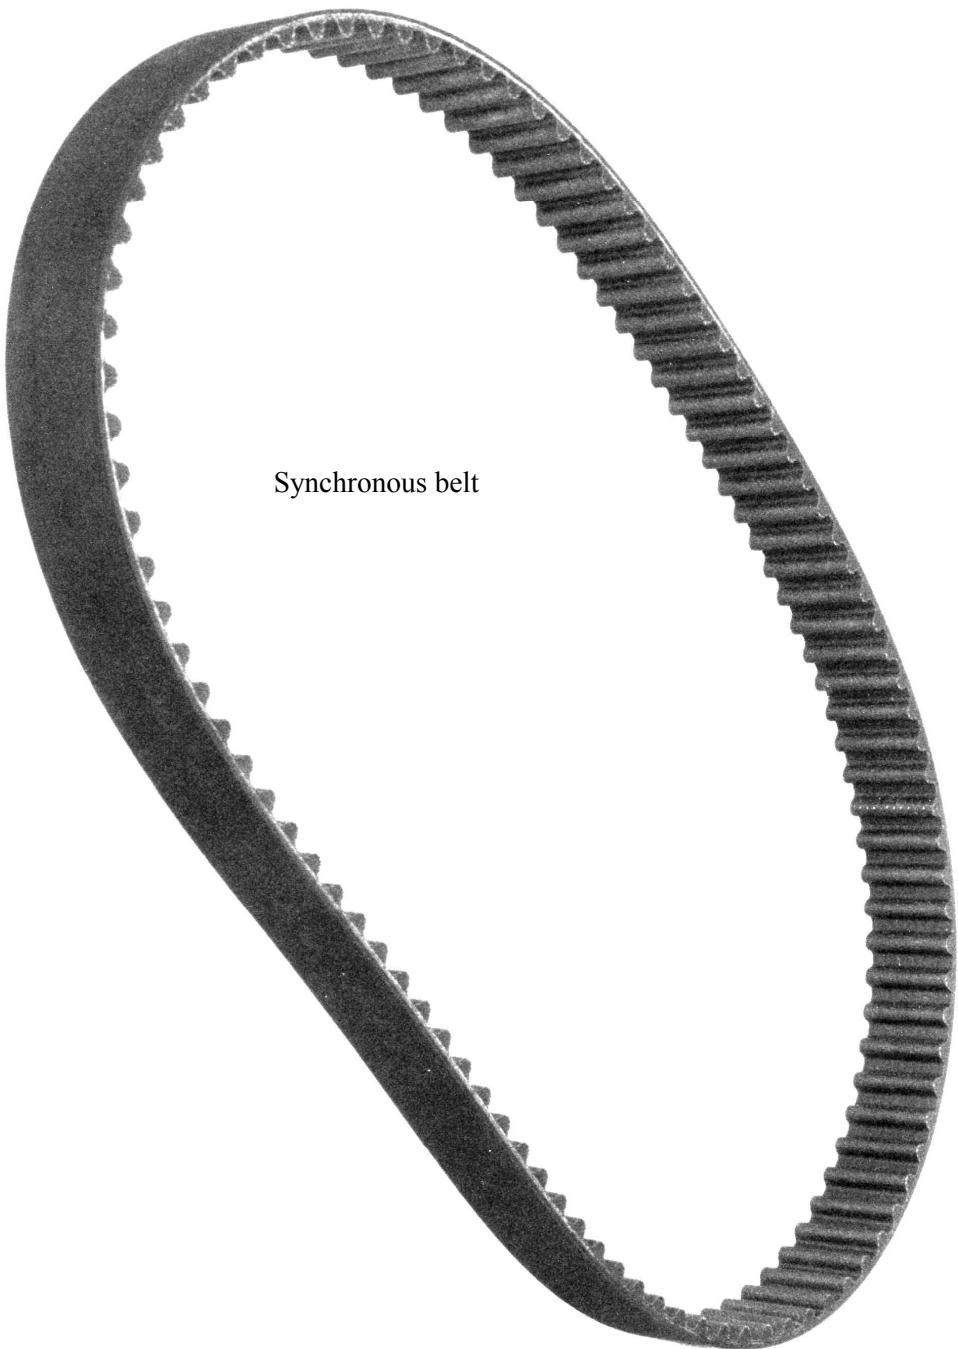

A V-ribbed belt is an endless belt with a longitudinally ribbed traction surface which engages and grips, by friction, pulley grooves of similar shape. V-ribbed belts are a type of V-belt.

Grooves (whether moulded or cut) in V-belts or belting reduce bending stress and help dissipate the heat from rapid flexing; this is especially important on drives where the belts run over small sheaves at high speeds. Grooves, other than longitudinal grooves, have no impact on the classification of V-belts or belting.

Synchronous belts (see illustration) are designed to transmit power while maintaining a constant rotational relationship between sheaves. The completed product is often simply referred to as a timing belt. Notches, usually on the inner surface of the belt, are provided to operate smoothly with notched sheaves. Synchronous belts or belting do not have a trapezoidal cross-section.

Belts of this heading may be presented in the form of a sleeve (tube) from which finished items can be cut; this presentation does not affect classification.

Synchronous belt

Conveyor or transmission belts or belting presented with the machines or apparatus for which they are designed, whether or not actually mounted, are to be classified with that machine or apparatus (e.g., **Section XVI**).

40.11 - New pneumatic tyres, of rubber (+).

- 4011.10 - Of a kind used on motor cars (including station wagons and racing cars)
- 4011.20 - Of a kind used on buses or lorries
- 4011.30 - Of a kind used on aircraft
- 4011.40 - Of a kind used on motorcycles
- 4011.50 - Of a kind used on bicycles
- 4011.70 - Of a kind used on agricultural or forestry vehicles and machines
- 4011.80 - Of a kind used on construction, mining or industrial handling vehicles and machines
- 4011.90 - Other

These tyres may be for use on any type of vehicle or aircraft, on wheeled toys, machinery, artillery weapons, etc. They may or may not require inner tubes.

Subheading Explanatory Notes.

Subheading 4011.70

Images of some of the types of tyres which are covered by this subheading are reproduced below for illustrative purposes only.

- Examples of tyres for agricultural vehicles or machines :

- Examples of tyres for forestry vehicles or machines :

Subheading 4011.80

Images of some of the types of tyres which are covered by this subheading are reproduced below for illustrative purposes only.

- Examples of tyres for construction, mining or industrial handling vehicles or machines :

40.12 - Retreaded or used pneumatic tyres of rubber; solid or cushion tyres, tyre treads and tyre flaps, of rubber (+).

- Retreaded tyres :

- 4012.11 -- Of a kind used on motor cars (including station wagons and racing cars)
- 4012.12 -- Of a kind used on buses or lorries
- 4012.13 -- Of a kind used on aircraft
- 4012.19 -- Other
- 4012.20 - Used pneumatic tyres
- 4012.90 - Other

This heading includes retreaded pneumatic tyres of rubber and used pneumatic tyres of rubber, suitable either for further use or for retreading.

Solid tyres are used, for example, on wheeled toys and mobile articles of furniture. **Cushion tyres**, which are solid tyres with a sealed internal air space, are used on barrows and trolleys. **Tyre treads** are bonded to the circumference of pneumatic tyre carcasses and generally have ribbed tread design. They are used for retreading pneumatic tyres. This heading also covers **interchangeable tyre treads**, which are presented in the form of rings to be fitted on a tyre carcass specially designed for that purpose. **Tyre flaps** are used to protect the inner tube from the metal rim or spoke ends.

The heading **excludes** solid or cushion tyres of products of Chapter 39, for example, polyurethane (generally **Section XVII**) and worn-out tyres not suitable for retreading (**heading 40.04**).

○
○ ○

Subheading Explanatory Note.

Subheadings 4012.11, 4012.12, 4012.13, 4012.19 and 4012.20

In the context of subheadings 4012.11, 4012.12, 4012.13 and 4012.19, the expression “retreaded tyres” covers tyres from which the worn tread has been removed from the tyre carcass and to which a new tread has been created by either of two methods : (i) a tread is moulded from unvulcanised rubber onto the tyre carcass or (ii) a vulcanised tread is attached to the tyre carcass by a vulcanisable rubber strip. Such tyres may be referred to as having undergone top-capping (replacement of the tread), re-capping (replacement of the tread with new material extending over part of the sidewall) or bead-to-bead retreading (replacement of the tread and renovation of the sidewall including all or part of the side walls of the tyre).

Used tyres of subheading 4012.20 may be subjected to **recutting** or **regrooving**, by which worn (but visible) grooves of the tread are deepened by cutting. Such regrooving usually is performed on tyres used for heavy motor vehicles (e.g., buses and or lorries). Used tyres which have been recut or regrooved do not fall within subheadings 4012.11, 4012.12, 4012.13 and 4012.19.

The tyres of subheadings 4012.11, 4012.12, 4012.13, 4012.19 and 4012.20 may also be subjected to **supplementary recutting**, in which transversal or diagonal grooves are added to the original tread pattern by cutting. Such supplementary recutting does not affect their classification as retreaded tyres of subheadings 4012.11, 4012.12, 4012.13, 4012.19 or used tyres of 4012.20.

However, new pneumatic tyres which have undergone supplementary recutting remain classifiable in their appropriate subheadings in **heading 40.11**.

40.13 - Inner tubes, of rubber.

4013.10 - Of a kind used on motor cars (including station wagons and racing cars), buses or lorries

4013.20 - Of a kind used on bicycles

4013.90 - Other

Inner tubes are fitted to the tyres of, for example, motor cars, trailers or bicycles.

40.14 - Hygienic or pharmaceutical articles (including teats), of vulcanised rubber other than hard rubber, with or without fittings of hard rubber.

4014.10 - Sheath contraceptives

4014.90 - Other

This heading covers goods of vulcanised rubber other than hard rubber (with or without fittings of hard rubber or other materials), of the kind used for hygienic or prophylactic purposes. It therefore covers, *inter alia*, sheath contraceptives, cannulas, syringes and bulbs for syringes, vaporisers, droppers, etc., teats (nursing nipples), nipple shields, ice-bags, hot-water bottles, oxygen bags, finger-stalls, pneumatic cushions specialised for nursing (e.g., ring-type).

The heading **does not include** clothing or clothing accessories (e.g., surgeons' and radiologists' aprons and gloves) (**heading 40.15**).

40.15 - Articles of apparel and clothing accessories (including gloves, mittens and mitts), for all purposes, of vulcanised rubber other than hard rubber (+).

- Gloves, mittens and mitts :

4015.11 - - Surgical

4015.19 - - Other

4015.90 - Other

This heading covers articles of apparel and clothing accessories (including gloves, mittens and mitts) e.g., protective gloves and clothing for surgeons, radiologists, divers, etc., whether assembled by means of an adhesive or by sewing or otherwise obtained. These goods may be :

- (1) Wholly of rubber.
- (2) Of woven, knitted or crocheted fabrics, felt or nonwovens, impregnated, coated, covered or laminated with rubber, **other than** those falling in **Section XI** (see Note 3 to Chapter 56 and Note 4 to Chapter 59).
- (3) Of rubber, with parts of textile fabric, when the rubber is the constituent giving the goods their essential character.

The goods in the three categories cited above include capes, aprons, dress-shields, bibs, belts and corset-belts.

The following articles are **excluded** from the heading :

- (a) Articles of apparel and clothing accessories of textile materials combined with rubber threads (**Chapter 61 or 62**).
 - (b) Footwear and parts thereof of **Chapter 64**.
 - (c) Headgear (including bathing caps) and parts of headgear, of **Chapter 65**.
- ◦ ◦

Subheading Explanatory Note.

Subheading 4015.11

Surgical gloves are thin, highly tear-resistant articles manufactured by immersion, of a kind worn by surgeons. They are generally presented in sterile packs.

40.16 - Other articles of vulcanised rubber other than hard rubber.

4016.10 - Of cellular rubber

- Other :

4016.91 -- Floor coverings and mats

4016.92 -- Erasers

4016.93 -- Gaskets, washers and other seals

4016.94 -- Boat or dock fenders, whether or not inflatable

4016.95 -- Other inflatable articles

4016.99 -- Other

This heading covers all articles of vulcanised rubber (other than hard rubber) not covered by the preceding headings of this Chapter or by other Chapters.

The heading includes :

- (1) Articles of cellular rubber.
- (2) Floor coverings and mats (including bath mats), **other than** rectangular (including square) mats cut from plates or sheets of rubber and not further worked than surface-worked (see the Explanatory Note to **heading 40.08**).
- (3) Erasers.
- (4) Gaskets, washers and other seals.
- (5) Boat or dock fenders, whether or not inflatable.
- (6) Pneumatic mattresses, pillows and cushions and other inflatable articles (**other than** those of **heading 40.14** or **63.06**); water-mattresses.
- (7) Rubber bands; tobacco-pouches; characters for date stamps and the like.
- (8) Stoppers and rings for bottles.
- (9) Pump rotors and moulds; rubber liners for milking machines; taps, cocks, valves and similar appliances; other articles for technical uses (including parts and accessories of machines and appliances of Section XVI and of instruments and apparatus of Chapter 90).
- (10) Chassis mounting rubbers, mudflaps and pedal covers for motor vehicles, brake-blocks, mudguard-flaps and pedal blocks for cycles, and other parts and accessories for vehicles, aircraft or vessels of Section XVII.
- (11) Plates, sheets and strip merely cut to non-rectangular shapes, and articles excluded from heading 40.08 because they have been milled, turned, assembled by glueing or sewing or otherwise worked.

- (12) Rectangular (including square) patches with bevelled edges and patches of any other shapes for repairing inner tubes, obtained by moulding, cutting or grinding, consisting generally of a layer of self-vulcanising rubber on a vulcanised rubber backing and, subject to the provisions of Note 4 to Chapter 59, such patches consisting of several layers of fabric and rubber.
- (13) Rubber-headed hammers.
- (14) Small suction hooks, table mats, sink plugs, sink plungers, doorstops, rubber feet for furniture legs and other articles for household use.

The following are also **excluded** from this heading :

- (a) Articles of woven, knitted or crocheted fabrics, felt or nonwovens, impregnated, coated, covered or laminated with rubber, falling in **Section XI** (see Note 3 to Chapter 56 and Note 4 to Chapter 59) and articles made from textile materials combined with rubber threads (**Section XI**).
- (b) Footwear and parts thereof of **Chapter 64**.
- (c) Headgear (including bathing caps) and parts of headgear, of **Chapter 65**.
- (d) Vacuum cup holders (suction grips) consisting of a base, a handle and a vacuum lever, of base metal, and rubber discs (**Section XV**).
- (e) Rubber boats and rafts (**Chapter 89**).
- (f) Parts and accessories of musical instruments (**Chapter 92**).
- (g) Mattresses, pillows and cushions of cellular rubber, whether or not covered, including electric bed-warming pads fitted internally with cellular rubber, of **heading 94.04**.
- (h) Toys, games and sports requisites and parts thereof of **Chapter 95**.
- (ij) Date, sealing or numbering stamps, and the like, designed for operating in the hand, and other articles of **Chapter 96**.

40.17 - Hard rubber (for example, ebonite) in all forms, including waste and scrap; articles of hard rubber.

Hard rubber (for example, ebonite) is obtained by vulcanising rubber with a high proportion (more than 15 parts per hundred parts of rubber) of combined sulphur. Hard rubber may also contain pigments and high levels of fillers, for example, coal, clays and silica. In the absence of fillers, pigments and cellular structures, hard rubber is a hard, brownish-black (or sometimes red) material which is relatively inflexible and inelastic and can be moulded, sawn, drilled, turned, polished, etc. Many hard rubbers acquire a highly lustrous finish when polished.

This heading covers hard rubber including the cellular variety, in all forms including waste and scrap.

The heading also covers all hard rubber articles not specified or included in other Chapters. It includes vats, troughs, articles of tubing, knife handles and knobs, grip-handles and the like of all kinds, sanitary and hygienic articles.

This heading **excludes**, *inter alia* :

- (a) Mechanical or electrical appliances or parts thereof of **Section XVI** (including electrical goods of all kinds), of hard rubber.
 - (b) Parts and accessories of hard rubber for vehicles, aircraft, etc., which fall to be classified within any heading in **Chapters 86 to 88**.
 - (c) Instruments and appliances for medical, surgical, dental or veterinary purposes, and other instruments and apparatus of **Chapter 90**.
 - (d) Musical instruments and parts and accessories thereof (**Chapter 92**).
 - (e) Butt plates and other parts of arms (**Chapter 93**).
 - (f) Furniture, lamps and lighting fittings, and other articles of **Chapter 94**.
 - (g) Toys, games and sports requisites (**Chapter 95**).
 - (h) Brushes and other articles of **Chapter 96**.
-

Section VIII

**RAW HIDES AND SKINS, LEATHER, FURSKINS AND ARTICLES
THEREOF; SADDLERY AND HARNESS; TRAVEL GOODS, HANDBAGS
AND SIMILAR CONTAINERS; ARTICLES OF ANIMAL GUT
(OTHER THAN SILK-WORM GUT)**

Chapter 41

Raw hides and skins (other than furskins) and leather

Notes.

- 1.- This Chapter does not cover :
 - (a) Parings or similar waste, of raw hides or skins (heading 05.11);
 - (b) Birdskins or parts of birdskins, with their feathers or down, of heading 05.05 or 67.01; or
 - (c) Hides or skins, with the hair or wool on, raw, tanned or dressed (Chapter 43); the following are, however, to be classified in Chapter 41, namely, raw hides and skins with the hair or wool on, of bovine animals (including buffalo), of equine animals, of sheep or lambs (except Astrakhan, Broadtail, Caracul, Persian or similar lambs, Indian, Chinese, Mongolian or Tibetan lambs), of goats or kids (except Yemen, Mongolian or Tibetan goats and kids), of swine (including peccary), of chamois, of gazelle of camels (including dromedaries), of reindeer, of elk, of deer, of roebucks or of dogs.
- 2.- (A) Headings 41.04 to 41.06 do not cover hides and skins which have undergone a tanning (including pre-tanning) process which is reversible (headings 41.01 to 41.03, as the case may be).
(B) For the purposes of headings 41.04 to 41.06, the term “crust” includes hides and skins that have been retanned, coloured or fat-liquored (stuffed) prior to drying.
- 3.- Throughout the Nomenclature the expression “ composition leather ” means only substances of the kind referred to in heading 41.15.

GENERAL

This Chapter covers :

- (I) **Raw hides (the skins of the larger quadrupeds) and skins (other than birdskins with their feathers or down and furskins) (headings 41.01 to 41.03).** These headings also include raw hides and skins with the hair or wool on of animals mentioned in Note 1 (c) and referred to in the Explanatory Notes to headings 41.01 to 41.03.

Before undergoing tanning, hides and skins are first subjected to a series of preparatory processes, which consist of soaking them in alkaline solutions (to soften them and remove any salt used for preservation), dehauling and defleshing (“fleshing”), then removing the lime and other substances used in dehauling, and finally rinsing.

Headings 41.01 to 41.03 also cover raw hides and skins without the hair or wool, which have been subjected to a reversible tanning (including pre-tanning) process. Such process temporarily stabilises the hide or skin for splitting operations and temporarily prevents putrefaction. Hides and skins thus processed require further tanning before finishing and are **not** considered products of headings 41.04 to 41.06.

Hides and skins with the hair or wool on that have been pre-tanned or further prepared are **excluded** from this Chapter by Note 1(c) to this Chapter.

- (II) **Hides and skins which have been tanned or crusted but not further prepared (headings 41.04 to 41.06).** Tanning renders the hides and skins resistant to decay, and increases their impermeability to water. Tannins penetrate into the hide structure and form crosslinks with the collagen. This is an irreversible chemical reaction, which gives the resultant product stability against heat, light or perspiration and makes a hide or skin mouldable and usable.

They are then either “vegetable tanned” (in baths containing certain woods, barks, leaves, etc., or their extracts), “mineral tanned” (with mineral salts, e.g., chrome salts, iron salts or alums) or “chemically tanned” (with formaldehyde or certain synthetic chemicals). Sometimes combinations of these processes are used. Tanning of heavy leather by a mixture of alum and salt is known as **Hungarian dressing**, while in **alum tanning** a mixture of salt, alum, egg yolk and flour is used. Alum tanned hides and skins are used mainly in the manufacture of gloves, apparel and footwear.

Hides and skins which have been tanned or further prepared beyond tanning are known in trade as “**leather**”. Leather which has been dried after tanning is known as “**crust**” or “**crust leather**”. During the crusting procedure, a fat-liquor or oil may be added to give the crust some lubrication and flexibility, and the hide or skin may be retanned or coloured by immersion (e.g., in a drum) before drying.

Sheep and lamb skins which have been oil-tanned and dressed to produce **chamois** leather (including combination chamois leather) are provided for in **heading 41.14**.

- (III) **Leather further prepared after tanning or crusting (headings 41.07, 41.12 and 41.13).** After tanning or crusting, the leather frequently undergoes further treatment (“currying”) to remove irregularities of the surface and render it ready for use by making it more supple, waterproof, etc. These processes consist of further working by softening, stretching, thinning, beating or hardening the surface, and feeding (“stuffing”) with oils.

The leather may then be further dressed or finished by the application of a surface colour or pigment, graining or stamping to imitate skins of other kinds, sizing, polishing, grinding (or buffing) of the flesh side (or occasionally the grain side) to give a suède or velvet finish, waxing, blacking, smoothing (glazing), satin finishing, printing, etc.

Parchment-dressed leather is prepared from raw hides or skins, not by a process of tanning, but by treating the raw hides and skins to ensure their preservation. These are softened, dehaired, defleshed, washed and then stretched on a frame, coated with a paste containing whiting and soda or slaked lime, shaved to reduce them to the desired thickness and ground with pumice. Finally, they may be dressed with gelatin and starch.

The finer quality leathers, called “vellum”, are prepared from the skins of new-born calves. These materials are used for fine bookbinding, for important documents, for drum-skins, etc. Thicker hides and skins (i.e., usually of larger bovine animals) are sometimes similarly treated (the coarser products being known as “rawhide”) and are used for the manufacture of machinery parts, tools, travel goods, etc.

(IV) **Chamois leather; patent leather and patent laminated leather; metallised leather (heading 41.14).** Heading 41.14 includes the specialty leathers named in the heading text and produced by specific finishing operations. The heading therefore covers sheep and lamb skins which have been oil-tanned and dressed to produce **chamois leather** (including combination chamois leather); leather which has been coated or covered with a varnish or lacquer or with a pre-formed sheet of plastics (**patent leather or patent laminated leather**); and leather which has been coated with metal powder or metal leaf (**metallised leather**).

(V) **Composition (bonded) leather with a basis of leather or leather fibre (heading 41.15).**

(VI) **Parings and other waste of leather or of composition leather (heading 41.15).** This heading does not include parings and similar waste of raw hides or skins or of furskins.

Hides, skins and leather fall in this Chapter whether whole (i.e., the shape of the hides, skins and leather have the contour of the animal, but may have the skin of the head and legs removed) or in portions (e.g., sides, shoulders, butts, bends, bellies, cheeks), strips or sheets; pieces of leather cut to special shapes are, however, regarded as articles of other Chapters, particularly **Chapter 42 or 64.**

Split hides and skins and split leathers are classified in the same headings as the corresponding whole hides and skins and whole leathers respectively. Splitting is the process to horizontally divide hides and skins into more than one layer and may be carried out either before or after tanning. The object in splitting is to obtain a more even thickness for processing and a more uniform final leather. The outer or grain layer of a hide, known as the "grain split", is levelled by passing the hide across an endless band-knife to an accuracy of a few millimetres; the bottom layer, known as the "flesh split", is of irregular shape and thickness. Several layers can be produced from an exceptionally thick hide, such as buffalo. However, in such cases, the middle layers are weaker in structure than the outer layers.

41.01 - Raw hides and skins of bovine (including buffalo) or equine animals (fresh, or salted, dried, limed, pickled or otherwise preserved, but not tanned, parchment-dressed or further prepared), whether or not dehaired or split.

4101.20 - Whole hides and skins, unsplit, of a weight per skin not exceeding 8 kg when simply dried, 10 kg when dry-salted, or 16 kg when fresh, wet-salted or otherwise preserved

4101.50 - Whole hides and skins, of a weight exceeding 16 kg

4101.90 - Other, including butts, bends and bellies

This heading covers raw hides and skins (whether or not the hair has been removed) of bovine animals (including buffalo) (i.e., animals of heading 01.02, see the Explanatory Note to that heading) or equine animals (horses, mules, asses, zebras, etc.).

These raw hides and skins may be fresh (green) or temporarily preserved by salting, drying, liming, pickling or any other method to prevent putrefaction in the short term. They may also be cleaned, split or scraped, or may have undergone a tanning (including pre-tanning) process which is reversible, but not subjected to any other tanning or equivalent process (such as parchment-dressing) nor further prepared.

Hides and skins may be either **dry salted**, or **wet salted** by means of brine. In the dry salting process, small proportions of other substances are sometimes added to prevent staining. In India, a clayey earth containing sodium sulphate is sometimes added.

Hides may be **dried** directly or as an additional treatment after salting. During drying, the hides and skins are often treated with insecticidal, disinfecting or similar preparations.

Hides and skins are **limed** by soaking them in lime water or by painting them with a paste containing slaked lime. The liming facilitates dehairing and also helps to preserve the hides and skins.

Hides and skins are **pickled** by steeping in weak solutions of hydrochloric or sulphuric acid, or of certain other chemicals, together with common salt. This process preserves the hides and skins.

The heading **does not include** :

- (a) Uncooked edible skins of animals (**heading 02.06** or **02.10**). (When cooked, such skins are classified in **heading 16.02**.)
- (b) Parings and similar waste of raw hides or skins (**heading 05.11**).

41.02 - Raw skins of sheep or lambs (fresh, or salted, dried, limed, pickled or otherwise preserved, but not tanned, parchment-dressed or further prepared), whether or not with wool on or split, other than those excluded by Note 1 (c) to this Chapter.

4102.10 - With wool on

- Without wool on :

4102.21 -- Pickled

4102.29 -- Other

This heading covers raw skins of sheep or lambs whether or not with wool on. It **does not**, however, **cover** skins with wool on of Astrakhan, Broadtail, Caracul, Persian or similar lambs (i.e., lambs of a variety similar to Caracul or Persian but known by different names in various parts of the world), Indian, Chinese, Mongolian or Tibetan lambs.

These raw skins may be fresh (green) or temporarily preserved by salting, drying, liming, pickling or any other method to prevent putrefaction in the short term (see the Explanatory Note to heading 41.01). They may also be cleaned, split or scraped, or may have undergone a tanning (including pre-tanning) process which is reversible, but not subjected to any other tanning or equivalent process (such as parchment-dressing) nor further prepared.

The heading **does not include** :

- (a) Uncooked edible skins of animals (**heading 02.06 or 02.10**). (When cooked, such skins are classified in **heading 16.02**).
- (b) Parings and similar waste of raw skins (**heading 05.11**).

41.03 - Other raw hides and skins (fresh, or salted, dried, limed, pickled or otherwise preserved, but not tanned, parchment-dressed or further prepared), whether or not dehaired or split, other than those excluded by Note 1 (b) or 1 (c) to this Chapter.

4103.20 - Of reptiles

4103.30 - Of swine

4103.90 - Other

This heading covers :

- (A) All raw hides and skins without hair or dehaired, **other than** those of **heading 41.01** or **41.02**. The heading includes birdskins from which the feathers and down have been removed, and fish skins, reptile skins and dehaired skins of goats or kids (including Yemen, Mongolian or Tibetan goats and kids).
- (B) Raw hides and skins, from which the hair has not been removed, of the following animals only :
 - (1) Goats and kids (**other than** Yemen, Mongolian or Tibetan goats and kids).
 - (2) Swine, including peccary.
 - (3) Chamois, gazelle and camels (including dromedaries).
 - (4) Elk, reindeer, roebucks and other deer.
 - (5) Dogs.

These raw hides and skins may be fresh (green) or temporarily preserved by salting, drying, liming, pickling or any other method to prevent putrefaction in the short term (see the Explanatory Note to heading 41.01). They may also be cleaned, split or scraped, or may have undergone a tanning (including pre-tanning) process which is reversible, but not subjected to any other tanning or equivalent process (such as parchment-dressing) nor further prepared.

The heading **does not include** :

- (a) Uncooked edible skins of animals (**Chapter 2**) or of fish (**Chapter 3**). (When cooked, such skins are classified in **Chapter 16**.)
- (b) Parings and similar waste of raw hides or skins (**heading 05.11**).
- (c) Birdsksins and parts of birdsksins, with their feathers or down, of **heading 05.05** or **67.01**.

41.04 - Tanned or crust hides and skins of bovine (including buffalo) or equine animals, without hair on, whether or not split, but not further prepared.

- In the wet state (including wet-blue) :

4104.11 -- Full grains, unsplit; grain splits

4104.19 -- Other

- In the dry state (crust) :

4104.41 -- Full grains, unsplit; grain splits

4104.49 -- Other

This heading covers dehaired hides and skins, of bovine (including buffalo) or equine animals, which have been tanned or crusted but not further prepared (see the General Explanatory Note to this Chapter).

The heading **excludes** :

- (a) Chamois (including combination chamois) leather (**heading 41.14**).
- (b) Parings and other waste of tanned or crust leather (**heading 41.15**).
- (c) Hides and skins of bovine (including buffalo) or equine animals, tanned or crusted, with the hair on (**Chapter 43**).

41.05 - Tanned or crust skins of sheep or lambs, without wool on, whether or not split, but not further prepared.

4105.10 - In the wet state (including wet-blue)

4105.30 - In the dry state (crust)

This heading covers the skins of sheep or lambs (including those of crossed sheep and goats), tanned or crusted, without the wool on, but not further prepared (see the General Explanatory Note to this Chapter).

Sheep or lamb leather is somewhat similar to that of goats or kids but is of looser texture and has a more irregular grain.

Sheepskins are often "alum tanned" (see the General Explanatory Note to this Chapter).

The grain splits of the sheepskin, when tanned, are called a "skiver"; "basils" are sheepskins tanned with certain vegetable tannings.

The heading **excludes** :

- (a) Chamois (including combination chamois) leather (**heading 41.14**).
- (b) Parings and other waste of tanned or crust leather (**heading 41.15**).
- (c) Sheep or lamb skins, tanned or crusted, with the wool on (**Chapter 43**).

41.06 - Tanned or crust hides and skins of other animals, without wool or hair on, whether or not split, but not further prepared.

- Of goats or kids :

4106.21 -- In the wet state (including wet-blue)

4106.22 -- In the dry state (crust)

- Of swine :

4106.31 -- In the wet state (including wet-blue)

4106.32 -- In the dry state (crust)

4106.40 - Of reptiles

- Other :

4106.91 -- In the wet state (including wet-blue)

4106.92 -- In the dry state (crust)

This heading covers the skins of goats or kids, tanned or crusted, without the hair on, but not further prepared (see the General Explanatory Note to this Chapter).

Features which distinguish sheep leather from that of goats are referred to in the Explanatory Note to heading 41.05.

Goat or kid skins may also be "alum tanned" (see the General Explanatory Note to this Chapter).

This heading also covers the hairless or dehaired hides or skins of all animals **not referred to in headings 41.04 and 41.05** which have been processed in the same way as the hides and skins of those headings (see the General Explanatory Note to this Chapter).

The heading therefore covers, for example, the leather of swine, reptiles (lizards, snakes, crocodiles, etc.), antelope, kangaroos, deer, chamois, reindeer, elk, elephants, camels (including dromedaries), hippo-potami, dogs, and of fish or marine mammals.

The heading **excludes** :

- (a) Chamois (including combination chamois) leather (**heading 41.14**).
- (b) Parings and other waste of tanned or crust leather (**heading 41.15**).
- (c) Hides and skins, tanned or crusted, with the hair on (**Chapter 43**).

41.07 - Leather further prepared after tanning or crusting, including parchment-dressed leather, of bovine (including buffalo) or equine animals, without hair on, whether or not split, other than leather of heading 41.14.

- Whole hides and skins :

4107.11 -- Full grains, unsplit

4107.12 -- Grain splits

4107.19 -- Other

- Other, including sides :

4107.91 -- Full grains, unsplit

4107.92 -- Grain splits

4107.99 -- Other

This heading covers dehaired hides and skins, of bovine (including buffalo) or equine animals, which have been parchment-dressed, and leather which has been prepared after tanning or crusting (see the General Explanatory Note to this Chapter).

Bovine or equine leathers are particularly notable for their stoutness and durability; sole leather and leather for machinery belting are, therefore, generally of these kinds.

Sole leather is a hard-rolled or hammered leather. It is usually vegetable-tanned or tanned by a combination process and brown in colour, but some varieties (of a greenish-blue colour) are chrome-tanned.

Leather for machinery belting is usually made from the backs of ox hides, generally vegetable-tanned, and well greased and dressed to provide strong, flexible leather almost free from stretch.

Bovine (including buffalo) or equine leather is also frequently used for boot or shoe uppers, e.g., the varieties known as "box-calf" or "willow-calf" (coloured and polished chrome-tanned calf leather which has been tanned by chrome or sometimes by a combination process).

The heading excludes :

- (a) Chamois (including combination chamois) leather, and patent leather, patent laminated leather and metallised leather (**heading 41.14**).
- (b) Parings and other waste of leather (**heading 41.15**).
- (c) Hides and skins of bovine (including buffalo) or equine animals, dressed with the hair on (**Chapter 43**).

[41.08]

[41.09]

[41.10]

[41.11]

41.12 - Leather further prepared after tanning or crusting, including parchment-dressed leather, of sheep or lamb, without wool on, whether or not split, other than leather of heading 41.14.

This heading covers the skins of sheep or lambs (including those of crossed sheep and goats), without the wool on, which have been parchment-dressed, and leather of sheep or lambs which has been further prepared after tanning or crusting (see the General Explanatory Note to this Chapter).

Sheep or lamb leather is somewhat similar to that of goats or kids but is of looser texture and has a more irregular grain.

The heading **excludes** :

- (a) Chamois (including combination chamois) leather, and patent leather, patent laminated leather and metallised leather (**heading 41.14**).
- (b) Parings and other waste of leather (**heading 41.15**).
- (c) Sheep or lamb skins, dressed with the wool on (**Chapter 43**).

41.13 - Leather further prepared after tanning or crusting, including parchment-dressed leather, of other animals, without wool or hair on, whether or not split, other than leather of heading 41.14.

4113.10 - Of goats or kids

4113.20 - Of swine

4113.30 - Of reptiles

4113.90 - Other

This heading covers the skins of goats or kids without the hair which have been parchment-dressed, and leather of goats which has been further prepared after tanning or crusting (see the General Explanatory Note to this Chapter).

Features which distinguish sheep leather from goat leather are referred to in the Explanatory Note to heading 41.12.

Goat or kid skins may also be "alum tanned" (see the General Explanatory Note to this Chapter).

This heading also covers the leather produced from the hairless or dehaired hides or skins of all animals **not referred to in headings 41.07 and 41.12** which have been processed in the same way as the hides and skins of those headings (see the General Explanatory Note to this Chapter).

The heading therefore covers, for example, the leather (**other than** leather of **heading 41.14**) of swine, reptiles (lizards, snakes, crocodiles, etc.), antelope, kangaroos, deer, chamois, reindeer, elk, elephants, camels (including dromedaries), hippopotami, dogs, and of fish or marine mammals.

The leather commercially known as "doeskin" is a washable leather made from split sheepskin, tanned with formaldehyde or oil, and is **excluded (heading 41.12 or 41.14)**.

The heading also **excludes** :

- (a) Chamois (including combination chamois) leather, and patent leather, patent laminated leather and metallised leather (**heading 41.14**).
- (b) Parings and other waste of leather (**heading 41.15**).
- (c) Hides and skins, dressed with the hair on (**Chapter 43**).

41.14 - Chamois (including combination chamois) leather; patent leather and patent laminated leather; metallised leather.

4114.10 - Chamois (including combination chamois) leather

4114.20 - Patent leather and patent laminated leather; metallised leather

(I) Chamois (including combination chamois) leather

Chamois leather is tanned and dressed by repeated working of the skins with fish or animal oil, after which they are dried by warming or exposure to air, and washed in alkali to remove surplus oil. The surface may then be cleaned and dressed by fluffing with pumice or other abrasives. The leather usually treated in this way is made from the flesh split of sheep skin or lamb skin from which the grain has been removed by frizing.

Chamois leather is characterised by its softness, yellow colour (except when dyed) and washable character. It is used largely for gloves, wash-leathers, etc., and the skins of larger animals (deer, stag, etc.) similarly treated are used for clothing, harness or certain industrial purposes.

Chamois leather which is obtained by using solely oils, as described above, is sometimes referred to as full oil chamois.

White washable leather, similar in properties to the yellow chamois leather, is obtained by partial tanning with formaldehyde followed by oil tanning such as described above and is known as combination chamois. The heading covers this leather also, but **not other** washable leathers (e.g., alum and formaldehyde tanned), **nor** leather merely "stuffed" with oil after being fully tanned by other processes.

(II) Patent leather and patent laminated leather; metallised leather

This group covers :

- (1) **Patent leather**, which is leather coated or covered with a varnish or lacquer or with a pre-formed sheet of plastics and which has a lustrous mirror-like surface.

The applied varnish or lacquer may be pigmented or non-pigmented and may have a basis of :

- (a) vegetable drying oil (usually linseed oil);
- (b) cellulose derivatives (e.g., nitrocellulose);
- (c) synthetic products (whether or not thermoplastic), mainly polyurethanes.

The pre-formed sheet of plastics applied to leather is generally made from polyurethane or poly(vinyl chloride).

The surface of the products of this group is not necessarily smooth. It may be embossed to imitate certain skins (crocodile, lizard, etc.) or artificially crushed, crinkled or grained. It must, however, retain a lustrous mirror-like appearance.

The thickness of the coating or the sheet does not exceed 0.15 mm.

This group also covers leather coated or covered with a paint or lacquer consisting of pigments (including mica, silica or similar flakes) to give the leather a metallic lustre, in a binder of, e.g., plastics or vegetable drying oil ("imitation metallised leather").

- (2) **Patent laminated leather** also known in the trade as **patent coated leather**, which is **leather** covered with a pre-formed sheet of plastics of a thickness exceeding 0.15 mm but less than half the total thickness and having the lustrous mirror-like appearance of patent leather. (Leather covered with a pre-formed sheet of plastics the thickness of which exceeds 0.15 mm but is not less than one half of the total thickness falls in **Chapter 39**.)
- (3) **Metallised leather**, which is leather coated with metal powder or metal leaf (for example, of silver, gold, bronze or aluminium).

The heading does not, however, include composition leather, varnished or metallised (**heading 41.15**).

41.15 - Composition leather with a basis of leather or leather fibre, in slabs, sheets or strip, whether or not in rolls; parings and other waste of leather or of composition leather, not suitable for the manufacture of leather articles; leather dust, powder and flour.

4115.10 - Composition leather with a basis of leather or leather fibre, in slabs, sheets or strip, whether or not in rolls

4115.20 - Parings and other waste of leather or of composition leather, not suitable for the manufacture of leather articles; leather dust, powder and flour

(I) **Composition leather**

This group covers **only** composition leather with a basis of natural leather or leather fibres. It is to be noted that it **does not apply** to imitation leathers not based on natural leather, such as plastics (**Chapter 39**), rubber (**Chapter 40**), paper and paperboard (**Chapter 48**) or coated textile fabrics (**Chapter 59**).

Composition leather, which is also known as “bonded leather”, may be made by various processes :

- (1) By agglomerating parings and small waste pieces of leather with glue or other binder.
- (2) By agglomerating parings and small waste pieces of leather without a binder under strong compression.
- (3) By breaking down parings and waste into thin fibres by heating in hot water (without binders, like paper); the pulp thus obtained is formed into sheets by sieving, rolling and calendering.

Composition leather may be dyed, embossed, polished, grained or stamped, suede finished by grinding with carborundum or emery, varnished or metallised.

Such composition leather is classified in this heading when in slabs, sheets or strip, whether or not in rolls; if cut to shapes other than square or rectangular, it is classified in other Chapters, in particular **Chapter 42**.

(II) **Parings and other waste**

This group covers :

- (1) Parings and other waste of leather (including composition or parchment-dressed leather) resulting from the manufacture of leather goods, suitable for the production of composition leather or glue, etc., or for use as fertilisers.
- (2) Worn out articles of leather, incapable of further use for their original purpose, and not usable as leather for the production of other articles.
- (3) Leather dust and powder (the waste of leather buffing and fluffing) used as a fertiliser or for making artificial suèdes, composition floorings, etc.
- (4) Leather flour, produced by grinding waste leather and used in making suèded fabrics or as a filler in plastics, etc.

Scrap pieces of leather and worn out leather goods (e.g., old machinery belting) capable of being used in the manufacture of leather goods are classified as leather in the appropriate heading (**headings 41.07 or 41.12 to 41.14**).

The heading also **excludes** :

- (a) Parings and similar waste of raw hides or skins (**heading 05.11**).
 - (b) Old footwear of **heading 63.09**.
-

Chapter 42

Articles of leather; saddlery and harness; travel goods, handbags and similar containers; articles of animal gut (other than silk-worm gut)

Notes.

- 1.- For the purposes of this Chapter, the term “leather” includes chamois (including combination chamois) leather, patent leather, patent laminated leather and metallised leather.
- 2.- This Chapter does not cover :
 - (a) Sterile surgical catgut or similar sterile suture materials (heading 30.06);
 - (b) Articles of apparel or clothing accessories (except gloves, mittens and mitts), lined with furskin or artificial fur or to which furskin or artificial fur is attached on the outside except as mere trimming (heading 43.03 or 43.04);
 - (c) Made up articles of netting (heading 56.08);
 - (d) Articles of Chapter 64;
 - (e) Headgear or parts thereof of Chapter 65;
 - (f) Whips, riding-crops or other articles of heading 66.02;
 - (g) Cuff-links, bracelets or other imitation jewellery (heading 71.17);
 - (h) Fittings or trimmings for harness, such as stirrups, bits, horse brasses and buckles, separately presented (generally Section XV);
 - (ij) Strings, skins for drums or the like, or other parts of musical instruments (heading 92.09);
 - (k) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings);
 - (l) Articles of Chapter 95 (for example, toys, games, sports requisites); or
 - (m) Buttons, press-fasteners, snap-fasteners, press-studs, button moulds or other parts of these articles, button blanks, of heading 96.06.
- 3.- (A) In addition to the provisions of Note 2 above, heading 42.02 does not cover :
 - (a) Bags made of sheeting of plastics, whether or not printed, with handles, not designed for prolonged use (heading 39.23);
 - (b) Articles of plaiting materials (heading 46.02).

(B) Articles of headings 42.02 and 42.03 which have parts of precious metal or metal clad with precious metal, of natural or cultured pearls, of precious or semi-precious stones (natural, synthetic or reconstructed) remain classified in those headings even if such parts constitute more than minor fittings or minor ornamentation, provided that these parts do not give the articles their essential character. If, on the other hand, the parts give the articles their essential character, the articles are to be classified in Chapter 71.
- 4.- For the purposes of heading 42.03, the expression “articles of apparel and clothing accessories” applies, *inter alia*, to gloves, mittens and mitts (including those for sport or for protection), aprons and other protective clothing, braces, belts, bandoliers and wrist straps, but excluding watch straps (heading 91.13).

GENERAL

This Chapter principally covers articles of leather or composition leather; however, headings 42.01 and 42.02 also include certain articles characteristically of the leather trade but made from other materials. It further covers certain articles of gut, goldbeater's skin, bladders or tendons.

Leather

For the purposes of this Chapter, the term "leather" is defined in Note 1 to this Chapter. The term "leather" includes chamois (including combination chamois) leather, patent leather, patent laminated leather and metallised leather, i.e., the products described in heading 41.14.

Certain leather articles, however, are classified in **other Chapters** and these are referred to in the Explanatory Notes to the various headings hereafter.

42.01 - Saddlery and harness for any animal (including traces, leads, knee pads, muzzles, saddle cloths, saddle bags, dog coats and the like), of any material.

This heading covers equipment for all kinds of animals, of leather, composition leather, furskin, textiles or other materials.

These goods include, *inter alia*, saddles and harness (including reins, bridles and traces) for saddle, draught and pack animals, knee pads, blinkers and boots for horses, decorated trappings for circus animals, muzzles for any animal, collars, leads and trappings for dogs or cats, saddle cloths, saddle cushions and saddle bags, horse blankets specially shaped for the purpose, coats for dogs.

The heading **does not cover** :

- (a) Fittings or trimmings for harness, such as stirrups, bits, horse brasses and buckles, separately presented (generally **Section XV**) and decorations such as plumes for circus animals (classified in their own appropriate headings).
- (b) Harness for children or adults (**headings 39.26, 42.05, 63.07**, etc.).
- (c) Whips, riding-crops or other articles of **heading 66.02**.

42.02 - Trunks, suit-cases, vanity-cases, executive-cases, brief-cases, school satchels, spectacle cases, binocular cases, camera cases, musical instrument cases, gun cases, holsters and similar containers; travelling-bags, insulated food or beverages bags, toilet bags, rucksacks, handbags, shopping-bags, wallets, purses, map-cases, cigarette-cases, tobacco-pouches, tool bags, sports bags, bottle-cases, jewellery boxes, powder-boxes, cutlery cases and similar containers, of leather or of composition leather, of sheeting of plastics, of textile materials, of vulcanised fibre or of paperboard, or wholly or mainly covered with such materials or with paper (+).

- Trunks, suit-cases, vanity-cases, executive-cases, brief-cases, school satchels and similar containers :

4202.11 -- With outer surface of leather or of composition leather

4202.12 -- With outer surface of plastics or of textile materials

4202.19 -- Other

- Handbags, whether or not with shoulder strap, including those without handle :

4202.21 -- With outer surface of leather or of composition leather

4202.22 -- With outer surface of sheeting of plastics or of textile materials

4202.29 -- Other

- Articles of a kind normally carried in the pocket or in the handbag :

4202.31 -- With outer surface of leather or of composition leather

4202.32 -- With outer surface of sheeting of plastics or of textile materials

4202.39 -- Other

- Other :

4202.91 -- With outer surface of leather or of composition leather

4202.92 -- With outer surface of sheeting of plastics or of textile materials

4202.99 -- Other

This heading covers **only** the articles specifically named therein and similar containers.

These containers may be rigid or with a rigid foundation, or soft and without foundation.

Subject to Notes 2 and 3 to this Chapter, the articles covered by the first part of the heading may be of any material. The expression "similar containers" in the first part includes hat boxes, camera accessory cases, cartridge pouches, sheaths for hunting or camping knives, portable tool boxes or cases, specially shaped or internally fitted to contain particular tools with or without their accessories, etc.

The articles covered by the second part of the heading must, however, be only of the materials specified therein or must be wholly or mainly covered with such materials or with paper (the foundation may be of wood, metal, etc.). The term "leather" includes chamois (including combination chamois) leather, patent leather, patent laminated leather and metallised leather (see Note 1 to this Chapter). The expression "similar containers" in this second part includes note-cases, writing-cases, pen-cases, ticket-cases, needle-cases, key-cases, cigar-cases, pipe-cases, tool and jewellery rolls, shoe-cases, brush-cases, etc.

The goods of this heading may have parts of precious metal or metal clad with precious metal, of natural or cultured pearls, of precious or semi-precious stones (natural, synthetic or reconstructed), even if such parts constitute more than minor fittings or minor ornamentation, **provided** that these parts do not give the articles their essential character. Thus a leather handbag with a silver frame and a clasp of onyx would remain in this heading (see Note 3 (B) to this Chapter).

The expression "sports bags" includes articles such as golf bags, gym bags, tennis racket carrying bags, ski bags and fishing bags.

The term "jewellery boxes" covers not only boxes specially designed for keeping jewellery, but also similar lidded containers of various dimensions (with or without hinges or fasteners) specially shaped or fitted to contain one or more pieces of jewellery and normally lined with textile material, of the type in which articles of jewellery are presented and sold and which are suitable for long-term use.

The expression "insulated food or beverage bags" covers reusable insulated bags used to maintain the temperature of foods and beverages during transport or temporary storage.

The heading **does not cover** :

- (a) Shopping bags, including bags consisting of two outer layers of plastics sandwiching an inner layer of cellular plastics, not designed for prolonged use, as described in Note 3 (A) (a) to this Chapter (**heading 39.23**).
- (b) Articles of plaiting materials (**heading 46.02**).
- (c) Articles which, although they may have the character of containers, are not similar to those enumerated in the heading, for example, book covers and reading jackets, file-covers, document-jackets, blotting pads, photo-frames, sweetmeat boxes, tobacco jars, ashtrays, flasks made of ceramics, glass, etc., and which are wholly or mainly covered with leather, sheeting of plastics, etc. Such articles fall in **heading 42.05** if made of (or covered with) leather or composition leather, and in **other Chapters** if made of (or covered with) other materials.
- (d) Made up articles of netting (**heading 56.08**).
- (e) Imitation jewellery (**heading 71.17**).

- (f) Tool boxes or cases, not specially shaped or internally fitted to contain particular tools with or without their accessories (generally, **heading 39.26** or **73.26**).
- (g) Scabbards or sheaths for swords, bayonets, daggers or similar arms (**heading 93.07**).
- (h) Articles of **Chapter 95** (for example, toys, games, sports requisites).

◦
◦ ◦

Subheading Explanatory Notes.

Subheadings 4202.11, 4202.21, 4202.31 and 4202.91

For the purposes of these subheadings, the expression “with outer surface of leather” includes leather coated with a thin layer of plastics or synthetic rubber which is invisible to the naked eye (usually less than 0.15 mm in thickness), to protect the leather surface, no account being taken of a change in colour or shine.

Subheadings 4202.31, 4202.32 and 4202.39

These subheadings cover articles of a kind normally carried in the pocket or in the handbag and include spectacle cases, note-cases (bill-folds), wallets, purses, key-cases, cigarette-cases, cigar-cases, pipe-cases and tobacco-pouches.

42.03 - Articles of apparel and clothing accessories, of leather or of composition leather (+).

4203.10 - Articles of apparel

- Gloves, mittens and mitts :

4203.21 -- Specially designed for use in sports

4203.29 -- Other

4203.30 - Belts and bandoliers

4203.40 - Other clothing accessories

This heading covers all wearing apparel and clothing accessories (with the exceptions specified below), of leather or of composition leather. It therefore covers coats, overcoats, gloves, mittens and mitts (including those for sport or for protection), aprons, sleeves and other protective clothing, braces, belts, bandoliers, girdles, neckties and wrist straps.

It also covers leather strips obtained by cutting, tapered at one end, and identifiable as intended for making up belts.

Gloves, mittens and mitts of both leather and furskin or of both leather and artificial fur are in all cases classified in the heading.

Except in the case of gloves, mittens and mitts, articles of apparel and clothing accessories of leather or composition leather which are lined with furskin or artificial fur, or to which furskin or artificial fur is attached on the outside except as mere trimming, fall in **heading 43.03 or 43.04**.

Goods remain classified in this heading whether or not they contain electric heating elements.

The goods of this heading may have parts of precious metal or metal clad with precious metal, of natural or cultured pearls, of precious or semi-precious stones (natural, synthetic or reconstructed), even if such parts constitute more than minor fittings or minor ornamentation, **provided** that these parts do not give the articles their essential character. Thus a leather belt with a gold buckle would remain in this heading (see Note 3 (B) to this Chapter).

The heading also **excludes** :

- (a) Articles of apparel or clothing accessories of skin tanned with the hair or wool on, particularly lamb or sheep skin (**Chapter 43**).
- (b) Garments of textile materials with leather reinforcements (**Chapter 61 or 62**).
- (c) Articles of **Chapter 64** (for example, footwear and parts of footwear).
- (d) Headgear or parts thereof, of **Chapter 65**.
- (e) Cuff-links, bracelets or other imitation jewellery (**heading 71.17**).
- (f) Watch straps (**heading 91.13**).

- (g) Articles of **Chapter 95** (for example, sports requisites such as shin-guards for cricket, hockey, etc., or protective equipment for sports, e.g. fencing masks and breast plates). (Leather sports clothing and sports gloves, mittens and mitts, however, are classified in this heading.)
- (h) Buttons, press-fasteners, snap-fasteners and press-studs, button moulds or other parts of these articles, button blanks (**heading 96.06**).

○
○ ○

Subheading Explanatory Note.

Subheading 4203.21

The expression “ Gloves, mittens and mitts, specially designed for use in sports ” includes gloves, mittens and mitts, whether sold singly or in pairs, having functional design features which make them particularly suitable for use in sports (e.g., ice hockey gloves, which protect the hands and assist the holding of the stick, and boxing gloves).

[42.04]

42.05 - Other articles of leather or of composition leather.

This heading covers those articles of leather or composition leather which do not fall in the preceding headings of this Chapter or in other Chapters of the Nomenclature.

The heading includes the following articles of a kind used in machinery or mechanical appliances or for other technical uses :

- (1) Transmission or conveyor belting for machinery (including plaited belting) of any section, whether made up into finished belts or in the length. Flat leather belting is composed of strips of selected leather spliced and cemented end to end. Round belting is generally prepared from strips, rolled and cemented to form a circular section. Conveyor buckets are also included.

Transmission or conveyor belts or belting presented with the machines or apparatus for which they are designed, whether or not actually mounted, are to be classified with that machine or apparatus (e.g., **Section XVI**).

- (2) Lug straps, pickers, combing leathers, card clothing leathers (card clothing fitted with pins falls in **heading 84.48**), heald straps and other leather articles for textile machinery; gears, gaskets, washers, valve leathers, pump or press leathers, cylinder sleeves for printing presses, and perforated leather for grading machines; rawhide hammers; gas meter diaphragms and other leather parts of mechanical appliances or instruments of Chapter 90; leather tubes and hose-piping.

It also includes the following articles :

Luggage labels; razor strops; boot laces; handles for parcel-carriers; corner reinforcers (for trunks, suit-cases, etc.); unstuffed pouffe cases (stuffed pouffes are classified in **heading 94.04**); straps of general use (**other than** those of **heading 42.01**); harness for children or adults; leather welts in the length; leather mats (**other than** saddle cloths which are classified in **heading 42.01**); reading-covers for books; blotting pads; leather or goatskin water bottles and other containers (including those wholly or mainly covered with leather or composition leather) not being similar to those specified in **heading 42.02**; parts of braces; leather-covered buckles, clasps and the like; cases, tassels and the like for umbrellas, sunshades or walking-sticks; sword knots; chamois-dressed leather with serrated edges or assembled (however, chamois-dressed leather not cut to special shapes or with serrated edges, e.g., for use as dusters, is classified in **heading 41.14**); nail-polishers covered with buckskin; pieces cut to shape for leather or composition leather articles (e.g., apparel), not elsewhere specified or included.

The heading also **excludes** :

- (a) Parts of footwear of **Chapter 64**.
- (b) Whips, riding-crops or other articles of **heading 66.02**.
- (c) Artificial flowers, foliage or fruit or parts thereof (**heading 67.02**).
- (d) Cuff-links, bracelets or other imitation jewellery (**heading 71.17**).
- (e) Articles of **Chapter 94** (for example, furniture, parts of furniture, lamps and lighting fittings).
- (f) Articles of **Chapter 95** (for example, toys, games, sports requisites).
- (g) Buttons, press-fasteners, etc., of **heading 96.06**.

42.06 - Articles of gut (other than silk-worm gut), of goldbeater's skin, of bladders or of tendons.

This heading includes :

- (1) Catgut, manufactured by twisting strips of cleaned and dried gut, especially sheep's gut. Catgut is used mainly in the manufacture of rackets, of fishing tackle and of machinery parts.

The heading **excludes**, however, sterile surgical catgut or similar sterile suture materials (**heading 30.06**) or gut put up or prepared as musical instrument strings (**heading 92.09**).

- (2) Goldbeater's skin in rectangular (including square) pieces or cut to other shapes, and other articles of goldbeater's skin. (Goldbeater's skin is the prepared blind gut of sheep or other ruminant animals.)
 - (3) Articles made from bladders, such as tobacco pouches; tendons made up as machinery belting, laces for machinery belting, etc. "Artificial" guts made by glueing together split natural guts also fall in this heading.
-

Chapter 43

Furskins and artificial fur; manufactures thereof

Notes.

- 1.- Throughout the Nomenclature references to “ furskins ”, other than to raw furskins of heading 43.01, apply to hides or skins of all animals which have been tanned or dressed with the hair or wool on.
- 2.- This Chapter does not cover :
 - (a) Birdskins or parts of birdskins, with their feathers or down (heading 05.05 or 67.01);
 - (b) Raw hides or skins, with the hair or wool on, of Chapter 41 (see Note 1 (c) to that Chapter);
 - (c) Gloves, mittens and mitts, consisting of leather and furskin or of leather and artificial fur (heading 42.03);
 - (d) Articles of Chapter 64;
 - (e) Headgear or parts thereof of Chapter 65; or
 - (f) Articles of Chapter 95 (for example, toys, games, sports requisites).
- 3.- Heading 43.03 includes furskins and parts thereof, assembled with the addition of other materials, and furskins and parts thereof, sewn together in the form of garments or parts or accessories of garments or in the form of other articles.
- 4.- Articles of apparel and clothing accessories (except those excluded by Note 2) lined with furskin or artificial fur or to which furskin or artificial fur is attached on the outside except as mere trimming are to be classified in heading 43.03 or 43.04 as the case may be.
- 5.- Throughout the Nomenclature the expression “ artificial fur ” means any imitation of furskin consisting of wool, hair or other fibres gummed or sewn on to leather, woven fabric or other materials, but does not include imitation furskins obtained by weaving or knitting (generally, heading 58.01 or 60.01).

GENERAL

This Chapter covers :

- (1) Raw furskins **other than** raw hides and skins of **heading 41.01, 41.02 or 41.03**.
- (2) Hides and skins tanned or dressed with the hair or wool on, unassembled or assembled.
- (3) Apparel, clothing accessories and other manufactured articles of furskin (subject to the **exceptions** specified in the Explanatory Note to heading 43.03).
- (4) Artificial fur and articles thereof.

It is to be noted that birdskins and parts of birdskins, with their feathers or down, are **not** treated as furskins; they fall in **heading 05.05** or **67.01**.

*
* *

It is to be noted that headings 43.01 to 43.03 cover furskins and articles of furskin of some species of wild animals which are now threatened with extinction or which may become so unless trade in specimens of such species is strictly regulated. Such species are listed in the Appendices of the 1973 Convention on International Trade in Endangered Species of Wild Fauna and Flora (Washington Convention).

43.01 - Raw furskins (including heads, tails, paws and other pieces or cuttings, suitable for furriers' use), other than raw hides and skins of heading 41.01, 41.02 or 41.03.

4301.10 - Of mink, whole, with or without head, tail or paws

4301.30 - Of lamb, the following : Astrakhan, Broadtail, Caracul, Persian and similar lamb, Indian, Chinese, Mongolian or Tibetan lamb, whole, with or without head, tail or paws

4301.60 - Of fox, whole, with or without head, tail or paws

4301.80 - Other furskins, whole, with or without head, tail or paws

4301.90 - Heads, tails, paws and other pieces or cuttings, suitable for furriers' use

This heading covers the raw (i.e., not tanned or dressed) skins with the hair or wool on, of all animals **except** the following, which fall in **heading 41.01, 41.02 or 41.03** :

- (a) Bovine animals (including buffalo) (i.e., animals of heading 01.02, see the Explanatory Note to that heading).
- (b) Equine animals (horses, mules, asses, zebras, etc.).
- (c) Sheep and lambs (**other than** Astrakhan, Broadtail, Caracul, Persian or similar lambs, and Indian, Chinese, Mongolian or Tibetan lambs).

The names Astrakhan, Broadtail, Caracul and Persian are used loosely for similar kinds of lambs. However, these terms, when used in relation to furs, denote different qualities of furs, depending upon, for example, the age of the lamb.

- (d) Goats and kids (**other than** Yemen, Mongolian or Tibetan goats and kids).
- (e) Swine, including peccary.
- (f) Chamois, gazelle and camels (including dromedaries).
- (g) Elk, reindeer, roebucks and other deer.
- (h) Dogs.

Furskins are regarded as raw and falling in this heading not only when in the natural state, but also if cleaned and preserved from deterioration, e.g., by drying or salting (wet or dry). The fur may also be "pulled" or "sheared", i.e., the coarse hairs extracted or cut down, or the skin surface may be "fleshed" or scraped.

Pieces of furskin and parts such as heads, tails and paws, in the raw state, are also classified in this heading **unless** clearly waste material not suitable for furriers' use, in which case they are **excluded (heading 05.11)**.

43.02 - Tanned or dressed furskins (including heads, tails, paws and other pieces or cuttings), unassembled, or assembled (without the addition of other materials) other than those of heading 43.03.

- Whole skins, with or without head, tail or paws, not assembled :

4302.11 -- Of mink

4302.19 -- Other

4302.20 - Heads, tails, paws and other pieces or cuttings, not assembled

4302.30 - Whole skins and pieces or cuttings thereof, assembled

This heading covers :

- (1) Unassembled hides or skins (including heads, tails, paws and other pieces or cuttings) tanned or dressed with the hair or wool on provided that they have **not** been cut to shape for specific uses. Tanned or dressed whole furskins, unassembled and not cut to shape or otherwise processed for specific uses, remain in this heading, even if they can be put to immediate use (for example, as rugs).
- (2) Assemblies of tanned or dressed furskins or parts thereof (including "dropped" skins), sewn together without the addition of other materials usually in rectangles (including squares), trapeziums or crosses.

" Dropped furskins " are furskins which have been cut into V- or W-shaped strips, and reassembled in their original order so as to obtain a longer but narrower furskin.

Tanning consists of the treatment of the flesh side by methods analogous to those used in the manufacture of leather (see the General Explanatory Note to Chapter 41). The skins so treated may generally be distinguished from raw skins by their softness and pliability. The hair or wool may also be treated to improve its appearance or to imitate finer fur by such processes as bleaching, blending or " topping " (surface dyeing by means of a brush), dyeing, combing, trimming and glossing, including treatment with artificial resins.

It is to be noted that skins with the hair or wool on, of the kinds excluded from heading 43.01 (such as pony skins, calfskins, and sheepskins), fall in this heading if tanned or dressed.

The assemblies of tanned or dressed furskins or parts thereof of this heading are semi-manufactures consisting of two or more skins or pieces of skin which have been sewn together, usually in the form of rectangles (including squares), trapeziums or crosses without the addition of other materials. These semi-manufactures are intended to be further worked.

Such forms are known as :

- (1) **Plates, mats and strips** - rectangular (including square) assemblies.
- (2) **Crosses** - cruciform assemblies.
- (3) **Sacs (linings or robes)** - assemblies in the form of a trapezium, sometimes sewn into tubular form.

Bodies for making fur coats or jackets also fall in this heading. They usually consist of three separate assemblies of furskin, one in the form of isosceles trapezium with a long curved base (from which the back will be cut) and the other two in rectangular form (from which the front and sleeves will be cut).

The heading **excludes** :

- (a) Furskins and assemblies of furskins (including heads, paws, tails and other pieces or cuttings) in the rough form of garments or parts or accessories of garments or of other articles, and finished trimmings ready for use as such or requiring only to be cut to length in order to be applied as a trimming (**heading 43.03**).
- (b) Assemblies (for example, galloonage) consisting of furskins and other materials (e.g., tails combined with leather or textile fabric) (**heading 43.03**).

43.03 - Articles of apparel, clothing accessories and other articles of furskin.

4303.10 - Articles of apparel and clothing accessories

4303.90 - Other

With the **exceptions** referred to below, this heading covers all articles of apparel, including parts and clothing accessories (muffs, stoles, ties, collars, etc.) made of :

- (A) Furskin.
- (B) Other materials lined with furskin.
- (C) Other materials having furskin on the outside (**except** as mere trimming).

Fur on a garment would be regarded as mere trimming if constituting, for example, the collar and revers (provided the collar or revers were not so exaggerated as to form virtually a cape or bolero), cuffs or edging to pockets, skirts, coats, etc.

This heading also covers hides or skins tanned or dressed with the hair or wool on, assembled with the addition of other materials (e.g. galloonage) **provided** that the addition of these other materials does not alter the essential character of the assembly as a furskin.

In addition, the heading covers all other articles, including parts, made of furskin, or in which furskin gives the essential character. Examples are rugs, coverlets, unstuffed pouffes, cases, handbags, game-bags and haversacks, and articles and accessories for use in machinery or mechanical appliances or for industrial purposes (e.g., polishing caps, sleeves for rollers used for painting or decorating).

The heading **excludes** :

- (a) Articles of the first part of **heading 42.02**.
- (b) Gloves, mittens and mitts, of leather and furskin (**heading 42.03**) (those wholly of furskin remain in this heading).
- (c) Articles of **Chapter 64**.
- (d) Headgear and parts thereof of **Chapter 65**.
- (e) Articles of **Chapter 95** (for example, toys, games and sports requisites).

43.04 - Artificial fur and articles thereof.

The expression “artificial fur” means a material consisting of wool, hair or other fibres (including fibres in the form of chenille yarn) gummed or sewn on to leather, woven fabric or other material in a manner imitating furskins; the description does **not**, however, extend to woven or knitted long pile fabrics of the kind sometimes known as “fur fabric” (generally **heading 58.01** or **60.01**), nor to “pointed” furs, i.e., real furs in which additional hairs have been inserted.

This heading applies to such material in the piece and to articles (including apparel and clothing accessories) made therefrom, subject to the same qualifications as are referred to in the Explanatory Note to heading 43.03 as regards similar articles of real furskin.

The heading applies also to artificial tails made by assembling fibres of fur or hair fibres on a core of leather or cord. Fabricated tails consisting of a number of real tails or scraps of fur threaded on a core are, however, **excluded (heading 43.03)**.

Section IX

**WOOD AND ARTICLES OF WOOD; WOOD CHARCOAL; CORK AND
ARTICLES OF CORK; MANUFACTURES OF STRAW, OF ESPARTO OR OF
OTHER PLAITING MATERIALS; BASKETWARE AND WICKERWORK**

Chapter 44

Wood and articles of wood; wood charcoal

Notes.

1.- This Chapter does not cover :

- (a) Wood, in chips, in shavings, crushed, ground or powdered, of a kind used primarily in perfumery, in pharmacy, or for insecticidal, fungicidal or similar purposes (heading 12.11);
 - (b) Bamboos or other materials of a woody nature of a kind used primarily for plaiting, in the rough, whether or not split, sawn lengthwise or cut to length (heading 14.01);
 - (c) Wood, in chips, in shavings, ground or powdered, of a kind used primarily in dyeing or in tanning (heading 14.04);
 - (d) Activated charcoal (heading 38.02);
 - (e) Articles of heading 42.02;
 - (f) Goods of Chapter 46;
 - (g) Footwear or parts thereof of Chapter 64;
 - (h) Goods of Chapter 66 (for example, umbrellas and walking-sticks and parts thereof);
 - (ij) Goods of heading 68.08;
 - (k) Imitation jewellery of heading 71.17;
 - (l) Goods of Section XVI or Section XVII (for example, machine parts, cases, covers, cabinets for machines and apparatus and wheelwrights' wares);
 - (m) Goods of Section XVIII (for example, clock cases and musical instruments and parts thereof);
 - (n) Parts of firearms (heading 93.05);
 - (o) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings, prefabricated buildings);
 - (p) Articles of Chapter 95 (for example, toys, games, sports requisites);
 - (q) Articles of Chapter 96 (for example, smoking pipes and parts thereof, buttons, pencils, and monopods, bipods, tripods and similar articles) excluding bodies and handles, of wood, for articles of heading 96.03; or
 - (r) Articles of Chapter 97 (for example, works of art).
- 2.- In this Chapter, the expression "densified wood" means wood which has been subjected to chemical or physical treatment (being, in the case of layers bonded together, treatment in excess of that needed to ensure a good bond), and which has thereby acquired increased density or hardness together with improved mechanical strength or resistance to chemical or electrical agencies.
- 3.- Headings 44.14 to 44.21 apply to articles of the respective descriptions of particle board or similar board, fibreboard, laminated wood or densified wood as they apply to such articles of wood.

- 4.- Products of heading 44.10, 44.11 or 44.12 may be worked to form the shapes provided for in respect of the goods of heading 44.09, curved, corrugated, perforated, cut or formed to shapes other than square or rectangular or submitted to any other operation provided it does not give them the character of articles of other headings.
 - 5.- Heading 44.17 does not apply to tools in which the blade, working edge, working surface or other working part is formed by any of the materials specified in Note I to Chapter 82.
 - 6.- Subject to Note 1 above and except where the context otherwise requires, any reference to "wood" in a heading of this Chapter applies also to bamboos and other materials of a woody nature.
- ◦ ◦

Subheading Note.

- 1.- For the purposes of subheading 4401.31, the expression "wood pellets" means by-products such as cutter shavings, sawdust or chips, of the mechanical wood processing industry, furniture-making industry or other wood transformation activities, which have been agglomerated either directly by compression or by the addition of a binder in a proportion not exceeding 3 % by weight. Such pellets are cylindrical, with a diameter not exceeding 25 mm and a length not exceeding 100 mm.

GENERAL

This Chapter covers unmanufactured wood, semi-finished products of wood and, in general, articles of wood.

These products may be grouped broadly as follows :

- (1) Wood in the rough (as felled, split, roughly squared, debarked, etc.) and fuel wood, wood waste and scrap, sawdust, wood in chips or particles; hoopwood, poles, piles, pickets, stakes, etc.; wood charcoal; wood wool and wood flour; railway or tramway sleepers (generally headings 44.01 to 44.06). However, the Chapter **excludes** wood, in chips, in shavings, crushed, ground or powdered, of a kind used primarily in perfumery, in pharmacy, or for insecticidal, fungicidal or similar purposes (**heading 12.11**) and wood, in chips, in shavings, ground or powdered, of a kind used primarily in dyeing or in tanning (**heading 14.04**).
- (2) Sawn, chipped, sliced, peeled, planed, sanded, end-jointed, e.g., finger-jointed (i.e., jointed by a process whereby shorter pieces of wood are glued together end to end, with joints resembling interlaced fingers, in order to obtain a greater length of wood) and continuously shaped wood (headings 44.07 to 44.09).
- (3) Particle board and similar board, fibreboard, laminated wood and densified wood (headings 44.10 to 44.13).

- (4) Articles of wood (**except** certain kinds specified in Note 1 to this Chapter and which, together with others, are referred to in the Explanatory Notes to particular headings below) (headings 44.14 to 44.21).

As a general rule, building panels composed of layers of wood and plastics are classified in this Chapter. Classification of these panels depends on their external surface or surfaces which normally give them their essential character in terms of their intended uses. Thus, for example, a building panel, used as a structural element in roofing, wall or floor applications and consisting of an external layer of particle board and a layer of insulating material of plastics, is classified in heading 44.10, whatever the thickness of the layer of plastics, since it is the rigid, strong, wood portion which allows the panel to be used as a structural element, the plastics having a subsidiary insulation function. On the other hand, a panel in which a wood backing serves merely as a support for an exterior surface of plastics is, in most cases, classified in **Chapter 39**.

Articles of wood presented unassembled or disassembled are classified with the corresponding complete articles, provided the parts are presented together. Similarly, accessories or parts of glass, marble, metal or other material presented with wooden articles to which they belong are classified with such articles whether fitted thereto or not.

Headings 44.14 to 44.21 which cover manufactured articles of wood, apply to such articles whether made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

Generally speaking, throughout the Nomenclature, the classification of wood is not affected by treatment necessary for its preservation, such as seasoning, superficial charring, priming and stopping, or impregnation with creosote or other wood preservatives (e.g., coal tar, pentachlorophenol (ISO), chromated copper arsenate or ammoniacal copper arsenate); nor is it affected by reason of being painted, stained or varnished. However, these general considerations do **not** apply in the case of the subheadings of headings 44.03 and 44.06, where specific classification provision has been made for particular categories of painted, stained or preservative-treated wood.

Certain materials of a woody nature, e.g., bamboo and osier, are used mainly in making articles of basketware. In the unmanufactured state such materials are classified in **heading 14.01**, and in the form of articles of basketware in **Chapter 46**. However, products such as bamboo in chips or particles (used for the manufacture of particle board, fibreboard or cellulose pulp) and articles of bamboo or other woody materials, **other than** basketware, furniture or other articles specifically included in other Chapters, are classified in this Chapter with the corresponding products or articles of true wood, **except** where the context otherwise requires (e.g., in the case of headings 44.10 and 44.11) (see Note 6 to this Chapter).

Subheading Explanatory Note.

Names of certain tropical woods

For the purposes of the relevant subheadings of headings 44.03, 44.07, 44.08, 44.09 and 44.12, the names of tropical woods are designated according to the pilot-names recommended by the International Technical Association for Tropical Timber (*l'Association technique internationale des bois tropicaux*) (ATIBT), the French Agricultural Research Centre for International Development) (Centre de Coopération Internationale en Recherche Agronomique pour le Développement) (CIRAD) and the International Tropical Timber Organization (ITTO). The pilot-name is based on the popular name employed in the principal country of production or of consumption.

The relevant pilot-names, together with corresponding scientific names and local names, are listed in the Annex to the Explanatory Notes to this Chapter.

44.01 - Fuel wood, in logs, in billets, in twigs, in faggots or in similar forms; wood in chips or particles; sawdust and wood waste and scrap, whether or not agglomerated in logs, briquettes, pellets or similar forms.

- Fuel wood, in logs, in billets, in twigs, in faggots or in similar forms :

4401.11 -- Coniferous

4401.12 -- Non-coniferous

- Wood in chips or particles :

4401.21 -- Coniferous

4401.22 -- Non-coniferous

- Sawdust and wood waste and scrap, agglomerated in logs, briquettes, pellets or similar forms :

4401.31 -- Wood pellets

4401.39 -- Other

4401.40 - Sawdust and wood waste and scrap, not agglomerated

This heading covers :

(A) **Fuel wood**, which is generally in the form of :

- (1) Short pieces of logs, usually with the bark.
- (2) Split logs or billets.
- (3) Twigs, faggots, rough sticks, vine stems, tree stumps and roots.

(B) **Wood in chips or particles**, i.e., wood mechanically reduced into small chips (flat, rigid and roughly squared) or particles (thin and flexible) used for producing cellulose pulp by mechanical means, by chemical means or by combining mechanical and chemical means or for the manufacture of fibreboard or particle board. By virtue of Note 6 to this Chapter, the heading also includes similar products obtained, for example, from bamboo.

Pulpwood presented in the round or quarter-split is **excluded (heading 44.03)**.

(C) **Sawdust**, whether or not agglomerated in logs, briquettes, pellets or similar forms.

(D) **Wood waste and scrap**, not usable as timber. These materials are used in particular for pulping (manufacture of paper) and in the manufacture of particle board and fibreboard and as fuel. Such waste and scrap includes, saw mill or planing mill rejects; manufacturing waste; broken planks; old crates unusable as such; bark and shavings (whether or not agglomerated in logs, briquettes, pellets or similar forms); other waste and scrap of joinery and carpentry; spent dyewood and tanning wood or bark. The heading also includes wood waste and scrap segregated from construction and demolition waste and not usable as timber. However, wood articles so segregated and suitable for reuse as such (e.g., beams, planks, doors) are classified in their appropriate headings.

The heading also **excludes** :

- (a) Wood and wood waste coated with resin or otherwise made up as firelighters (**heading 36.06**).

- (b) Logs of the kind used for pulping or for the manufacture of match sticks (**heading 44.03**); these, unlike fuel logs, are carefully graded, may be barked or peeled and are generally not broken, split, curved, knotty or forked.

44.02 - Wood charcoal (including shell or nut charcoal), whether or not agglomerated.

4402.10 - Of bamboo

4402.90 - Other

Wood charcoal is obtained when wood is carbonised out of contact with air. It is classified in this heading whether in the form of blocks, sticks or in granules or powder, or agglomerated with tar or other substances in briquettes, tablets, balls, etc.

Wood charcoal, unlike animal or mineral carbon, is lighter than water and in the piece shows the grain of wood.

The similar products obtained by carbonising coconut or other shells also fall in this heading.

The heading **excludes** :

- (a) Wood charcoal put up in the form of medicaments as defined in **Chapter 30**.
- (b) Wood charcoal mixed with incense, put up in tablets or other forms (**heading 33.07**).
- (c) Activated carbon (**heading 38.02**).
- (d) Drawing charcoals (charcoal pencils) (**heading 96.09**).

44.03 - Wood in the rough, whether or not stripped of bark or sapwood, or roughly squared (+).

- Treated with paint, stains, creosote or other preservatives :

4403.11 -- Coniferous

4403.12 -- Non-coniferous

- Other, coniferous :

4403.21 -- Of pine (*Pinus spp.*), of which any cross-sectional dimension is 15 cm or more

4403.22 -- Of pine (*Pinus spp.*), other

4403.23 -- Of fir (*Abies spp.*) and spruce (*Picea spp.*), of which any cross-sectional dimension is 15 cm or more

4403.24 -- Of fir (*Abies spp.*) and spruce (*Picea spp.*), other

4403.25 -- Other, of which any cross-sectional dimension is 15 cm or more

4403.26 -- Other

- Other, of tropical wood :

4403.41 -- Dark Red Meranti, Light Red Meranti and Meranti Bakau

4403.49 -- Other

- Other :

4403.91 -- Of oak (*Quercus spp.*)

4403.93 -- Of beech (*Fagus spp.*), of which any cross-sectional dimension is 15 cm or more

4403.94 -- Of beech (*Fagus spp.*), other

4403.95 -- Of birch (*Betula spp.*), of which any cross-sectional dimension is 15 cm or more

4403.96 -- Of birch (*Betula spp.*), other

4403.97 -- Of poplar and aspen (*Populus spp.*)

4403.98 -- Of eucalyptus (*Eucalyptus spp.*)

4403.99 -- Other

This heading includes timber in the natural state as felled, usually with the branches lopped off, and such timber stripped of its outer or both its outer and inner bark or from which merely the rough protuberances have been removed. It also includes wood from which the waste outer layers, consisting of the most recent growths (sapwood), have been removed for economy in transport or to prevent decay.

The principal products classified here, when of the above description, include : timber for sawing; poles for telephone, telegraph or electrical power transmission lines; unpointed and

unsplit piles, pickets, stakes, poles and props; round pit-props; logs, whether or not quarter-split, for pulping; round logs for the manufacture of veneer sheets, etc.; logs for the manufacture of match sticks, woodware, etc.

Telegraph, telephone or electrical power transmission poles are also to be classified in this heading when further trimmed with a draw knife or peeled with a mechanical peeler to a smooth surface ready for use. These poles are often painted, stained, varnished or impregnated with creosote or other substances.

Tree stumps and roots of special woods, and certain growths such as those used for making veneers or smoking pipes, also fall here.

The heading also includes roughly squared wood which consists of trunks or sections of trunks of trees, the round surfaces of which have been reduced to flat surfaces by means of axe or adze, or by coarse sawing, to form wood of roughly rectangular (including square) cross-section; roughly squared wood is characterised by the presence of rough areas or bark traces. Half-squared wood, which is wood prepared in this manner on two opposite faces only, is also classified here. Timber is prepared in these forms for sawmills or may be used as such, e.g., as roofing timber.

Certain kinds of timber (e.g., teak) are split by wedges or hewn into baulks along the grain; such baulks are also regarded as falling in this heading.

The heading **excludes** :

- (a) Roughly trimmed wood suitable for the manufacture of walking-sticks, umbrellas, tool handles or the like (**heading 44.04**).
- (b) Wood cut into the form of railway or tramway sleepers (cross-ties) (**heading 44.06**).
- (c) Wood cut into the form of planks, beams, etc. (**heading 44.07** or **44.18**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 4403.11 and 4403.12

Subheadings 4403.11 and 4403.12 cover those products which have been treated with paint, stains, creosote or other preservatives, such as coal tar, pentachlorophenol (ISO), chromated copper arsenate or ammoniacal copper arsenate, with a view to their long-term preservation.

They do not include products treated with substances for the purpose of simply maintaining them during shipment or storage.

44.04 - Hoopwood; split poles; piles, pickets and stakes of wood, pointed but not sawn lengthwise; wooden sticks, roughly trimmed but not turned, bent or otherwise worked, suitable for the manufacture of walking-sticks, umbrellas, tool handles or the like; chipwood and the like.

4404.10 - Coniferous

4404.20 - Non-coniferous

This heading covers :

- (1) **Hoopwood**, consisting of split rods of willow, hazel, birch, etc., whether with the bark or roughly shaved, and used in the manufacture of barrel hoops, hurdles, etc. Hoopwood is usually put up in bundles or coils.
Hoopwood cut to length and notched at the ends for interlocking when fitted to the barrel falls in **heading 44.16**.
- (2) **Split poles**, consisting of stems or branches of trees split along the length. These are largely used as supports in horticulture and agriculture, for fencing or in some cases as ceiling or roofing laths.
- (3) **Pointed piles, pickets and stakes** (including fence posts), consisting of round or split poles, pointed at the ends, whether or not peeled or impregnated with preservative, but not sawn lengthwise.
- (4) **Wooden sticks, roughly trimmed but not turned, bent or otherwise worked**, of a length and thickness clearly suitable for the manufacture of walking-sticks, whips, golf-club shafts, umbrellas, handles for tools, besoms, etc., dyeing sticks and the like.

Similar wood which has been planed, turned (on an ordinary or a pole lathe), bent, or otherwise further worked and is recognisable as umbrella handles, walking-sticks, tool handles, etc., is classified in the **headings for the respective articles**.

- (5) **Chipwood**, that is, wood sliced, peeled or sometimes sawn in flexible, narrow, thin and even strips of a kind used for plaiting and for making sieves, chip-boxes, chip-baskets, pill-boxes, match-boxes, etc. It also includes similar strips of wood for making match splints and boot or shoe pegs.

The heading also covers wood shavings, usually of beech or hazel, which resemble coiled chipwood and are used in the manufacture of vinegar or for the clarification of liquids; these can be distinguished from the waste shavings of **heading 44.01** because they are of uniform thickness, width and length and are evenly coiled into rolls.

Blanks for brush bodies or for boot or shoe lasts fall in **heading 44.17**.

44.05 - Wood wool; wood flour.

Wood wool consists of fine slivers of wood, curled or twisted to form a tangled mass. The slivers are of regular size and thickness and of considerable length (thus differing from ordinary wood shavings of **heading 44.01**). They are manufactured in this form from logs (of poplars, coniferous wood, etc.) by a special shaving machine. Wood wool is usually presented in pressed bales.

Wood wool remains in this heading if dyed, gummed, etc., or if roughly twisted together or put in the form of sheets between layers of paper. It is used mainly for packing or stuffing purposes. It is also used in the manufacture of agglomerated panels (e.g., certain boards of heading 44.10 or 68.08).

Wood flour is a powder obtained by grinding sawdust, shavings or other wood waste or by sifting sawdust. It is used largely as a filler in the plastics industry, for the manufacture of particle board and in the manufacture of linoleum. Wood flour can be distinguished from sawdust of **heading 44.01** on the basis of the smaller size and greater regularity of its particles.

Similar flour made from shells of coconuts or the like is **excluded (heading 14.04)**.

44.06 - Railway or tramway sleepers (cross-ties) of wood (+).

- Not impregnated :

4406.11 -- Coniferous

4406.12 -- Non-coniferous

- Other :

4406.91 -- Coniferous

4406.92 -- Non-coniferous

This heading covers unplaned wood in pieces of more or less rectangular section of the kind commonly used to support railway or tramway track. The heading also includes switch ties, which are longer than sleepers, and bridge ties, which are wider and thicker and usually longer than sleepers.

The edges of these products may be roughly chamfered and they may be provided with holes or seatings for fixing the rails or chairs. They may also sometimes be strengthened at the ends by means of staples, nails, bolts or steel strips to prevent their splitting.

The products of this heading may be surface treated with insecticides or fungicides for the purpose of protection. For long-term preservation they are often impregnated with creosote or other substances.

○
○ ○

Subheading Explanatory Note.

Subheadings 4406.11 to 4406.92

For the purposes of classification in these subheadings, the expression "impregnated" means treated with creosote or other preservatives with a view to their long-term preservation. It **does not include** sleepers treated with a fungicide or insecticide for the purpose of protecting them from fungi or parasites simply during shipment or storage, which are to be classified as "not impregnated".

44.07 - Wood sawn or chipped lengthwise, sliced or peeled, whether or not planed, sanded or end-jointed, of a thickness exceeding 6 mm.

- Coniferous :

4407.11 -- Of pine (*Pinus spp.*)

4407.12 -- Of fir (*Abies spp.*) and spruce (*Picea spp.*)

4407.19 -- Other

- Of tropical wood ::

4407.21 -- Mahogany (*Swietenia spp.*)

4407.22 -- Virola, Imbuia and Balsa

4407.25 -- Dark Red Meranti, Light Red Meranti and Meranti Bakau

4407.26 -- White Lauan, White Meranti, White Seraya, Yellow Meranti and Alan

4407.27 -- Sapelli

4407.28 -- Iroko

4407.29 -- Other

- Other :

4407.91 -- Of oak (*Quercus spp.*)

4407.92 -- Of beech (*Fagus spp.*)

4407.93 -- Of maple (*Acer spp.*)

4407.94 -- Of cherry (*Prunus spp.*)

4407.95 -- Of ash (*Fraxinus spp.*)

4407.96 -- Of birch (*Betula spp.*)

4407.97 -- Of poplar and aspen (*Populus spp.*)

4407.99 -- Other

With a few exceptions, this heading covers all wood and timber, of any length but of a thickness exceeding 6 mm, sawn or chipped along the general direction of the grain or cut by slicing or peeling. Such wood and timber includes sawn beams, planks, flitches, boards, laths, etc., and products regarded as the equivalent of sawn wood or timber, which are obtained by the use of chipping machines and which have been chipped to extremely accurate dimensions, a process which results in a surface better than that obtained by sawing and which thereby renders subsequent planing unnecessary. It also includes sheets of sliced or peeled (rotary cut) wood, and wooden blocks, strips and friezes for flooring, **other than** those which have been continuously shaped along any of their edges, ends or faces (**heading 44.09**).

It is to be noted that the wood of this heading need not necessarily be of rectangular (including square) section nor of uniform section along the length.

The products of this heading may be planed (whether or not the angle formed by two adjacent sides is slightly rounded during the planing process), sanded or end-jointed, e.g. finger-jointed (see the General Explanatory Note to this Chapter).

The heading also **excludes** :

- (a) Wood roughly squared, e.g., by coarse sawing (**heading 44.03**).
- (b) Chipwood and the like (**heading 44.04**).
- (c) Veneer sheets and sheets for plywood (and other wood not elsewhere specified or included) of a thickness not exceeding 6 mm (**heading 44.08**).
- (d) Wood continuously shaped along any of its edges, ends or faces, of **heading 44.09**.
- (e) Strips and friezes of wood of **heading 44.12**.
- (f) Builders' joinery and carpentry (**heading 44.18**).

44.08 - Sheets for veneering (including those obtained by slicing laminated wood), for plywood or for similar laminated wood and other wood, sawn lengthwise, sliced or peeled, whether or not planed, sanded, spliced or end-jointed, of a thickness not exceeding 6 mm.

4408.10 - Coniferous

-Of tropical wood :

4408.31 -- Dark Red Meranti, Light Red Meranti and Meranti Bakau

4408.39 -- Other

4408.90 - Other

This heading applies to wood, whether actually to be used for veneering or making plywood or for other purposes (for violins, cigar boxes, etc.), in sheets of a thickness not exceeding 6 mm (excluding any reinforcing material), obtained by sawing, slicing or peeling (rotary cutting), whether or not smoothed, dyed, coated or impregnated, or reinforced with paper or fabric backings, or in decorative sheets imitating marquetry.

Woods used for the manufacture of plywood are generally cut by the peeling process in which the log, usually prepared by steaming, or soaking in hot water, is turned on its axis against the blade of the peeling machine so that it is cut in a continuous sheet.

In slicing the log of wood, often first steamed or soaked in hot water, is cut by knives driven against it in a vertical or horizontal shearing action, the log moving towards the knife or vice versa after each operation. In a variation of the process, the log is moved forward against a stationary knife. In this way the wood is sliced into very thin sheets.

Sheets for veneering are also produced by slicing blocks of laminated wood as a substitute for veneer sheets made by the traditional method.

The sheets of this heading may be spliced (i.e., taped, stitched or glued together edge to edge to make larger sheets for use in plywood and similar laminated wood). In addition, they may be planed, sanded or end-jointed, e.g. finger-jointed (see the General Explanatory Note to this Chapter). Moreover, the fact that a sheet for plywood has been patched with paper, plastics or wood to cover or strengthen a defect (e.g., a knot hole) does not affect the classification of such a sheet in this heading.

The sheets for veneering of fine highly grained woods used in cabinet-making veneers are more often obtained by sawing or slicing.

The heading also includes short lengths of approximately square cross-section and about 3 mm in thickness used in making fireworks, cases, toys, models, etc.

The heading **excludes** sliced or peeled wood in narrow strips of the kind used for plaiting or to make chip-baskets, pill-boxes, etc. (**heading 44.04**).

44.09 - Wood (including strips and friezes for parquet flooring, not assembled) continuously shaped (tongued, grooved, rebated, chamfered, v-jointed, beaded, moulded, rounded or the like) along any of its edges, ends or faces, whether or not planed, sanded or end-jointed.

4409.10 - Coniferous

- Non-coniferous :

4409.21 -- Of bamboo

4409.22 -- Of tropical wood

4409.29 -- Other

This heading covers timber, particularly in the form of boards, planks, etc., which, after sawing or squaring, has been continuously shaped along any of its edges, ends or faces either to facilitate subsequent assembly or to obtain the mouldings or beadings described in Item (4) below, whether or not planed, sanded or end-jointed, e.g. finger-jointed (see the General Explanatory Note to this Chapter). Continuously shaped wood covers both products with a uniform cross-section throughout the length or width and products having a repetitive design in relief.

Tongued and grooved wood consists of boards of which one edge or end is grooved and the other flanged (tongued), the tongue of one board fitting into the groove of another when assembled side by side.

Rebated boards are those in which one or more edges or ends have been cut to form a step.

Chamfered boards are those of which one or more corners have been removed at an angle to the face and the edge or end.

Other common forms of timber covered by the heading include :

- (1) **Boards with rounded edges or ends.**
- (2) **V-jointed** wood (i.e., wood tongued and grooved with chamfered edges or ends), including **centre-V-jointed** wood (i.e., with a V-shaped channel in the centre of the board and also usually tongued and grooved and sometimes chamfered at the edges or ends).
- (3) **Beaded** wood (i.e., wood tongued and grooved with a simple bead between the edge or end and the tongue), including **centrebeaded** wood (i.e., wood tongued and grooved with a simple bead along the centre of the face).
- (4) **Moulded wood** (also known as mouldings or beadings), i.e., strips of wood shaped to various contours (obtained mechanically or by hand), such as are used for the manufacture of picture frames, decoration of walls, furniture, doors and other carpentry or joinery.
- (5) **Rounded woods** such as drawn woods, which are very thin rods, generally of round section, of a kind used in the manufacture of certain types of match splints, pegs for footwear, certain types of wooden sun-blinds (pinoleum blinds), toothpicks, cheese-making screens, etc. Dowelling in the length, being round wooden rods or poles of a uniform cross-section, generally ranging in diameter from 2 mm to 75 mm and in length from 45 cm to 250 cm, of a kind used, e.g., for joining parts of wooden furniture, is also classified in this heading.

The heading also covers strips and friezes for flooring consisting of narrow pieces of boards, provided they have been continuously shaped, e.g., tongued and grooved. If they have not been worked beyond planing, sanding or end-jointing, e.g. finger-jointing, they fall in **heading 44.07**.

Strips of plywood or veneered wood for parquet flooring are also **excluded (heading 44.12)**.

The heading also **excludes** :

- (a) Planed or other worked boards presented in sets as box boards (**heading 44.15**).
- (b) Wood which has been mortised or tenoned, dovetailed or similarly worked at the ends and wood assembled into panels being builders' carpentry or joinery (e.g., assembled flooring panels, including parquet flooring panels, made up from wooden blocks, strips, friezes, etc., whether or not on a support of one or more layers of wood) (**heading 44.18**).
- (c) Panels consisting of laths of roughly sawn wood, assembled with glue in order to facilitate transport or later working (**heading 44.21**).
- (d) Moulded wood built up by superimposing a moulding on another piece of moulded or unmoulded wood (**heading 44.18** or **44.21**).
- (e) Wood which has been surface worked beyond planing or sanding, other than painting, staining or varnishing (e.g., veneered, polished, bronzed, or faced with metal leaf) (generally **heading 44.21**).
- (f) Wooden strips of a kind clearly identifiable for incorporation in an article of furniture, such as notched strips for cupboard and bookcase shelves, etc. (**heading 94.03**).

44.10 - Particle board, oriented strand board (OSB) and similar board (for example, waferboard) of wood or other ligneous materials, whether or not agglomerated with resins or other organic binding substances.

- Of wood :

4410.11 -- Particle board

4410.12 -- Oriented strand board (OSB)

4410.19 -- Other

4410.90 - Other

Particle board is a flat product manufactured in various lengths, widths and thicknesses by pressing or extrusion. It is usually made from wood chips or particles obtained by the mechanical reduction of roundwood or wood residues. It may also be produced from other ligneous materials such as fragments obtained from bagasse, bamboo, cereal straw or from flax or hemp shives. Particle board is normally agglomerated by means of an added organic binder, usually a thermosetting resin, which generally does not exceed 15 % of the weight of the board.

The chips, particles or other fragments constituting the particle boards of this heading are usually recognisable at the edges of the board with the naked eye. However, in some cases, microscopic examination may be required to distinguish the particles and fragments from the ligno-cellulosic fibres characterising the fibreboard of heading 44.11.

This heading also covers :

- (1) **Oriented strand board**, which is made from layers of thin strands of wood which are at least twice as long as they are wide. These strands are mixed with binders (usually waterproof) such as isocyanate or phenolic resins, interleaved together and laid down in layers forming a thick mat in which the strands are generally oriented lengthwise in the surface layers and generally cross oriented or laid down randomly in the inner layers in order to give the board improved elastomechanical properties. The mat is subjected to heat and pressure producing a solid, uniform, rigid structural board.
- (2) **Waferboard**, which is made from thin wafers of wood which are less than twice as long as they are wide. These wafers are mixed with binders (usually waterproof) such as isocyanate or phenolic resins, interleaved together and laid down randomly, thus forming a thick mat. The mat is subjected to heat and pressure producing a solid, uniform, structural board having high strength and water resistance.

The particle boards of this heading are usually sanded. Moreover, they may be impregnated with one or more substances not essential for the agglomeration of their constituent materials but which confer on the board an additional property, e.g., impermeability to water, resistance to rot, insect attack, fire or the spread of flame, chemical agencies or electricity, greater density. In the last instance, the impregnating substances attain an important proportion.

Extruded particle board may have holes running internally from end to end.

Also classified in this heading are laminated panels consisting of :

- (1) particle board covered on one or both faces with fibreboard;
- (2) several particle boards whether or not covered on one or both faces with fibreboard;
- (3) several particle boards and several fibreboards assembled in any order.

The products of this heading remain classified herein whether or not they have been worked to form the shapes provided for in respect of the goods of heading 44.09, curved, corrugated, perforated, cut or formed to shapes other than square or rectangular and whether or not they have been worked at the surface, the edge or the end, or coated or covered (e.g., with textile fabric, plastics, paint, paper or metal) or submitted to any other operation, **provided** these operations do not thereby give such products the essential character of articles of other headings.

The heading **does not cover** :

- (a) Plates or strips of plastics containing wood flour as a filler (**Chapter 39**).
- (b) Veneered particle board and similar board (for example, oriented strand board and waferboard), whether or not with holes running internally from end to end (**heading 44.12**).
- (c) Cellular wood panels of which both faces are particle board (**heading 44.18**).
- (d) Boards of ligneous materials agglomerated with cement, plaster or with other mineral binding substances (**heading 68.08**).

Also **excluded** from this heading are goods having the character of articles or parts of articles more specifically covered elsewhere, whether obtained directly by pressing, extrusion or moulding or by other processes.

44.11 - Fibreboard of wood or other ligneous materials, whether or not bonded with resins or other organic substances.

- Medium density fibreboard (MDF) :

4411.12 -- Of a thickness not exceeding 5 mm

4411.13 -- Of a thickness exceeding 5 mm but not exceeding 9 mm

4411.14 -- Of a thickness exceeding 9 mm

- Other :

4411.92 -- Of a density exceeding 0.8 g/cm³

4411.93 -- Of a density exceeding 0.5 g/cm³ but not exceeding 0.8 g/cm³

4411.94 -- Of a density not exceeding 0.5 g/cm³

Fibreboard is most often manufactured from wood chips which have been mechanically defibred (defibrated) or steam exploded or from other defibred ligno-cellulosic material (obtained e.g., from bagasse or bamboo). The fibres making up the board are recognisable under microscopic examination. They are bonded together in the board by felting and by their own adhesive properties, generally deriving from their lignin content. Additional resins or other organic bonding substances may be used to agglomerate the fibres. Impregnating or other agents may also be added during or after manufacture of the board to give an extra property, e.g., impermeability to water or resistance to rot, insect attack, fire or the spread of flame. Fibreboard may consist of a single sheet or of several sheets bonded together.

The categories of fibreboard of this heading can be distinguished according to their production process and they include :

(A) Fibreboard obtained by the “dry production process”
