This group includes, in particular, **medium density fibreboard (MDF)**, which is manufactured in a process in which additional thermosetting resins are added to the dried wood fibres in order to assist the bonding process in the press. The density generally ranges from 0.45 g/cm³ to 1 g/cm³. In the unworked state it has two smooth surfaces. It can be used in many different applications such as furniture, interior decoration and in building.

Medium density fibreboard of a density exceeding 0.8 g/cm³ is sometimes also referred to by the trade as “high density fibreboard (HDF)”.

(B) Fibreboard obtained by the “wet production process”

This group includes the following types of fibreboard :

- (1) **Hardboard**, which is manufactured in a wet production process in which the wood fibres in suspension in water are compressed in the form of a mat under high temperature and high pressure on a metallic mesh. In the unworked state this type of fibreboard has one smooth and one rough surface with a mesh pattern. However, it can sometimes also have two smooth surfaces obtained by special surface treatment or a special production process. It generally has a density exceeding 0.8 g/cm^3 . Hardboard is mainly used for furniture, in the automotive industries, for doorskins and for packaging, especially fruit and vegetable packaging.
- (2) **Mediumboard**, which is manufactured in a way similar to the one for hardboard but at a lower pressure. It generally has a density exceeding 0.35 g/cm^3 but not exceeding 0.8 g/cm^3 . The main application is in furniture production and for interior or exterior walls.
- (3) **Softboard**. This fibreboard is not compressed as the other types of fibreboard obtained by the wet production process. It generally has a density of 0.35 g/cm^3 or less. These boards are used mainly for thermal or sound insulation in building. Special types of insulating board are used as sheathing or sarking materials.

The products of this heading remain classified herein whether or not they have been worked to form the shapes provided for in respect of the goods of heading 44.09, curved, corrugated, perforated, cut or formed to shapes other than square or rectangular and whether or not they have been worked at the surface, the edge or the end, or coated or covered (e.g., with textile fabric, plastics, paint, paper or metal) or submitted to any other operation, **provided** these operations do not thereby give such products the essential character of articles of other headings.

The heading **does not cover** :

- (a) Particle board whether or not laminated with one or several fibreboards (**heading 44.10**).
- (b) Laminated wood with a core consisting of fibreboard (**heading 44.12**).
- (c) Cellular wood panels of which both faces are fibreboard (**heading 44.18**).
- (d) Paperboard, such as multiplex paperboard, « presspan » and strawboard, which can generally be distinguished from fibreboard by their layer structure made apparent on cleaving (**Chapter 48**).
- (e) Fibreboard panels clearly identifiable as parts of furniture (generally **Chapter 94**).

44.12 - Plywood, veneered panels and similar laminated wood (+).

4412.10 - Of bamboo

- Other plywood, consisting solely of sheets of wood (other than bamboo), each ply not exceeding 6 mm thickness :

4412.31 - - With at least one outer ply of tropical wood

4412.33 - - Other, with at least one outer ply of non-coniferous wood of the species alder (*Alnus spp.*), ash (*Fraxinus spp.*), beech (*Fagus spp.*), birch (*Betula spp.*), cherry (*Prunus spp.*), chestnut (*Castanea spp.*), elm (*Ulmus spp.*), eucalyptus (*Eucalyptus spp.*), hickory (*Carya spp.*), horse chestnut (*Aesculus spp.*), lime (*Tilia spp.*), maple (*Acer spp.*), oak (*Quercus spp.*), plane tree (*Platanus spp.*), poplar and aspen (*Populus spp.*), robinia (*Robinia spp.*), tulipwood (*Liriodendron spp.*) or walnut (*Juglans spp.*)

4412.34 - - Other, with at least one outer ply of non-coniferous wood not specified under subheading 4412.33

4412.39 - - Other, with both outer plies of coniferous wood

- Other :

4412.94 - - Blockboard, laminboard and battenboard

4412.99 - - Other

This heading covers :

- (1) **Plywood** consisting of three or more sheets of wood glued and pressed one on the other and generally disposed so that the grains of successive layers are at an angle; this gives the panels greater strength and, by compensating shrinkage, reduces warping. Each component sheet is known as a "ply" and plywood is usually formed of an odd number of plies, the middle ply being called the "core".
- (2) **Veneered panels**, which are panels consisting of a thin veneer of wood affixed to a base, usually of inferior wood, by glueing under pressure.

Wood veneered on to a base other than wood (e.g., panels of plastics) is also classified here provided it is the veneer which gives the panel its essential character.

- (3) **Similar laminated wood.** This group can be divided into two categories :

- Blockboard, laminboard and battenboard, in which the core is thick and composed of blocks, laths or battens of wood glued together and surfaced with the outer plies. Panels of this kind are very rigid and strong and can be used without framing or backing.
- Panels in which the wooden core is replaced by other materials such as a layer or layers of particle board, fibreboard, wood waste glued together, asbestos or cork.

However, the heading **does not cover** massive products such as laminated beams and arches (so-called "glulam" products) (generally **heading 44.18**).

The products of this heading remain classified herein whether or not they have been worked to form the shapes provided for in respect of the goods of heading 44.09, curved, corrugated, perforated, cut or formed to shapes other than square or rectangular and whether or not they have been worked at the surface, the edge or the end, or coated or covered (e.g., with textile fabric, plastics, paint, paper or metal) or submitted to any other operation, **provided** these operations do not thereby give such products the essential character of articles of other headings.

The heading also covers plywood panels, veneered panels and panels of similar laminated wood, used as flooring panels, some of which are referred to as "parquet flooring". These panels have a thin veneer of wood affixed to the surface, so as to imitate an assembled flooring panel.

The heading also **excludes** :

- (a) Thin sheets of wood for veneering, obtained by slicing laminated wood (**heading 44.08**).
- (b) Panels of laminated densified wood (**heading 44.13**).
- (c) Cellular wood panels and assembled flooring panels, including parquet flooring panels, or tiles including those consisting of wooden blocks, strips, friezes, etc., assembled on a support of one or more layers of wood and known as "multilayer" parquet flooring panels (**heading 44.18**).
- (d) Wood marquetry and inlaid wood (**heading 44.20**).
- (e) Panels clearly identifiable as parts of furniture (generally **Chapter 94**).

○
○ ○

Subheading Explanatory Note.

Subheadings 4412.10, 4412.31, 4412.33, 4412.34 and 4412.39

Plywood remains classified in these subheadings even if it has been surface-covered or further worked as described in the antepenultimate paragraph of the Explanatory Note to heading 44.12.

44.13 - Densified wood, in blocks, plates, strips or profile shapes.

Densified wood covered by this heading has been chemically or physically treated to increase its density or hardness and improve its mechanical strength or resistance to chemical or electrical agencies. Such wood may be solid or consist of several layers bonded together, in the latter case the treatment applied being in excess of that required merely to produce a good bond between the layers.

Two main processes, impregnation and densification, are used to produce the products of this heading. These processes may be used separately or together.

In **impregnation** the wood is deeply impregnated, usually with thermosetting plastics or with molten metal.

Impregnation with thermosetting plastics (e.g., amino-resins or phenolic resins) is more often applied to very thin veneers built up into laminated wood than to solid wood, since penetration is thereby facilitated.

Metallised wood is obtained by plunging pieces of solid wood, previously heated, into a bath of molten metal (e.g., tin, antimony, lead, bismuth or their alloys) under pressure in a closed vessel. The density of metallised wood generally exceeds 3.5 g/cm³.

Densification has the effect of contracting the cells of the wood; this may be done by transverse compression by means of powerful hydraulic presses or between rollers, or by compression in all directions at high temperature in an autoclave. Densified wood may have a density as great as 1.4 g/cm³.

Impregnation and densification may be carried out simultaneously by glueing very thin sheets of wood (usually beech) with thermosetting plastics under heavy pressure at a high temperature so that the wood is deeply impregnated and compressed as well as bonded.

Densified wood is generally used in the manufacture of gears, shuttles, bearings and other machine parts, propellers, insulators and other electric goods, vessels for the chemical industry, etc.

44.14 - Wooden frames for paintings, photographs, mirrors or similar objects.

This heading covers wooden frames of all shapes and dimensions, whether cut in one piece from a solid block of wood or built up from beadings or mouldings. The frames of the heading may also be of wood marquetry or inlaid wood.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

Frames remain in this heading if fitted with backs, supports and plain glass.

Printed pictures and photographs presented in wooden frames are also classified in this heading when the essential character of the whole is given by the frames; in other cases such articles are classified in **heading 49.11**.

Framed glass mirrors are also **excluded (heading 70.09)**.

In the case of framed paintings, drawings, pastels, collages and similar decorative plaques, and original engravings, prints and lithographs, to determine whether the framed articles are to be classified as a whole or whether the frames are to be classified separately, see Note 5 to Chapter 97 and the Explanatory Notes to headings 97.01 and 97.02.

44.15 - Packing cases, boxes, crates, drums and similar packings, of wood; cable-drums of wood; pallets, box pallets and other load boards, of wood; pallet collars of wood.

4415.10 - Cases, boxes, crates, drums and similar packings; cable-drums

4415.20 - Pallets, box pallets and other load boards; pallet collars

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

**(I) PACKING CASES, BOXES, CRATES,
DRUMS AND SIMILAR PACKINGS**

This part of the heading includes :

- (1) Packing cases and boxes with solid sides, lids and bottoms, used for general packing and transport purposes.
- (2) Crates, fruit or vegetable boxes, egg trays and other containers with slatted sides and open tops (including those of a kind used for the transport of glassware, ceramic products, machinery, etc.).
- (3) Boxes made of sliced or peeled wood (but **not** those of plaited wood) of the kind used for packing cheese, pharmaceutical products, etc.; match-boxes (including those with a striking surface) and conical open containers for marketing butter, fruit, etc.
- (4) Drums and barrel-shaped containers, **not** of the kind made by coopers, such as are used for the transport of dry colours, chemicals, etc.

These containers may be presented without a lid ("open" containers such as cases, crates, etc.). They may be unassembled or partly assembled, **provided** the wood is in sets of the parts necessary to make a complete container or an incomplete container having the essential character of a complete container. Where the wood is not in such sets, it is to be classified as sawn or planed wood, plywood, etc., as the case may be.

The packing cases, etc., of this heading may be simply nailed or dovetailed or otherwise jointed. They may be fitted with hinges, handles, fasteners, feet or corner pieces, or lined with metal, paper, etc.

Used boxes, crates, etc., capable of further use as such, remain classified in this heading, but those not usable except as fuel are **excluded (heading 44.01)**.

The heading also **excludes** :

- (a) Articles of **heading 42.02**.
- (b) Caskets, cases, and similar articles of **heading 44.20**.
- (c) Containers specially designed and equipped for carriage by one or more modes of transport (**heading 86.09**).

(II) CABLE-DRUMS

Cable-drums are large drums, often with a diameter exceeding 1 m, used to hold and transport electric cables, telephone cables and similar cables. They are intended to be rolled to assist in laying the cable.

(III) PALLETS, BOX PALLETS AND OTHER LOAD BOARDS

Load boards are portable platforms for the assembly of a quantity of goods to form a unit load for handling, transportation and storage by mechanical appliances.

A pallet is a load board consisting of two decks separated by bearers or a single deck supported by feet and designed essentially for handling by means of fork-lift trucks or pallet trucks. Box pallets have a superstructure of at least three fixed, removable or collapsible vertical sides and designed for stacking with a double-decked pallet or another box pallet.

Platforms, post platforms, collar-type box platforms, side-rail platforms and end-rail platforms are other examples of load boards.

(IV) PALLET COLLARS

Pallet collars are collars made up of four pieces of wood, usually with hinges on the ends to form a frame that is placed over the pallet itself.

44.16 - Casks, barrels, vats, tubs and other coopers' products and parts thereof, of wood, including staves.

This heading is restricted to containers which are products of the coopers' trade, that is those of which the bodies are composed of staves with grooves into which the heads and bottoms are fitted, the shape being maintained by hoops of wood or metal.

Coopers' products include casks of various kinds (tuns, barrels, hogsheads, etc.) whether tight (for wet goods) or slack (for dry goods), as well as vats, tubs, etc.

These goods may be disassembled or partly assembled, and are sometimes lined or coated inside.

The heading also covers staves and all other wooden products, finished or not, recognisable as parts of coopers' products (e.g., barrel heads, hoopwood cut to length and notched at the ends for assembly).

The heading also includes unfinished staves (stavewood), that is, the strips of wood used for forming the sides, heads or bottoms of barrels and other coopers' products. Such stavewood may be in the form of :

- (1) Strips cleft from sectors of tree trunks along the direction of the medullary rays. Such cleft staves may also be further flat sawn on one of the principal faces, the other face being merely trueed by axe or knife.
- (2) Sawn staves, **provided** that at least one of the two-principal faces is concave or convex, such curved surfaces being produced by sawing with a cylindrical saw.

The heading **excludes** :

- (a) Wood which is sawn flat on both principal faces (**heading 44.07 or 44.08**).
- (b) Containers made of staves fixed to the heads and bottoms by nailing (**heading 44.15**).
- (c) Casks, etc., cut to shape for use as furniture (e.g., tables and chairs) (**Chapter 94**).

44.17 - Tools, tool bodies, tool handles, broom or brush bodies and handles, of wood; boot or shoe lasts and trees, of wood.

This heading covers :

- (1) **Tools of wood, other than** tools in which the blade, working edge, working surface or other working part is formed by any of the materials specified in Note 1 to Chapter 82.
Tools of this heading include spatulas (**other than** kitchenware of **heading 44.19**), modelling-knives, mallets or mauls, rakes, forks, shovels, bench-screws and clamps, sand-papering blocks, etc.
- (2) **Tool bodies of wood** (e.g., stocks for planes, spokeshaves, bow saws or similar tools) not fitted with their metal working parts (blades and irons).
- (3) **Wooden handles**, whether or not turned, for tools or implements of all kinds (e.g., handles for spades, shovels, rakes, hammers, screwdrivers, saws, files, knives, smoothing irons, date or similar stamps).
- (4) **Broom or brush bodies of wood**. These are pieces of wood, finished or not, shaped to the actual form of broom or brush heads. They may sometimes consist of more than one piece.
- (5) **Brush or broom handles of wood**, whether or not turned, and whether of a kind for fitting with fibres or bristles at one end (such as paint brushes) or for fixing to bodies (e.g., broom handles).
- (6) **Boot or shoe lasts of wood** (i.e., shapes used in the manufacture of footwear) and **boot or shoe trees**, finished or not, for preserving the shape or for stretching footwear.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

The heading **does not cover** :

- (a) Wood roughly trimmed or rounded for the manufacture of tool handles (**heading 44.04**).
- (b) Wood merely sawn (e.g., into blocks) for manufacture into articles of this heading, but not having been shaped to the stage of blanks (**heading 44.07**).
- (c) Wooden handles for table knives, spoons and forks (**heading 44.21**).
- (d) Hat-making blocks (**heading 84.49**).
- (e) Casting moulds, etc., of wood, of **heading 84.80**.
- (f) Machinery or parts of machinery (**Chapter 84**).

44.18 - Builders' joinery and carpentry of wood, including cellular wood panels, assembled flooring panels, shingles and shakes (+).

4418.10 - Windows, French-windows and their frames

4418.20 - Doors and their frames and thresholds

4418.40 - Shuttering for concrete constructional work

4418.50 - Shingles and shakes

4418.60 - Posts and beams

- Assembled flooring panels :

4418.73 -- Of bamboo or with at least the top layer (wear layer) of bamboo

4418.74 -- Other, for mosaic floors

4418.75 -- Other, multilayer

4418.79 -- Othe

- Other :

4418.91 -- Of bamboo

4418.99 -- Other

This heading applies to woodwork, including that of wood marquetry or inlaid wood, used in the construction of any kind of building, etc., in the form of assembled goods or as recognisable unassembled pieces (e.g., prepared with tenons, mortises, dovetails or other similar joints for assembly), whether or not with their metal fittings such as hinges, locks, etc.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

The term “**joinery**” applies more particularly to builders’ fittings (such as doors, windows, shutters, stairs, door or window frames), whereas the term “**carpentry**” refers to woodwork (such as beams, rafters and roof struts) used for structural purposes or in scaffoldings, arch supports, etc., and includes assembled shuttering for concrete constructional work. However, plywood panels, even if surface treated for the purposes of concrete shuttering, are classified in **heading 44.12**.

Builders’ carpentry also includes glue-laminated timber (glulam), which is a structural timber product obtained by gluing together a number of wood laminations having their grain essentially parallel. Laminations of curved members are arranged so that the plane of each lamination is at 90 degrees to the plane of the applied load; thus, laminations of a straight glulam beam are laid flat.

This heading also covers **cellular wood panels** which are somewhat similar in appearance to the blockboard and battenboard described in the Explanatory Note to heading 44.12, but the battens or laths forming the core are spaced one from the other, either parallel or in lattice form. In certain cases the panels may consist of facing sheets separated by an internal frame at the edges only. The interstices may be packed with sound-insulating or heat-resisting materials (e.g., cork, glass wool, wood pulp, asbestos). The facing sheets may be of solid wood, particle board or similar board, fibreboard or plywood, and the panels (like those in heading 44.12) may be faced with base metal. Panels of this kind are relatively light but strong and are used for partitions, doors and sometimes in the manufacture of furniture.

This heading also covers **solid blocks, strips, friezes, etc., assembled into flooring panels (including parquet panels) or tiles**, with or without borders. It also includes flooring panels or tiles consisting of blocks, strips, friezes, etc., assembled on a support of one or more layers of wood, known as "**multilayer" parquet flooring panels**". The top layer (wear layer) is commonly made from two or more rows of strips making up the panel. These panels or tiles may be tongued and grooved at the edges to facilitate assembly.

A **shingle** is wood sawn lengthwise which is generally thicker than 5 mm at one end (the butt) but thinner than 5 mm at the other end (the tip). It may have its edges resawn to be parallel; its butt may be resawn to be at right angles to its edges or to form a curve or other shape. One of its faces may be sanded from the butt to the tip or grooved along its length.

A **shake** is wood split by hand or machine from a bolt or block. Its face reveals the natural texture of the wood resulting from the splitting process. Shakes are sometimes sawn lengthwise through their thicknesses to obtain two shakes, each then having a split face and a sawn back.

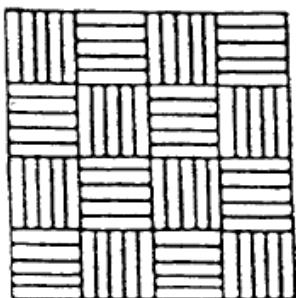

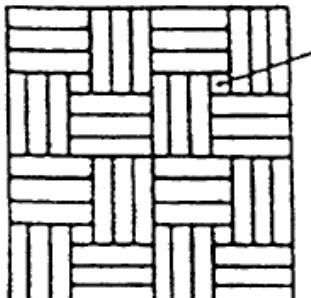

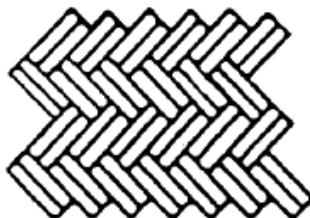

The heading **does not cover** :

- (a) Plywood panels, veneered panels or panels of similar laminated wood, used as flooring panels, which have a thin veneer of wood affixed to the surface so as to imitate an assembled flooring panel of heading 44.18 (**heading 44.12**).
- (b) Cupboards, with or without backs, even if designed to be nailed or otherwise secured to the ceiling or wall (**heading 94.03**).
- (c) Prefabricated buildings (**heading 94.06**).

Subheading Explanatory Note.**Subheading 4418.71**

Assembled flooring panels for mosaic floors are prefabricated panels composed of a number of separate square or rectangular elements and possibly including "cabochons" (small square, rectangular, triangle, diamond or otherwise shaped wooden pieces used as fillers to attain the desired pattern). The strips are laid out according to a certain pattern, e.g., chequered, "basket-weave" and herringbone (see examples below).

*Chequered pattern**'Basket-weave' pattern**Herringbone pattern*

44.19 - Tableware and kitchenware, of wood.

- Of bamboo :

4419.11 - - Bread boards, chopping boards and similar boards

4419.12 - - Chopsticks

4419.19 - - Other

4419.90 - Other

This heading covers **only** household articles of wood, whether or not turned, or of wood marquetry or inlaid wood, which are of the nature of tableware or kitchenware. It **does not**, however, **cover** goods which are primarily ornamental in character, nor furniture.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

The heading includes : spoons, forks, salad-servers; platters and serving-dishes; jars, cups and saucers; common spice-boxes and other kitchen containers; crumb-scoops, **not** incorporating brushes; napkin rings; rolling pins; pastry moulds; butter patters; pestles; nutcrackers; trays; bowls; bread boards; chopping boards; plate racks; capacity measures for use in the kitchen.

The heading **does not cover** :

- (a) Coopers' products (**heading 44.16**).
- (b) Wooden parts of tableware or kitchenware (**heading 44.21**).
- (c) Brushes and brooms (**heading 96.03**).
- (d) Hand sieves (**heading 96.04**).

44.20 - Wood marquetry and inlaid wood; caskets and cases for jewellery or cutlery, and similar articles, of wood; statuettes and other ornaments, of wood; wooden articles of furniture not falling in chapter 94.

4420.10 - Statuettes and other ornaments, of wood

4420.90 - Other

This heading covers panels of wood marquetry and inlaid wood, including those partly of material other than wood.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

It also covers a wide variety of articles of wood (including those of wood marquetry or inlaid wood), generally of careful manufacture and good finish, such as : small articles of cabinetwork (for example, caskets and jewel cases); small furnishing goods; decorative articles. Such articles are classified in this heading, even if fitted with mirrors, **provided** they remain essentially articles of the kind described in the heading. Similarly, the heading includes articles wholly or partly lined with natural or composition leather, paperboard, plastics, textile fabrics, etc., **provided** they are articles essentially of wood.

The heading includes :

- (1) Boxes of lacquered wood (of the Chinese or Japanese type); cases and boxes of wood, for knives, cutlery, scientific apparatus, etc; snuff-boxes and other small boxes to be carried in the pocket, in the handbag or on the person; stationery cases, etc.; needlework boxes; tobacco jars and sweetmeat boxes. However, the heading **excludes** ordinary kitchen spice-boxes, etc. (**heading 44.19**).
- (2) Articles of wooden furniture, **other than** those of **Chapter 94** (see the General Explanatory Note to that Chapter). This heading therefore covers such goods as coat or hat racks, clothes brush hangers, letter trays for office use, ashtrays, pen-trays and ink stands.
- (3) Statuettes, animals, figures and other ornaments.

Wooden parts of the articles of this heading are **excluded** (**heading 44.21**).

The heading also **excludes** :

- (a) Cases for musical instruments or for guns, of wood, and sheaths, cases, boxes and similar containers covered with leather or composition leather, paper or paperboard, vulcanised fibre, sheeting of plastics, or textile materials (**heading 42.02**).
- (b) Imitation jewellery (**heading 71.17**).
- (c) Clock cases and parts thereof of **Chapter 91**.
- (d) Musical instruments and parts thereof of **Chapter 92**.
- (e) Scabbards and sheaths for side-arms (**heading 93.07**).
- (f) Articles of **Chapter 94** (for example, furniture, lamps and lighting fittings).
- (g) Smoking pipes and parts thereof, buttons, pencils and other articles of **Chapter 96**.
- (h) Works of art or antiques of **Chapter 97**.

44.21 - Other articles of wood.

4421.10 - Clothes hangers

4421.90 - Other :

4421.91 -- Of bamboo

4421.99 -- Other

This heading covers all articles of wood manufactured by turning or by any other method, or of wood marquetry or inlaid wood, **other than** those specified or included in the preceding headings and **other than** articles of a kind classified elsewhere irrespective of their constituent material (see, for example, Chapter Note 1).

It also covers wooden parts of the articles specified or included in the preceding headings, **other than** those of **heading 44.16**.

The articles of this heading may be made of ordinary wood or of particle board or similar board, fibreboard, laminated wood or densified wood (see Note 3 to this Chapter).

The heading includes :

- (1) Spools, cops, bobbins, sewing thread reels, etc. These articles normally have a stem (or core) of turned wood on which yarn or fine wire can be wound; the stem may be cylindrical or conical, usually with a central bore, and may have a flange at one or both ends. The heading also includes bobbins made up of a central stem of turned wood with fitted ends of wood or other material and used, for example, for insulated electric wire.
- (2) Rabbit-hutches, hen-coops, bee-hives, cages, kennels, troughs; yokes for livestock.
- (3) Theatrical scenery; joiners' benches; joiners' benches; tables with a screw device for holding the cross threads, used in the hand sewing of books; ladders and steps; trestles; letters, road signs, figures; signs; labels for horticulture, etc.; toothpicks; trellises and fencing panels; level crossing gates; roller blinds, Venetian and other blinds; spigots; templates; rollers for spring blinds; clothes hangers; washing boards; ironing boards; clothes pegs; dowel pins; oars, paddles, rudders; coffins.
- (4) Wood paving blocks which are usually uniform in size and generally have rectangular sides. They are manufactured by means of a multiple circular saw cutter.

Spacing strips may sometimes be nailed to the sides to allow for swelling of the blocks when laid.

- (5) Match splints which are manufactured by cutting drawn, or more usually, sliced or peeled wood, to the dimensions of matches. They may also be punched in quantity out of a single block of wood. They may be impregnated with chemical substances (e.g., ammonium phosphates) but are not classified in this Chapter if with their inflammable heads. The heading also covers strips of wood toothed or slotted on one edge for the manufacture of book matches.

44.21

- (6) Wooden pegs or pins for footwear which are made in the same way as match splints, but which are pointed at one end and may be of round, square or triangular section. They are used in some cases instead of nails for fixing the soles and heels of boots and shoes
- (7) Capacity measures **other than** kitchenware of **heading 44.19**.
- (8) Wooden handles for table knives, spoons and forks.
- (9) Panels consisting of laths of roughly sawn wood, assembled with glue in order to facilitate transport or later working.
- (10) Moulded wood built up by superimposing a moulding on another piece of moulded or unmoulded wood (**other than** that of **heading 44.18**).

The heading **does not cover** :

- (a) Strips of wood for match splints (**heading 44.04**).
- (b) Unfinished shoe pegs in the form of strips of wood, of which one edge is sharply bevelled on both sides, ready for cutting into pegs (**heading 44.09**).
- (c) Wooden handles, for knives (**other than** table knives) and other tools or implements, of **heading 44.17**.
- (d) Articles of **Chapter 46**.
- (e) Footwear and parts thereof of **Chapter 64**.
- (f) Walking-sticks and parts of walking-sticks, umbrellas or riding-crops (**Chapter 66**).
- (g) Machines, machinery parts and electrical goods of **Section XVI** (for example, wooden moulding patterns of **heading 84.80**).
- (h) Goods of **Section XVII** (for example, boats, wheel-barrows, carts and other vehicles, wheelwrights' wares).
- (ij) Mathematical or drawing instruments, measuring instruments (**other than** those for measuring capacity) and other goods of **Chapter 90**.
- (k) Gun stocks and other parts of arms (**heading 93.05**).
- (l) Toys, games and sports requisites (**Chapter 95**).

*

Chapter 45

Cork and articles of cork

Note.

1.- This Chapter does not cover :

- (a) Footwear or parts of footwear of Chapter 64;
- (b) Headgear or parts of headgear of Chapter 65; or
- (c) Articles of Chapter 95 (for example, toys, games, sports requisites).

GENERAL

Cork is obtained almost exclusively from the outer bark of the cork-oak (*Quercus suber*) which is grown in Southern Europe and North Africa.

The first stripping of bark is known as “ virgin ” cork and is hard, brittle, inelastic, of inferior quality and low value. It has a blistered and cracked outer surface, while the inner surface is yellowish with red spots.

Subsequent yields are commercially more important. They are compact and homogeneous, and the outer surface, although to some extent fissured, is less rugged than that of virgin cork.

Cork is light, elastic, compressible, flexible, waterproof, rotproof, and a bad conductor of heat and sound.

This Chapter covers natural and agglomerated cork in all forms (including articles of cork and agglomerated cork), other than those **excluded** at the end of the Explanatory Note to heading 45.03.

45.01 - Natural cork, raw or simply prepared; waste cork; crushed, granulated or ground cork.

4501.10 - Natural cork, raw or simply prepared

4501.90 - Other

This heading covers :

- (1) **Natural cork, raw or simply prepared.** Raw cork is presented in curved slabs as stripped from the cork tree. Natural cork, simply prepared, includes cork which has been surface scraped or otherwise cleaned (e.g., by charring the outer surface), the cracked outer layer remaining, or with the edges cleaned to remove parts unsuitable for use (trimmed cork). Cork treated with fungicides or flattened by pressing after treatment in boiling water or steam also remains in the heading; cork which has been debarked (deprived of the outer bark), or which has been roughly squared, is, however, **excluded (heading 45.02).**
- (2) **Waste of natural or agglomerated cork** (i.e., shavings, waste pieces and scrap) used generally for the production of crushed, granulated or powdered cork. It includes waste turnings, etc., of cork in the form of "cork wool", which is sometimes used as a stuffing or filling material.
- (3) **Crushed, granulated or ground cork**, made from virgin cork or cork waste, and mainly used in the manufacture of agglomerated cork, linoleum or lincrusta. Granulated cork is also used as a heat- or sound-insulating material and to some extent for packing fruit. Crushed, granulated or ground cork remains in the heading if coloured, impregnated, baked or expanded by heat-treatment; but agglomerated cork is **excluded (heading 45.04).**

45.02 - Natural cork, debacked or roughly squared, or in rectangular (including square) blocks, plates, sheets or strip (including sharp-edged blanks for corks or stoppers).

This heading covers natural cork slabs :

- (1) With the whole of the back (outer bark) sawn or otherwise removed from the outer surface (**debacked cork**); or
- (2) With the outer (bark) and inner (tree) surfaces sawn or otherwise cut so as to be approximately parallel (**roughly squared cork**).

The heading also covers products which have been further worked into the form of rectangular (including square) blocks, plates, sheets or strip obtained from the bulk cork of heading 45.01, by slicing both faces and cutting the edges at right angles. Such products remain classified in this heading whether or not consisting of layers of cork placed one above the other and glued together.

Blocks, plates, sheets and strip cut to shapes **other than** rectangular (including square) are regarded as articles of cork (**heading 45.03**).

Cork sheets reinforced with paper or fabric, including the strips of very thin cork in rolls used for tipping cigarettes, are included in this heading. (The term "cork-paper" is sometimes applied to very thin sheet or strip cork even though not paper-backed.)

The heading also covers blanks for corks or stoppers, in the form of sharp-edged cubes or square slabs, including those cut from slabs composed of two or more layers glued together. Similar products with rounded edges, however, are **excluded (heading 45.03)**.

45.03 - Articles of natural cork (+).

4503.10 - Corks and stoppers

4503.90 - Other

This heading covers, *inter alia* :

- (1) Corks and stoppers of all kinds, of natural cork, including blanks with rounded edges. Cork stoppers may sometimes be fitted with caps of metal, plastics, etc. Pourer-stoppers, measure-stoppers and other articles in which a cork stopper is a subsidiary part are, however, **classified elsewhere** according to the kind of article or the material giving it its essential character.
- (2) Discs, washers and wafers of natural cork, for lining crown corks and other closures for bottles, jars, etc.; cork linings or shells for the interior of bottle necks.
- (3) Blocks, plates, sheets and strip of natural cork, cut to shape other than rectangular (including square); lifebuoys, floats for fishing nets, bath-mats, table-mats, typewriter or other mats.
- (4) Handle grips of various kinds (knife handles, etc.), washers and gaskets (**other than** those included in assorted sets of **heading 84.84**).

The following are, however, **excluded** from this heading :

- (a) Footwear and parts thereof, including removable in-soles (socks), of **Chapter 64**.
- (b) Headgear and parts thereof of **Chapter 65**.
- (c) Crown corks of base metal lined with cork discs (**heading 83.09**).
- (d) Cork cartridge wads (**heading 93.06**).
- (e) Toys, games and sports requisites, including fishing-line floats, and parts thereof (**Chapter 95**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 4503.10

Corks and stoppers of subheading 4503.10 are pieces of natural cork shaped like straight sided or tapered cylinders or rectangular prisms with rounded lateral edges. They may be dyed, polished, paraffined, perforated, fire- or dye-branded. Some solid cork stoppers have an enlarged head or are capped with metal, plastics, etc. Corks or stoppers are used as plugs to close containers. Hollow stoppers (or shell corks) are used as coverings of, for example, glass stoppers for bottles of glass or ceramic material.

The subheading also includes identifiable blanks for corks or stoppers, **provided** their edges have been rounded.

The subheading **does not include** thin cork discs used as seals in crown corks (**subheading 4503.90**).

45.04 - Agglomerated cork (with or without a binding substance) and articles of agglomerated cork.

4504.10 - Blocks, plates, sheets and strip; tiles of any shape; solid cylinders, including discs

4504.90 - Other

Agglomerated cork is manufactured by agglomerating crushed, granulated or ground cork generally under heat and pressure either :

- (1) With an added binding substance (e.g., unvulcanised rubber, glue, plastics, tar, gelatin), or
- (2) Without an added binding substance at a temperature of about 300 °C. In this latter case the natural gum in the cork acts as a binder.

Agglomerated cork of this heading may be impregnated (e.g., with oil), or reinforced by backing with paper or cloth **provided** it does not have the character of linoleum or similar materials classified in **heading 59.04**.

Agglomerated cork retains most of the properties of natural cork, and in particular is an excellent heat- or sound-insulating material. In many cases, however, the addition of the binders required for the agglomeration modifies some of the characteristic features of the cork, in particular the specific gravity and the tensile or crushing strengths. In addition, agglomerated cork has the advantage of being suitable for direct moulding to any size or shape.

Agglomerated cork is used to make much the same range of products as those referred to under heading 45.03 but, whereas it is rarely used for making stoppers, it is used more often than natural cork for crown cork discs.

Agglomerated cork is also used largely, and in preference to natural cork, for building materials such as panels, blocks and tiles, and as moulded shapes (cylinders, shells, etc.), for insulating or protecting hot water or steam piping, for lining petrol pipelines, for expansion jointing in the construction industry and for the manufacture of filters.

See the Explanatory Note to heading 45.03 as regards articles **excluded** from this heading.

Chapter 46

Manufactures of straw, of esparto or of other plaiting materials; basketware and wickerwork

Notes.

- 1.- In this Chapter the expression "plaiting materials" means materials in a state or form suitable for plaiting, interlacing or similar processes; it includes straw, osier or willow, bamboos, rattans, rushes, reeds, strips of wood, strips of other vegetable material (for example, strips of bark, narrow leaves and raffia or other strips obtained from broad leaves), unspun natural textile fibres, monofilament and strip and the like of plastics and strips of paper, but not strips of leather or composition leather or of felt or nonwovens, human hair, horsehair, textile rovings or yarns, or monofilament and strip and the like of Chapter 54.
- 2.- This Chapter does not cover :
 - (a) Wall coverings of heading 48.14;
 - (b) Twine, cordage, ropes or cables, plaited or not (heading 56.07);
 - (c) Footwear or headgear or parts thereof of Chapter 64 or 65;
 - (d) Vehicles or bodies for vehicles of basketware (Chapter 87); or
 - (e) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings).
- 3.- For the purposes of heading 46.01, the expression "plaiting materials, plaits and similar products of plaiting materials, bound together in parallel strands" means plaiting materials, plaits and similar products of plaiting materials, placed side by side and bound together, in the form of sheets, whether or not the binding materials are of spun textile materials.

GENERAL

In addition to articles of loofah, this Chapter covers semi-manufactured products (heading 46.01) and certain articles (headings 46.01 and 46.02) made by interlacing, weaving or by similar methods of assembling unspun materials, particularly :

- (1) Straw, osier or willow, bamboos, rushes, rattans, reeds, chipwood (i.e., wood in thin strips), drawn wood, strips of other vegetable material (for example, strips of bark, narrow leaves and raffia or other strips obtained from broad leaves such as those of banana plants or palm trees), **provided** they are in a state or form suitable for plaiting, interlacing or similar processes.
- (2) Unspun natural textile fibres.
- (3) Monofilament and strip and the like of plastics of Chapter 39 (but **not** monofilament of which no cross-sectional dimension exceeds 1 mm **nor** strip or the like of an apparent width not exceeding 5 mm, of man-made textile materials, of **Chapter 54**).
- (4) Strips of paper (including paper covered with plastics).

- (5) Certain materials consisting of a textile core (unspun fibres, braid, etc.), wound or covered with strips of plastics, or thickly coated with plastics, so that the product no longer has the character of the fibres, braid, etc., forming the core.

Certain of these materials, particularly the vegetable products, may be prepared (e.g., by splitting, drawing, peeling, etc., or by impregnating with wax, glycerol, etc.) to render them more suitable for plaiting, interlacing or similar processes.

For the purposes of this Chapter, the following are **not** considered to be plaiting materials and articles or products made therefrom are **excluded** from the Chapter :

- (i) Horsehair (**heading 05.11** or **Section XI**).
- (ii) Monofilament of which no cross-sectional dimension exceeds 1 mm, or strip or flattened tubes (including strip and flattened tubes folded along the length), whether or not compressed or twisted (artificial straw and the like), of man-made textile materials, **provided** that the apparent width (i.e., in the folded, flattened, compressed or twisted state) does not exceed 5 mm (**Section XI**).
- (iii) Textile rovings (except when wholly covered with plastics as described in paragraph (5) above) (**Section XI**).
- (iv) Textile yarn impregnated, coated, covered or sheathed with plastics (**Section XI**).
- (v) Strips of leather or composition leather (generally **Chapter 41** or **42**) or of felt or nonwovens (**Section XI**) or human hair (**Chapter 5, 59, 65** or **67**).

In addition the Chapter **does not cover** :

- (a) Saddlery and harness (**heading 42.01**).
- (b) Products or articles of bamboo, of **Chapter 44**.
- (c) Wall coverings of **heading 48.14**.
- (d) Twine, cordage, rope or cables, even if plaited or of unspun fibres (**heading 56.07**).
- (e) Narrow fabrics consisting of warp without weft assembled by means of an adhesive (bolducs) (**heading 58.06**).
- (f) Footwear or parts thereof of **Chapter 64**.
- (g) Headgear or parts of headgear, including hat-shapes, of **Chapter 65**.
- (h) Whips (**heading 66.02**).
- (ij) Artificial flowers (**heading 67.02**).
- (k) Vehicles, or bodies for vehicles of basketware (**Chapter 87**).
- (l) Articles of **Chapter 94** (for example, furniture, lamps and lighting fittings).
- (m) Articles of **Chapter 95** (for example, toys, games, sports requisites).
- (n) Brooms or brushes (**heading 96.03**) or tailors' dummies, etc. (**heading 96.18**).

46.01 - Plaits and similar products of plaiting materials, whether or not assembled into strips; plaiting materials, plaits and similar products of plaiting materials, bound together in parallel strands or woven, in sheet form, whether or not being finished articles (for example, mats, matting, screens).

- Mats, matting and screens of vegetable materials :

4601.21 -- Of bamboo

4601.22 -- Of rattan

4601.29 -- Other.

- Other :

4601.92 -- Of bamboo

4601.93 -- Of rattan

4601.94 -- Of other vegetable materials

4601.99 -- Other

(A) Plaits and similar products of plaiting materials, whether or not assembled into strips.

This group covers :

- (1) **Plaits.** These consist of strands of plaiting material, without warp or weft, interlaced either by hand or machine in a general longitudinal direction. By varying the nature, colour, thickness and number of strands, and the manner of interlacing, different decorative effects may be obtained.

Plaits of this kind may be joined side by side and assembled into wider strips by sewing, etc.

- (2) **Products similar to plaits** in the sense that they have the same or similar uses, and that, though they are made by a process other than plaiting, they are also formed in longitudinal thong-like forms, strips, etc., from plaiting materials. They include :

(a) Products made from two or more strands by twisting together, joining together or otherwise assembling (**other than** decorative motifs of **heading 46.02**).

(b) Products (e.g., those known in trade as "China cord") consisting of a kind of cord made from non-crushed vegetable materials assembled simply by twisting.

The above goods are mainly used in millinery, but are also used for the manufacture of certain furniture, shoes, mats, baskets or other receptacles.

The goods of this heading may contain spun textile yarn serving primarily for assembly or reinforcement purposes, whether or not having a supplementary decorative effect.

(B) **Plaiting materials, plaits and similar products of plaiting materials, bound together in parallel strands or woven, in sheet form, whether or not being finished articles (for example, mats, matting, screens).**

The goods of this group are obtained either directly from plaiting materials as defined in the General Explanatory Note to the Chapter or from the plaits or similar products of plaiting materials described in Part (A) above.

Those obtained directly from plaiting materials are either formed of strands woven together, generally in the manner of warp and weft fabrics, or made of parallel strands placed side by side and maintained in position in the form of sheets by transverse binding threads or strands holding the successive parallel strands.

The woven goods may consist wholly of plaiting materials, or may consist of a warp of plaiting material and a weft of textile yarn, or *vice versa*, provided that the sole function of the textile yarn (apart from incidentally introducing colour effects) is to bind the plaiting substances.

Similarly, in the case of the goods made by binding parallel strands of plaiting materials, the binder may be a plaiting material, a textile yarn or some other material.

Similar processes of binding together or weaving are also used to obtain goods in sheet form from the plaits or similar products of plaiting materials described in Part (A) above.

The goods of this group, which may be reinforced or backed or lined with woven textile fabric or with paper, include :

- (1) **Semi-manufactured products** such as raffia, rattan and similar fabrics; and the finer products made in the piece in the form of lapping or strips for use in millinery, upholstery, etc.
- (2) **Certain finished articles**, for example :
 - (a) Mats and matting (floor coverings, etc.), including in particular the so-called Chinese (or Indian) mats and matting (whether rectangular or in other shapes), made by weaving or binding together parallel strands of plaiting materials (or plaits or similar products of plaiting materials) with other plaiting materials, twine, cord, etc.
 - (b) Coarse matting such as the straw mats used for horticultural purposes.
 - (c) Screens or panels such as those of willow or osier; building panels of plaiting materials or of plaits or similar products of plaiting materials (straw, reeds, etc.) laid parallel, compressed and bound together at regular intervals with base metal wire. These building panels or slabs may be covered on all surfaces and edges with kraft paperboard.

The heading **excludes** mats and matting of coir or sisal fibre or the like with a base of cordage or of woven textile fabric (**Chapter 57**).

46.02 - Basketwork, wickerwork and other articles, made directly to shape from plaiting materials or made up from goods of heading 46.01; articles of loofah.

- Of vegetable materials :

4602.11 -- Of bamboo

4602.12 -- Of rattan

4602.19 -- Other

4602.90 - Other

Subject to the exclusions specified in the General Explanatory Note to this Chapter, the heading covers :

- (i) articles made directly to shape from plaiting materials;
- (ii) articles made up from the already assembled products of heading 46.01, i.e., from plaits or similar products, or from the products bound together in parallel strands or woven in sheet form.

The heading **does not**, however, **cover** finished articles of **heading 46.01**, that is, plaiting materials, plaits and similar products of plaiting materials, which have acquired the character of finished articles by reason of being bound together in parallel strands or woven, in sheet form (for example, mats, matting or screens) : see the Explanatory Note to heading 46.01, paragraph (B) (2); and

- (iii) articles of loofah (gloves, pads, etc.) lined or not.

Such articles include :

- (1) Baskets, panniers, hampers and basketware containers of all kinds, whether or not fitted with rollers or castors, including fish baskets, creels and fruit baskets.
- (2) Similar baskets or boxes of interlaced chipwood. But chipbaskets of non-interlaced chipwood are **excluded** (**heading 44.15**).
- (3) Travelling-bags and suitcases.
- (4) Handbags, shopping-bags and the like.
- (5) Lobster pots and similar articles; birdcages and beehives.
- (6) Trays, bottleholders, carpet-beaters, tableware, kitchenware and other household articles.
- (7) Millinery motifs and other fancy articles, **other than** those of **heading 67.02**.
- (8) Straw envelopes for bottles. These articles are mostly in the form of hollow cones of coarse straw or similar materials roughly laid parallel and bound together with yarn or cord.
- (9) Mats made by assembling long plaits into squares, circles, etc., and binding them together with twine.

Section X

**PULP OF WOOD OR OF OTHER FIBROUS CELLULOSIC MATERIAL;
RECOVERED (WASTE AND SCRAP) PAPER OR PAPERBOARD; PAPER
AND PAPERBOARD AND ARTICLES THEREOF**

Chapter 47

Pulp of wood or of other fibrous cellulosic material; recovered (waste and scrap) paper or paperboard

Note.

- 1.- For the purposes of heading 47.02, the expression "chemical wood pulp, dissolving grades" means chemical wood pulp having by weight an insoluble fraction of 92 % or more for soda or sulphate wood pulp or of 88 % or more for sulphite wood pulp after one hour in a caustic soda solution containing 18 % sodium hydroxide (NaOH) at 20 °C, and for sulphite wood pulp an ash content that does not exceed 0.15 % by weight.

GENERAL

The pulp of this Chapter consists essentially of cellulose fibres obtained from various vegetable materials, or from waste textiles of vegetable origin.

The most important pulp in international trade is wood pulp, termed "mechanical wood pulp", "chemical wood pulp", "semi-chemical wood pulp" or "chemi-mechanical pulp", according to its method of preparation. The woods mostly used are pine, spruce, poplar and aspen, but harder woods such as beech, chestnut, eucalyptus and certain tropical woods are also used.

Other materials used for making pulp include :

- (1) Cotton linters.
- (2) Recovered (waste and scrap) paper or paperboard.
- (3) Rags (particularly cotton, linen or hemp) and other textile wastes such as old ropes.
- (4) Straw, esparto, flax, ramie, jute, hemp, sisal, bagasse, bamboo and various other grasses and reeds.

Wood pulp may be brown or white. It may be semi-bleached or bleached by chemicals or may be unbleached. A pulp should be regarded as semi-bleached or bleached if, after manufacture, it has been subjected to any treatment intended to increase its degree of whiteness (brightness).

Apart from their use in the paper industry, some pulps (especially bleached pulps) serve as a source of cellulose in the manufacture of various products such as artificial textile materials, plastics, varnishes and explosives; they may also be used in cattle fodder.

Pulp is generally presented in baled sheets (whether or not perforated), wet or dry, but may sometimes be in slabs, in rolls or in the form of powder or flakes.

The Chapter **does not cover** :

- (a) Cotton linters (**heading 14.04**).
- (b) Synthetic paper pulps consisting of sheets of non-coherent polyethylene or polypropylene fibres (**heading 39.20**).
- (c) Fibreboard (**heading 44.11**).
- (d) Filter blocks, slabs or plates, of paper pulp (**heading 48.12**).
- (e) Other articles of paper pulp (**Chapter 48**).

47.01 - Mechanical wood pulp.

Mechanical wood pulp is obtained solely by a mechanical process i.e., by disintegrating or grinding wood, freed of its bark and sometimes of its knots, into its fibres by mechanical milling under a flow of water.

Milling without prior steam treating produces the so-called “white” mechanical wood pulp in which the fibres are broken and weakened. The wood may be steam treated before grinding, producing stronger fibres of brown colour (brown mechanical wood pulp).

Further development from the traditional grinding methods is the pulp referred to as refiner mechanical pulp where wood chips are shredded in a disc refiner by passing the chips between two closely spaced ridged plates, one or both of which may be rotating. One of the superior grades of this type of pulp is produced by refining wood chips after they have received preliminary heat treatment to soften them and allow an easier separation of the fibres with less fibre damage. The resultant pulp quality is superior to the traditional mechanical wood pulp.

Thus the main types of mechanical wood pulp are :

Stone groundwood (SGW) produced from roundwood or blocks in stone grinders at atmospheric pressure.

Pressurised stone groundwood (PGW) produced from roundwood or blocks in pressurised stone grinders.

Refiner mechanical pulp (RMP) produced from wood chips or wafers in refiners discharging at atmospheric pressure.

Thermo-mechanical pulp (TMP) produced from wood chips or wafers in refiners after high-pressure steaming of the wood.

It should be noted that some pulps produced in refiners may be chemically treated. Such pulps fall in **heading 47.05**.

Mechanical wood pulp is not generally used alone because the fibres are relatively short and would produce weak products. In paper-making it is more often mixed with chemical pulp. Newsprint is generally made from such a mixture (see Note 4 to Chapter 48).

47.02 - Chemical wood pulp, dissolving grades.

This heading covers chemical wood pulp of dissolving grades **only**, as defined in Note 1 to this Chapter. This pulp is specially refined or purified to meet the requirements of its intended use. It is used for making regenerated cellulose, cellulose ethers and esters and products of these materials, such as plates, sheets, film, foil and strip, textile fibres and certain papers (e.g., paper of a kind used as a base for photosensitive paper, filter paper and vegetable parchment). According to the final use or to the end product, it is also called viscose pulp, acetate pulp, etc.

Chemical wood pulp is obtained by first reducing the wood to chips or particles which are then treated with chemicals. As a result of the treatment the greater part of the lignin and other non-cellulosic materials is removed.

The chemicals usually employed are sodium hydroxide ("soda" process), a mixture of sodium hydroxide and sodium sulphate, which is converted partly into sodium sulphide ("sulphate" process), calcium bisulphite or magnesium bisulphite, also known as calcium hydrogen sulphite or magnesium hydrogen sulphite respectively ("sulphite" process).

The product obtained is superior in fibre length and richer in cellulose than mechanical pulp made from the same raw material.

The manufacture of chemical wood pulp, dissolving grades, is achieved through extensive chemical and physicochemical reactions. In addition to whitening, its manufacture may require chemical purification, deresination, depolymerisation, ash reduction or adjustment of reactivity, most of which are combined in a complex bleaching and purification process.

47.03 - Chemical wood pulp, soda or sulphate, other than dissolving grades.

- Unbleached :

4703.11 -- Coniferous

4703.19 -- Non-coniferous

- Semi-bleached or bleached :

4703.21 -- Coniferous

4703.29 -- Non-Coniferous

Soda or sulphate pulps are produced by boiling the wood, usually in chipped form, in strongly alkaline solutions. For soda pulp the cooking liquor is a solution of sodium hydroxide; for sulphate pulp a modified sodium hydroxide solution is employed. The term "sulphate" came to be applied because sodium sulphate, part of which is converted into sodium sulphide, is used at a stage in the preparation of the cooking liquor. Sulphate pulp is by far the more important.

Pulps from these processes are used in the manufacture of absorbent products (such as fluffing and napkins for babies) as well as for papers and paperboards requiring high tearing resistance and tensile and bursting strength.

47.04 - Chemical wood pulp, sulphite, other than dissolving grades.

- Unbleached :

4704.11 -- Coniferous

4704.19 -- Non-coniferous

- Semi-bleached or bleached :

4704.21 -- Coniferous

4704.29 -- Non-coniferous

The sulphite process generally employs an acid solution and takes its name from the various "sulphite" chemicals, such as calcium bisulphite (calcium hydrogen sulphite), magnesium bisulphite (magnesium hydrogen sulphite), sodium bisulphite (sodium hydrogen sulphite), ammonium bisulphite (ammonium hydrogen sulphite), which may be used during the preparation of the cooking liquor (see the Explanatory Note to heading 47.02). The solution also contains free sulphur dioxide. The process is used extensively for the treatment of spruce fibre.

Sulphite pulp is used, alone or mixed with other pulps, for various writing or printing papers, etc. It is also used, *inter alia*, for greaseproof or glazed transparent papers.

47.05 - Wood pulp obtained by a combination of mechanical and chemical pulping processes.

This heading covers wood pulp manufactured by a combination of mechanical and chemical pulping processes. Such pulp is variously described as semi-chemical pulp, chemi-mechanical pulp, etc.

Semi-chemical pulp is produced in a two-part process in which the wood, generally in chips, is first chemically softened in digesters and then mechanically refined. It contains a great deal of impurities and ligneous matter and is used mainly for medium-quality papers. It is generally known as neutral sulphite semi-chemical (NSSC), bisulphite semi-chemical or kraft semi-chemical.

Chemi-mechanical pulp is produced in refiners from wood in chips, shavings, sawdust or similar forms. The wood is reduced to a fibrous state by the abrasive action induced by two closely spaced ridged plates or discs, one or both of which are rotating. Small amounts of chemicals are introduced as a pre-treatment or during refining in order to facilitate fibre separation. The wood may be subjected to steaming for different periods of time at different pressures and temperatures. Depending on the combination of processes employed in its manufacture, and the order in which the processes are carried out, chemi-mechanical pulp is also known as chemi-thermomechanical pulp (CTMP), chemi-refiner mechanical pulp (CRMP) or thermo chemi-mechanical pulp (TCMP).

Chemi-mechanical pulps are used, *inter alia*, in the production of newsprint (see Note 4 to Chapter 48). They are also used for making tissue and graphic paper.

The heading includes pulps known as screenings.

47.06 - Pulps of fibres derived from recovered (waste and scrap) paper or paperboard or of other fibrous cellulosic material.

4706.10 - Cotton linters pulp

4706.20 - Pulps of fibres derived from recovered (waste and scrap) paper or paperboard

4706.30 - Other, of bamboo

- Other :

4706.91 -- Mechanical

4706.92 -- Chemical

4706.93 -- Obtained by a combination of mechanical and chemical processes

The important kinds of fibrous cellulosic material, other than wood, used for making pulps are mentioned in the General Explanatory Note.

Pulps of fibres derived from recovered (waste and scrap) paper or paperboard are usually presented in the form of dried, baled sheets and consist of heterogenous blends of cellulosic fibres. They may be bleached or unbleached. These pulps are obtained by a series of mechanical or chemical cleaning, screening and de-inking processes. Depending on the input material and the extent of the processing, they may contain small quantities of residues such as ink, clay, starch, polymer coatings or glues.

Pulps of this heading **other than** those derived from recovered (waste and scrap) paper or paperboard may be obtained by a mechanical process, a chemical process or a combination of mechanical and chemical processes.

47.07 - Recovered (waste and scrap) paper or paperboard (+).

- 4707.10 - Unbleached kraft paper or paperboard or corrugated paper or paperboard
- 4707.20 - Other paper or paperboard made mainly of bleached chemical pulp, not coloured in the mass
- 4707.30 - Paper or paperboard made mainly of mechanical pulp (for example, newspapers, journals and similar printed matter)
- 4707.90 - Other, including unsorted waste and scrap

Waste of paper or paperboard covered by this heading includes shavings, cuttings, clippings, torn sheets, old newspapers and journals, proof-sheets, printers' rejects and similar material.

The heading also covers scrap articles of paper or paperboard.

Such waste and scrap is normally used for pulping and is often presented in compressed bales, but it should be noted that its possible use for other purposes (e.g., packing) does not exclude its classification in this heading.

Paper wool, however, even if manufactured from waste paper, is **excluded (heading 48.23)**.

The heading also **excludes** waste and scrap of paper or paperboard, containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal, e.g., waste and scrap photographic paper or paperboard containing silver or compounds thereof (**heading 71.12**).

Subheading Explanatory Note.

Subheadings 4707.10, 4707.20 and 4707.30

Although, in principle, subheadings 4707.10, 4707.20 and 4707.30 cover sorted waste and scrap, classification in any one of these subheadings is not affected by the presence of small quantities of paper or paperboard of any other subheading of heading 47.07.

Chapter 48

PAPER AND PAPERBOARD; ARTICLES OF PAPER PULP, OF PAPER OR OF PAPERBOARD

Notes.

- 1.- For the purposes of this Chapter, except where the context otherwise requires, a reference to "paper" includes references to paperboard (irrespective of thickness or weight per m²).
- 2.- This Chapter does not cover :
 - (a) Articles of Chapter 30;
 - (b) Stamping foils of heading 32.12;
 - (c) Perfumed papers or papers impregnated or coated with cosmetics (Chapter 33);
 - (d) Paper or cellulose wadding impregnated, coated or covered with soap or detergent (heading 34.01), or with polishes, creams or similar preparations (heading 34.05);
 - (e) Sensitised paper or paperboard of headings 37.01 to 37.04;
 - (f) Paper impregnated with diagnostic or laboratory reagents (heading 38.22);
 - (g) Paper-reinforced stratified sheeting of plastics, or one layer of paper or paperboard coated or covered with a layer of plastics, the latter constituting more than half the total thickness, or articles of such materials, other than wall coverings of heading 48.14 (Chapter 39);
 - (h) Articles of heading 42.02 (for example, travel goods);
 - (ij) Articles of Chapter 46 (manufactures of plaiting material);
 - (k) Paper yarn or textile articles of paper yarn (Section XI);
 - (l) Articles of Chapter 64 or Chapter 65;
 - (m) Abrasive paper or paperboard (heading 68.05) or paper- or paperboard-backed mica (heading 68.14) (paper and paperboard coated with mica powder are, however, to be classified in this Chapter);
 - (n) Metal foil backed with paper or paperboard (generally Section XIV or XV);
 - (o) Articles of heading 92.09;
 - (p) Articles of Chapter 95 (for example, toys, games, sports requisites); or
 - (q) Articles of Chapter 96 (for example, buttons, sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies).
- 3.- Subject to the provisions of Note 7, headings 48.01 to 48.05 include paper and paperboard which have been subjected to calendering, super-calendering, glazing or similar finishing, false water-marking or surface sizing, and also paper, paperboard, cellulose wadding and webs of cellulose fibres, coloured or marbled throughout the mass by any method. Except where heading 48.03 otherwise requires, these headings do not apply to paper, paperboard, cellulose wadding or webs of cellulose fibres which have been otherwise processed.

- 4.- In this Chapter the expression "newsprint" means uncoated paper of a kind used for the printing of newspapers, of which not less than 50 % by weight of the total fibre content consists of wood fibres obtained by a mechanical or chemi-mechanical process, unsized or very lightly sized, having a surface roughness Parker Print Surf (1 MPa) on each side exceeding 2.5 micrometres (microns), weighing not less than 40 g/m² and not more than 65 g/m², and apply only to paper : (a) in strips or rolls of a width exceeding 28 cm; or (b) in rectangular (including square) sheets with one side exceeding 28 cm and the other side exceeding 15 cm in the unfolded state.
- 5.- For the purposes of heading 48.02, the expressions "paper and paperboard, of a kind used for writing, printing or other graphic purposes" and "non perforated punch-cards and punch tape paper" mean paper and paperboard made mainly from bleached pulp or from pulp obtained by a mechanical or chemi-mechanical process and satisfying any of the following criteria :

For paper or paperboard weighing not more than 150 g/m² :

- (a) containing 10 % or more of fibres obtained by a mechanical or chemi-mechanical process, and
 - 1. weighing not more than 80 g/m², or
 - 2. coloured throughout the mass; or
- (b) containing more than 8 % ash, and
 - 1. weighing not more than 80 g/m², or
 - 2. coloured throughout the mass; or
- (c) containing more than 3 % ash and having a brightness of 60 % or more ; or
- (d) containing more than 3 % but not more than 8 % ash, having a brightness less than 60 % , and a burst index equal to or less than 2.5 kPa m²/g; or
- (e) containing 3 % ash or less, having a brightness of 60 % or more and a burst index equal to or less than 2.5 kPa m²/g.

For paper or paperboard weighing more than 150 g/m² :

- (a) coloured throughout the mass; or
- (b) having a brightness of 60 % or more, and
 - 1. a caliper of 225 micrometres (microns) or less, or
 - 2. a caliper more than 225 micrometres (microns) but not more than 508 micrometres (microns) and an ash content more than 3 %; or
- (c) having a brightness of less than 60 %, a caliper of 254 micrometres (microns) or less and an ash content more than 8 %.

Heading 48.02 does not, however, cover filter paper or paperboard (including tea-bag paper) or felt paper or paperboard.

- 6.- In this Chapter " kraft paper and paperboard " means paper and paperboard of which not less than 80 % by weight of the total fibre content consists of fibres obtained by the chemical sulphate or soda processes.
- 7.- Except where the terms of the headings otherwise require, paper, paperboard, cellulose wadding and webs of cellulose fibres answering to a description in two or more of the headings 48.01 to 48.11 are to be classified under that one of such headings which occurs last in numerical order in the Nomenclature.

8.- Headings 48.03 to 48.09 apply only to paper, paperboard, cellulose wadding and webs of cellulose fibres :

- (a) in strips or rolls of a width exceeding 36 cm; or
- (b) in rectangular (including square) sheets with one side exceeding 36 cm and the other side exceeding 15 cm in the unfolded state.

9.- For the purposes of heading 48.14, the expression " wallpaper and similar wall coverings " applies only to :

- (a) Paper in rolls, of a width of not less than 45 cm and not more than 160 cm, suitable for wall or ceiling decoration :
 - (i) Grained, embossed, surface-coloured, design-printed or otherwise surface-decorated (for example, with textile flock), whether or not coated or covered with transparent protective plastics;
 - (ii) With an uneven surface resulting from the incorporation of particles of wood, straw, etc.;
 - (iii) Coated or covered on the face side with plastics, the layer of plastics being grained, embossed, coloured, design-printed or otherwise decorated; or
 - (iv) Covered on the face side with plaiting material, whether or not bound together in parallel strands or woven;
- (b) Borders and friezes, of paper, treated as above, whether or not in rolls, suitable for wall or ceiling decoration;
- (c) Wall coverings of paper made up of several panels, in rolls or sheets, printed so as to make up a scene, design or motif when applied to a wall.

Products on a base of paper or paperboard, suitable for use both as floor coverings and as wall coverings, are to be classified in heading 48.23.

10.-Heading 48.20 does not cover loose sheets or cards, cut to size, whether or not printed, embossed or perforated.

11.-Heading 48.23 applies, *inter alia*, to perforated paper or paperboard cards for Jacquard or similar machines and paper lace.

12.-Except for the goods of heading 48.14 or 48.21, paper, paperboard, cellulose wadding and articles thereof, printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods, fall in Chapter 49.

◦
◦ ◦

Subheading Notes.

1.- For the purposes of subheadings 4804.11 and 4804.19, " kraftliner " means machine-finished or machine-glazed paper and paperboard, of which not less than 80 % by weight of the total fibre content consists of wood fibres obtained by the chemical sulphate or soda processes, in rolls, weighing more than 115 g/m² and having a minimum Mullen bursting strength as indicated in the following table or the linearly interpolated or extrapolated equivalent for any other weight.

Weight g/m ²	Minimum Mullen bursting strength kPa
115	393
125	417
200	637
300	824
400	961

2.- For the purposes of subheadings 4804.21 and 4804.29, "sack kraft paper" means machine-finished paper, of which not less than 80 % by weight of the total fibre content consists of fibres obtained by the chemical sulphate or soda processes, in rolls, weighing not less than 60 g/m² but not more than 115 g/m² and meeting one of the following sets of specifications :

- a) Having a Mullen burst index of not less than 3.7 kPa m²/g and a stretch factor of more than 4.5 % in the cross direction and of more than 2 % in the machine direction.
- b) Having minima for tear and tensile as indicated in the following table or the linearly interpolated equivalent for any other weight :

Weight g/m ²	Minimum tear mN		Minimum tensile kN/m	
	Machine direction	Machine direction plus cross direction	Cross direction	Machine direction plus cross direction
60	700	1,510	1.9	6
70	830	1,790	2.3	7.2
80	965	2,070	2.8	8.3
100	1,230	2,635	3.7	10.6
115	1,425	3,060	4.4	12.3

3.- For the purposes of subheading 4805.11, "semi-chemical fluting paper" means paper, in rolls, of which not less than 65 % by weight of the total fibre content consists of unbleached hardwood fibres obtained by a combination of mechanical and chemical pulping processes, and having a CMT 30 (Corrugated Medium Test with 30 minutes of conditioning) crush resistance exceeding 1.8 newtons/g/m² at 50 % relative humidity, at 23 °C.

- 4.- Subheading 4805.12 covers paper, in rolls, made mainly of straw pulp obtained by a combination of mechanical and chemical processes, weighing 130 g/m² or more, and having a CMT 30 (Corrugated Medium Test with 30 minutes of conditioning) crush resistance exceeding 1.4 newtons/g/m² at 50 % relative humidity, at 23 °C.
- 5.- Subheadings 4805.24 and 4805.25 cover paper and paperboard made wholly or mainly of pulp of recovered (waste and scrap) paper or paperboard. Testliner may also have a surface layer of dyed paper or of paper made of bleached or unbleached non-recovered pulp. These products have a Mullen burst index of not less than 2 kPa m²/g.
- 6.- For the purposes of subheading 4805.30, "sulphite wrapping paper" means machine-glazed paper, of which more than 40 % by weight of the total fibre content consists of wood fibres obtained by the chemical sulphite process, having an ash content not exceeding 8 % and having a Mullen burst index of not less than 1.47 kPa m²/g.
- 7.- For the purposes of subheading 4810.22, "light-weight coated paper" means paper, coated on both sides, of a total weight not exceeding 72 g/m², with a coating weight not exceeding 15 g/m² per side, on a base of which not less than 50 % by weight of the total fibre content consists of wood fibres obtained by a mechanical process.

Subheading Explanatory Notes.

Subheading Note 1

In this Note the minimum Mullen bursting strength is expressed in kilopascals (kPa). The g/cm² equivalents are as follows :

Weight g/m ²	kPa	g/cm ²
115	393	4,030
125	417	4,250
200	637	6,500
300	824	8,400
400	961	9,800

The calculation of the intermediate values (interpolation) or of values of more than 400 g (extrapolation) should be based on the following formulae :

<u>Basis weight</u>	<u>Minimum Mullen bursting strength g/cm²</u>
Not exceeding 125 g/m ²	Basis weight (g/m ²) x 22 + 1,500
Exceeding 125 g/m ² but not exceeding 200 g/m ²	Basis weight (g/m ²) x 30 + 500
Exceeding 200 g/m ² but not exceeding 300 g/m ²	Basis weight (g/m ²) x 19 + 2,700
Exceeding 300 g/m ²	Basis weight (g/m ²) x 14 + 4,200

Subheading Note 2

For papers of weights per m² falling between the values indicated in this Note, the minima could be calculated (with an error not exceeding 2 %) on the basis of the following table :

	<u>Minimum</u>
Tear, machine direction (mN) (rounded to nearest 0 or 5 millinewton)	Basis weight (g/m ²) x 13.23 — 94.64
Tear, machine direction plus cross direction (mN) (rounded as indicated above)	Basis weight (g/m ²) x 28.22 — 186.2
Tensile, cross direction (kN/m)	Basis weight (g/m ²) x 0.0449 — 0.8186
Tensile, machine direction plus cross direction (kN/m)	Basis weight (g/m ²) x 0.1143 — 0.829

GENERAL

In the Explanatory Notes to this Chapter, except where the context otherwise requires, a reference to "paper" includes references to paperboard (irrespective of thickness or weight).

Paper consists essentially of the cellulosic fibres of the pulps of Chapter 47 felted together in sheet form. Many products, such as certain tea-bag materials, consist of a mixture of these cellulose fibres and of textile fibres (in particular man-made fibres as defined in Note 1 to Chapter 54). Where the textile fibres predominate by weight, the products are not regarded as paper and are classified as nonwovens (**heading 56.03**).

To avoid discrepancies which can result from the use of different methods, it is highly desirable that all administrations use the International Organization for Standardization (ISO) test methods to determine the physical properties of paper and paperboard of Chapter 48. Whenever the following analytical and physical criteria are mentioned throughout this Chapter, the ISO Standards listed below should be used :

Ash Content :

ISO 2144 Paper and board - - Determination of ash

Brightness :

ISO 2470 Paper and board - - Measurement of diffuse blue reflectance factor (ISO brightness)

Bursting strength and burst index :

ISO 2758 Paper - - Determination of bursting strength

ISO 2759 Board - - Determination of bursting strength

CMT 60 (crush resistance) :

ISO 7263 Corrugating medium - - Determination of the flat crush resistance after laboratory fluting

Fibre composition :

ISO 9184/1-3 Paper, board and pulps - - Fibre furnish analysis

Grammage (weight) :

ISO 536 Paper and board - - Determination of grammage

Parker Print-Surf surface roughness :

ISO 8791/4 Paper and board - - Determination of roughness/smoothness (air leak methods)

Single sheet thickness (caliper) :

ISO 534 Paper and board - - Determination of thickness and apparent bulk density or apparent sheet density

Tearing resistance :

ISO 1974 Paper - - Determination of tearing resistance (Elmendorf method)

Tensile strength and stretch :

ISO 1924/2 Paper and board - - Determination of tensile properties - - Part 2 : Constant rate of elongation method.

The manufacture of paper, whether by machine or by hand, may be considered as being in three stages, the preparation of the pulp, formation of the sheet or web, and finishing.

PREPARATION OF THE PULP

The pulp is prepared by blending if necessary, mixing with fillers, size, or colouring matter as required, and reduction to a suitable consistency by dilution in water and mechanical beating.

The fillers, which are generally of inorganic origin (e.g., kaolin (China clay), titanium dioxide, calcium carbonate) are used in order to increase opacity, improve printability or economise pulp. Size (e.g., rosin mixed with alum) is used to render the paper less absorbent to ink, etc.

FORMATION OF THE SHEET OR WEB

(A) Machine-made paper and paperboard.

The most commonly used method of making paper by machine is the Fourdrinier process. In this process the pulp, after being prepared as above, is fed through the head box onto a large endless band of man-made monofilaments or brass or bronze wire moving forward, generally with a vibratory movement; the pulp loses most of its water by gravity and by table rolls, foils or suction boxes placed along the underside of the wire. The fibres become felted and assume the form of a limp web. In some machines this web then passes under a wire-covered roll (dandy-roll) where it is consolidated and smoothed and, if required, is given a watermark produced, e.g., by an embossed design or line effect applied to the surface of the dandy roll cover. The web next passes to an endless belt of felt and so to the press section where it is further consolidated; it is then dried by passing over heated cylinders.

An alternative method is the twin wire former (used particularly in newsprint manufacture). The pulp passes between two forming rolls and is carried between two "wires". Water is deflected from both wires, aided by suction boxes and suction rolls, and the web is formed. The newly formed web is drawn to the pressing and dryer sections. The twin wires forming both sides of the paper are alike, thus eliminating the felt side and wire side which characterise paper produced by the Fourdrinier process.

In other types of machines the Fourdrinier wire is replaced by a large cylinder ("mould") covered with wire gauze revolving partly immersed in the prepared pulp. The cylinder takes up a layer of pulp and forms it into a paper web which is transferred to drying felts either in continuous lengths or, by dividing the surface of the roll, in sheet form. In a variation of the process, layers are allowed to build up around a large diameter roll to be cut off when the required thickness is reached.

Machines with multiple wires or cylinder moulds (or a combination of Fourdrinier wire and cylinder moulds) are used to make boards composed of layers (sometimes of different colour or quality) produced simultaneously and rolled together in the wet state without the use of adhesive.

(B) **Hand-made paper and paperboard.**

In the manufacture of hand-made paper and paperboard the essential operation of moulding the pulp fibres into sheet form is performed by hand, even though other operations may be performed by machine.

Hand-made paper and paperboard may be made from any paper-making material but generally best grade linen or cotton rags are used.

In forming the sheet, a quantity of pulp is agitated on a sieve-like mould until most of the water is removed and the fibres felted. The sheet is then removed from the mould, pressed between felts and hung up to dry.

The hand mould on which the fibres are felted together may consist either of parallel-laid wires or of woven wire cloth which produce watermarks on the paper. Watermark designs may also be affixed to the wire.

The characteristic properties of hand-made paper are strength and durability and the quality of the grain. These properties render it suitable for special uses, e.g., banknote paper, document paper, drawing paper, etching paper, special filter papers, ledger paper, mounting paper, high class printing or stationery papers. It is also used for making wedding cards, letterheads, calendars, etc.

Hand-made paper is normally made to size as used and has four deckled edges with marked feathering; these may, however, sometimes be trimmed and in any case are not a reliable distinguishing feature since some machine-made papers, particularly mould-made paper, also have deckled edges which are not, however, so markedly feathered.

FINISHING OPERATIONS

Paper may be finished by calendering or supercalendering (being first moistened if necessary), either by calenders integral with the paper-making machine or separate from it; this gives a more or less polished or glazed surface on either one or both faces. A similar surface on one side of the paper may be obtained by machine glazing using a heated cylinder. The paper may also receive a kind of false watermarking at this stage. Almost all ordinary writing, printing and drawing papers are also surface sized, for example, with some kind of glue or starch solution, generally in order to increase their surface strength and their resistance to the penetration and spreading of aqueous liquids, for example, writing ink.

Coated paper and paperboard

This term applies to paper or paperboard which has been given a coating on one or both sides either to produce a specially glossy finish or to render the surface suitable for particular requirements.

Coating products generally consist of mineral substances, binding agents and other additives necessary for the coating operation, such as hardeners and dispersing agents.

Carbon paper, self-copy and other copying or transfer papers, in rolls or sheets of particular dimensions, fall in heading 48.09.

Paper and paperboard, coated with kaolin (China clay) or other inorganic substances, with or without a binder, in rolls or sheets, fall in heading 48.10. In addition to kaolin, the inorganic substances used for coating include barium sulphate, calcium carbonate, calcium sulphate, magnesium silicate, zinc oxide, and powdered metal. These coating materials are generally applied by means of a binding agent such as glue, gelatin, amylaceous substances (e.g., starch, dextrin), shellac, albumin, synthetic latex. Products are coated with kaolin, etc., to attain a glossy, dull or matte finish. Examples of products coated with kaolin or other inorganic substances are : coated printing papers and paperboard (including coated art or chromo papers), coated folding carton stock, papers coated with metal powder (**other than** stamping foils of **heading 32.12**) or mica powder, enamel papers (used largely for labels and for covering boxes). It may be noted that the binding agents used for fixing the coating, such as glue or starch, are also used for surface sizing but in the case of an uncoated surface sized paper, the coating pigments are absent.

Subject to the exceptions mentioned in the heading, paper and paperboard with a coating of tar, bitumen, asphalt, plastics or other organic materials such as wax, stearin, textile dust, sawdust, granulated cork, shellac, in rolls or sheets, fall in heading 48.11. These coating materials may not require a binding agent for their application. The coatings are used to obtain the physical characteristics for a broad range of end uses, for example, for waterproof packages, release paper and paperboard. Such coated papers and paperboards include gummed or adhesive paper, flock papers (coated with textile dust and used for box coverings and wallpaper), paper coated with granulated cork (used as packing material), graphite paper, tarred wrapping paper.

Colouring materials are also frequently added to the coating medium.

Many coated papers and paperboards are finished with a high gloss by super-calendering, or the coating may be varnished in order to protect it from moisture (as in the case of washable papers, for example).

It is possible to distinguish between surface sizing and coating by using a combination of chemical and physical methods. In most cases, differentiation can easily be made either on the basis of the nature or quantity of the material present or on the basis of the overall physical characteristics. In general, in the case of surface sizing, the appearance and texture of the natural surface of the paper or paperboard are maintained, whereas, in the case of coated paper or paperboard, the irregularities of the natural surface are substantially eliminated by the coating material.

Problems may arise in borderline cases, particularly for the following reasons : low coated papers may have had the coating applied in the size press; certain substances present in coatings also exist in paper itself (e.g., filler); and fibres may be visible in the case of papers coated with material which does not contain a pigment, e.g., an aqueous dispersion of poly(vinyl chloride). However, it should be possible to deal with these cases by one or more of the methods indicated below.

Many coated papers, such as mineral-coated art printing papers, cannot easily be distinguished by the eye from highly finished uncoated papers. The coating, however, may sometimes be seen by scraping the surface or be removed by immersion in water.

One method of testing which may determine whether or not a paper is coated (particularly with inorganic substances) involves sticking the paper to an adhesive tape. When the tape is peeled off most of the coating adheres to the tape. It is then necessary to dissolve the wood fibres and any starch present on the tape with cupriethylene diamine. The presence or absence of a coating is indicated by comparing the weights of the tape before and after these operations. This method can also be used for papers coated with organic substances.

Among other methods used for identifying coated paper and paperboard are scanning electron microscopy (SEM), X-ray diffraction and infra-red spectrophotometry. These can be used for identifying products of both headings 48.10 and 48.11.

Coloured or printed paper and paperboard

These include papers printed by any process with one or several colours, stripes, motifs, designs, etc., and also surface marbled or jaspé papers. These papers are used for various purposes such as box covering and bookbinding.

Paper may be surface-printed in ink of any colour with lines, whether parallel, convergent, or at an angle. Such paper is used, *inter alia*, for account books and book-keeping, school exercise books, drawing books, manuscript music sheets and books, writing paper, graphpaper and note books.

This Chapter includes printed papers (such as wrapping papers for individual traders, printed with names of traders, trade marks and devices, directions for use of merchandise) **provided** that the printing is merely incidental to the use of the paper for wrapping, writing, etc., and that the goods do not constitute printed matter of **Chapter 49** (see Note 12 to this Chapter).

Impregnated paper and paperboard

Most of these papers and paperboards are obtained by treatment with oils, waxes, plastics, etc., in such a manner as to permeate them and give them special qualities (e.g., to render them waterproof, greaseproof, and sometimes translucent or transparent). They are used largely for protective wrapping or as insulating materials.

Impregnated papers and paperboards include, oiled wrapping paper, oiled or waxed manifold paper, stencil paper, insulating paper and paperboard impregnated, e.g., with plastics, rubberised paper, paper and paperboard merely impregnated with tar or bitumen.

Certain papers such as wallpaper base may be impregnated with insecticides or chemicals.

*
* *

This Chapter also includes **cellulose wadding and webs of cellulose fibres** which consist of a variable number of very thin layers of loosely felted cellulose fibres rolled together when in a damp condition so that the layers tend to separate on drying.

SCOPE OF THE CHAPTER

This Chapter covers :

- (I) Paper, paperboard, cellulose wadding and webs of cellulose fibres, of all kinds, in rolls or sheets :

(A) Headings 48.01, 48.02, 48.04 and 48.05 relate to machine-made uncoated papers subjected, if required, to sizing and simple finishing processes (e.g., calendering, glazing). Heading 48.02 also covers uncoated hand-made papers, which may be subjected to those same processes. Heading 48.03 relates to uncoated papers of a kind used for household or sanitary purposes, cellulose wadding and webs of cellulose fibres, which may be subjected to processes mentioned in the heading. Note 3 to this Chapter specifies the processes permitted for paper, paperboard, cellulose wadding and webs of cellulose fibres, of headings 48.01 to 48.05.

The processes admissible in headings 48.01 to 48.05 are performed as a part of the continuous paper-manufacturing run. A characteristic of the papers of these headings is that the appearance and texture of their natural surface are maintained. In the case of coated papers, the irregularities of the natural surface are substantially eliminated by the coating material which forms a new, superior, non-cellulosic surface.

(B) Headings 48.06 to 48.11 relate to certain special papers or paperboards, (for example, parchment, greaseproof, composite) or paper, paperboard or cellulose wadding and webs of cellulose fibres which have been subjected to various treatments, such as coating, design printing, ruling, impregnating, corrugation, creping, embossing, and perforation.

Heading 48.11 also includes certain floor coverings on a base of paper or paperboard.

*
* *

Except where the terms of the headings otherwise require, when paper or paperboard answers to a description in two or more of the above-mentioned headings it is classified in that heading which occurs last in numerical order in the Nomenclature (Note 7 to this Chapter).

It should also be noted that headings 48.03 to 48.09 apply only to paper, paperboard, cellulose wadding and webs of cellulose fibres, which are :

- (1) in strips or rolls of a width exceeding 36 cm; or
- (2) in rectangular (including square) sheets with one side exceeding 36 cm and the other side exceeding 15 cm in the unfolded state.

On the other hand, headings 48.02, 48.10 and 48.11 cover paper and paperboard, in rolls or rectangular (including square) sheets, of any size. However, hand-made paper and paperboard in any size or shape as made directly and having all its edges deckled remains classified in heading 48.02, subject to Note 7 to this Chapter.

- (II) Filter blocks, slabs and plates, of paper pulp (heading 48.12), cigarette paper, whether or not cut to size or in the form of booklets or tubes (heading 48.13), wallpaper and similar wall coverings (as defined in Note 9 to this Chapter) and window transparencies (heading 48.14).
- (III) Paper, paperboard, cellulose wadding and webs of cellulose fibres, (but not the kinds falling in headings 48.02, 48.10 and 48.11, or in (II) above), in rolls or sheets cut to sizes below those stated in (I) above or cut to shapes other than rectangular (including square) and articles of paper pulp, paper, paperboard, cellulose wadding or webs of cellulose fibres. These fall in one or other of the headings 48.16 to 48.23.

For the purposes of headings 48.12, 48.18, 48.22 and 48.23 and of the relevant Explanatory Notes, the term "paper pulp" means all the products of headings 47.01 to 47.06, that is to say pulp of wood or of other fibrous cellulosic material.

The Chapter **does not cover**, however, goods excluded by Notes 2 and 12 to this Chapter.

48.01 - Newsprint, in rolls or sheets.

The expression “ newsprint ” is defined in Note 4 to this Chapter.

In this definition the expression “ wood fibres obtained by a mechanical or chemi-mechanical process ” means fibres obtained by various pulp manufacturing techniques in which defibration is solely or principally achieved by the application of mechanical forces upon the raw material. These fibres are generally produced in the form of the following pulps :

- (1) **Mechanical pulps**, which include stone groundwood (SGW) and pressurised stone groundwood (PGW) pulps, as well as pulps produced in refiners, for example refiner mechanical pulp (RMP) and thermo-mechanical pulp (TMP).
- (2) **Chemi-mechanical pulps**, which are also produced in refiners but have been treated with **small amounts** of chemicals. They include chemi-thermomechanical pulp (CTMP), chemi-refiner mechanical pulp (CRMP) and thermo chemi-mechanical pulp (TCMP), but **do not** include semi-chemical pulps generally known as neutral sulphite semi-chemical (NSSC), bisulphite semi-chemical or kraft semi-chemical pulps.

The expression “ wood fibres ” in this definition **does not cover** bamboo fibres.

In accordance with Note 8 to this Chapter, this heading applies only to newsprint in strips or rolls of a width exceeding 36 cm, or in rectangular (including square) sheets with one side exceeding 36 cm and the other side exceeding 15 cm in the unfolded state.

The newsprint of this heading may be subjected to processes mentioned in Note 3 to this Chapter. Newsprint otherwise processed is, however, **excluded**.

48.02 - Uncoated paper and paperboard, of a kind used for writing, printing or other graphic purposes, and non perforated punch-cards and punch tape paper, in rolls or rectangular (including square) sheets, of any size, other than paper of heading 48.01 or 48.03; hand-made paper and paperboard (+).

4802.10 - Hand-made paper and paperboard

4802.20 - Paper and paperboard of a kind used as a base for photo-sensitive, heat-sensitive or electro-sensitive paper or paperboard

4802.40 - Wallpaper base

- Other paper and paperboard, not containing fibres obtained by a mechanical or chemi-mechanical process or of which not more than 10 % by weight of the total fibre content consists of such fibres :

4802.54 -- Weighing less than 40 g/m²

4802.55 -- Weighing 40 g/m² or more but not more than 150 g/m², in rolls

4802.56 -- Weighing 40 g/m² or more but not more than 150 g/m², in sheets with one side not exceeding 435 mm and the other side not exceeding 297 mm in the unfolded state

4802.57 -- Other, weighing 40 g/m² or more but not more than 150 g/m²

4802.58 -- Weighing more than 150 g/m²

- Other paper and paperboard, of which more than 10 % by weight of the total fibre content consists of fibres obtained by a mechanical or chemi-mechanical process :

4802.61 -- In rolls

4802.62 -- In sheets with one side not exceeding 435 mm and the other side not exceeding 297 mm in the unfolded state

4802.69 -- Other

Uncoated paper and paperboard, of a kind used for writing, printing or other graphic purposes, and non perforated punch-cards and punch tape paper of this heading are defined in Note 5 to this Chapter. Such paper and paperboard complying with that definition are always classified in this heading.

Hand-made paper and paperboard in any size or shape as made directly and having all its edges deckled falls, subject to the provisions of Chapter Note 7, in this heading.

Hand-made paper and paperboard having any of its edges trimmed or cut and machine-made paper and paperboard are, however, classified in this heading only if they are in strips or rolls or in rectangular (including square) sheets, of any size. If they have been cut to any other shape, they fall in later headings of this Chapter (for example, 48.17, 48.21 or 48.23).

Paper and paperboard of this heading may be subjected to processes specified in Note 3 to this Chapter, such as colouring or marbling throughout the mass, calendering, super-calendering glazing, false watermarking or surface sizing. Paper and paperboard which have been otherwise processed, are **excluded** (generally, **headings 48.06 to 48.11**).

In addition to hand-made paper and paperboard and subject to Chapter Note 5 to this Chapter, the heading includes :

(A) Base papers and paperboard, for example :

- (1) Paper and paperboard of a kind used as a base for photo-sensitive, heat-sensitive or electro-sensitive paper or paperboard;
- (2) Carbonising base paper (a thin, tear-resistant paper weighing from 9 to 70 g per m² according to the intended use) for conversion into one-time or other carbon paper;
- (3) Wallpaper base;
- (4) Base paper and paperboard for conversion into kaolin coated paper and paperboard of heading 48.10.

(B) Other paper and paperboard, of a kind used for writing, printing or other graphic purposes, for example :

- (1) Magazine paper and book printing paper (including thin and bulky printings);
- (2) Offset printing papers;
- (3) Printing Bristol board, index Bristol, postcard stock, tag stock, cover paper;
- (4) Poster paper, drawing paper, school exercise or note book paper, writing tablet or school paper;
- (5) Bond paper, duplicating paper, mimeograph paper, typewriter paper, onionskin, manifold and other paper for office or personal stationery, including paper of a kind used in printers or in photocopying apparatus;
- (6) Ledger paper, adding machine roll paper;
- (7) Envelope paper and folder paper;
- (8) Register or recording paper, form bond paper, and continuous stationery;
- (9) Security paper used for cheques, stamps, banknotes or the like.

(C) Non perforated punch-cards and punch tape paper.

This heading also **excludes** :

- (a) Newsprint (**heading 48.01**).
- (b) Paper of **heading 48.03**.
- (c) Filter paper and paperboard (including tea-bag paper) and felt paper and paperboard (**heading 48.05**).
- (d) Cigarette paper (**heading 48.13**).

Subheading Explanatory Note.

Subheading 4802.20

Subject to Note 5 to this Chapter, paper and paperboard of a kind used as a base for photo-sensitive paper or paperboard generally means paper or paperboard of rag pulp or fine paper or paperboard containing rag pulp, entirely free of extraneous matter (particularly metals such as iron or copper).

48.03 - Toilet or facial tissue stock, towel or napkin stock and similar paper of a kind used for household or sanitary purposes, cellulose wadding and webs of cellulose fibres, whether or not creped, crinkled, embossed, perforated, surface-coloured, surface-decorated or printed, in rolls or sheets.

This heading covers two categories of goods :

- (1) Toilet or facial tissue stock, towel or napkin stock and similar paper of a kind used for household or sanitary purposes. However, such paper in rolls of a width not exceeding 36 cm or cut to any size or shape other than that mentioned in Note 8 to this Chapter, and other household or sanitary articles made from this kind of paper fall in **heading 48.18**.
- (2) Cellulose wadding and webs of cellulose fibres. However, such products in rolls of a width not exceeding 36 cm or cut to any size or shape other than that mentioned in Note 8 to this Chapter, and other articles of cellulose wadding or webs of cellulose fibres, fall in **heading 48.18, 48.19 or 48.23**.

Cellulose wadding consists of a creped web of cellulose fibres of open formation, with a crepe ratio of more than 35 % comprising one or more plies, with each ply having a grammage (basis weight) that may reach 20 g/m² before creping.

Webs of cellulose fibres (tissues) consist of a creped web of cellulose fibres of closed formation, with a maximum crepe ratio of 35 %, comprising one or more plies, with each ply having a grammage (basis weight) that may reach 20 g/m² before creping.

It should be noted that in addition to being subjected to the processes specified in Note 3 to this Chapter, the products of this heading may be creped, crinkled, embossed, perforated, surface-coloured, surface-decorated or printed.

The heading also **excludes** :

- (a) Cellulose wadding impregnated or coated with pharmaceutical substances or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes (**heading 30.05**).
- (b) Paper and cellulose wadding impregnated, coated or covered with soap or detergent (**heading 34.01**), or with polishes, creams or similar preparations (**heading 34.05**).
- (c) Blotting paper (**heading 48.05**).

48.04 - Uncoated kraft paper and paperboard, in rolls or sheets, other than that of heading 48.02 or 48.03.

- Kraftliner :

4804.11 -- Unbleached

4804.19 -- Other

- Sack kraft paper :

4804.21 -- Unbleached

4804.29 -- Other

- Other kraft paper and paperboard weighing 150 g/m² or less :

4804.31 -- Unbleached

4804.39 -- Other

- Other kraft paper and paperboard weighing more than 150 g/m² but less than 225 g/m² :

4804.41 -- Unbleached

4804.42 -- Bleached uniformly throughout the mass and of which more than 95 % by weight of the total fibre content consists of wood fibres obtained by a chemical process

4804.49 -- Other

- Other kraft paper and paperboard weighing 225 g/m² or more :

4804.51 -- Unbleached

4804.52 -- Bleached uniformly throughout the mass and of which more than 95 % by weight of the total fibre content consists of wood fibres obtained by a chemical process

4804.59 -- Other

The expression "kraft paper and paperboard" is defined in Note 6 to this Chapter. The most important categories of kraft paper and paperboard are kraftliner, sack kraft paper and other kraft paper for wrapping and packaging purposes.

"Kraftliner" and "sack kraft paper" are defined in subheading Notes 1 and 2 to this Chapter. The expression "wood fibres" in the definition of kraftliner **does not cover** bamboo fibres.

Kraft paper and paperboard are classified in this heading only if they are in strips or rolls of a width exceeding 36 cm or in rectangular (including square) sheets with one side exceeding 36 cm and the other side exceeding 15 cm in the unfolded state (see Note 8 to this Chapter). If they have been cut to any other size or shape, they generally fall in **heading 48.23**.

Paper and paperboard of this heading may be subjected to processes specified in Note 3 to this Chapter, such as colouring or marbling throughout the mass, calendering, super-calendering, glazing or surface sizing. Paper and paperboard which have been otherwise processed are excluded (generally **heading 48.07, 48.08, 48.10 or 48.11**).

48.05 - Other uncoated paper and paperboard, in rolls or sheets, not further worked or processed than as specified in note 3 to this chapter (+).

- Fluting paper :

4805.11 -- Semi-chemical fluting paper

4805.12 -- Straw fluting paper

4805.19 -- Other

- Testliner (recycled liner board) :

4805.24 -- Weighing 150 g/m² or less

4805.25 -- Weighing more than 150 g/m²

4805.30 - Sulphite wrapping paper

4805.40 - Filter paper and paperboard

4805.50 - Felt paper and paperboard

- Other :

4805.91 -- Weighing 150 g/m² or less

4805.92 -- Weighing more than 150 g/m² but less than 225 g/m²

4805.93 -- Weighing 225 g/m² or more

This heading covers machine-made uncoated papers and paperboards as manufactured in the form of rolls or sheets (for dimensions, see Note 8 to this Chapter), **other than** those included in **headings 48.01 to 48.04**. It **excludes**, however, certain special papers and paperboards or special products (**headings 48.06 to 48.08** and **headings 48.12 to 48.16**) and paper and paperboard which have been subjected to processes other than those permitted in Note 3, for example, coated or impregnated paper or paperboard (**headings 48.09 to 48.11**).

Examples of paper and paperboard of this heading are :

- (1) **Semi-chemical fluting paper** as defined in subheading Note 3 to this Chapter.
- (2) **Multi-ply paper and paperboard** which are products obtained by pressing together two or more layers of moist pulps of which at least one has characteristics different from the others. These differences may arise from the nature of the pulps used (e.g., recycled waste), the method of production (e.g., mechanical or chemical) or, if the pulps are of the same nature and have been produced by the same method, the degree of processing (e.g., unbleached, bleached or coloured).
- (3) **Sulphite wrapping paper** as defined in subheading Note 6 to this Chapter. The expression "wood fibres" in this definition **does not cover** bamboo fibres.
- (4) **Filter paper and paperboard** (including tea-bag paper).

(5) Felt paper and paperboard.

(6) Blotting paper.

The heading also **excludes** fibreboard (**heading 44.11**).

Subheading Explanatory Notes.

Subheading 4805.19

Subheading 4805.19 includes "Wellenstoff fluting paper (recycled medium)", being paper in rolls made mainly of pulp of recovered (waste and scrap) paper or paperboard, with additives (e.g., starch), weighing at least 100 g/m², and having a CMT 30 (Corrugated Medium Test with 30 minutes of conditioning) crush resistance exceeding 1.6 newtons/g/m² at 50 % relative humidity, at 23 °C.

Subheading 4805.40

Filter paper and paperboard are porous products, devoid of wood fibres obtained by a mechanical or semi-chemical process, unsized and designed to remove solid particles from liquids or gases. They are obtained from rag or chemical pulp or a mixture thereof and may also contain synthetic or glass fibres. The pore size is determined by the size of the particles to be removed. These products include filter paper and paperboard for the manufacture of tea bags, of coffee filters, of filters for motor vehicles, as well as analytical filter paper and paperboard which should be neither acidic nor alkaline and should have a very low ash content.

Subheading 4805.50

Felt paper and paperboard are products made from a fibrous mass of varying degrees of absorbency. Waste and scrap of paper or paperboard, wood pulp or textile waste in the form of fibres are used in their manufacture. Felt paper and paperboard are generally of a dull blue grey colour with coarsely fibrous surface and contain impurities. They are used, *inter alia*, in the manufacture of paperboard for roofing and as intermediate layers for cases and fancy leather articles.

48.06 - Vegetable parchment, greaseproof papers, tracing papers and glassine and other glazed transparent or translucent papers, in rolls or sheets.

4806.10 - Vegetable parchment

4806.20 - Greaseproof papers

4806.30 - Tracing papers

4806.40 - Glassine and other glazed transparent or translucent papers

Vegetable parchment is made by immersing unsized and unloaded paper of good quality in sulphuric acid for a few seconds. The action of the acid converts some of the cellulose into amyloid form having a gelatinous and impermeable character. When the treated paper is thoroughly washed and dried the resultant product is much stronger than the original paper, is translucent and resistant to oil, grease and, to a large extent, impervious to water and gas. The heavier and more rigid qualities of vegetable parchment paper, and the product obtained by pressing two or more sheets of vegetable parchment paper together while in the wet state, are known as vegetable parchment paperboard.

Similar papers may be made by the same method except that titanium oxide is added to the pulp. The papers thus obtained, although still parchment papers, are then opaque.

Vegetable parchment paper is used as a protective wrapping for fatty substances (e.g., butter, lard) and other provisions, for packing dynamite, as membranes for use in the processes of osmosis and dialysis, as papers for diplomas, etc., as tracing paper and plan paper for certain uses, for the manufacture of greetings cards, etc. Vegetable parchment paperboard is used as a substitute for parchment in bookbinding, for the manufacture of lampshades, travel goods, etc.

Paper which has been parchmented on one side only (used in the manufacture of certain types of wallpaper) also falls in this heading.

Greaseproof papers (known in certain countries as " imitation parchment paper ") are made directly from pulp (usually sulphite pulp) by reducing the fibres to a state of fine subdivision and hydrolysing them by prolonged beating in water. The paper is translucent and to a large extent impervious to oil and grease. In general it is used for the same purposes as vegetable parchment but, being cheaper, it is particularly suitable for wrapping fatty foods. It is hardly ever glazed and resembles vegetable parchment in appearance but can be distinguished from it by its lower resistance to water.

Vegetable parchment and greaseproof paper are sometimes made softer and more translucent by the use of glycerol, glucose, etc., during the surface finishing. Such treatment does not affect their classification.

Greaseproof paper can be distinguished from vegetable parchment by testing their resistance to water. When soaked for a few minutes vegetable parchment tears only with difficulty and shows a clean break, whereas greaseproof paper treated in the same way tears easily with a more fibrous break.

Similar paper (**imitation greaseproof paper**) having greaseproof qualities but in a less marked degree is obtained when the beating of the pulp is not so prolonged and hydrolysis of the fibres not so complete. To increase the transparency and give a brighter finish, paraffin wax or stearin may be added to the pulp.

A form of **tracing paper**, similar to greaseproof, is made by prolonged beating of the pulp to produce high transparency. The heading also covers other kinds of tracing papers.

Glassine, a glazed transparent paper, is made in the same manner as greaseproof paper but in the final stage of manufacture it obtains its characteristic transparency and high-density finish by repeated damping and glazing under pressure between heated rollers in a supercalender. Similar glazed transparent papers are now made by the same process but with the addition of plastics or other materials to the pulp.

Glazed transparent or translucent papers are mainly uncoloured, but tinted varieties (glazed translucent papers) are also produced by the addition of colouring matter at the pulp stage. They are generally less impermeable than vegetable parchment or greaseproof papers but are also used as protective wrapping for provisions, sweetmeats, etc., for the manufacture of windows for envelopes and, when shredded into shavings, as fine packing material, e.g., for chocolates.

For the dimensions of the products of this heading, see Note 8 to this Chapter.

*
* * *

The heading **excludes** papers which have been rendered greaseproof or waterproof by coating, impregnation or similar processes after manufacture of the paper (**heading 48.09 or 48.11**).

48.07 - Composite paper and paperboard (made by sticking flat layers of paper or paperboard together with an adhesive), not surface-coated or impregnated, whether or not internally reinforced, in rolls or sheets.

This heading covers paper and paperboard made by sticking two or more layers of paper or paperboard together with the aid of an adhesive. These products can be made from paper or paperboard of any quality and the bonding material may be of animal, vegetable or mineral origin (e.g., dextrin, glue, tar, gum, asphalt, latex).

The products of this heading can be distinguished from the products of the preceding headings (made by assembling layers by compression without the aid of bonding materials) by the fact that, on immersion in water or other suitable solvent, the separate layers can be readily parted and bear evidence of the adhesive substance. The layers of composite papers and paperboards also usually separate on burning.

Composite paper and paperboard in which the bonding medium also acts as waterproofing material (e.g., tarred duo-kraft) are included in this heading, as are also paper and paperboard which are internally reinforced with bitumen, tar, asphalt, textile or other material (e.g., textile or metal gauze, plastics), **provided** the essential character of the products remains that of paper or paperboard. These products are principally used as waterproof wrapping.

The finer qualities of composite papers and paperboards, in which the laminated character is not readily apparent, are used for printing or stationery. Others are used for box-making or bookbinding.

For the dimensions of the products of this heading, see Note 8 to this Chapter.

Fibreboard is **excluded** from this heading (**heading 44.11**).

48.08 - Paper and paperboard, corrugated (with or without glued flat surface sheets), creped, crinkled, embossed or perforated, in rolls or sheets, other than paper of the kind described in heading 48.03.

4808.10 - Corrugated paper and paperboard, whether or not perforated

4808.40 - Kraft paper, creped or crinkled, whether or not embossed or perforated

4808.90 - Other

This heading covers a variety of papers and paperboards in rolls or sheets having the common characteristic of having been worked during or after manufacture in such a way that they are no longer flat or of uniform surface. For the dimensions of the products of this heading, see Note 8 to this Chapter. The heading includes :

(1) Corrugated paper and paperboard.

Corrugated paper and paperboard results from processing the material through grooved rollers with the application of heat and steam. They may consist of a single corrugated layer or may be combined with flat surface sheets on one side (single faced) or both sides (double faced). Heavier boards may be built up with successive plies of corrugated paper or paperboard with alternate flat surface layers.

The most common use of corrugated paper and paperboard is in the manufacture of corrugated containers. It is also used as protective packing material.

(2) Creped or crinkled papers.

These are made by mechanical treatment of the webs of paper in the moist state, or by passing the made paper between rollers with wrinkled surfaces. The original surface area of the paper is considerably reduced in the process and the resultant product has a wrinkled appearance and the property of high elasticity.

Cellulose wadding and webs of cellulose fibres, which normally have a crinkled appearance, are **not** regarded as a creped or crinkled paper and fall in **heading 48.03, 48.18 or 48.23**. Also **excluded** is extensible paper produced by the clupak process which compacts the paper web thereby flexing and crowding the fibres during production. This paper, although made by mechanical treatment of the web in the moist state and possessing the property of elasticity, is generally free from the normal wrinkled appearance of creped and crinkled papers (generally **heading 48.04 or 48.05**).

Creped or crinkled papers are often coloured and are used in either single or multiple ply for the manufacture of a large variety of articles (e.g., cement bags and other packings, decorative streamers). However, such papers of a kind used for household or sanitary purposes are **excluded** (**heading 48.03**). Products of the kind specified in **heading 48.18** are also **excluded**.

(3) Embossed paper and paperboard.

Embossed papers and paperboards are those on which a perceptible unevenness of surface has been obtained, generally after the paper is made, by passing the paper, either in the wet or dry state, between rollers embossed or engraved on the surface with a pattern, or by pressing it with engraved or embossed metal plates. These products vary considerably in quality and appearance and include those papers commonly known as goffered papers, papers with embossed patterns simulating various leather grains, linen-finished papers (including those produced by rollers faced with cloth). They are used for the manufacture of certain writing papers, wallpaper, for lining and covering boxes, for bookbinding, etc.

(4) Perforated paper and paperboard.

These are made by punching holes mechanically with dies in the paper or paperboard in the dry state. The perforations may be in the form of designs or may be simply at regular intervals.

This heading includes paper perforated in lines to facilitate tearing to size.

Perforated paper is used for conversion into fancy papers (e.g., shelf papers and border papers) or for packing purposes, etc.

In addition to the goods of **headings 48.03** and **48.18**, the heading also **excludes** :

- (a) Papers with a naturally raised grain, e.g., drawing paper (**heading 48.02** or **48.05**).
- (b) Perforated paper and paperboard cards for Jacquard or similar machines, and paper lace (**heading 48.23**).
- (c) Perforated paper and paperboard music cards, discs and rolls (**heading 92.09**).

48.09 - Carbon paper, self-copy paper and other copying or transfer papers (including coated or impregnated paper for duplicator stencils or offset plates), whether or not printed, in rolls or sheets.

4809.20 - Self-copy paper

4809.90 - Other

This heading covers papers coated, impregnated or otherwise obtained, in rolls or sheets. For the dimensions of the products of this heading, see Note 8 to this Chapter. These papers when not meeting these conditions, fall in **heading 48.16**; for detailed description of these papers see the Explanatory Note to heading 48.16

The heading **excludes** :

- (a) Stamping foils (**heading 32.12**).
- (b) Sensitised paper (generally **heading 37.03**).

48.10 - Paper and paperboard, coated on one or both sides with kaolin (china clay) or other inorganic substances, with or without a binder, and with no other coating, whether or not surface-coloured, surface-decorated or printed, in rolls or rectangular (including square) sheets, of any size (+).

- Paper and paperboard of a kind used for writing, printing or other graphic purposes, not containing fibres obtained by a mechanical or chemi-mechanical process or of which not more than 10 % by weight of the total fibre content consists of such fibres :

4810.13 -- In rolls

4810.14 -- In sheets with one side not exceeding 435 mm and the other side not exceeding 297 mm in the unfolded state

4810.19 -- Other

- Paper and paperboard of a kind used for writing, printing or other graphic purposes, of which more than 10 % by weight of the total fibre content consists of fibres obtained by a mechanical or chemi-mechanical process :

4810.22 -- Light-weight coated paper

4810.29 -- Other

- Kraft paper and paperboard, other than that of a kind used for writing, printing or other graphic purposes :

4810.31 -- Bleached uniformly throughout the mass and of which more than 95 % by weight of the total fibre content consists of wood fibres obtained by a chemical process, and weighing 150 g/m² or less

4810.32 -- Bleached uniformly throughout the mass and of which more than 95 % by weight of the total fibre content consists of wood fibres obtained by a chemical process, and weighing more than 150 g/m²

4810.39 -- Other

- Other paper and paperboard :

4810.92 -- Multi-ply

4810.99 -- Other

The inorganic substances, other than kaolin (China clay), commonly used for coating include barium sulphate, magnesium silicate, calcium carbonate, calcium sulphate, zinc oxide and powdered metal (see the General Explanatory Note to this Chapter : coated paper and paperboard). The inorganic coating materials referred to in the heading may contain small amounts of organic substances for example to enhance the surface characteristics of the paper.

The heading covers paper and paperboard of a kind used for writing, printing or other graphic purposes, including such paper of a kind used in printers or in photocopying apparatus (light-weight coated paper of this category is defined in subheading Note 7; the expression "wood fibres" in the definition **does not cover** bamboo fibres), kraft paper and paperboard and multi-ply paper and paperboard (described in the Explanatory Note to heading 48.05), provided they are coated with kaolin or other inorganic substances.

Paper and paperboard are classified in this heading only if they are in strips or rolls or in rectangular (including square) sheets, of any size. If they have been cut to any other shape, they fall in later headings of this Chapter (for example, **48.17, 48.21** or **48.23**).

The heading **excludes** :

- (a) Perfumed papers or papers impregnated or coated with cosmetics (**Chapter 33**).
- (b) Sensitised paper or paperboard of **heading 37.01 to 37.04**.
- (c) Strips impregnated with diagnostic or laboratory reagents (**heading 38.22**).
- (d) Copying papers of **heading 48.09 or 48.16**.
- (e) Wallpaper and similar wall coverings and window transparencies of paper (**heading 48.14**).
- (f) Correspondence cards and other paper or paperboard stationery of **heading 48.17**.
- (g) Abrasive paper or paperboard (**heading 68.05**) and mica (other than mica powder) on a paper or paperboard support (**heading 68.14**).
- (h) Metal foil backed with paper or paperboard (**generally Section XIV or XV**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheadings 4810.13, 4810.14, 4810.19, 4810.22 and 4810.29

The paper and paperboard covered by these subheadings are those which, in the uncoated state, fall in heading 48.02.

Subheading 4810.92

Multi-ply paper and paperboard are described in the Explanatory Note to heading 48.05.

48.11 - Paper, paperboard, cellulose wadding and webs of cellulose fibres, coated, impregnated, covered, surface-coloured, surface-decorated or printed, in rolls or rectangular (including square) sheets, of any size, other than goods of the kind described in heading 48.03, 48.09 or 48.10.

4811.10 - Tarred, bituminised or asphalted paper and paperboard

- Gummed or adhesive paper and paperboard :

4811.41 -- Self-adhesive

4811.49 -- Other

- Paper and paperboard coated, impregnated or covered with plastics (excluding adhesives) :

4811.51 -- Bleached, weighing more than 150 g/m²

4811.59 -- Other

4811.60 - Paper and paperboard, coated, impregnated or covered with wax, paraffin wax, stearin, oil or glycerol

4811.90 - Other paper, paperboard, cellulose wadding and webs of cellulose fibres

Paper and paperboard are classified in this heading only if they are in strips or rolls or in rectangular (including square) sheets, of any size. If they have been cut to any other shape, they fall in later headings of this Chapter (for example, 48.23). **Subject** to these conditions and the **exceptions** mentioned in the heading and those referred to at the end of this Explanatory Note, this heading applies to the following in rolls or sheets :

- (A) Paper, paperboard, cellulose wadding and webs of cellulose fibres, to which superficial coatings of materials other than kaolin or other inorganic substances have been applied over the whole or part of one or both surfaces (e.g., thermosensitive paper used, for example, in telefax machines).
- (B) Impregnated paper, paperboard, cellulose wadding and webs of cellulose fibres (see the General Explanatory Note to this Chapter : impregnated paper and paperboard).
- (C) Paper, paperboard, cellulose wadding and webs of cellulose fibres, coated or covered, provided in the case of paper or paperboard coated or covered with plastics, the layer of plastics does not constitute more than half the total thickness (see Note 2 (g) to this Chapter).
Paper and paperboard for the manufacture of packagings for beverages and other foodstuffs, printed with texts and illustrations referring to the goods to be packaged therein, covered on both faces with thin transparent sheets of plastics, with or without a lining of metal foil (on the face which will form the inside of the packaging), are also classified in this heading. These products may be creased and marked to identify individual containers to be cut from the rolls.
- (D) Paper, paperboard, cellulose wadding and webs of cellulose fibres, coloured on the surface with a single colour or with different colours, including surface marbled and design printed paper, and those printed with motifs, characters or pictorial representations merely incidental to their primary use and not constituting printed matter of **Chapter 49** (see Note 12 and General Explanatory Note to this Chapter : coloured or printed paper and paperboard).

The heading also **excludes** :

- (a) Cellulose wadding impregnated or coated with pharmaceutical substances, etc., of **heading 30.05**.
- (b) Perfumed papers or papers impregnated or coated with cosmetics (**Chapter 33**).
- (c) Paper and cellulose wadding impregnated, coated or covered with soap or detergent (**heading 34.01**), or with polishes, creams or similar preparations (**heading 34.05**).
- (d) Sensitised paper or paperboard of **heading 37.01 to 37.04**.
- (e) Litmus and pole-finding papers and other paper impregnated with diagnostic or laboratory reagents (**heading 38.22**).
- (f) One layer of paper or paperboard coated or covered with a layer of plastics, the latter constituting more than half the total thickness (**Chapter 39**).
- (g) Paper merely watermarked with lines, etc. even if the lines serve the purpose of printed lines (**headings 48.02, 48.04 and 48.05**).
- (h) Wallpaper and similar wall coverings and window transparencies of paper (**heading 48.14**).
- (ij) Correspondence cards and other paper or paperboard stationery of **heading 48.17**.
- (k) Roofing boards consisting of a substrate of paperboard completely enveloped in, or covered on both sides by, a layer of asphalt or similar material (**heading 68.07**).

48.12 - Filter blocks, slabs and plates, of paper pulp.

These are composed of vegetable fibres (cotton, flax, wood, etc.) with a high cellulose content, compressed together in the form of blocks, slabs or plates without the aid of any binding materials, the fibres remaining in a loosely adherent condition.

The vegetable fibres may be mixed with asbestos fibres; in that case, the blocks, slabs or plates are classified in this heading provided that they still retain the character of articles of paper pulp.

Before manufacture into blocks, slabs or plates the fibres are reduced to the consistency of paper pulp and, in view of the purpose for which they are required, are freed from all impurities in order to avoid giving a colour, odour or taste to the filtered materials.

Filter blocks may also be manufactured by compressing together two or more such slabs made (sometimes by hand) from the prepared and purified pulp.

Filter blocks (also known as filter mass) are used in filters for clarifying liquids (e.g., wine, spirits, beer, vinegar). They are classified in this heading irrespective of their size or shape. This heading **excludes**:

- (a) Cotton linters merely compressed in the form of sheets or slabs (**heading 14.04**).
- (b) Other paper products used for filtering liquids, e.g., filter paper (**heading 48.05 or 48.23**), cellulose wadding (**heading 48.03 or 48.23**).

48.13 - Cigarette paper, whether or not cut to size or in the form of booklets or tubes.

4813.10 - In the form of booklets or tubes

4813.20 - In rolls of a width not exceeding 5 cm

4813.90 - Other

The heading covers all cigarette paper (including plug wrap and tipping paper, used for wrapping the filter mass and for assembling the filter-tip and the cigarette, respectively), regardless of its size or presentation. Generally, the cigarette paper is in one of the following forms :

- (1) In leaves or booklets (printed or not) containing a number of loose leaves of paper of a size sufficient for a single cigarette. These are for rolling cigarettes by hand.
- (2) Tubes of the dimensions of a cigarette.
- (3) In rolls cut to size (generally not exceeding 5 cm in width) for use on cigarette machines.
- (4) In rolls of a width exceeding 5 cm.

This paper, often laid or watermarked, is of good quality (frequently of hemp or linen rag pulp), but very thin and relatively strong. It may be free from loading or lightly charged with special fillers. It is usually made from white paper but may also be coloured, and is sometimes impregnated with substances such as potassium nitrate, wood creosote or liquorice.

Cigarette paper may be coated at one end with wax, metal pigments or other non-absorbent substances and the tubes are sometimes tipped with cork, straw, silk, etc. Paper in the form of tubes may also be fitted with filters, generally consisting of small plugs of absorbent paper, cellulose wadding or cellulose acetate fibres, or the tip ends may be reinforced with paper of heavier quality.

48.14 - Wallpaper and similar wall coverings; window transparencies of paper (+).

4814.20 - Wallpaper and similar wall coverings, consisting of paper coated or covered, on the face side, with a grained, embossed, coloured, design-printed or otherwise decorated layer of plastics

4814.90 - Other

(A) WALLPAPER AND SIMILAR WALL COVERINGS

In accordance with Note 9 to this Chapter, the expression "wallpaper and similar wall coverings" applies only to :

- (a) Paper in rolls, of a width of not less than 45 cm and not more than 160 cm, suitable for wall or ceiling decoration and answering to **one** of the following descriptions :
 - (1) Grained, embossed, surface-coloured, design-printed or otherwise surface-decorated (e.g., with textile flock), whether or not coated or covered with transparent protective plastics to render the paper washable or even scrubbable. These are commonly known as "wallpaper".
"Lincrusta" also belongs to this group. It consists of heavy paper material coated with a drying mixture composed of oxidised linseed oil and fillers, the coating being embossed and surface-decorated in a manner rendering the paper suitable for wall or ceiling decoration.
 - (2) Having an uneven surface resulting from the incorporation, during manufacture, of particles of wood, straw, etc. These wall coverings are commonly known as "ingrain" paper. They may be surface-decorated (e.g., painted) or undecorated. Undecorated ingrain paper is usually painted after being hung on the wall.
 - (3) Coated or covered on the face side with plastics, the layer of plastics having been grained, embossed, coloured, design-printed or otherwise decorated. These wall coverings are washable and are more resistant to abrasive wear than those described in Item (i) above. Products having a poly(vinyl chloride) layer are often called "vinyl wall coverings" or "vinyl wallpaper".
 - (4) Entirely or partly covered on the face side with plaiting material, whether or not bound together in parallel strands or woven. Some of these wall coverings have a layer of plaiting material bound by spun textile fibre.
- (b) Borders and friezes, being narrow strips of paper, treated as above (e.g., embossed, design-printed, surface-decorated with a mixture of drying oil and fillers, coated or covered with plastics), whether or not in rolls and suitable for wall or ceiling decoration.
- (c) Wall coverings of paper made up of several panels which are printed so as to make up a scene, design or motif when applied to a wall (also known as photo murals). The panels may be of any dimensions and may be presented in rolls or in sheets.

(B) WINDOW TRANSPARENCIES OF PAPER

These products are made from thin, hard and highly-glazed translucent or transparent paper. They are printed in a variety of ornamental designs, frequently coloured to imitate stained glass, and are used either for decorative purposes or simply to reduce the transparency of windows. They may also be printed with texts or illustrations, e.g., for advertising or display purposes.

They may be supplied in rolls, or in sizes and shapes ready for pasting on to the glass of windows or doors. They are sometimes also coated with adhesive.

*
* *

This heading **excludes** :

- (a) Self-adhesive wall coverings consisting solely of a sheet of plastics affixed to a protective layer of paper which is removed at the time of application (**Chapter 39**).
- (b) Wall coverings consisting of veneer or cork backed with paper (**heading 44.08, 45.02 or 45.04**).
- (c) Products similar to wall coverings but of heavier and more rigid construction, consisting, for example, of a layer of plastics on a base of paperboard, usually presented in wider rolls (e.g., 183 cm), used as both floor coverings and wall coverings (generally **heading 48.23**).
- (d) Transfers (decalcomanias) somewhat similar in appearance to window transparencies (**heading 49.08**).
- (e) Textile wall coverings on a base of paper (**heading 59.05**).
- (f) Wall coverings consisting of aluminium foil backed with paper (**heading 76.07**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 4814.10

“ Ingrain ” paper is the paper described in Note 9 (a) (ii) to this Chapter.

[48.15]

48.16 - Carbon paper, self-copy paper and other copying or transfer papers (other than those of heading 48.09), duplicator stencils and offset plates, of paper, whether or not put up in boxes.

4816.20 - Self-copy paper

4816.90 - Other

This heading covers papers coated, or sometimes impregnated, in such a way that one or more copies of an original document can be made by applying pressure (e.g., by the impact of a typewriter key), moisture, ink, etc.

Such papers fall in this heading only if presented in rolls of a width not exceeding 36 cm or in rectangular (including square) sheets of which no side exceeds 36 cm in unfolded state, or cut into shapes other than rectangles (including squares); otherwise they fall in **heading 48.09**. For duplicator stencils and offset plates there are no conditions as to size. The papers of this heading are usually put up in boxes.

They can be grouped in two categories, according to the reproduction process involved :

(A) PAPERS REPRODUCING THE ORIGINAL DOCUMENT BY TRANSFER OF ALL OR PART OF THEIR COATING SUBSTANCE OR IMPREGNANT TO ANOTHER SURFACE

This category includes :

(1) Carbon or similar copying papers.

These consist of paper which has been coated or sometimes impregnated, with fatty or waxy substances mixed with carbon black or other colouring material. They are used for pen, pencil or typewriter copying onto ordinary paper.

These papers may be :

(a) thin paper used for interleaving and for one time or repeated use,

or

(b) ordinary-weight coated paper which usually forms part of a set.

This group also covers hectographic carbon paper for duplicators, used to make a master sheet which in turn serves as a printing "plate" to produce more copies.

(2) Self-copy papers.

Self-copy papers, also known as carbonless copy papers, may be put up in fan-fold form. Pressure applied by means of an office machine or a stylus on the original sheet produces a reaction between two different ingredients normally separated from each other either in the same sheet or in two adjacent sheets, reproducing the impression of the original.

(3) Heat transfer papers.

These are coated on one side with a thermosensitive substance, for use in an infra-red copying machine to make a copy of an original document by transferring a dye compounded with the coating substance on to a sheet of ordinary paper (heat transfer process).

**(B) COPYING PAPER, DUPLICATOR STENCILS
AND OFFSET PLATES USING PROCESSES OTHER THAN
THOSE DESCRIBED IN (A) ABOVE**

This category includes :

(1) Paper for duplicator stencils and duplicator stencils.

Papers for duplicator stencils are thin, strong, unsized papers proofed by coating or impregnating with paraffin or other wax, collodion or preparations of similar products. Pressure applied by means of a typewriter, a stylus or any other appropriate instrument perforates the surface coating with the textual matter or patterns to be reproduced.

Duplicator stencils are usually provided with a detachable thick paper backing attached to the top edge which is specially perforated to allow for the fixing of the prepared stencil on to the duplicator, and they are sometimes interleaved with a paper for making a carbon copy. Furthermore, stencils generally bear guide marks and various other printed particulars.

The heading also includes framed addressing machine stencils.

(2) Paper for offset plates and offset plates.

Paper for offset plates has a special coating on one side rendering it impervious to lithographic ink. The plates are used on office-type offset machines for the reproduction on ordinary paper of texts or designs applied to them by hand, with a machine or by any other marking process.

*
* *

The papers of this heading may also be in fan-fold form and combine two or more of the reproduction processes described above. A typical example is a paper coated on one side with a special ink by means of which (as with carbon paper) a reverse image of a text or design can be formed on a second paper similar to the plates described in paragraph (B) (2) above. When this second paper is placed on a suitable duplicating machine, the ink deposited on its reverse side is transferred to ordinary paper as a positive image of the original, and many copies can be made.

Copying or transfer papers, bearing texts or designs for reproduction, remain classified in this heading, whether or not bound in sequence.

The heading **excludes** :

- (a) Transfer papers of the types known as stamping foils or blocking foils. These are thin papers with a coating of metal, metal powder or pigment and are used for printing book covers, hat bands, etc. (**heading 32.12**).
- (b) Sensitised paper or paperboard of **headings 37.01 to 37.04**.
- (c) Copying paste with a basis of gelatin on a paper backing (**heading 38.24**).
- (d) Duplicator stencils consisting of a thin layer of plastics provided with a detachable paper backing, cut to size and perforated at one edge (**Chapter 39**).
- (e) Paper coated with a thermosensitive substance used to make a copy of an original document by direct blackening of the coating substance (thermocopying process) (**heading 48.11** or **48.23**).
- (f) Manifold business forms and interleaved carbon sets (**heading 48.20**).
- (g) Transfers (decalcomanias) (**heading 49.08**).

48.17 - Envelopes, letter cards, plain postcards and correspondence cards, of paper or paperboard; boxes, pouches, wallets and writing compendiums, of paper or paperboard, containing an assortment of paper stationery.

4817.10 - Envelopes

4817.20 - Letter cards, plain postcards and correspondence cards

4817.30 - Boxes, pouches, wallets and writing compendiums, of paper or paperboard, containing an assortment of paper stationery

This heading covers paper or paperboard stationery of the kind used in correspondence, e.g., envelopes, letter cards, plain postcards (including correspondence cards). Separate writing paper in loose sheets or in blocks and certain other articles referred to below are, however, **excluded**.

These articles may be printed with addresses, names, trade marks, decorations, crests, initials, etc., merely incidental to their use as stationery.

Letter **cards** are sheets of paper or paperboard or card with gummed (and sometimes perforated) edges or other provision for closing or sealing without the use of envelopes.

Plain **postcards** do not fall in this heading **unless** they contain printed provision for the address or stamp or other indications of their use.

Correspondence **cards** do not fall in this heading **unless** they have deckled or gilt edges or rounded corners, or are printed or otherwise prepared in such a manner as clearly to indicate their use as stationery. Plain cards not so prepared are classified in **heading 48.02, 48.10, 48.11 or 48.23**, as the case may be.

The heading also covers boxes, pouches, wallets and writing compendiums, of paper or paperboard, containing an assortment of paper stationery.

This heading also **excludes** :

- (a) Letter paper in folded or unfolded sheets, printed or not, and whether or not boxed or packeted (**heading 48.02, 48.10 or 48.11**, as the case may be).
- (b) Letter pads, memorandum pads, etc. of **heading 48.20**.
- (c) Envelopes, postcards, letter cards, etc., stamped by printing or otherwise, with stamps of current issue (**heading 49.07**).
- (d) Printed or illustrated postcards and printed cards of **heading 49.09**.
- (e) Printed letters and similar articles, which are designed for special purposes, e.g., demand notes, removal notices, advertisement letters, including such articles requiring completion in manuscript (**heading 49.11**).
- (f) Illustrated first-day covers and maximum cards : if not bearing postage stamps (**heading 49.11**); if bearing postage stamps (**heading 97.04**).

48.18 - Toilet paper and similar paper, cellulose wadding or webs of cellulose fibres, of a kind used for household or sanitary purposes, in rolls of a width not exceeding 36 cm, or cut to size or shape; handkerchiefs, cleansing tissues, towels, tablecloths, serviettes, bed sheets and similar household, sanitary or hospital articles, articles of apparel and clothing accessories, of paper pulp, paper, cellulose wadding or webs of cellulose fibres.

4818.10 - Toilet paper

4818.20 - Handkerchiefs, cleansing or facial tissues and towels

4818.30 - Tablecloths and serviettes

4818.50 - Articles of apparel and clothing accessories

4818.90 - Other

This heading covers toilet paper and similar paper, cellulose wadding and webs of cellulose fibres, of a kind used for household or sanitary purposes :

- (1) in strips or rolls of a width not exceeding 36 cm;
- (2) in rectangular (including square) sheets of which no side exceeds 36 cm in the unfolded state;
- (3) cut to shape other than rectangular (including square).

It also covers household, sanitary or hospital articles, as well as articles of apparel and clothing accessories, of paper pulp, paper, cellulose wadding or webs of cellulose fibres.

The goods of this heading are often made from the materials of heading 48.03.

The heading **excludes** :

- (a) Cellulose wadding impregnated or coated with pharmaceutical substances or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes (**heading 30.05**).
- (b) Perfumed papers and papers impregnated or coated with cosmetics (**Chapter 33**).
- (c) Paper and cellulose wadding impregnated, coated or covered with soap or detergent (**heading 34.01**), or with polishes, creams or similar preparations (**heading 34.05**).
- (d) Articles of **Chapter 64**.
- (e) Headgear and parts thereof of **Chapter 65**.
- (f) Sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles of **heading 96.19**.

48.19 - Cartons, boxes, cases, bags and other packing containers, of paper, paperboard, cellulose wadding or webs of cellulose fibres; box files, letter trays, and similar articles, of paper or paperboard of a kind used in offices, shops or the like.

4819.10 - Cartons, boxes and cases, of corrugated paper or paperboard

4819.20 - Folding cartons, boxes and cases, of non-corrugated paper or paperboard

4819.30 - Sacks and bags, having a base of a width of 40 cm or more

4819.40 - Other sacks and bags, including cones

4819.50 - Other packing containers, including record sleeves

4819.60 - Box files, letter trays, storage boxes and similar articles, of a kind used in offices, shops or the like

(A) Cartons, boxes, cases, bags and other packing containers.

This group covers containers of various kinds and sizes generally used for the packing, transport, storage or sale of merchandise, whether or not also having a decorative value. The heading includes cartons, boxes, cases, bags, cones, packets, sacks, paperboard drums (containers), whether manufactured by rolling or by any other method, and whether or not fitted with reinforcing circular bands of other materials, tubular containers for posting documents, protective garment bags, jars, pots and the like (e.g., for milk or cream), whether or not waxed. The heading also covers special purpose paper bags such as bags for vacuum cleaners, bags for travel sickness, and record boxes and sleeves.

The heading includes folding cartons, boxes and cases. These are :

- cartons, boxes and cases in the flat in one piece, for assembly by folding and slotting (e.g., cake boxes);
and
- containers assembled or intended to be assembled by means of glue, staples, etc., on one side only, the construction of the container itself providing the means of forming the other sides, although, where appropriate, additional means of fastening, such as adhesive tape or staples may be used to secure the bottom or lid.

The articles of this group may be printed, e.g., with the name of the merchant, directions for use, illustrations. Thus, seed packets with pictures of the products and sowing directions, in addition to the name of the firm, or chocolate or cereal packets with pictures for the amusement of children remain classified in this heading.

The articles of this heading may also have reinforcements or accessories of materials other than paper (e.g., textile backings, wooden supports, string handles, corners of metal or plastics).

(B) Box files, letter trays and similar articles of a kind used in offices, shops or the like.

This group covers containers, such as filing cabinets, box files, letter trays, storage boxes and similar articles of a rigid and durable type, and generally of better finish than the packing containers of group (A) above. They are used for the filing or storage of documents or stock of various kinds in offices, shops, warehouses, etc.

These articles may have reinforcements or accessories of non-paper materials (e.g., hinges, handles, locking devices of metal, wood, plastics or textile material). They may also be provided with frames of metal, plastics, etc., for the insertion of indication cards.

The heading **excludes** :

- (a) Articles of **heading 42.02** (travel goods, etc.).
- (b) Articles of plaited paper (**heading 46.02**).
- (c) Coated, covered and printed paper or paperboard of **heading 48.11**, presented in rolls, used for the manufacture of containers and creased and marked to identify individual containers to be cut from the rolls.
- (d) Albums for samples or for collections (**heading 48.20**).
- (e) Sacks and bags of woven paper yarn, of **heading 63.05**.

48.20 - Registers, account books, note books, order books, receipt books, letter pads, memorandum pads, diaries and similar articles, exercise books, blotting-pads, binders (loose-leaf or other), folders, file covers, manifold business forms, interleaved carbon sets and other articles of stationery, of paper or paperboard; albums for samples or for collections and book covers, of paper or paperboard.

4820.10 -Registers, account books, note books, order books, receipt books, letter pads, memorandum pads, diaries and similar articles

4820.20 - Exercise books

4820.30 - Binders (other than book covers), folders and file covers

4820.40 - Manifold business forms and interleaved carbon sets

4820.50 - Albums for samples or for collections

4820.90 - Other

This heading covers various articles of stationery, **other than** correspondence goods of **heading 48.17** and the goods referred to in Note 10 to this Chapter. It includes :

- (1) Registers, account books, note books of all kinds, order books, receipt books, copy books, diaries, letter pads, memorandum pads, engagement books, address books and books, pads, etc., for entering telephone numbers.
- (2) Exercise books. These may simply contain sheets of lined paper but may also include printed examples of handwriting for copying in manuscript.

Educational workbooks, sometimes called writing books, with or without narrative texts, which contain printed textual questions or exercises not incidental to their primary use as workbooks and usually with spaces for completion in manuscript are, however, **excluded (heading 49.01)**. Children's workbooks consisting essentially of pictures, with complementary texts, for writing or other exercises are also **excluded (heading 49.03)**.

- (3) Binders designed for holding loose sheets, magazines, or the like (e.g., clip binders, spring binders, screw binders, ring binders), and folders, file covers, files (**other than** box files) and portfolios.
- (4) Manifold business forms : These are multipart form sets either printed on self copy paper or interleaved with carbon paper. These forms are used to make multiple copies and may be continuous or non-continuous. They contain printed matter which requires the insertion of additional information to complete.
- (5) Interleaved carbon sets : These are similar to manifold business forms but they either contain no printed matter or contain only identifying information such as letter heads. They are used extensively for typing multiple copies and like most manifold business forms are held together by means of a glued and perforated stub.

- (6) Albums for samples or for collections (e.g., stamp, photograph).
- (7) Other articles of stationery such as blotting-pads (folding or not).
- (8) Book covers (binding covers and dust covers), whether or not printed with characters (title, etc.) or illustrations.

Some articles of this heading often contain a considerable amount of printed matter but remain classified in this heading (and not in Chapter 49) **provided** that the printing is incidental to their primary use, for example, on forms (essentially for completion in manuscript or typescript) and diaries (essentially for writing).

The goods of this heading may be bound with materials other than paper (e.g., leather, plastics or textile material) and have reinforcements or fittings of metal, plastics, etc.

On the other hand, articles such as desk memo-blocks consisting essentially of wood, marble, etc., are classified as manufactures of wood, marble, etc., as the case may be. Loose sheets of exercise paper and other writing paper, including perforated sheets for loose-leaf books, fall generally in **heading 48.02, 48.10, 48.11 or 48.23**, as the case may be. Loose-leaf sheets for albums are also **excluded** from this heading and fall in other headings according to their characteristics.

The heading **excludes** :

- (a) Cheque books (**heading 49.07**).
- (b) Blank multi-coupon travel tickets (**heading 49.11**).
- (c) Lottery tickets, "scratch cards", raffle tickets and tombola tickets (generally **heading 49.11**).

48.21 - Paper or paperboard labels of all kinds, whether or not printed (+).

4821.10 - Printed

4821.90 - Other

This heading covers all varieties of paper and paperboard labels of a kind used for attachment to any type of article for the purpose of indicating its nature, identity, ownership, destination, price, etc. They may be of the stick-on type (gummed or self-adhesive) or designed to be affixed by other means, e.g., string.

These labels may be plain, printed to any extent with characters or pictures, gummed, fitted with ties, clasps, hooks or other fasteners or reinforced with metal or other materials. They may be perforated or put up in sheets or booklets.

Self-adhesive printed stickers designed to be used, for example, for publicity, advertising or mere decoration, e.g., "comic stickers" and "window stickers", are **excluded (heading 49.11)**.

The heading **does not cover** "labels" consisting of a relatively strong sheet of base metal covered on one or both sides with a thin sheet of paper, whether or not printed (**headings 73.26, 76.16, 79.07**, etc., or **heading 83.10**).

○
○ ○

Subheading Explanatory Note.

Subheading 4821.10

This subheading covers all printed labels regardless of the significance or extent of the printing thereon. Labels printed, for example, with lines or other simple borders or merely incorporating small motifs or other symbols are therefore regarded as "printed" for the purposes of this subheading.

48.22 - Bobbins, spools, cops and similar supports of paper pulp, paper or paperboard (whether or not perforated or hardened).

4822.10 - Of a kind used for winding textile yarn

4822.90 - Other

The heading covers bobbins, tubes, spools, cops, cones and similar supports for winding yarn or wire, whether for industrial use or for retail sale. It also covers cylindrical cores (open ended or closed) of the kind used for winding cloth, paper or other material.

These goods may be made of paperboard, of rolled paper sheets, or of pressed or moulded pulp (see penultimate paragraph of the General Explanatory Note to this Chapter). They are sometimes perforated. They may be glued, impregnated or coated with plastics, etc., but such articles which have the character of goods of laminated plastics are **excluded (Chapter 39)**.

The bobbins, tubes, spools, etc., may have reinforcements or fittings, at one or both ends, of wood, metal, or other materials.

The heading **excludes** flat supports of various shapes used for similar purposes (**heading 48.23**).

48.23 - Other paper, paperboard, cellulose wadding and webs of cellulose fibres, cut to size or shape; other articles of paper pulp, paper, paperboard, cellulose wadding or webs of cellulose fibres.

4823.20 - Filter paper and paperboard

4823.40 - Rolls, sheets and dials, printed for self-recording apparatus

- Trays, dishes, plates, cups and the like, of paper or paperboard :

4823.61 -- Of bamboo

4823.69 -- Other

4823.70 - Moulded or pressed articles of paper pulp

4823.90 - Other

This heading includes :

(A) Paper and paperboard, cellulose wadding and webs of cellulose fibres, not covered by any of the previous headings of this Chapter :

- in strips or rolls of a width not exceeding 36 cm;
- in rectangular (including square) sheets of which no side exceeds 36 cm in the unfolded state;
- cut to shape other than rectangular (including square).

It is to be noted, however, that paper and paperboard in strips or rolls, or in rectangular (including square) sheets, of any size, of **headings 48.02, 48.10 and 48.11** remain classified in these headings.

(B) Articles of paper pulp, paper, paperboard, cellulose wadding or webs of cellulose fibres, not covered by any of the previous headings of this Chapter nor excluded by Note 2 to this Chapter.

Thus the heading includes :

- (1) Filter paper and paperboard (folded or not). Generally these are in shapes other than rectangular (including square), such as circular filter papers and boards.
- (2) Printed dials, other than in rectangular (including square) form, for self-recording apparatus.
- (3) Paper and paperboard, of a kind used for writing, printing or other graphic purposes, not covered in the earlier headings of this Chapter, cut to shape other than rectangular (including square).
- (4) Trays, dishes, plates, cups and the like, of paper or paperboard.
- (5) Moulded or pressed articles of paper pulp.
- (6) Uncoated strip paper (whether or not folded) for plaiting or other uses, other than for graphic purposes.

- (7) Paper wool (i.e., narrow strips in a tangled mass, used for packing).
- (8) Confectionery wrappers, fruit wrappers and other wrappings cut to size.
- (9) Cake cards and papers; jam-pot covers; shaped papers for bags.
- (10) Perforated paper and paperboard cards for Jacquard or similar machines (see Note 11 to this Chapter) i.e., those already provided with the perforations required for control of the loom ("punched" paper and paperboard cards).
- (11) Paper lace and embroidery; shelf edging.
- (12) Paper gaskets and washers.
- (13) Stamp mounts, photograph mounting corners and photo mounts, reinforcement corners for suit-cases.
- (14) Textile spinning cans; flat shaped cards for winding yarn, ribbon, etc.; moulded sheets for packing eggs.
- (15) Sausage casings.
- (16) Dress patterns, models and templates, whether or not assembled.
- (17) Fans and hand screens, with paper mounts or leaves and frames of any material, and separately presented mounts. However, fans or hand screens with frames of precious metal are classified in **heading 71.13**.

In addition to the goods excluded by Note 2 to this Chapter, the heading **excludes** :

- (a) Fly-papers (**heading 38.08**).
 - (b) Strips impregnated with diagnostic or laboratory reagents (**heading 38.22**).
 - (c) Fibreboard (**heading 44.11**).
 - (d) Uncoated strip paper of a kind used for writing, printing or other graphic purposes, of **heading 48.02**.
 - (e) Strip paper, coated, covered or impregnated, of **heading 48.10** or **48.11**.
 - (f) Lottery tickets, "scratch cards", raffle tickets and tombola tickets (generally **heading 49.11**).
 - (g) Paper sun umbrellas (**heading 66.01**).
 - (h) Artificial flowers, foliage and fruit and parts thereof (**heading 67.02**).
 - (ij) Insulators and other electrical goods (**Chapter 85**).
 - (k) Articles of **Chapter 90** (e.g., orthopaedic appliances or demonstrational apparatus, dials for scientific instruments).
 - (l) Dials for clocks and watches (**heading 91.14**).
 - (m) Cartridge cases and wads (**heading 93.06**).
 - (n) Lampshades (**heading 94.05**).
-

Chapter 49

Printed books, newspapers, pictures and other products of the printing industry; manuscripts, typescripts and plans

Notes.

- 1.- This Chapter does not cover :
 - (a) Photographic negatives or positives on transparent bases (Chapter 37);
 - (b) Maps, plans or globes, in relief, whether or not printed (heading 90.23);
 - (c) Playing cards or other goods of Chapter 95; or
 - (d) Original engravings, prints or lithographs (heading 97.02), postage or revenue stamps, stamp-postmarks, first-day covers, postal stationery or the like of heading 97.04, antiques of an age exceeding one hundred years or other articles of Chapter 97.
- 2.- For the purposes of Chapter 49, the term "printed" also means reproduced by means of a duplicating machine, produced under the control of an automatic data processing machine, embossed, photographed, photocopied, thermocopied or typewritten.
- 3.- Newspapers, journals and periodicals which are bound otherwise than in paper, and sets of newspapers, journals or periodicals comprising more than one number under a single cover are to be classified in heading 49.01, whether or not containing advertising material.
- 4.- Heading 49.01 also covers :
 - (a) A collection of printed reproductions of, for example, works of art or drawings, with a relative text, put up with numbered pages in a form suitable for binding into one or more volumes;
 - (b) A pictorial supplement accompanying, and subsidiary to, a bound volume; and
 - (c) Printed parts of books or booklets, in the form of assembled or separate sheets or signatures, constituting the whole or a part of a complete work and designed for binding.
- However, printed pictures or illustrations not bearing a text, whether in the form of signatures or separate sheets, fall in heading 49.11.
- 5.- Subject to Note 3 to this Chapter, heading 49.01 does not cover publications which are essentially devoted to advertising (for example, brochures, pamphlets, leaflets, trade catalogues, year books published by trade associations, tourist propaganda). Such publications are to be classified in heading 49.11.
- 6.- For the purposes of heading 49.03, the expression "children's picture books" means books for children in which the pictures form the principal interest and the text is subsidiary.

GENERAL

With the few **exceptions** referred to below, this Chapter covers all printed matter of which the essential nature and use is determined by the fact of its being printed with motifs, characters or pictorial representations.

On the other hand, besides the goods of **heading 48.14** or **48.21**, paper, paperboard or cellulose wadding, or articles thereof, in which the printing is merely incidental to their primary use (e.g., printed wrapping paper and printed stationery) fall in **Chapter 48**. Also, printed textile articles such as scarves or handkerchiefs, in which the printing is mainly for decorative or novelty purposes and does not affect the essential character of the goods, embroidery fabrics and prepared tapestry canvases bearing printed designs fall in **Section XI**.

Goods of **heading 39.18**, **39.19**, **48.14** or **48.21** are also **excluded** from this Chapter, even if they are printed with motifs, characters or pictorial representations, which are not merely incidental to the primary use of the goods.

For the purposes of this Chapter, the term “printed” includes not only reproduction by the several methods of ordinary hand printing (e.g., prints from engravings or woodcuts, other than originals) or mechanical printing (letterpress, offset printing, lithography, photogravure, etc.), but also reproduction by duplicating machines, production under the control of an automatic data processing machine, embossing, photography, photocopying thermocopying or typewriting (see Note 2 to this Chapter), irrespective of the form of the characters in which the printing is executed (e.g., letters of any alphabet, figures, shorthand signs, Morse or other code symbols, Braille characters, musical notations, pictures, diagrams). The term **does not**, however, **include** coloration or decorative or repetitive-design printing.

The Chapter also includes similar products executed by hand (including hand-drawn maps and plans), as well as carbon copies of hand-written or typewritten texts.

In general the goods of this Chapter are executed on paper but the goods may be on other materials provided they have the characteristics described in the first paragraph of this General Explanatory Note. However, letters, numbers, sign-plates and similar motifs for shop signs and shop windows, bearing a printed picture or text, of ceramics, of glass, or of base metal are classifiable in **headings 69.14**, **70.20** and **83.10** respectively, or in **heading 94.05** if illuminated.

In addition to the more common forms of printed products (e.g., books, newspapers, pamphlets, pictures, advertising matter), this Chapter covers such articles as: printed transfers (decalcomanias); printed or illustrated postcards, greeting cards; calendars, maps, plans and drawings; postage, revenue or similar stamps. Microcopies on opaque bases, of articles of this Chapter, are classified in heading 49.11. Microcopies are obtained by means of an optical device which greatly reduces the dimensions of the documents photographed; microcopies normally need to be read by means of a magnifying device.

This Chapter also **excludes**:

- (a) Photographic negatives or positives on transparent bases (for example, microfilms) of **Chapter 37**.
- (b) Goods of **Chapter 97**.

49.01 - Printed books, brochures, leaflets and similar printed matter, whether or not in single sheets.

4901.10 - In single sheets, whether or not folded

- Other :

4901.91 - - Dictionaries and encyclopaedias, and serial instalments thereof

4901.99 - - Other

This heading covers virtually all publications and printed reading matter, illustrated or not, with the **exception** of publicity matter and products more specifically covered by other headings of the Chapter (particularly **heading 49.02, 49.03 or 49.04**). It includes :

(A) **Books and booklets** consisting essentially of textual matter of any kind, and printed in any language or characters, including Braille or shorthand. They include literary works of all kinds, text-books (including educational workbooks sometimes called writing books), with or without narrative texts, which contain questions or exercises (usually with spaces for completion in manuscript); technical publications; books of reference such as dictionaries, encyclopaedias and directories (e.g., telephone directories, including "yellow pages"); catalogues for museums and public libraries (but **not** trade catalogues); liturgical books such as prayer books and hymn books (**other than** music hymn books of **heading 49.04**); children's books (**other than** children's picture, drawing or colouring books of **heading 49.03**). Such books may be bound (in paper or with soft or stiff covers) in one or more volumes, or may be in the form of printed sheets comprising the whole or a part of the complete work and designed for binding.

Dust covers, clasps, book-marks and other minor accessories supplied with the books are regarded as forming part of the book.

(B) **Brochures, pamphlets and leaflets**, whether consisting of several sheets of reading matter fastened together (e.g., stapled), or of unfastened sheets, or even of single sheets.

These include publications such as : shorter scientific theses and monographs, instruction notices, etc., issued by government departments or other bodies, tracts, hymn sheets, etc.

This group **excludes** printed cards bearing personal greetings, messages or announcements (**heading 49.09**), and printed forms which require the insertion of certain additional information for completion (**heading 49.11**).

(C) **Textual matter in the form of sheets for binding in loose-leaf binders.**

The heading also covers :

- (1) Newspapers, journals and periodicals bound otherwise than in paper, and sets of newspapers, journals or periodicals comprising more than one number under a single cover, whether or not containing advertising material.
- (2) Bound picture books (**other than** children's picture books of **heading 49.03**).

- (3) A collection of printed reproductions of works of art, drawings, etc., with a relative text (for example, a biography of the artist), put up with numbered pages and forming a whole suitable for binding.
- (4) A pictorial supplement accompanying, and subsidiary to, a bound volume containing the relative text.

Other pictorial publications are **excluded** and generally fall in **heading 49.11**.

Subject to Chapter Note 3, the heading also **excludes** all publications essentially devoted to advertising (including tourist propaganda) and those which are published by or on behalf of a trader for publicity purposes, even though those of the latter kind may consist of matter not of direct advertising value. Such advertising publications include, for example, trade catalogues, year books published by trade associations containing a certain amount of informative matter, together with a substantial number of advertisements by members of the association and publications drawing attention to the products or services supplied by the publisher. The heading also does not cover publications containing indirect or concealed publicity, i.e., publications which, though essentially devoted to advertising, are so presented as to make it seem that advertising is not the intended purpose.

On the other hand, such publications as scientific theses published by or for industrial firms and those publications merely describing trends or progress or activity in a particular branch of commerce or industry, but not having direct or indirect publicity value may fall in this heading.

The heading further **excludes** :

- (a) Copying and transfer papers, bearing texts or designs for reproduction, bound in sequence (**heading 48.16**).
- (b) Diaries and other stationery books of **heading 48.20**, that is those which are essentially for completion in manuscript or typescript.
- (c) Newspapers, journals and periodicals in single copies, unbound or bound only in paper (**heading 49.02**).
- (d) Children's workbooks consisting essentially of pictures with complementary texts, for writing or other exercises (**heading 49.03**).
- (e) Music books (**heading 49.04**).
- (f) Atlases (**heading 49.05**).
- (g) Parts of books, whether in the form of signatures or separate sheets, consisting of pictorial matter without a printed text (**heading 49.11**).

49.02 - Newspapers, journals and periodicals, whether or not illustrated or containing advertising material.

4902.10 - Appearing at least four times a week

4902.90 - Other

The distinguishing feature of the publications of this heading is that they constitute one issue in a continuous series under the same title published at regular intervals, each issue being dated (even by merely indicating the period of the year, e.g., "Spring 1996") and also frequently numbered. They may be unbound or bound in paper, but if otherwise bound or if consisting of more than one issue under a single cover, they are **excluded (heading 49.01)**. These publications usually consist essentially of reading matter but they may also be profusely illustrated and may even consist mainly of pictorial matter. They may also contain advertising material.

The types of publications covered by the heading include :

- (1) **Newspapers**, daily or weekly, in the form of unbound sheets of printed matter consisting mainly of current news of general interest, together usually with literary articles on subjects of current, historical, biographical, etc., interest. They also generally devote a considerable amount of space to illustrations and advertisements.
- (2) **Journals and other periodicals**, issued weekly, fortnightly, monthly, quarterly or half-yearly, either in the form of newspapers or as paperbound publications. They may be mainly devoted to the publication of intelligence on subjects of a specialised nature or sectional interest (e.g., legal, medical, financial, commercial, fashion or sporting), in which case they are frequently published by or for organisations of the interests concerned. Or they may be of more general interest, such as the ordinary fiction magazine. These include periodicals published by or for named industrial concerns (e.g., motor car manufacturers) to promote interest in their products, staff journals normally having circulation only within the industrial, etc., organisations concerned and periodicals such as fashion magazines which may be issued by a trader or an association for publicity purposes.

Parts of large works (such as books of reference) sometimes published in weekly, fortnightly, etc., instalments over a limited and predetermined period are not regarded as periodicals but are classified in **heading 49.01**.

Supplements such as pictures, patterns, etc., issued with newspapers or periodicals and normally sold therewith, are regarded as forming part of the publication.

Waste paper consisting of old newspapers, journals or periodicals falls in **heading 47.07**.

49.03 - Children's picture, drawing or colouring books.

This heading is **restricted** to those picture books clearly compiled for the interest or amusement of children or for guidance in their first steps of primary education, **provided** the pictures form the principal interest and are not subsidiary to the text (see Note 6 to this Chapter).

This category includes, for example, pictorial alphabet books and books of the kind in which the sense of stories is conveyed by a series of episodal pictures accompanied by captions or summary narratives related to the individual pictures. It also includes children's workbooks consisting essentially of pictures with complementary texts, for writing or other exercises.

It **does not include** books, even profusely illustrated, written in the form of continuous narratives with illustrations of selected episodes. These fall in **heading 49.01**.

The books of this heading may be printed on paper, textile, etc., and include children's rag books.

A child's picture book incorporating "stand-up" or movable figures also falls in this heading but if the article is essentially a toy it is **excluded** (**Chapter 95**). Similarly, a child's picture book containing pictures or models for cutting out remains in this heading **provided** the "cut-out" portions are a minor feature, but if more than half the pages (including covers) are designed for cutting out, whether wholly or in part, the article, even if also containing a certain amount of text, is regarded as a toy (**Chapter 95**).

This heading also includes children's drawing or colouring books. These consist mainly of bound pages (sometimes in the form of detachable postcards) containing simple pictures for copying, or outlines of pictures, with or without printed instructions, for completion by drawing or colouring; sometimes coloured illustrations for guidance are incorporated. They also include similar books with "invisible" outlines or colour which can be made visible by rubbing with a pencil or applying water with a paint brush, and also books in which the small amounts of water colour required for colouring are contained in the book (e.g., in the form of a palette).

49.04 - Music, printed or in manuscript, whether or not bound or illustrated.

This heading covers music of all kinds, instrumental or vocal, printed or in manuscript, whether or not bound or illustrated, and whatever the system of notation (e.g., tonic sol-fa, staff notation, numerical symbols, Braille music).

The music in this heading may be printed or written on paper or other material and may be in the form of separate sheets (including paperboards), bound books, etc., whether or not illustrated or with accompanying words.

In addition to the more common forms of printed or manuscript music, this heading includes such productions as music hymn books, scores (including miniature) and music instruction books (tutors), **provided** they contain practice pieces and exercises as well as an instructional text.

Dust covers supplied with such music are regarded as forming a part thereof.

This heading **does not include** :

- (a) Printed books, catalogues, etc., containing musical notation which is merely incidental or illustrative of the text, e.g., a particular theme or motif referred to in the text of a book (**heading 49.01 or 49.11**).
- (b) Cards, discs and rolls for mechanical instruments (**heading 92.09**).

49.05 - Maps and hydrographic or similar charts of all kinds, including atlases, wall maps, topographical plans and globes, printed.

4905.10 - Globes

- Other :

4905.91 -- In book form

4905.99 -- Other

This heading covers all printed globes (for example, terrestrial, lunar or celestial), maps, charts and plans designed to represent the natural or artificial features of countries, towns, seas, the heavens, etc., conventional signs being used to indicate contours, etc. Maps and charts incorporating advertising matter remain classified in this heading.

These products may be printed on paper or other material (e.g., cloth), reinforced or not, and may be in the form of single or folded sheets, or consist of a collection of such sheets bound together in book form (e.g., an atlas). The articles may be fitted with movable indicators and rollers, and may have transparent protective coverings or other accessories.

The heading includes, *inter alia* :

Geographical maps (including sectors for globes), road maps, wall maps, atlases, hydrographic, geographical and astronomical charts, geological surveys, topographical plans (e.g., plans of towns or districts).

It also covers printed globes with internal lighting, **provided** they are not merely toys.

The heading **does not include** :

- (a) Books containing maps or plans as a subsidiary feature (**heading 49.01**).
- (b) Hand-drawn maps, plans, etc., their carbon copies and their photographic reproductions (**heading 49.06**).
- (c) Aerial survey or landscape photographs, whether or not topographically accurate, **provided** that they are not prepared as finished maps, charts or plans (**heading 49.11**).
- (d) Schematic maps designed to show by suitable illustrations the particular industrial, tourist or other activities, the outline of railway systems, etc., of a country or district (**heading 49.11**).
- (e) Textile articles, e.g., scarves or handkerchiefs, containing prints of maps for ornamental or decorative purposes (**Section XI**).
- (f) Maps, plans and globes, in relief, whether or not printed (**heading 90.23**).

49.06 - Plans and drawings for architectural, engineering, industrial, commercial, topographical or similar purposes, being originals drawn by hand; hand-written texts; photographic reproductions on sensitised paper and carbon copies of the foregoing.

This heading covers industrial plans and drawings the purpose of which, generally, is to indicate the position and relation of parts or features of buildings, machinery or other constructions either as they exist, or for the guidance of builders or manufacturers in their construction (e.g., architects' or engineers' plans and drawings). The plans and drawings may include specifications, directions, etc., printed or not.

This heading also includes drawings and sketches for publicity purposes (e.g., fashion drawings, poster designs, designs for pottery, wallpaper, jewellery, furniture).

It should be noted that such products fall in the heading **only** if consisting of originals drawn or written by hand, or of photographic reproductions on sensitised paper or of carbon copies of such originals.

Maps, charts and topographical plans which, when printed, fall in heading 49.05, are included in this heading if they are the hand-drawn originals or their carbon copies or photographic reproductions on sensitised paper.

Hand-written texts (including shorthand but **not including** music), and also their carbon copies or photographic reproductions on sensitised paper of such texts, are also included in this heading whether bound or not.

The heading **does not cover** :

- (a) Copying and transfer papers, bearing written or typed texts for reproduction (**heading 48.16**).
- (b) Printed plans and drawings (**heading 49.05 or 49.11**).
- (c) Typescripts (including carbon copies) and copies of manuscripts or typescripts obtained by duplicating machines (**heading 49.01 or 49.11**).

49.07 - Unused postage, revenue or similar stamps of current or new issue in the country in which they have, or will have, a recognised face value; stamp-impressed paper; banknotes; cheque forms; stock, share or bond certificates and similar documents of title.

The characteristic of the products of this heading is that on being issued (if necessary, after completion and validation) by the appropriate authority, they have a fiduciary value in excess of the intrinsic value.

These products comprise :

- (A) **Printed stamps** if unused (i.e., uncancelled) and of a kind in current or new issue in the country in which they have, or will have, a recognised face value.

The stamps in this heading are printed on paper, usually gummed, in various designs and colours, and bear printed indications of their value and sometimes of the particular use or uses for which they are intended.

They include :

- (1) **Postage stamps**, normally used in prepayment of postal transmission fees but in some countries also usable as revenue stamps (e.g., for receipts or certificates). " Postage due " stamps for surcharging understamped letters, etc., are also included.
- (2) **Revenue stamps** used for affixing to documents of various kinds, legal, commercial, etc., and sometimes to goods as evidence of payment of government taxes or duties to the amount indicated by the value of the stamps. Revenue stamps in the form of labels for attachment to certain kinds of dutiable goods, as evidence of the payment of the duties, fall in this heading.
- (3) **Other stamps**, for example those for purchase by the public as a means of making payments, compulsory or voluntary, to the State or other public authorities, e.g., as contributions to State welfare or other social service schemes or as national savings.

This heading **does not include** :

- (a) Vouchers in the form of stamps sometimes issued by retailers to their customers as a rebate on purchases, religious stamps of a kind issued to school children, stamps issued by charitable organisations, etc., as a means of raising funds or obtaining publicity, and " savings stamps " issued by private or commercial bodies to customers (**heading 49.11**).
- (b) Used stamps, and unused stamps not of current or new issue in the country of destination (**heading 97.04**).
- (B) **Stamped envelopes, letter cards, postcards, etc.**, bearing uncancelled prints or impressions of postage stamps of the kind described above and of current or new issue in the country in which they have, or will have, a recognised face value, or with " reply paid " postal marking.
- (C) **Other stamp-impressed paper** such as official forms, blank forms (e.g., for legal documents subject to revenue stamp duties), printed or embossed with revenue stamps.

- (D) **Banknotes.** This term covers promissory notes of all denominations issued by the State or approved issuing banks for use as currency or legal tender either in the country of issue or elsewhere. It includes banknotes which, at the time of presentation, are not yet or are no longer legal tender in any country. However, banknotes which are collectors' pieces or which form a collection, are classified in **heading 97.05**.
- (E) **Cheque forms** are stamped or unstamped blank cheque forms, frequently found in paper covers, in booklet form, and issued by banks, including Post Office banks in some countries, for use by their customers.
- (F) **Stock, share or bond certificates and similar documents of title.** These are formal documents issued, or for issue, by public or private bodies conferring ownership of, or entitlement to, certain financial interests, goods or benefits named therein. Apart from the certificates mentioned, these documents include letters of credit, bills of exchange, travellers' cheques, bills of lading, title deeds and dividend coupons. They usually require completion and validation.

Banknotes, cheque forms, and stock, etc., certificates are generally printed on special paper bearing special watermarkings or other marks, and are usually serially numbered. Lottery tickets printed on special security paper and serially numbered are, however, **excluded** from this heading and are generally classified in **heading 49.11**.

Products of the kinds described fall in this heading when in quantity as a commercial transaction, usually by the issuing authority, whether or not the documents (e.g., share certificates) require completion and validation.

49.08 - Transfers (decalcomanias).

4908.10 - Transfers (decalcomanias), vitrifiable

4908.90 - Other

Transfers (decalcomanias) consist of pictures, designs or lettering in single or multiple colours, lithographed or otherwise printed on absorbent, lightweight paper (or sometimes thin transparent sheeting of plastics), coated with a preparation, such as of starch and gum, to receive the imprint which is itself coated with an adhesive. This paper is often backed with a supporting paper of heavier quality. The designs are sometimes printed against a background of metal leaf.

When the printed paper is moistened and applied with slight pressure to a permanent surface (e.g., glass, pottery, wood, metal, stone or paper), the coating printed with the picture, etc., is transferred to the permanent surface.

This heading also covers vitrifiable transfers, i.e. transfers printed with vitrifiable preparations of heading 32.07.

Transfers may be used for decoration or utility purposes, e.g., for decorating pottery or glass, or for marking various articles such as vehicles, machines and instruments.

Transfers produced and supplied mainly for the amusement of children are also covered by this heading, as are also articles such as embroidery or hosier transfers which consist of papers on which designs are outlined in pigment which is transferred, usually to a textile surface, by pressure with a heated smoothing iron.

The articles described above should not be confused with the products known as window transparencies, which fall in **heading 48.14** or **49.11** (see the Explanatory Note to the former heading).

The heading also **excludes** transfer paper of the types known as stamping foils or blocking foils, prepared with a coating of metal, metal powder or pigment, and used for printing book covers, hat bands, etc. (**heading 32.12**). Other transfer papers, as used in lithographic work, fall in **heading 48.09** or **48.16** as appropriate.

49.09 - Printed or illustrated postcards; printed cards bearing personal greetings, messages or announcements, whether or not illustrated, with or without envelopes or trimmings.

This heading covers :

- (i) Printed or illustrated postcards regardless of whether they are for private, commercial or advertising purposes, and
- (ii) Printed cards bearing personal greetings, messages or announcements for any occasion. Such printed cards may be illustrated or not and may be with or without envelopes or trimmings.

These products comprise particularly :

- (1) **Picture postcards**, i.e., cards which have printed indications of their use as postcards, and in which the whole or greater part of one side is devoted to pictorial matter of any kind. Similar products not having such indications of use are classified as pictures in **heading 49.11**. These picture postcards may be in sheet or booklet form. Printed postcards in which the pictorial matter does not form the principal feature (e.g., certain postcards with advertising matter or small pictures) also fall in this heading. However, such postcards, if printed or embossed with postage stamps, are **excluded (heading 49.07)**. Plain postcards where printing is merely incidental to their primary use are also **excluded (heading 48.17)**.
- (2) **Christmas, New Year, birthday or similar cards**. These may be in the form of picture postcards, or consist of two or more folded leaves fastened together, one face or more being devoted to pictorial matter. The term "similar cards" is to be taken to include cards used to announce births or christenings, or for conveying congratulations or thanks. The printed cards may incorporate trimmings such as ribbons, cords, tassels and embroidery, or novelty features such as pull-out views, or be decorated with glass powder, etc.

The products of this heading are sometimes printed on materials other than paper, e.g., plastics or gelatin.

The heading **does not cover** :

- (a) Picture postcards put up in the form of children's picture, drawing or colouring books (**heading 49.03**).
- (b) Christmas or New Year cards, etc., in the form of calendars (**heading 49.10**).

49.10 - Calendars of any kind, printed, including calendar blocks.

This heading relates to calendars of any kind whether they are printed on paper, paperboard, woven fabric or any other material, **provided** that the printing gives the article its essential character. They may contain, in addition to the normal sequence of dates, days of the week, etc., various other items of information, such as notes of important events, festivals, astronomical and other data, verses and proverbs. They may also incorporate pictorial or advertising matter. However, publications sometimes improperly called calendars which, although dated, are published essentially to give information concerning public or private events, etc., are classified in **heading 49.01** (unless falling in **heading 49.11** as publicity matter).

The heading also covers calendars of the “perpetual” type or with replaceable blocks mounted on bases of materials other than paper or paperboard (e.g., wood, plastics or metal).

The heading further includes calendar blocks. These consist of a number of slips of paper each printed with particulars of a separate day of the year and assembled in chronological order in the form of a block from which the separate slips are removed daily. These blocks are generally used for mounting on a base of paperboard, or for annual replacement in calendars with bases of a more permanent nature.

The heading, however, **does not cover** articles whose essential character is not determined by the presence of a calendar.

The heading also **excludes**:

- (a) Memorandum pads incorporating calendars and diaries (including so-called engagement calendars) (**heading 48.20**).
- (b) Printed calendar backs not incorporating calendar blocks (**heading 49.11**).

49.11 - Other printed matter, including printed pictures and photographs.

4911.10 - Trade advertising material, commercial catalogues and the like

- Other :

4911.91 -- Pictures, designs and photographs

4911.99 -- Other

This heading covers all printed matter (including photographs and printed pictures) of this Chapter (see the General Explanatory Note above) but not more particularly covered by any of the preceding headings of the Chapter.

Framed pictures and photographs remain classified in this heading when the essential character of the whole is given by the pictures or photographs; in other cases such articles are to be classified in the heading appropriate to the frames, as articles of wood, metal, etc.

Certain printed articles may be intended for completion in manuscript or typescript at the time of use but remain in this heading **provided** they are essentially printed matter (see Note 12 to Chapter 48). Thus, printed forms (e.g., magazine subscription forms), blank multi-coupon travel (e.g., air, rail and coach) tickets, circular letters, identity documents and cards and other articles printed with messages, notices, etc., requiring only the insertion of particulars (e.g., dates and names) are classified in this heading. Stock, share or bond certificates and similar documents of title and cheque forms, which also require completion and validation are, however, classified in **heading 49.07**.

On the other hand, certain articles of stationery with printing which is merely incidental to their primary use for writing or typing are classified in **Chapter 48** (see Note 12 to Chapter 48 and in particular the Explanatory Notes to **headings 48.17 and 48.20**).

The heading includes the following in addition to the more obvious products :

- (1) Advertising matter (including posters), year books and similar publications devoted essentially to advertising, trade catalogues of all kinds (including book or music publishers' lists, and catalogues of works of art) and tourist propaganda. Newspapers, periodicals and journals, whether or not containing advertising material, are however excluded (**heading 49.01 or 49.02**, as appropriate).
- (2) Brochures containing the programme of a circus, sporting event, opera, play or similar presentation.
- (3) Printed calendar backs with or without illustrations.
- (4) Schematic maps.
- (5) Anatomical, botanical, etc., instructional charts and diagrams.
- (6) Tickets for admission to places of entertainment (e.g., cinemas, theatres and concerts), tickets for travel by public or private transport and other similar tickets.
- (7) Microcopies on opaque bases of the articles of this Chapter.

- (8) Screens made by printing a film of plastics with letters or symbols to be cut out for use in design work.

Such screens simply printed with dots, lines or squares are **excluded** (**Chapter 39**).

- (9) Maximum cards and illustrated first-day covers not bearing postage stamps (see also Part (D) of the Explanatory Note to heading 97.04).

- (10) Self-adhesive printed stickers designed to be used, for example, for publicity, advertising or mere decoration, e.g., "comic stickers" and "window stickers".

- (11) Lottery tickets, "scratch cards", raffle tickets and tombola tickets.

The following articles, in particular, are also **excluded** from this heading :

- (a) Photographic negatives or positives on films or plates (**heading 37.05**).
 - (b) Goods of **heading 39.18, 39.19, 48.14 or 48.21** or printed paper products of **Chapter 48** in which the printed characters or pictures are merely incidental to the primary use of the products.
 - (c) Letters, numbers, sign-plates and similar motifs for shop signs and shop windows, bearing a printed picture or text, of ceramics, of glass, or of base metal, which are classifiable in **headings 69.14, 70.20** and **83.10** respectively, or in **heading 94.05** if illuminated.
 - (d) Decorative glass mirrors, whether or not framed, with printed illustrations on one surface (**heading 70.09 or 70.13**).
 - (e) Printed "smart cards" (including proximity cards or tags) as defined in Note 4 (b) to Chapter 85 (**heading 85.23**).
 - (f) Printed dials of instruments or apparatus of **Chapter 90 or 91**.
 - (g) Printed paper toys (e.g., children's cut-out sheets), playing cards and the like, and other printed games (**Chapter 95**).
 - (h) Original engravings, prints and lithographs, of **heading 97.02**, that is, impressions produced directly, in black and white or in colour, of one or of several plates wholly executed by hand by the artist, irrespective of the process or of the material employed by him, but not including any mechanical or photo-mechanical process.
-

Section XI

TEXTILES AND TEXTILE ARTICLES

Notes.

1.- This Section does not cover :

- (a) Animal brush-making bristles or hair (heading 05.02); horsehair or horsehair waste (heading 05.11);
- (b) Human hair or articles of human hair (heading 05.01, 67.03 or 67.04), except straining cloth of a kind commonly used in oil presses or the like (heading 59.11);
- (c) Cotton linters or other vegetable materials of Chapter 14;
- (d) Asbestos of heading 25.24 or articles of asbestos or other products of heading 68.12 or 68.13;
- (e) Articles of heading 30.05 or 30.06; yarn used to clean between the teeth (dental floss), in individual retail packages, of heading 33.06;
- (f) Sensitised textiles of headings 37.01 to 37.04;
- (g) Monofilament of which any cross-sectional dimension exceeds 1 mm or strip or the like (for example, artificial straw) of an apparent width exceeding 5 mm, of plastics (Chapter 39), or plaited or fabrics or other basketware or wickerwork of such monofilament or strip (Chapter 46);
- (h) Woven, knitted or crocheted fabrics, felt or nonwovens, impregnated, coated, covered or laminated with plastics, or articles thereof, of Chapter 39;
- (ij) Woven, knitted or crocheted fabrics, felt or nonwovens, impregnated, coated, covered or laminated with rubber, or articles thereof, of Chapter 40;
- (k) Hides or skins with their hair or wool on (Chapter 41 or 43) or articles of furskin, artificial fur or articles thereof, of heading 43.03 or 43.04;
- (l) Articles of textile materials of heading 42.01 or 42.02;
- (m) Products or articles of Chapter 48 (for example, cellulose wadding);
- (n) Footwear or parts of footwear, gaiters or leggings or similar articles of Chapter 64;
- (o) Hair-nets or other headgear or parts thereof of Chapter 65;
- (p) Goods of Chapter 67;
- (q) Abrasive-coated textile material (heading 68.05) and also carbon fibres or articles of carbon fibres of heading 68.15;
- (r) Glass fibres or articles of glass fibres, other than embroidery with glass thread on a visible ground of fabric (Chapter 70);
- (s) Articles of Chapter 94 (for example, furniture, bedding, lamps and lighting fittings);
- (t) Articles of Chapter 95 (for example, toys, games, sports requisites and nets);
- (u) Articles of Chapter 96 (for example, brushes, travel sets for sewing, slide fasteners, typewriter ribbons, sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies); or
- (v) Articles of Chapter 97.

- 2.- (A) Goods classifiable in Chapters 50 to 55 or in heading 58.09 or 59.02 and of a mixture of two or more textile materials are to be classified as if consisting wholly of that one textile material which predominates by weight over any other single textile material.

When no one textile material predominates by weight, the goods are to be classified as if consisting wholly of that one textile material which is covered by the heading which occurs last in numerical order among those which equally merit consideration.

- (B) For the purposes of the above rule :
- (a) Gimped horsehair yarn (heading 51.10) and metallised yarn (heading 56.05) are to be treated as a single textile material the weight of which is to be taken as the aggregate of the weights of its components; for the classification of woven fabrics, metal thread is to be regarded as a textile material;
 - (b) The choice of appropriate heading shall be effected by determining first the Chapter and then the applicable heading within that Chapter, disregarding any materials not classified in that Chapter;
 - (c) When both Chapters 54 and 55 are involved with any other Chapter, Chapters 54 and 55 are to be treated as a single Chapter;
 - (d) Where a Chapter or a heading refers to goods of different textile materials, such materials are to be treated as a single textile material.
- (C) The provisions of paragraphs (A) and (B) above apply also to the yarns referred to in Note 3, 4, 5 or 6 below.
- 3.- (A) For the purposes of this Section, and subject to the exceptions in paragraph (B) below, yarns (single, multiple (folded) or cabled) of the following descriptions are to be treated as "twine, cordage, ropes and cables" :
- (a) Of silk or waste silk, measuring more than 20,000 decitex;
 - (b) Of man-made fibres (including yarn of two or more monofilaments of Chapter 54), measuring more than 10,000 decitex;
 - (c) Of true hemp or flax :
 - (i) Polished or glazed, measuring 1,429 decitex or more; or
 - (ii) Not polished or glazed, measuring more than 20,000 decitex;
 - (d) Of coir, consisting of three or more plies;
 - (e) Of other vegetable fibres, measuring more than 20,000 decitex; or
 - (f) Reinforced with metal thread.
- (B) Exceptions :
- (a) Yarn of wool or other animal hair and paper yarn, other than yarn reinforced with metal thread;
 - (b) Man-made filament tow of Chapter 55 and multifilament yarn without twist or with a twist of less than 5 turns per metre of Chapter 54;
 - (c) Silk worm gut of heading 50.06, and monofilaments of Chapter 54;
 - (d) Metallised yarn of heading 56.05; yarn reinforced with metal thread is subject to paragraph (A) (f) above; and
 - (e) Chenille yarn, gimped yarn and loop wale-yarn of heading 56.06.

- 4.- (A) For the purposes of Chapters 50, 51, 52, 54 and 55, the expression "put up for retail sale" in relation to yarn means, subject to the exceptions in paragraph (B) below, yarn (single, multiple (folded) or cabled) put up :
- (a) On cards, reels, tubes or similar supports, of a weight (including support) not exceeding :
 - (i) 85 g in the case of silk, waste silk or man-made filaments; or
 - (ii) 125 g in other cases;
 - (b) In balls, hanks or skeins of a weight not exceeding :
 - (i) 85 g in the case of man-made filament yarn of less than 3,000 decitex, silk or silk waste;
 - (ii) 125 g in the case of all other yarns of less than 2,000 decitex; or
 - (iii) 500 g in other cases.
 - (c) In hanks or skeins comprising several smaller hanks or skeins separated by dividing threads which render them independent one of the other, each of uniform weight not exceeding :
 - (i) 85 g in the case of silk, waste silk or man-made filaments; or
 - (ii) 125 g in other cases.
- (B) Exceptions :
- (a) Single yarn of any textile material, except :
 - (i) Single yarn of wool or fine animal hair, unbleached; and
 - (ii) Single yarn of wool or fine animal hair, bleached, dyed or printed, measuring more than 5,000 decitex;
 - (b) Multiple (folded) or cabled yarn, unbleached :
 - (i) Of silk or waste silk, however put up; or
 - (ii) Of other textile material except wool or fine animal hair, in hanks or skeins;
 - (c) Multiple (folded) or cabled yarn of silk or waste silk, bleached, dyed or printed, measuring 133 decitex or less; and
 - (d) Single, multiple (folded) or cabled yarn of any textile material :
 - (i) In cross-reeled hanks or skeins; or
 - (ii) Put up on supports or in some other manner indicating its use in the textile industry (for example, on cops, twisting mill tubes, pirns, conical bobbins or spindles, or reeled in the form of cocoons for embroidery looms).
- 5.- For the purposes of headings 52.04, 54.01 and 55.08, the expression "sewing thread" means multiple (folded) or cabled yarn :
- (a) Put up on supports (for example, reels, tubes) of a weight (including support) not exceeding 1,000 g;
 - (b) Dressed for use as sewing thread; and
 - (c) With a final "Z" twist.

6.- For the purposes of this Section, the expression " high tenacity yarn " means yarn having a tenacity, expressed in cN/tex (centinewtons per tex), greater than the following :

Single yarn of nylon or other polyamides, or of polyesters 60 cN/tex

Multiple (folded) or cabled yarn of nylon or other polyamides, or of polyesters 53 cN/tex

Single, multiple (folded) or cabled yarn of viscose rayon 27 cN/tex.

7.- For the purposes of this Section, the expression " made up " means :

(a) Cut otherwise than into squares or rectangles;

(b) Produced in the finished state, ready for use (or merely needing separation by cutting dividing threads) without sewing or other working (for example, certain dusters, towels, table cloths, scarf squares, blankets);

(c) Cut to size and with at least one heat-sealed edge with a visibly tapered or compressed border and the other edges treated as described in any other subparagraph of this Note, but excluding fabrics the cut edges of which have been prevented from unravelling by hot cutting or by other simple means;

(d) Hemmed or with rolled edges, or with a knotted fringe at any of the edges, but excluding fabrics the cut edges of which have been prevented from unravelling by whipping or by other simple means;

(e) Cut to size and having undergone a process of drawn thread work;

(f) Assembled by sewing, gumming or otherwise (other than piece goods consisting of two or more lengths of identical material joined end to end and piece goods composed of two or more textiles assembled in layers, whether or not padded);

(g) Knitted or crocheted to shape, whether presented as separate items or in the form of a number of items in the length.

8.- For the purposes of Chapters 50 to 60 :

(a) Chapters 50 to 55 and 60 and, except where the context otherwise requires, Chapters 56 to 59 do not apply to goods made up within the meaning of Note 7 above; and

(b) Chapters 50 to 55 and 60 do not apply to goods of Chapters 56 to 59.

9.- The woven fabrics of Chapters 50 to 55 include fabrics consisting of layers of parallel textile yarns superimposed on each other at acute or right angles. These layers are bonded at the intersections of the yarns by an adhesive or by thermal bonding.

10.- Elastic products consisting of textile materials combined with rubber threads are classified in this Section.

11.- For the purposes of this Section, the expression " impregnated " includes " dipped ".

12.- For the purposes of this Section, the expression " polyamides " includes " aramids ".

13.- For the purposes of this Section and, where applicable, throughout the Nomenclature, the expression " elastomeric yarn " means filament yarn, including monofilament, of synthetic textile material, other than textured yarn, which does not break on being extended to three times its original length and which returns, after being extended to twice its original length, within a period of five minutes, to a length not greater than one and a half times its original length.

14.- Unless the context otherwise requires, textile garments of different headings are to be classified in their own headings even if put up in sets for retail sale. For the purposes of this Note, the expression " textile garments " means garments of headings 61.01 to 61.14 and headings 62.01 to 62.11.

Subheading Notes.

1.- In this Section and, where applicable, throughout the Nomenclature, the following expressions have the meanings hereby assigned to them :

(a) Unbleached yarn

Yarn which :

- (i) has the natural colour of its constituent fibres and has not been bleached, dyed (whether or not in the mass) or printed; or
- (ii) is of indeterminate colour ("grey yarn"), manufactured from garnetted stock.

Such yarn may have been treated with a colourless dressing or fugitive dye (which disappears after simple washing with soap) and, in the case of man-made fibres, treated in the mass with delustering agents (for example, titanium dioxide).

(b) Bleached yarn

Yarn which :

- (i) has undergone a bleaching process, is made of bleached fibres or, unless the context otherwise requires, has been dyed white (whether or not in the mass) or treated with a white dressing;
- (ii) consists of a mixture of unbleached and bleached fibres; or
- (iii) is multiple (folded) or cabled and consists of unbleached and bleached yarns.

(c) Coloured (dyed or printed) yarn

Yarn which :

- (i) is dyed (whether or not in the mass) other than white or in a fugitive colour, or printed, or made from dyed or printed fibres;
- (ii) consists of a mixture of dyed fibres of different colours or of a mixture of unbleached or bleached fibres with coloured fibres (marl or mixture yarns), or is printed in one or more colours at intervals to give the impression of dots;
- (iii) is obtained from slivers or rovings which have been printed; or
- (iv) is multiple (folded) or cabled and consists of unbleached or bleached yarn and coloured yarn.

The above definitions also apply, *mutatis mutandis*, to monofilament and to strip or the like of Chapter 54.

(d) Unbleached woven fabric

Woven fabric made from unbleached yarn and which has not been bleached, dyed or printed. Such fabric may have been treated with a colourless dressing or a fugitive dye.

(e) Bleached woven fabric

Woven fabric which :

- (i) has been bleached or, unless the context otherwise requires, dyed white or treated with a white dressing, in the piece;
- (ii) consists of bleached yarn; or
- (iii) consists of unbleached and bleached yarn.

(f) Dyed woven fabric

Woven fabric which :

- (i) is dyed a single uniform colour other than white (unless the context otherwise requires) or has been treated with a coloured finish other than white (unless the context otherwise requires), in the piece; or
- (ii) consists of coloured yarn of a single uniform colour.

(g) Woven fabric of yarns of different colours

Woven fabric (other than printed woven fabric) which :

- (i) consists of yarns of different colours or yarns of different shades of the same colour (other than the natural colour of the constituent fibres);
- (ii) consists of unbleached or bleached yarn and coloured yarn; or
- (iii) consists of marl or mixture yarns.

(In all cases, the yarn used in selvedges and piece ends is not taken into consideration.)

(h) Printed woven fabric

Woven fabric which has been printed in the piece, whether or not made from yarns of different colours.

(The following are also regarded as printed woven fabrics : woven fabrics bearing designs made, for example, with a brush or spray gun, by means of transfer paper, by flocking or by the batik process.)

The process of mercerisation does not affect the classification of yarns or fabrics within the above categories.

The definitions at (d) to (h) above apply, mutatis mutandis, to knitted or crocheted fabrics.

(ij) Plain weave

A fabric construction in which each yarn of the weft passes alternately over and under successive yarns of the warp and each yarn of the warp passes alternately over and under successive yarns of the weft.

2.- (A) Products of Chapters 56 to 63 containing two or more textile materials are to be regarded as consisting wholly of that textile material which would be selected under Note 2 to this Section for the classification of a product of Chapters 50 to 55 or of heading 58.09 consisting of the same textile materials.

(B) For the application of this rule :

- (a) where appropriate, only the part which determines the classification under Interpretative Rule 3 shall be taken into account;
- (b) in the case of textile products consisting of a ground fabric and a pile or looped surface no account shall be taken of the ground fabric;
- (c) in the case of embroidery of heading 58.10 and goods thereof, only the ground fabric shall be taken into account. However, embroidery without visible ground, and goods thereof, shall be classified with reference to the embroidering threads alone.

GENERAL

In general, Section XI covers raw materials of the textile industry (silk, wool, cotton, man-made fibres, etc.), semi-manufactured products (such as yarns and woven fabrics) and the made up articles made from those products. However, it **excludes** a certain number of materials and products such as those mentioned in Note 1 to Section XI, the Notes to certain Chapters or in the following Explanatory Notes on headings in the Section. In particular, the following **are not classified** in Section XI :

- (a) Human hair and articles thereof (generally **heading 05.01, 67.03 or 67.04**), **except** straining cloth of a kind used in oil presses or the like (**heading 59.11**).
- (b) Asbestos fibres and articles (yarns, fabrics, clothing, etc.) of asbestos (**heading 25.24, 68.12 or 68.13**).
- (c) Carbon fibres and other non-metallic mineral fibres (e.g., silicon carbide, rock wool) and articles of such fibres (**Chapter 68**).
- (d) Glass fibres, yarns, fabrics, and articles made therefrom, and composite articles of glass fibres and textile fibres having the character of articles of glass fibres (**Chapter 70**), **other than** embroidery with glass thread on a visible ground of fabric.

Section XI is divided into fourteen Chapters which may be considered in two parts, the first (Chapters 50 to 55) being divided according to the nature of the textile material, and the second (Chapters 56 to 63), with the exception of headings 58.09 and 59.02, covering products without distinction, at heading level, as to the nature of the textile.

(I) CHAPTERS 50 TO 55

Chapters 50 to 55 each deal with one or more textile materials, alone or mixed, at their various stages of manufacture, up to and including their conversion into woven fabrics as described in Part (I) (C) below. They cover, in most cases, the raw material, recovered waste (including garnetted stock but **not** unpulled rags), carded or combed fibres in the form of slivers, rovings, etc., yarns and woven fabrics.

(A) Classification of products composed of mixed textile materials

(See Note 2 to Section XI)

A textile product classifiable in any heading in Chapters 50 to 55 (waste, yarn, woven fabric, etc.) or in heading 58.09 or 59.02 and of a mixture of two or more different textile materials is to be classified as if consisting wholly of that one textile material which predominates by weight over any other single textile material.

When no one textile material predominates by weight, the goods are to be classified as if consisting wholly of that one textile material which is covered by the heading which occurs last in numerical order among those which equally merit consideration.

The textile materials may be mixed :

- prior to or during spinning;
- during twisting;
- during weaving.

In the case of products (other than those of heading 58.11) consisting of two or more textile fabrics of different composition assembled in layers by sewing, gumming, etc., classification is determined in accordance with Interpretative Rule 3. Accordingly, Note 2 to Section XI applies only where it is necessary to determine the textile material which predominates by weight in the fabric taken into consideration for the classification of the product as a whole.

Similarly, the provisions of Note 2 to Section XI apply to mixed products composed of textile and non-textile materials **only** if, by virtue of the General Rules for the Interpretation of the Nomenclature, they are classified as textile products.

It should be noted that, for the application of Note 2 to the Section :

- (1) When a Chapter or a heading refers to products composed of textile materials of different kinds, those materials are aggregated together for the purpose of classifying similar products containing those materials mixed with others; the choice of appropriate heading shall be effected by determining **first** the Chapter and **then** the applicable heading within that Chapter, disregarding any materials not classified in that Chapter.

Examples :

- (a) A woven fabric composed of :

40 % by weight of synthetic staple fibres,
35 % by weight of combed wool, and
25 % by weight of combed fine animal hair

is not classified in heading 55.15 (other woven fabrics of synthetic staple fibres) but comes under **heading 51.12** (woven fabrics of combed wool or of combed fine animal hair), since the proportions of wool and of fine animal hair must, in this case, be taken in the aggregate.

- (b) A woven fabric weighing 210 g/m² composed of :

40 % by weight of cotton,
30 % by weight of artificial staple fibres, and
30 % by weight of synthetic staple fibres

is not classified in heading 52.11 (woven fabrics of cotton, containing less than 85 % by weight of cotton, mixed mainly or solely with man-made fibres, weighing more than 200 g/m²), or in heading 55.14 (woven fabrics of synthetic staple fibres, containing less than 85 % by weight of such fibres, mixed mainly or solely with cotton, of a weight exceeding 170 g/m²), but comes under **heading 55.16** (woven fabrics of artificial staple fibres). This classification is reached by determining first the relevant Chapter (in this case Chapter 55 since the proportion of synthetic staple fibres and artificial staple fibres must, in this case, be taken in the aggregate) and then the applicable heading within that Chapter which, in this example, is heading 55.16, the heading which occurs last in numerical order among those which equally merit consideration.

- (c) A woven fabric composed of :

35 % by weight of flax,
25 % by weight of jute,
40 % by weight of cotton

is not classified in heading 52.12 (other woven fabrics of cotton) but in **heading 53.09** (woven fabrics of flax). This classification is reached by determining first the relevant Chapter (in this case Chapter 53 since the proportions of flax and jute must be taken in the aggregate) and then the applicable heading within that Chapter which, in this example, is **heading 53.09** since flax predominates over jute, the cotton content being disregarded in accordance with Section Note 2 (B) (b).

- (2) Gimped horsehair yarn and metallised yarn are treated as single textile materials, and their weight is taken as the aggregate of the weights of the components.
- (3) In classifying woven fabrics, metal thread is treated as a textile material.
- (4) When both Chapters 54 and 55 are involved with any other Chapter, Chapters 54 and 55 are to be treated as a single Chapter.

Example :

A woven fabric composed of :

35 % by weight of synthetic filaments,
25 % by weight of synthetic staple fibres, and
40 % by weight of combed wool

is not classified in heading 51.12 (woven fabrics of combed wool) but comes under **heading 54.07** (woven fabrics of synthetic filament yarn), since the proportions of synthetic filaments and synthetic staple fibres must, in this case, be taken in the aggregate.

- (5) Sizings or dressings (e.g., weighting (loading) in the case of silk) and also products for impregnating, coating, covering or sheathing, incorporated in textile fibres are not deemed to be non-textile materials; in other words, the weight of the textile fibres is calculated on the basis of their weight in the state in which they are presented.

When deciding if an admixture is **mainly** a particular textile material, regard is to be taken to the textile material which predominates by weight over any other single textile material in the admixture.

Example :

A woven fabric weighing not more than 200 g/m² and consisting of :

55 % by weight of cotton,
22 % by weight of man-made fibres,
21 % by weight of wool, and
2 % by weight of silk

does not fall in heading 52.12 (other woven fabrics of cotton), but in **heading 52.10** (woven fabrics of cotton, containing less than 85 % by weight of cotton, mixed mainly or solely with man-made fibres, weighing not more than 200 g/m²).

(B) Yarns

(1) General.

Textile yarns may be single, multiple (folded) or cabled. For the purposes of the Nomenclature :

(i) **Single yarns** means yarns composed **either of** :

- (a) Staple fibres, usually held together by twist (**spun yarns**); **or of**
- (b) One filament (monofilament) of headings 54.02 to 54.05, or two or more filaments (multifilament) of heading 54.02 or 54.03, held together, with or without twist (**continuous yarns**).

(ii) **Multiple (folded) yarns** means yarns formed from two or more single yarns, including those obtained from monofilaments of heading 54.04 or 54.05 (twofold, threefold, fourfold, etc. yarns) twisted together in one folding operation. However, yarns composed solely of monofilaments of heading 54.02 or 54.03, held together by twist, are not to be regarded as multiple (folded) yarns.

The **ply** (" fold ") of a multiple (folded) yarn means each of the single yarns with which it is formed.

(iii) **Cabled yarns** means yarns formed from two or more yarns, at least one of which is multiple (folded), twisted together in one or more folding operations.

The **ply** (" fold ") of a cabled yarn means each of the single or multiple (folded) yarns with which it is formed.

The above yarns are sometimes called **multiple wound** (assembled) yarns when they are obtained by juxtaposition of two or more single, multiple (folded) or cabled yarns. These are to be regarded as single, multiple (folded) or cabled yarns according to the type of the yarns of which they are composed.

Single, multiple (folded) or cabled yarns may have loops or slubs at intervals (**bouclé** or **looped, slub or flammé yarn**). They may also be composed of two or more yarns one of which is folded back on itself at intervals to give the effect of a loop or swelling.

Polished or **glazed** yarns are those which have been treated with preparations based on natural substances (wax, paraffin, etc.) or on synthetic substances (acrylic resins in particular). They are then made glossy by means of polishing rollers.

Yarns are designated according to their measurement. Various systems of numbering or counting are still in use. The Nomenclature, however, uses the universal " Tex " system, which is a unit for expressing linear density, equal to the weight in grams of one kilometre of yarn, filament, fibre, or other textile strand. Decitex is 0.1 Tex. The following formula for the conversion of metric numbers into decitex numbers is applied :

$$\frac{10,000}{\text{Metric number}} = \text{Decitex.}$$

Yarns may be unbleached, scoured, bleached, creamed, dyed, printed, marled, etc. They may also have been gassed (i.e., singed to remove fibres which give them a hairy appearance), mercerised (i.e., treated under tension with sodium hydroxide), oiled, etc.

However, Chapters 50 to 55 **do not include** :

- (a) Rubber thread, textile covered, and textile yarns impregnated (including dipped), coated, covered or sheathed with rubber or plastics, of **heading 56.04**.
- (b) Metallised yarn (**heading 56.05**).
- (c) Gimped yarn, chenille yarn and loop wale-yarn (**heading 56.06**).
- (d) Braided textile yarns (**heading 56.07** or **58.08**, as the case may be).
- (e) Textile yarns reinforced with metal thread (**heading 56.07**).
- (f) Yarns, monofilaments or textile fibres laid parallel and bonded with an adhesive (bolduc) (**heading 58.06**).
- (g) Textile yarns laid parallel and agglomerated with rubber of **heading 59.06**.

(2) Distinction between single, multiple (folded) or cabled yarns of Chapters 50 to 55, twine, cordage, rope or cables of heading 56.07 and braids of heading 58.08.

(See Note 3 to Section XI)

Chapters 50 to 55 do not cover all yarns. Yarns are classified according to their characteristics (measurement, whether or not polished or glazed, number of plies) in those headings of Chapters 50 to 55 relating to yarns, as twine, cordage, rope or cables under heading 56.07, or as braids under heading 58.08. Table I below shows the correct classification in each individual case :

TABLE I

Classification of yarns, twine, cordage, rope and cables of textile material.

Type (*)	Characteristics determining classification	Classification
Reinforced with metal thread	In all cases	Heading 56.07
Of metallised yarn	In all cases	Heading 56.05
Gimped yarn, other than those of headings 51.10 and 56.05, chenille yarn and loop wale yarn	In all cases	Heading 56.06
Braided textile yarn	(1) Tightly plaited and with a compact structure (2) Other	Heading 56.07 Heading 58.08
Other : - Of silk or waste silk (**)	(1) Measuring 20,000 decitex or less (2) Measuring more than 20,000 decitex	Chapter 50 Heading 56.07
- Of wool or other animal hair	In all cases	Chapter 51
- Of flax or true hemp	(1) Polished or glazed : (a) Measuring 1,429 decitex or more (b) Measuring less than 1,429 decitex (2) Neither polished nor glazed : (a) Measuring 20,000 decitex or less	Heading 56.07 Chapter 53 Chapter 53

Type (*)	(b) Measuring more than 20,000 decitex Characteristics determining classification	Heading 56.07 Classification
- Of coir	(1) Of one or two plies (2) Of three or more plies	Heading 53.08 Heading 56.07
- Of paper	In all cases	Heading 53.08
- Of cotton or other vegetable fibres	(1) Measuring 20,000 decitex or less (2) Measuring more than 20,000 decitex	Chapter 52 or 53 Heading 56.07
- Of man-made fibres (including those yarns of two or more monofilaments of Chapter 54 (**))	(1) Measuring 10,000 decitex or less (2) Measuring more than 10,000 decitex	Chapter 54 or 55 Heading 56.07

Footnotes.

- (*) References to the various textiles materials apply also to such mixtures as are classified therewith under the provisions of Note 2 to Section XI (see Part (I) (A) of this General Explanatory Note).
- (**) Silk worm gut of heading 50.06, multifilament yarn without twist or with a twist of less than 5 turns per metre, and monofilament, of Chapter 54, and man-made filament tow of Chapter 55 do not in any circumstances fall in heading 56.07.

(3) Yarns put up for retail sale.

(See Note 4 to Section XI)

Certain headings of Chapters 50, 51, 52, 54 and 55 make provision for textile yarns put up for retail sale. To be classified in those headings yarns must meet the criteria set out in Table II below.

However, the following yarns are **never** deemed to be put up for retail sale :

- (a) Single yarn of silk, waste silk, cotton or man-made fibres, however put up.
- (b) Single yarn of wool or of fine animal hair, bleached, dyed or printed, measuring 5,000 decitex or less, however put up.
- (c) Multiple (folded) or cabled yarn of silk or waste silk, unbleached, however put up.
- (d) Multiple (folded) or cabled yarn of cotton or man-made fibres, unbleached, in hanks or skeins.
- (e) Multiple (folded) or cabled yarn of silk or waste silk, bleached, dyed or printed, measuring 133 decitex or less.
- (f) Single, multiple (folded) or cabled yarn of any textile material, in cross-reeled hanks or skeins. (*)
- (g) Single, multiple (folded) or cabled yarn of any textile material, put up on supports (e.g., cops, twisting mill tubes, pirns, conical bobbins or spindles) or in some other manner (for example, in the form of cocoons for embroidery looms, cakes made by centrifugal spinning) indicating its use in the textile industry.

*
* *

Footnote

(*) Cross-reeling indicates that in building up the hank the thread crosses diagonally as the hank is being wound, preventing the hank from being split. Cross-reeling is the method usually adopted when the hanks are for dyeing.

"Not cross-reeled" "Cross-reeled"

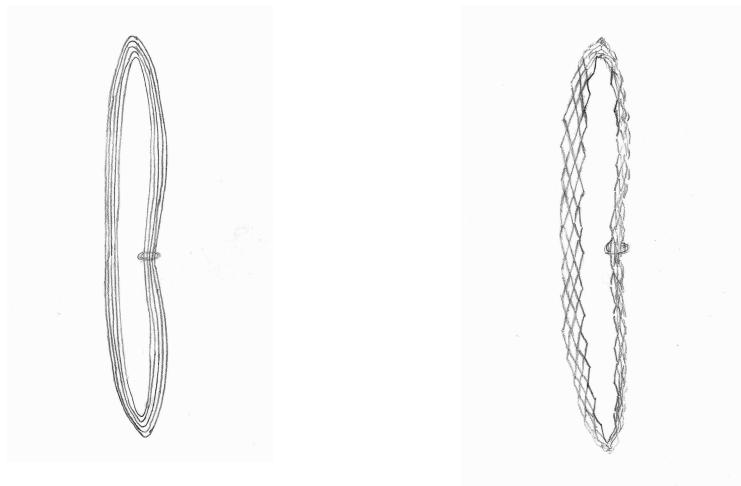

TABLE II
Yarns put up for retail sale (subject to the above-mentioned exceptions).

Way in which put up	Type of yarn (*)	Conditions under which the yarn is to be regarded as put up for retail sale
On cards, reels, tubes or similar supports	(1) Silk, waste silk or man-made filament yarns (2) Wool, fine animal hair, cotton or man-made staple yarns	Weighing 85 g or less (including support) Weighing 125 g or less (including support)
In balls, hanks or skeins	(1) Man-made filament yarn of less than 3,000 decitex, silk or waste silk yarns (2) Other yarns of less than 2,000 decitex (3) Other yarns	Weighing 85 g or less Weighing 125 g or less Weighing 500 g or less
In hanks or skeins comprising several smaller hanks or skeins separated by dividing threads which render them independent one of the other (**)	(1) Silk, waste silk, or man-made filament yarns (2) Wool, fine animal hair, cotton or man-made staple fibre yarns	Each of the smaller skeins to be of a uniform weight of 85 g or less Each of the smaller skeins to be of a weight of 125 g or less

Footnotes

- (*) References to the various textile materials apply also to such mixtures as are classified therewith under the provisions of Note 2 to Section XI (see Part (I) (A) of this General Explanatory Note).
- (**) The hanks or skeins comprising several smaller hanks or skeins separated by one or more dividing threads are formed of one continuous length of yarn which, on being cut, allows the component hanks or skeins to be readily separated. One or more dividing threads pass between the skeins and keep them separate from each other. These hanks and skeins are often wrapped round with paper bands. Other hanks and skeins of one continuous length, or yarn with dividing threads which do not separate the main hank or skein into smaller hanks or skeins of uniform weight, but are simply intended to prevent tangling during processing (e.g., dyeing), are not regarded as hanks or skeins comprising several smaller hanks or skeins separated by one or more dividing threads and are not regarded as put up for retail sale.

(4) Sewing thread.

(See Note 5 to Section XI)

For the purposes of headings 52.04, 54.01 and 55.08 the expression "sewing thread" means multiple (folded) or cabled yarn :

- Put up on supports (for example, reels, tubes) of a weight (including support) not exceeding 1,000 g;
- Dressed for use as sewing thread; and
- With a final "Z" twist.

The term "dressed" means given a finishing treatment. This treatment is designed to facilitate the use of textile yarn as a sewing thread, for example, by giving it antifriction properties or thermal resistance, preventing the formation of static electricity or improving its appearance. Such treatment involves the use of substances based on silicones, starch, wax, paraffin, etc.

The length of sewing thread is generally indicated on the support.

(5) High tenacity yarn.

(See Note 6 to Section XI)

In Chapters 54 and 59 there are provisions for "high tenacity yarn" and for fabrics made from such yarn.

The expression "high tenacity yarn" means yarn having a tenacity, expressed in cN/tex (centinewtons per tex), greater than the following :

Single yarn of nylon or other polyamides, or of polyesters 60 cN/tex

Multiple (folded) or cabled yarn of nylon or other polyamides, or of polyesters	53 cN/tex
Single, multiple (folded) or cabled yarn of viscose rayon	27 cN/tex.

(6) **Elastomeric and textured yarns.**

(See Note 13 to Section XI)

Elastomeric yarn is defined in Note 13 to this Section. It should be noted that the textured yarn referred to therein is defined in the Subheading Explanatory Note to subheadings 5402.31 to 5402.39.

(C) Woven fabrics.

The **woven fabrics** of Chapters 50 to 55 are products obtained by interlacing textile yarns (whether of the kinds classified in Chapters 50 to 55 or those regarded as twine, cordage, etc., of heading 56.07), rovings, monofilament or strip and the like of Chapter 54, loop wale-yarn, narrow ribbons, braids or narrow fabrics (consisting of warp without weft assembled by means of an adhesive, etc.), on warp and weft looms. Certain woven fabrics are, however, **excluded**, for example :

- (a) Carpets and other floor coverings (**Chapter 57**).
- (b) Pile fabrics or chenille fabrics of **heading 58.01**, terry towelling and similar woven terry fabrics of **heading 58.02**, gauze of **heading 58.03**, tapestries of **heading 58.05**, narrow woven fabrics of **heading 58.06** and woven fabrics of metal thread or metallised yarn of **heading 58.09**.
- (c) Coated, impregnated, etc., fabrics of **headings 59.01** and **59.03 to 59.07**; tyre cord fabrics of **heading 59.02** or textile fabrics for technical uses of **heading 59.11**.
- (d) Goods which have been made up within the meaning of Note 7 to Section XI (see Part (II) of this General Explanatory Note).

Subject to the provisions of (a) to (d) above the woven fabrics of Chapters 50 to 55, by application of Note 9 to Section XI, include, for example, fabrics consisting of :

- one layer of parallel "warp" yarns with a layer of parallel "weft" yarns superimposed at acute or right angles;
- two layers of parallel "warp" yarns between which a layer of "weft" yarns is inserted at acute or right angles.

The essential characteristic of these fabrics is that the yarns are not interlaced as in conventional woven fabrics but are bonded at the intersections with an adhesive or by thermal bonding.

These fabrics are sometimes referred to as **mesh scrims**; their uses include the reinforcement of other materials (plastics, paper, etc.). They are also used, for example, for the protection of agricultural crops.

The woven fabrics of Chapters 50 to 55 may be unbleached, scoured, bleached, dyed, made from yarns of different colours, printed, clouded, mercerised, glazed, moiré, raised (napped), goffered, fulled, gassed (singed), etc. They include unfigured and figured fabrics, and broché fabrics in which designs are produced by additional warp or weft threads introduced during weaving. These fabrics are not regarded as embroidered fabrics.

Chapters 50 to 55 also cover fabrics with their weft threads dissolved in places to give the effect of designs where both the warp and weft threads remain (e.g., certain fabrics which have warp threads of viscose rayon and weft threads of acetate fibres, the weft threads having been partially removed by means of a solvent).

Subheading Explanatory Notes.

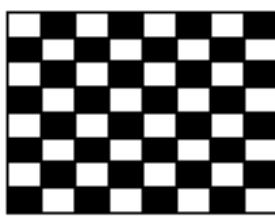

Woven fabric of yarns of different colours

Woven fabrics consisting either wholly or partly of printed yarns of different colours or of printed yarns of different shades of the same colour are regarded as "woven fabrics of yarns of different colours" and not as "dyed woven fabrics" or "printed woven fabrics".

Weaves

Plain weave is defined by Subheading Note 1 (ij) to Section XI as "a fabric construction in which each yarn of the weft passes alternately over and under successive yarns of the warp and each yarn of the warp passes alternately over and under successive yarns of the weft".

This weave pattern is shown diagrammatically below :

Plain weave

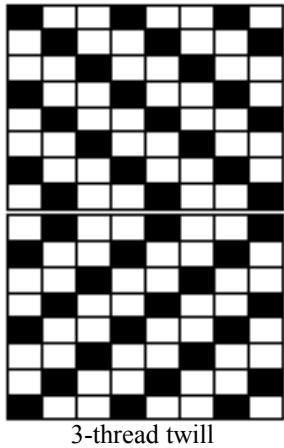

Plain weave is the simplest and most commonly used weave. The two surfaces of plain weave fabrics are always identical (double-faced fabrics) because an equal proportion of warp and weft threads is visible on each side.

In **twill weave**, the first warp thread (end) is bound by the first weft thread (pick), the second warp thread by the second weft thread, the third warp thread by the third weft thread, and so on. The step number for this kind of weave is one for both warp and weft. The weave repeat, i.e. the number of warp threads and weft threads required to repeat the pattern, is always greater than two. The closest twill weave is that in which the weft thread passes (floats) over two warp threads. This is a three-thread twill. In a four-thread twill, the weft thread passes over three warp threads.

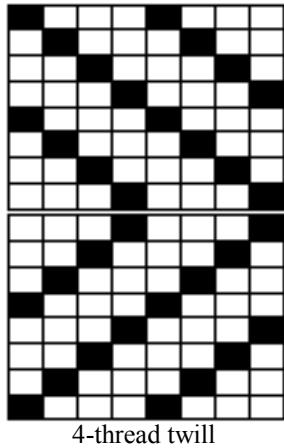

In twill weave, diagonal lines of ribbing formed by the stepped nature of the interlacing points, extend from one selvedge to the other, forming ridges and giving the impression that the weave is diagonal. The ribs may run from right to left or from left to right. A distinction is made between weft-faced twill, in which the weft thread is more apparent, and warp-faced twill, in which the warp thread is more apparent. Both these twills present a different appearance on the face (the right side) from the reverse (the wrong side). However, there is one category of twill, called double-faced twill or cross twill, which has the same appearance on both sides.

Double-faced twill or cross twill always has an even weave repeat. The warp or weft floats are the same on both faces; only the direction of the ribs is reversed. The simplest design is four-thread cross twill : each warp thread is raised on two consecutive picks, and depressed on the following two.

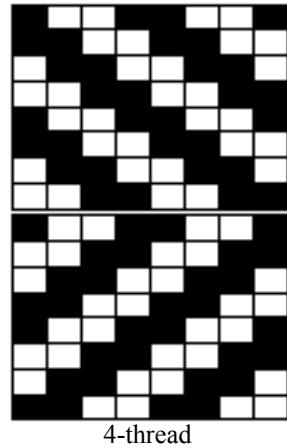

It should be noted that in headings 52.08, 52.09, 52.10, 52.11, 55.13 and 55.14, the subheadings relating to "3-thread or 4-thread twill, including double-faced twill or cross twill", because of their restrictive wording, cover only those twills whose weave patterns are given below :

3-thread twill

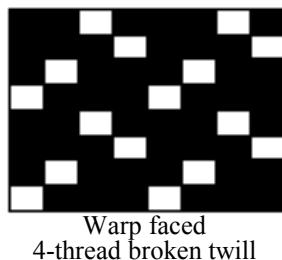

4-thread twill

4-thread
double-faced twill or
cross twill

Denim fabrics of subheadings 5209.42 and 5211.42, however, do not include 4-thread double-faced twill or cross twill, since these subheadings cover only warp faced fabrics (see Subheading Note 1 to Chapter 52). In addition to warp faced 3-thread twill and warp faced 4-thread twill, these subheadings also cover warp faced 4-thread broken twill, whose weave pattern is reproduced below :

Warp faced
4-thread broken twill

(II) CHAPTERS 56 TO 63

Chapters 56 to 63 cover certain kinds of textile fabrics and other textile articles **not** covered by Chapters 50 to 55 (e.g., pile fabrics; narrow woven fabrics; chenille yarn, gimped yarn, braids, galloons and other trimmings of heading 56.06 or 58.08; tulles and other net fabrics; lace; embroidery on woven fabrics or other textile materials; knitted or crocheted goods). They also include (subject to **exclusions** regarding certain articles classified elsewhere than in Section XI) made up textile articles.

Made up articles.

Under Note 7 to this Section, the expression "made up" in Chapters 56 to 63 means:

- (1) **Merely cut, otherwise than into squares or rectangles**, for example, dress patterns of textile material; articles with their edges pinked (e.g., certain dusters) are also regarded as made up.
- (2) **Produced in the finished state, ready for use** (or merely needing separation by cutting dividing threads) without sewing or other working. Goods of this kind include products knitted or crocheted directly to shape and certain dusters, towels, table cloths, scarf squares, blankets, etc., with threads along the warp left unwoven or the weft edges cut to form a fringe. Such articles may have been woven separately on the loom, but may also have been simply cut from lengths of fabric which have bands of unwoven threads (generally warp threads) at regular intervals. These lengths of fabric, from which ready-made articles of the types described above may be obtained by simply cutting the dividing threads, are also considered as "made up" articles.

However, rectangular (including square) articles simply cut out from larger pieces without other working and not incorporating fringes formed by cutting dividing threads are not regarded as "produced in the finished state" within the meaning of this Note. The fact that these articles may be presented folded or put up in packings (e.g., for retail sale) does not affect their classification.

- (3) **Cut to size and with at least one heat-sealed edge** with a visibly tapered or compressed border and the other edges treated as described in any other subparagraph of this Note, but excluding fabrics the cut edges of which have been prevented from unravelling by hot cutting or by other simple means.
- (4) **Hemmed or with rolled edges or with a knotted fringe** (whether or not incorporating added threads) at any of the edges (e.g., handkerchiefs with rolled edges and table covers with knotted fringes), but **excluding** fabrics the cut edges of which have been prevented from unravelling by whipping or by other simple means.
- (5) **Cut to size and incorporating drawn-thread work.** In this connection "drawn-thread work" means simply the withdrawing of certain warp or weft threads after weaving without further operation (e.g., by embroidery) on the material. The pieces of material so treated are often intended for further manufacture into lingerie.
- (6) **Assembled by sewing, gumming or otherwise.** These articles, which are very numerous, include garments. It should be noted, however, that piece goods consisting of two or more lengths of identical material joined end to end, or composed of two or more textiles assembled in layers, are not regarded as "made-up". Nor are textile products in the piece composed of one or more layers of textile materials assembled with padding by stitching or otherwise.
- (7) **Knitted or crocheted to shape**, whether presented as separate items or in the form of a number of items in the length.

Subheading Explanatory Note.

Products of Chapters 56 to 63 having a pile or looped surface

The provisions of Subheading Note 2 (B) (b) to Section XI apply whether or not the ground fabric is partly visible on the pile or looped side.

(III) TEXTILE PRODUCTS COMBINED WITH RUBBER THREADS

Under Note 10 to this Section, elastic products consisting of textile materials combined with rubber threads are classified in Section XI.

Rubber thread and cord, textile covered, are included in heading 56.04.

Other textile products combined with rubber threads are classified, in particular, in Chapters 50 to 55, 58 or 60 to 63, as the case may be.

**(IV) STANDARD ATMOSPHERES FOR CONDITIONING
AND TESTING OF TEXTILES**

(A) Scope and field of application.

The characteristics and use of standard atmospheres for conditioning and for determining the physical and mechanical properties of textiles are set out hereafter for guidance.

(B) Definitions.

- (a) **Relative humidity** : The ratio of the actual pressure of the water vapour in the atmosphere to the saturation vapour pressure at the same temperature. The ratio is usually expressed as a percentage.
- (b) **Standard temperate atmosphere** : An atmosphere which has a relative humidity of 65 % and a temperature of 20 °C.
- (c) **Standard temperate atmosphere for testing** : An atmosphere which has a relative humidity of 65 % and a temperature of 20 °C.

NOTE - The adjective "temperate" as used above has been chosen for the limited use of the textile industry.

(C) Pre-conditioning.

Before conditioning a textile, pre-conditioning may be required. If so, the textile shall be brought approximately to equilibrium in an atmosphere having a relative humidity of between 10 and 25 % and a temperature not exceeding 50 °C.

These conditions may be obtained by heating air at 65 % relative humidity and 20 °C to a temperature of 50 °C.

(D) Conditioning.

Before a textile is tested to determine a physical or mechanical property, it shall be conditioned by placing it in the standard temperate atmosphere for testing, in such a way that the air flows freely through the textile, and keeping it there for the time required to bring it into equilibrium with the atmosphere.

Unless otherwise specified in the method of test, the textile should be considered to be in equilibrium when successive weighings, at intervals of 2 hours, of the textile freely exposed to the moving air show no progressive change in weight greater than 0.25 %.

(E) **Testing.**

Except for special cases (for example wet tests), physical and mechanical tests of textiles are carried out in the conditioned state in the standard temperate atmosphere for testing.

Chapter 50

Silk

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Notes to this Chapter.

For the purposes of this Chapter the term " silk " covers not only the fibrous matter secreted by the *Bombyx mori* (mulberry feeding silk-worm), but also the products of the secretion of similar insects (e.g., *Bombyx textor*) known as wild silk. Among the wild varieties, so named because the producing worm has only very rarely been domesticated, the most important is tussah silk obtained from a silk-worm that feeds on oak. Spider silk and marine or byssus silk (the filaments by which certain shellfish of the *Pinna* family cling to rocks) are also classified in this Chapter.

Generally speaking, this Chapter covers silk, including mixed textile materials classified as silk, at its various stages of manufacture, from the raw material to the woven fabric. It also includes silk-worm gut.

50.01 - Silk worm cocoons suitable for reeling.

This heading applies only to those cocoons which can be reeled to become raw silk classified in heading 50.02. Cocoons unsuitable for reeling are **excluded (heading 50.03)**.

Silk-worm cocoons are usually whitish, yellowish or sometimes greenish.

50.02 - Raw silk (not thrown).

This raw silk is obtained by reeling the filaments from cocoons. In practice, since the filaments (baves) forming each cocoon are very fine, the raw silk (grège) is obtained by combining several filaments (usually 4 to 20) during the reeling process; these filaments adhere together as they are reeled because of the gum (sericin) with which they are covered. The raw silk filaments are wrapped around themselves during reeling giving an even texture and section, assisting the drainage of surplus moisture and compensating for weaknesses in individual filaments; this operation frequently results in the filaments acquiring a certain twist. However, the twist is only very slight and raw silk at this stage should not be confused with the single thrown yarns of **heading 50.04**.

Raw silk is usually whitish, yellowish or sometimes greenish. It is also covered by this heading if discharged (i.e., the gum removed by hot soapy water, dilute alkalis, etc.) or dyed, but not if thrown. It is usually put up in long lengths either on conical bobbins, or in hanks (skeins) of varying weight and tied in a loose knot (slips).

Thrown silk is excluded (heading **50.04**).

50.03 - Silk waste (including cocoons unsuitable for reeling, yarn waste and garnetted stock).

This heading covers silk waste of all kinds, in the crude unworked state or at its various stages of processing prior to its conversion into yarn. It includes :

(A) Waste obtained from the raw material, viz. :

- 1) **Cocoons unsuitable for reeling** : perforated or torn cocoons (damaged by the moth itself, by parasites, by accident or otherwise) with broken filament; cocoons so badly damaged that the filament, although not yet broken, would rupture at the affected points during the reeling process; badly stained or soiled cocoons whether or not still containing the chrysalis, etc.
- 2) **Blazes**. These are silky networks, formed of loose, tangled filaments, with which the silk-worm covers the cocoon to hold it in position on the branch; they often contain pieces of leaf or twig.

(B) Waste obtained during the reeling process, in particular :

- 1) **Frisons** (floss silk). This is the term applied to the coarse threads forming the outer covering of the cocoon; these are first removed with small brushes and then cut away to leave that part of the cocoon which can be reeled. They are marketed as tangled balls or bundles of threads.
- 2) **Cocoons** found to be faulty and rejected during the reeling process (sometimes known as " bassinés ").
- 3) " **Pelettes** " or " **telettes** ", i.e., the unreelable part of the thread forming the inner part of the cocoon and still enclosing the chrysalis, and " **pelades** " which are obtained by soaking the " pelettes " in warm water, removing the chrysalises and drying.

(C) Broken or knotted yarn or tangled masses of fibre or yarn. These are obtained as waste during the throwing, reeling or weaving processes.

(D) Products obtained by discharging and combing silk waste (in some countries known as " **schappe** ").

They are then in the form of sheets or laps of more or less parallel fibres, but at a later stage of processing they are converted into narrower strips or into tow or rope form (slivers or rovings). These forms which have not yet been spun into yarn remain in this heading. They include rovings which have been drawn out very fine to approximately the thickness of a single yarn and usually very lightly twisted; these should not be confused with the yarns of **heading 50.05**.

(E) **Noil silk.**

Noil silk is the residue removed during the combing of the wastes referred to in (D) above. This residue, of poorer quality than the silk waste referred to at (D) in that it has shorter fibres, cannot be further combed, but can be carded in its turn and subjected to various other processes preparatory to spinning. Noil silk processed in this way remains in this heading **provided** it has not yet reached the stage of spun yarn.

(F) **Combings.**

These are the very short fibres removed during the carding of noil silk.

(G) **Garnetted stock.**

This is obtained by tearing rags or other waste and scrap of fabric or articles of silk into their constituent fibres.

The heading **does not cover** :

- (a) Wadding (**heading 30.05 or 56.01**).
- (b) Textile flock and dust and mill nep, of silk (**heading 56.01**).
- (c) Rags of silk (**Chapter 63**).

50.04 - Silk yarn (other than yarn spun from silk waste) not put up for retail sale.

This heading applies to thrown silk, i.e., yarns obtained by twisting (either singly or two or more together) the raw silk threads of heading 50.02.

They are, however, **excluded** if put up for retail sale (**heading 50.06**) or if within the definition of twine, cordage, etc. (**heading 56.07**) (see Parts (I) (B) (2) and (3) of the General Explanatory Note to Section XI).

The yarns of this heading differ from the yarns spun from silk waste classified in the following heading in that they are formed of continuous fibres. There are many varieties, including :

- (1) **Single yarns** (sometimes known as **poils**), obtained by twisting a single raw silk thread. Hard-twisted yarns of this type are often called crêpe poils, mousselines or chiffon twist.
- (2) **Tram yarns**, obtained by loosely twisting two or more unthrown raw silk threads; these are used as weft yarns.
- (3) “**Crêpe twist**”, generally a hard-twisted tram.
- (4) **Organzine yarns**, obtained from two or more raw silk threads which have been well twisted in the single by doubling them with reverse twist. **Grenadine yarn** is a hard-twisted organzine. These are used mainly as warp yarns.

All these yarns may be discharged or finished.

The heading **excludes** imitation catgut of silk, of **heading 56.04**.

50.05 - Yarn spun from silk waste, not put up for retail sale.

This heading covers single yarns produced by spinning the noil or other silk waste of heading 50.03; it also covers multiple (folded) yarns produced from these single yarns.

They are, however, **excluded** if put up for retail sale (**heading 50.06**) or if within the definition of twine, cordage, etc. (**heading 56.07**) (see Parts (I) (B) (2) and (3) of the General Explanatory Note to Section XI).

(A) Yarn spun from silk waste other than noil silk.

Yarn spun from silk waste other than noil silk, unlike the silk yarn of the preceding heading, is formed of discontinuous fibres. These fibres, which may be up to 20 cm long, lie parallel in the yarn, giving it a smooth, silky and fairly glossy surface; these latter characteristics distinguish it from yarn spun from noil silk.

(B) Yarn spun from noil silk.

Noil silk yarns are of much poorer quality than other silk waste yarns; they are composed of fibres of varying lengths, usually less than 5 cm; since these fibres have simply been carded but not combed, they are usually still somewhat tangled and form small knots at intervals. Noil silk yarn accordingly lacks the strength and regularity of yarn spun from other silk waste and has a rather dull surface.

The heading includes yarn which has been processed as described in Part (I) (B) (1) of the General Explanatory Note to Section XI.

The heading **excludes** imitation catgut of silk, of **heading 56.04**.

50.06 - Silk yarn and yarn spun from silk waste, put up for retail sale; silk-worm gut.

(A) Silk yarn and yarn spun from silk waste.

This group covers the yarns of headings 50.04 and 50.05 put up for retail sale, i.e., in the forms and subject to the conditions described in Part (I) (B) (3) of the General Explanatory Note to Section XI.

(B) Silk-worm gut.

Silk-worm gut is obtained by extracting and stretching the silk glands of silk-worms killed by immersion in diluted acetic acid at the stage when they are ready to spin their cocoons. Silk-worm gut is less flexible and glossier than horsehair, and rarely exceeds 50 cm in length.

The heading **does not cover** :

- (a) Sterile silk-worm gut (**heading 30.06**).
- (b) Imitation catgut of silk, of **heading 56.04**.
- (c) Silk-worm gut fitted with hooks or made up into fishing lines (**heading 95.07**).

50.07 - Woven fabrics of silk or of silk waste (+).

5007.10 - Fabrics of noil silk

5007.20 - Other fabrics, containing 85 % or more by weight of silk or of silk waste other than noil silk

5007.90 - Other fabrics

This heading includes woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of silk yarn or of noil silk or other silk waste yarn.

These include :

- (1) Habutai, Shantung, Tussore and other Far East fabrics.
- (2) Crêpes.
- (3) Diaphanous fabrics such as muslins, grenadines and voiles.
- (4) Tightly-woven fabrics such as taffetas, satins, faille, moiré and damask.

But the heading **excludes** woven fabrics of **Chapters 57 to 59** (e.g., bolting cloth of **heading 59.11**).

○
○ ○

Subheading Explanatory Note.

Subheading 5007.20

Subheading 5007.20 covers only fabrics containing by weight at least 85 % of silk or of silk waste **other than** noil silk; noil silk must **not** be included in the 85 %.

Chapter 51

Wool, fine or coarse animal hair; horsehair yarn and woven fabric

Note.

1.- Throughout the Nomenclature :

- a) “ Wool ” means the natural fibre grown by sheep or lambs;
- b) “ Fine animal hair ” means the hair of alpaca, llama, vicuna, camel (including dromedary), yak, Angora, Tibetan, Kashmir or similar goats (but not common goats), rabbit (including Angora rabbit), hare, beaver, nutria or musk-rat;
- c) “ Coarse animal hair ” means the hair of animals not mentioned above, excluding brush-making hair and bristles (heading 05.02) and horsehair (heading 05.11).

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Notes to this Chapter.

In general, this Chapter covers wool and fine or coarse animal hair, including mixed textile materials classified as wool or animal hair, at the various stages from the raw materials to their transformation into woven fabrics. It also includes yarns and fabrics of horsehair, but **excludes** horsehair and horsehair waste of **heading 05.11**. As stated in Note 4 to Chapter 5, the expression “ horsehair ” means hair of the manes or tails of equine or bovine animals.

51.01 - Wool, not carded or combed.

- Greasy, including fleece-washed wool :

5101.11 -- Shorn wool

5101.19 -- Other

- Degreased, not carbonised :

5101.21 -- Shorn wool

5101.29 -- Other

5101.30 - Carbonised

Throughout the Nomenclature, "wool" means the natural fibre grown by sheep or lambs. Wool fibres are essentially composed of the protein keratin, and have a characteristic scaly surface. They are elastic, extremely hygroscopic (absorb moisture from the air) and, as a rule, have marked felting properties. Wool is almost uninflammable, but chars giving off an odour akin to that of burnt horn.

This heading covers sheep's or lambs' wool, not carded or combed, whether obtained by shearing the animal or the pelt of the dead animal (shorn wool), or by pulling from the pelt after fermentation or appropriate chemical treatment (e.g., pulled wool, slipe wool or skin wool).

Uncarded and uncombed wool is generally in the form of :

(A) Greasy, including fleece-washed wool.

Greasy wool is wool not yet washed or otherwise cleaned; it is therefore still impregnated with wool grease and fatty matter derived from the animal itself and may contain an appreciable quantity of impurities (burrs, seeds, earth, etc.). Greasy shorn wool is often in the form of "fleeces" having more or less the contours of the pelt.

Greasy pulled wool is removed from sheep or lamb skins by a fermentation ("sweating") process in which the fibres and the skin are subjected to the combined action of heat and moisture. It may also be removed by a depilatory method in which the flesh side of the skins is treated with a sodium sulphide or lime solution. Such wool is recognizable by the presence of hair roots.

Fleece-washed wool is wool washed in cold water while still on the animal or before being pulled from the pelt. It is incompletely cleaned.

Greasy wool is normally yellowish. Some, however, is grey, black, brown or russet in colour.

(B) Degreased wool, not carbonised.

This category includes :

- (1) **Hot-washed wool** - washed with hot water only and relieved of the majority of wool grease and earthy matter.

- (2) **Scoured wool** - wool from which the grease has been removed almost entirely by washing with hot water and soap or other detergents or with alkaline solutions.
- (3) **Wool treated with volatile solvents** (such as benzene and carbon tetrachloride) to remove grease.
- (4) **Frosted wool** - this has been subjected to a sufficiently low temperature to freeze the grease. The grease is then in a very brittle state and is easily broken up and removed as dust together with a large part of the natural impurities which are held in the wool by the grease.

Most washed and degreased wools still contain small amounts of grease and vegetable matter (burrs, seeds, etc.); this vegetable matter is removed mechanically at a later stage (see the Explanatory Note to heading 51.05) or by carbonisation.

(C) **Carbonised wool.**

Carbonising eliminates any vegetable matter still contained in the wools referred to at (B) above. The wool is immersed in a bath, usually of mineral acids or acid salts, which destroys the vegetable matter but does not affect the wool fibres.

Bleaching, dyeing or other processes applied prior to carding or combing do not affect the classification of wool in this heading.

This heading **excludes** :

- (a) Raw hides and skins, whether or not split, including sheepskins in the wool (**heading 41.02 or 43.01**).
- (b) Wool wastes of **heading 51.03** or garnetted stock of wool of **heading 51.04**.
- (c) Combed wool in fragments (**heading 51.05**).

51.02 - Fine or coarse animal hair, not carded or combed (+).

- Fine animal hair :

5102.11 -- Of Kashmir (cashmere) goats

5102.19 -- Other

5102.20 - Coarse animal hair

- (1) Throughout the Nomenclature, the expression " fine animal hair " means hair of alpaca, llama, vicuna, camel (including dromedary), yak, Angora goat (mohair), Tibetan, Kashmir (cashmere) or similar goats, rabbit (including Angora rabbit), hare, beaver, nutria or musk-rat (see Chapter Note 1 (b)).

Fine animal hair is generally softer and less curled than wool. The hair of the alpaca, llama, vicuna, camel (including dromedary), yak, Angora, Kashmir (cashmere) or similar goats or Angora rabbit is generally spun like wool into yarns; it is also used for wig-making and for the manufacture of dolls' hair. Other fine animal hair (i.e., of the hare, common rabbit, beaver, nutria or musk-rat) is usually unsuitable for spinning and is used for the manufacture of felts, padding, stuffing, etc.

- (2) Throughout the Nomenclature the expression " coarse animal hair " means all other animal hair not mentioned in (1) above, **except** wool (**heading 51.01**), hair of the manes or tails of equine or bovine animals (classified as " horsehair " **heading 05.11**), pigs' hogs' or boars' bristles or hair and badger hair or other brush-making hair (**heading 05.02**) (see Chapter Note 1 (c)).

Coarse animal hair classified here includes that from the flanks of bovine or equine animals and that of common goats, dogs, monkeys or otters.

Coarse animal hair is generally used in the manufacture of coarse yarns or woven fabrics, felts or carpets, or for padding or stuffing purposes.

Animal hairs are obtained by gathering during the moult, by shearing, by stripping from pelts, etc., and are included here **only** when not carded or combed, but classification here is not affected by their having been washed, bleached, dyed or artificially curled (this last operation is applied mainly to coarse animal hairs for stuffing).

The heading **does not cover** :

- (a) Human hair (**heading 05.01**).
- (b) Raw hides and skins and raw furskins (**headings 41.01 to 41.03** or **43.01**).
- (c) Fine or coarse animal hair waste (**heading 51.03**).
- (d) Garnetted stock of fine or coarse animal hair (**heading 51.04**).
- (e) Fine or coarse animal hair, carded or combed (**heading 51.05**).
- (f) Fine or coarse animal hair prepared for use in making wigs or the like (**heading 67.03**).

Subheading Explanatory Note.

Subheading 5102.11

For the purposes of subheading 5102.11, the expression "of Kashmir (cashmere) goats" means the fine soft hair of the undercoat (downy fleece) of the breed of goats that originated in Kashmir but is today raised in several other regions of the world. For the purposes of this subheading, the region in which the animals are raised is not to be taken into account.

51.03 - Waste of wool or of fine or coarse animal hair, including yarn waste but excluding garnetted stock.

5103.10 - Noils of wool or of fine animal hair

5103.20 - Other waste of wool or of fine animal hair

5103.30 - Waste of coarse animal hair

In general this heading covers all waste (**other than** garnetted stock) of wool or of fine or coarse animal hair, i.e., the waste recovered during the successive treatments converting the raw wool or hair into washed, carded, combed, spun, woven, knitted, etc., products.

The principal wastes included here are :

- (1) **Wastes from combing, carding or other processes preparatory to spinning**, such as : noils, the most important waste, composed of short fibres removed during combing; lap and sliver ends, small waste pieces of the combed lap; burr waste and carded shoddy, wastes collected during carding; fibres recovered on cleaning the rollers of carding machines and known as strippings.
- (2) **Yarn waste** such as broken, knotted or tangled yarns collected as waste during spinning, doubling, reeling, weaving, knitting, etc., operations.
- (3) **Wastes** such as sorting wastes and washing wastes collected from the bottom of the vat or from the gratings of washers.
- (4) **Waste**, such as old mattress hair and wool.

Some of these wastes may be impregnated with oil from the machines or mixed with dust or other impurities (natural impurities of vegetable origin, for example). These wastes, according to type and quality, may be used for spinning, for stuffing, etc. Their classification here is not affected by carbonisation, bleaching, dyeing, etc.

The heading **excludes** :

- (a) Horsehair waste (**heading 05.11**).
- (b) Wadding (**heading 30.05** or **56.01**).
- (c) Waste of wool or animal hair suitable only for use as fertilisers (**Chapter 31**).
- (d) Garnetted stock of wool or of fine or coarse animal hair (**heading 51.04**).
- (e) Carded or combed waste of wool or of fine or coarse animal hair (**heading 51.05**).
- (f) Textile flock and dust and mill neps (**heading 56.01**).

51.04 - Garnetted stock of wool or of fine or coarse animal hair.

This heading covers garnetted stock of wool or of fine or coarse animal hair, obtained by garnetting rags of knitted, woven, etc., material or by garnetting the waste yarns obtained during the spinning, weaving, knitting, etc., operations.

Garnetted wool (reclaimed or reworked wool) includes :

- (1) **Shoddy and mungo**, obtained by garnetting woollen or worsted yarns or rags.
- (2) **Extract wool**, obtained by garnetting the wool remaining when mixed rags are treated, usually with acid, to eliminate the vegetable fibres (e.g., cotton) or artificial staple fibres.

Garnetted stock of wool or of fine or coarse animal hair of this heading is usually spun into yarns either alone or mixed with new fibres, and is used for the manufacture of woven or knitted fabrics, of felts or for padding or stuffing purposes.

Such garnetted stock remains classified here whether or not bleached or dyed.

The heading **does not cover** :

- (a) Wadding (**heading 30.05** or **56.01**).
- (b) Carded or combed garnetted stock of wool or of fine or coarse animal hair (**heading 51.05**).
- (c) Textile flock and dust and mill neps (**heading 56.01**).
- (d) Used or new rags, not garnetted (**heading 63.10**).

51.05 - Wool and fine or coarse animal hair, carded or combed (including combed wool in fragments) (+).

5105.10 - Carded wool

- Wool tops and other combed wool :

5105.21 -- Combed wool in fragments

5105.29 -- Other

- Fine animal hair, carded or combed :

5105.31 -- Of Kashmir (cashmere) goats

5105.39 -- Other

5105.40 - Coarse animal hair, carded or combed

This heading covers :

- (1) Wool and fine or coarse animal hair (including waste and garnetted stock), **carded** preparatory to woollen spinning.
- (2) Wool and fine animal hair, **combed** following the "preparing" (gilling) or carding process.

The purpose of carding (on special carding machines) is to disentangle the fibres, lay them more or less parallel, and entirely or largely free them from any extraneous matter (mostly vegetable) which they may still contain. The fibres are then in the form of webs.

If "**woollen**" products (i.e., **those which have been carded only**) are required, the web of fibres is divided lengthwise into numerous elements which are then rolled or rubbed into the form of slubbings to increase the cohesion of the fibres and to facilitate their spinning into yarns. The slubbings are wound onto bobbins and can be used without further operation for spinning into woollen yarns.

If, on the contrary, **combed products (worsted)** are required, two alternative processes may be adopted, viz., either the carded webs are combed or, alternatively, the wool or animal hair is not first carded but before combing undergoes a "preparing" process in which the material is treated in gilling machines (also known as "gill boxes") which open out and straighten the fibres.

During the subsequent combing operation, the short fibres are eliminated, principally in the form of noils, while the remaining fibres are laid parallel in the form of a sliver. Any remaining vegetable impurities are also removed along with the noils. The combed sliver is then drafted and gilled to ensure a complete mixing of the fibres of various lengths, and the resulting sliver is wound into the form of a ball, known as a "top". Materials, chiefly hairs, which will not ball easily often leave this stage in the form of compressed coils, tightly tied between two sheets of paper, and known as "bumped tops". The combed products are put through a series of drawing and doubling operations which convert them into rovings. These are wound onto bobbins in readiness for spinning into worsted yarns.

This heading covers the slubbings, carded slivers, tops and rovings referred to above, and also cut or broken tops and cut or broken carded slivers which have been deliberately cut or broken into short uniform lengths.

This heading also covers **combed wool in fragments**, sometimes known as “ combed wool in bulk ”, “ scoured deburred wool ” or “ open tops ”. This wool, generally scoured, is wool which has been mechanically deburred by utilising part of the production line machinery (carding and combing) used to produce wool tops for worsted spinning. After leaving the combing machine, the continuous sliver produced is stretched and broken into irregular fluffy fragments which are then baled. The product is of short fibre length (average fibre length less than 45 mm) and is suitable for woollen or cotton system spinning but not for worsted spinning. It must, therefore, be re-carded before spinning. In appearance it resembles fluffy scoured wool with no vegetable material evident.

It should be noted that certain rovings may have much the same diameter as single yarns of **headings 51.06 to 51.10** and may also be slightly twisted, but since they have not yet been spun they do not constitute yarns and therefore remain in this heading.

Processes such as bleaching and dyeing do not affect the classification of the products in this heading.

The heading **does not include** :

- (a) Wadding (**heading 30.05 or 56.01**).
- (b) Wool prepared for use in making wigs or the like (**heading 67.03**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 5105.31

The provisions of the Explanatory Note to subheading 5102.11 apply, *mutatis mutandis*, to the products of this subheading.

51.06 - Yarn of carded wool, not put up for retail sale.

5106.10 - Containing 85 % or more by weight of wool

5106.20 - Containing less than 85 % by weight of wool

This heading covers woollen yarns whether single or multiple (folded), i.e., those obtained by spinning the slubbings of carded (but **not** combed) wool. It also includes yarns, known as combed-carded yarns, which are obtained from carded (but **not** combed) slivers by the spinning operations employed for combed yarns. All these yarns are usually wound on bobbins or cones.

This heading also covers yarns of carded wool derived from the combed wool in fragments described in the Explanatory Note to heading 51.05.

Yarns are **excluded** if put up for retail sale (see provisions of Part (I) (B) (3) of the General Explanatory Note to Section XI).

The yarns covered by this heading consist of short fibres or a mixture of long and short fibres which are not parallel but intermingle and cross each other. They are generally less regular and usually more loosely twisted than worsted yarns.

These yarns may have undergone the processes mentioned in Part (I) (B) (1) of the General Explanatory Note to Section XI.

Multiple (folded) yarns in which some strands are of carded wool and some of combed wool are classified in **heading 51.06** or **51.07** according to whether the carded or combed wool predominates in weight.

51.07 - Yarn of combed wool, not put up for retail sale.

5107.10 - Containing 85 % or more by weight of wool

5107.20 - Containing less than 85 % by weight of wool

This heading covers worsted yarns whether single or multiple (folded), i.e., those obtained by spinning rovings of combed wool.

They are **excluded** if put up for retail sale (see provisions of Part (I) (B) (3) of the General Explanatory Note to Section XI).

Worsted yarns differ from woollen yarns in having a smooth appearance and regular section; their fibres are parallel, and short and tangled fibres have been eliminated by combing.

These yarns may have undergone the processes mentioned in Part (I) (B) (1) of the General Explanatory Note to Section XI.

The heading **does not cover** yarns of carded wool derived from combed wool in fragments, or yarns known as combed-carded yarns (**heading 51.06**).

51.08 - Yarn of fine animal hair (carded or combed), not put up for retail sale.

5108.10 - Carded

5108.20 - Combed

This heading covers yarns, whether single or multiple (folded), obtained by spinning the rovings of carded or combed fine animal hair (see Explanatory Note to heading 51.02 for an explanation of what is meant by fine animal hair).

They are **excluded** if put up for retail sale (see provisions of Part (I) (B) (3) of the General Explanatory Note to Section XI).

The yarns of this heading are used mainly in the manufacture of knitted goods or woven fabrics for certain light clothing (e.g., alpaca), and for overcoats or blankets (e.g., camel (including dromedary) hair), for velvets or for imitation fur.

These yarns may have undergone the processes mentioned in Part (I) (B) (1) of the General Explanatory Note to Section XI.

51.09 - Yarn of wool or of fine animal hair, put up for retail sale.

5109.10 - Containing 85 % or more by weight of wool or of fine animal hair

5109.90 - Other

This heading covers woollen or worsted yarns and yarns of fine animal hair, when put up for retail sale, i.e., in the forms and subject to the conditions described in Part (I) (B) (3) of the General Explanatory Note to Section XI.

51.10 - Yarn of coarse animal hair or of horsehair (including gimped horsehair yarn), whether or not put up for retail sale.

This heading covers :

- (1) **Yarns**, whether single or multiple (folded), obtained by spinning the rovings **of coarse animal hair** (see Explanatory Note to heading 51.02 for an explanation of what is meant by coarse animal hair).

These yarns are used in the manufacture of certain woven fabrics, interlinings or articles for technical uses.

- (2) **Yarns of horsehair.** These yarns are obtained by spinning, generally using the shorter horsehairs (those from the manes of equine animals or the tails of bovine animals). The much longer horsehairs from the tails of equine animals cannot be spun. They are often knotted end to end, forming continuous filaments which are used as the warp thread in the manufacture of certain horsehair fabrics. In view of their use, filaments of this kind are also classified in this heading. However, single horsehairs (not tied end to end) fall in **heading 05.11**.

Horsehair yarns consisting of a bundle of horsehairs bound or gimped with yarn of cotton or of another textile material remain classified in this heading.

They may have undergone the processes mentioned in Part (I) (B) (1) of the General Explanatory Note to Section XI.

51.11 - Woven fabrics of carded wool or of carded fine animal hair.

- Containing 85 % or more by weight of wool or of fine animal hair :

5111.11 - - Of a weight not exceeding 300 g/m²

5111.19 - - Other

5111.20 - Other, mixed mainly or solely with man-made filaments

5111.30 - Other, mixed mainly or solely with man-made staple fibres

5111.90 - Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of yarns of carded wool or of yarns of carded fine animal hair.

These fabrics exist in great variety and include suitings, flannels, molletons and other fabrics for clothing, blankets, furnishing fabrics, etc.

The heading **does not cover** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Woven fabrics for technical uses, of **heading 59.11**.

51.12 - Woven fabrics of combed wool or of combed fine animal hair.

- Containing 85 % or more by weight of wool or of fine animal hair :

5112.11 - - Of a weight not exceeding 200 g/m²

5112.19 - - Other

5112.20 - Other, mixed mainly or solely with man-made filaments

5112.30 - Other, mixed mainly or solely with man-made staple fibres

5112.90 - Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of yarns of combed wool or of yarns of combed fine animal hair.

These fabrics exist in great variety and include suitings and other fabrics for clothing, furnishing fabrics, etc.

The heading **does not cover** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Woven fabrics for technical uses, of **heading 59.11**.

51.13 - Woven fabrics of coarse animal hair or of horsehair.

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of coarse animal hair included in heading 51.02 or of horsehair yarns (heading 51.10). However, woven fabrics of horsehair may also be made with single horsehairs of heading 05.11.

Woven fabrics of coarse animal hair are used for linings in furniture or furnishings, for interlinings in clothing, etc.

Those made with single horsehairs are made on special looms, generally by hand. In view of the shortness of the hair (from 20 to 70 cm), these tissues are generally in small pieces and are mainly used for sieves.

Other horsehair cloth is used largely for interlinings in garments.

The heading **does not include** woven fabrics for technical uses, of **heading 59.11**.

Chapter 52

Cotton

Subheading Note.

- 1.- For the purposes of subheadings 5209.42 and 5211.42, the expression "denim" means fabrics of yarns of different colours, of 3-thread or 4-thread twill, including broken twill, warp faced, the warp yarns of which are of one and the same colour and the weft yarns of which are unbleached, bleached, dyed grey or coloured a lighter shade of the colour of the warp yarns.

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Notes to this Chapter.

In general, the Chapter covers cotton fibres at the various stages of their conversion from raw material to woven fabrics, and includes mixed textile materials classified as cotton.

52.01 - Cotton, not carded or combed.

The seeds contained in the bolls (pods, fruit) of the cotton plant (*Gossypium*) are covered with cotton fibres. The essential constituent of these fibres is cellulose, and they are covered with a waxy substance. Their outer surface is smooth, and their natural colour white, yellowish or even brownish or reddish. They are harvested when the ripened bolls are more or less widely opened; the bolls are not picked but the cotton fibres are normally pulled from them while on the plant itself, bringing with them the cotton seeds which must be removed subsequently by ginning.

This heading covers uncarded and uncombed cotton fibres as harvested (seed cotton), or merely ginned (in ginned cotton a certain amount of pod waste, leaves or earthy matter still remains); it also includes cotton fibres (**other than** linters and waste) which have been cleaned, bleached, dyed or rendered absorbent.

International trade in raw cotton is concerned almost wholly with ginned cotton which is usually in strongly compressed bales; cotton cleaned in opening or scutching machines is in the form of loose, wide, continuous sheets.

Cotton linters are classified in **heading 14.04**. The fibres classified in this heading are generally between 1 and 5 cm in length and so are easily distinguished from cotton linters which consist of fibres usually less than 5 mm in length.

The heading also **excludes** :

- (a) Wadding (**heading 30.05** or **56.01**).
- (b) Cotton waste (**heading 52.02**).
- (c) Carded or combed cotton (**heading 52.03**).

52.02 - Cotton waste (including yarn waste and garnetted stock).

5202.10 - Yarn waste (including thread waste)

- Other :

5202.91 -- Garnetted stock

5202.99 -- Other

In general, this heading covers waste cotton obtained when cotton is prepared for spinning, or during spinning operations, weaving, knitting, etc., or from the garnetting of cotton goods.

It thus includes :

Combing waste, usually referred to as comber noils; stripings recovered from carding or combing cylinders; broken fibres detached during the drawing process; fragments of slivers or rovings; carding fly; tangled yarn and other yarn waste; yarn and fibres resulting from the garnetting of rags.

This waste may contain greasy matter, dust or other extraneous matter or may have been cleaned, bleached or dyed. It may be used for spinning or may serve for other purposes.

The heading excludes :

- (a) Cotton linters (**heading 14.04**).
- (b) Wadding (**heading 30.05** or **56.01**).
- (c) Carded or combed cotton waste (**heading 52.03**).
- (d) Textile flock and dust and mill nep (**heading 56.01**).
- (e) Used or new rags and other scrap textile articles (**heading 63.10**).

52.03 - Cotton, carded or combed.

This heading covers cotton (including garnetted stock and other cotton waste) which has been carded or combed, whether or not further prepared for spinning.

The main purpose of carding is to disentangle the cotton fibres, lay them more or less parallel, and entirely or largely free them from any extraneous matter they may still contain. The fibres are then in the form of wide webs (laps) which are generally condensed into slivers. These slivers may or may not be combed before being converted into rovings.

Combing, which is chiefly practised for the spinning of long staple cotton, removes the last traces of extraneous matter clinging to the fibres and eliminates the shorter fibres in the form of combing waste; only the longer fibres, lying parallel, remain.

The slivers, whether or not combed, undergo a series of doubling and drawing processes on drawing frames and roving frames, emerging from the latter as rovings. It should be noted that rovings may, on leaving the roving frames, have approximately the same diameter as the single yarn of heading 52.05 or 52.06, and that they are slightly twisted; however, since they have not been spun, they do not yet constitute yarns and remain in this heading.

Slivers are generally coiled into cans, whereas rovings are usually put up on large bobbins. Laps are normally rolled onto wooden rollers.

The products of this heading may be bleached or dyed.

Carded cotton in sliver form as used by hairdressers (sometimes called "barbers' wadding") is classified in this heading, but cotton wadding falls in **heading 56.01** or, if medicated or put up in packings for retail sale for medical or surgical purposes, in **heading 30.05**.

52.04 - Cotton sewing thread, whether or not put up for retail sale.

- Not put up for retail sale :

5204.11 -- Containing 85 % or more by weight of cotton

5204.19 -- Other

5204.20 - Put up for retail sale

This heading covers cotton sewing thread in the forms and subject to the conditions described in Part (I) (B) (4) of the General Explanatory Note to Section XI.

However, if such thread is within the definition of twine, etc. (see Part (I) (B) (2) of the General Explanatory Note to Section XI) it is **excluded (heading 56.07)**.

Sewing thread remains in this heading whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

52.05 - Cotton yarn (other than sewing thread), containing 85 % or more by weight of cotton, not put up for retail sale.

- Single yarn, of uncombed fibres :

- 5205.11 -- Measuring 714.29 decitex or more (not exceeding 14 metric number)
- 5205.12 -- Measuring less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number)
- 5205.13 -- Measuring less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number)
- 5205.14 -- Measuring less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number)
- 5205.15 -- Measuring less than 125 decitex (exceeding 80 metric number)
- Single yarn, of combed fibres :
- 5205.21 -- Measuring 714.29 decitex or more (not exceeding 14 metric number)
- 5205.22 -- Measuring less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number)
- 5205.23 -- Measuring less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number)
- 5205.24 -- Measuring less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number)
- 5205.26 -- Measuring less than 125 decitex but not less than 106.38 decitex (exceeding 80 metric number but not exceeding 94 metric number)
- 5205.27 -- Measuring less than 106.38 decitex but not less than 83.33 decitex (exceeding 94 metric number but not exceeding 120 metric number)
- 5205.28 -- Measuring less than 83.33 decitex (exceeding 120 metric number)
- Multiple (folded) or cabled yarn, of uncombed fibres :
- 5205.31 -- Measuring per single yarn 714.29 decitex or more (not exceeding 14 metric number per single yarn)
- 5205.32 -- Measuring per single yarn less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number per single yarn)
- 5205.33 -- Measuring per single yarn less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number per single yarn)

- 5205.34 -- Measuring per single yarn less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number per single yarn)
- 5205.35 -- Measuring per single yarn less than 125 decitex (exceeding 80 metric number per single yarn)
- Multiple (folded) or cabled yarn, of combed fibres :
- 5205.41 -- Measuring per single yarn 714.29 decitex or more (not exceeding 14 metric number per single yarn)
- 5205.42 -- Measuring per single yarn less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number per single yarn)
- 5205.43 -- Measuring per single yarn less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number per single yarn)
- 5205.44 -- Measuring per single yarn less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number per single yarn)
- 5205.46 -- Measuring per single yarn less than 125 decitex but not less than 106.38 decitex (exceeding 80 metric number but not exceeding 94 metric number per single yarn)
- 5205.47 -- Measuring per single yarn less than 106.38 decitex but not less than 83.33 decitex (exceeding 94 metric number but not exceeding 120 metric number per single yarn)
- 5205.48 -- Measuring per single yarn less than 83.33 decitex (exceeding 120 metric number per single yarn)

This heading covers cotton yarn (other than sewing thread), whether single or multiple (folded), obtained by spinning the rovings of heading 52.03, provided that they contain 85 % or more by weight of cotton.

However, such yarn is **excluded** if it is within the definition of twine, cordage, rope, etc. (**heading 56.07**) or put up for retail sale (see Parts (I) (B) (2) and (3) of the General Explanatory Note to Section XI).

The yarns remain in this heading whether or not processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

52.06 - Cotton yarn (other than sewing thread), containing less than 85 % by weight of cotton, not put up for retail sale.

- Single yarn, of uncombed fibres :

- 5206.11 -- Measuring 714.29 decitex or more (not exceeding 14 metric number)
- 5206.12 -- Measuring less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number)
- 5206.13 -- Measuring less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number)
- 5206.14 -- Measuring less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number)
- 5206.15 -- Measuring less than 125 decitex (exceeding 80 metric number)
- Single yarn, of combed fibres :
- 5206.21 -- Measuring 714.29 decitex or more (not exceeding 14 metric number)
- 5206.22 -- Measuring less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number)
- 5206.23 -- Measuring less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number)
- 5206.24 -- Measuring less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number)
- 5206.25 -- Measuring less than 125 decitex (exceeding 80 metric number)
- Multiple (folded) or cabled yarn, of uncombed fibres :
- 5206.31 -- Measuring per single yarn 714.29 decitex or more (not exceeding 14 metric number per single yarn)
- 5206.32 -- Measuring per single yarn less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number per single yarn)
- 5206.33 -- Measuring per single yarn less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number per single yarn)
- 5206.34 -- Measuring per single yarn less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number per single yarn)
- 5206.35 -- Measuring per single yarn less than 125 decitex (exceeding 80 metric number per single yarn)

- Multiple (folded) or cabled yarn, of combed fibres :

- 5206.41 -- Measuring per single yarn 714.29 decitex or more (not exceeding 14 metric number per single yarn)
- 5206.42 -- Measuring per single yarn less than 714.29 decitex but not less than 232.56 decitex (exceeding 14 metric number but not exceeding 43 metric number per single yarn)
- 5206.43 -- Measuring per single yarn less than 232.56 decitex but not less than 192.31 decitex (exceeding 43 metric number but not exceeding 52 metric number per single yarn)
- 5206.44 -- Measuring per single yarn less than 192.31 decitex but not less than 125 decitex (exceeding 52 metric number but not exceeding 80 metric number per single yarn)
- 5206.45 -- Measuring per single yarn less than 125 decitex (exceeding 80 metric number per single yarn)

The Explanatory Note to heading 52.05 applies, *mutatis mutandis*, to the yarns of this heading.

52.07 - Cotton yarn (other than sewing thread) put up for retail sale.

5207.10 - Containing 85 % or more by weight of cotton

5207.90 - Other

This heading covers cotton yarn (other than sewing thread) when put up for retail sale, i.e., in the forms and subject to the conditions described in Part (I) (B) (3) of the General Explanatory Note to Section XI.

52.08 - Woven fabrics of cotton, containing 85 % or more by weight of cotton, weighing not more than 200 g/m².

- Unbleached :

5208.11 -- Plain weave, weighing not more than 100 g/m²

5208.12 -- Plain weave, weighing more than 100 g/m²

5208.13 -- 3-thread or 4-thread twill, including cross twill

5208.19 -- Other fabrics

- Bleached :

5208.21 -- Plain weave, weighing not more than 100 g/m²

5208.22 -- Plain weave, weighing more than 100 g/m²

5208.23 -- 3-thread or 4-thread twill, including cross twill

5208.29 -- Other fabrics

- Dyed :

5208.31 -- Plain weave, weighing not more than 100 g/m²

5208.32 -- Plain weave, weighing more than 100 g/m²

5208.33 -- 3-thread or 4-thread twill, including cross twill

5208.39 -- Other fabrics

- Of yarns of different colours :

5208.41 -- Plain weave, weighing not more than 100 g/m²

5208.42 -- Plain weave, weighing more than 100 g/m²

5208.43 -- 3-thread or 4-thread twill, including cross twill

5208.49 -- Other fabrics

- Printed :

5208.51 -- Plain weave, weighing not more than 100 g/m²

5208.52 -- Plain weave, weighing more than 100 g/m²

5208.59 -- Other fabrics

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) weighing not more than 200 g/m², containing 85 % or more by weight of cotton.

Cotton fabrics are produced in great variety and are used, according to their characteristics, for making clothing, household linen, bedspreads, curtains, other furnishing articles, etc.

The heading **does not include** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Fabrics of **heading 58.01**.
- (c) Terry towelling and similar terry fabrics (**heading 58.02**).
- (d) Gauze (**heading 58.03**).
- (e) Woven fabrics for technical uses, of **heading 59.11**.

52.09 - Woven fabrics of cotton, containing 85 % or more by weight of cotton, weighing more than 200 g/m².

- Unbleached :

5209.11 -- Plain weave

5209.12 -- 3-thread or 4-thread twill, including cross twill

5209.19 -- Other fabrics

- Bleached :

5209.21 -- Plain weave

5209.22 -- 3-thread or 4-thread twill, including cross twill

5209.29 -- Other fabrics

- Dyed :

5209.31 -- Plain weave

5209.32 -- 3-thread or 4-thread twill, including cross twill

5209.39 -- Other fabrics

- Of yarns of different colours :

5209.41 -- Plain weave

5209.42 -- Denim

5209.43 -- Other fabrics of 3-thread or 4-thread twill, including cross twill

5209.49 -- Other fabrics

- Printed :

5209.51 -- Plain weave

5209.52 -- 3-thread or 4-thread twill, including cross twill

5209.59 -- Other fabrics

The Explanatory Note to heading 52.08 applies, *mutatis mutandis*, to the products of this heading.

52.10 - Woven fabrics of cotton, containing less than 85 % by weight of cotton, mixed mainly or solely with man-made fibres, weighing not more than 200 g/m².

- Unbleached :

5210.11 -- Plain weave

5210.19 -- Other fabrics

- Bleached :

5210.21 -- Plain weave

5210.29 -- Other fabrics

- Dyed :

5210.31 -- Plain weave

5210.32 -- 3-thread or 4-thread twill, including cross twill

5210.39 -- Other fabrics

- Of yarns of different colours :

5210.41 -- Plain weave

5210.49 -- Other fabrics

- Printed :

5210.51 -- Plain weave

5210.59 -- Other fabrics

This heading covers woven fabrics as defined in Part (I) (C) of the General Explanatory Note to Section XI.

It covers these fabrics provided they are classified as cotton fabrics by the application of Note 2 to Section XI (see also Part (I) (A) of the General Explanatory Note to Section XI) and provided they meet the following specification :

- (a) Contain less than 85 % by weight of cotton;
- (b) Are mixed mainly or solely with man-made fibres;
- (c) Weigh not more than 200 g/m².

In calculating the proportions it must be remembered that the total weight of man-made fibres is to be taken into consideration, no distinction being made between filaments and staple fibres.

The heading **does not include** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Fabrics of **heading 58.01**.
- (c) Terry towelling and similar terry fabrics (**heading 58.02**).
- (d) Gauze (**heading 58.03**).
- (e) Woven fabrics for technical uses, of **heading 59.11**.

52.11 - Woven fabrics of cotton, containing less than 85 % by weight of cotton, mixed mainly or solely with man-made fibres, weighing more than 200 g/m².

- Unbleached :

5211.11 -- Plain weave

5211.12 -- 3-thread or 4-thread twill, including cross twill

5211.19 -- Other fabrics

5211.20 - Bleached

- Dyed :

5211.31 -- Plain weave

5211.32 -- 3-thread or 4-thread twill, including cross twill

5211.39 -- Other fabrics

- Of yarns of different colours :

5211.41 -- Plain weave

5211.42 -- Denim

5211.43 -- Other fabrics of 3-thread or 4-thread twill, including cross twill

5211.49 -- Other fabrics

- Printed :

5211.51 -- Plain weave

5211.52 -- 3-thread or 4-thread twill, including cross twill

5211.59 -- Other fabrics

The Explanatory Note to heading 52.10 applies, *mutatis mutandis*, to the products of this heading.

52.12 - Other woven fabrics of cotton.

- Weighing not more than 200 g/m² :

5212.11 -- Unbleached

5212.12 -- Bleached

5212.13 -- Dyed

5212.14 -- Of yarns of different colours

5212.15 -- Printed

- Weighing more than 200 g/m² :

5212.21 -- Unbleached

5212.22 -- Bleached

5212.23 -- Dyed

5212.24 -- Of yarns of different colours

5212.25 -- Printed

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of cotton yarns. However, it should be noted that it covers only mixed woven fabrics, **other than** those of the preceding headings of this Chapter or specified or included in the second part of this Section (**Chapter 58 or 59**, usually).

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

Chapter 53

Other vegetable textile fibres; paper yarn and woven fabrics of paper yarn

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Notes to this Chapter.

In general, and with certain **exceptions** referred to in the Explanatory Note to heading 53.05, this Chapter deals with vegetable textile materials (**other than** cotton) at the various stages from the raw materials to their transformation into woven fabrics.

It also includes paper yarns and woven fabrics of paper yarn, and products of mixed textile materials assimilated to the products of this Chapter under the provisions of Note 2 to Section XI.

53.01 - Flax, raw or processed but not spun; flax tow and waste (including yarn waste and garnetted stock) (+).

5301.10 - Flax, raw or retted

- Flax, broken, scutched, hackled or otherwise processed, but not spun :

5301.21 -- Broken or scutched

5301.29 -- Other

5301.30 - Flax tow and waste

Flax exists in many varieties, the best known being *Linum usitatissimum*. Flax (or linen) fibres occur in the plant as compact bundles of bast held together with a pectic substance. For use in the textile industry, the fibres must be separated from each other and from the rest of the plant, particularly from the inner woody part.

This heading covers flax, raw, retted, scutched, hackled or otherwise processed but not spun.

(A) Raw flax (flax straw).

This is flax as harvested, whether or not rippled or bolled (i.e., with leaves and seeds removed).

(B) Retted flax.

Retting eliminates most of the pectic substance which surrounds the fibres, either by fermentation (by the action of bacteria or mould) or chemically. This process is normally effected either by :

- (1) exposing the plant to dew or damp;
- (2) immersing the plant in gently running streams or rivers, or in the stagnant water of ditches or pools;
- (3) immersing it in warm water in large tanks; or
- (4) treating it with steam or with chemical or microbial agents.

Retted flax is then dried in the open air or mechanically. The fibres are then sufficiently loosened from the inner woody part of the plant and from one another to be separated by breaking and scutching.

(C) Scutched flax.

The flax is first crushed to break the woody part into pieces. It is then scutched, i.e., the woody part is knocked out by hand or mechanically, leaving the flax fibres. Some tow and waste is produced during this process.

(D) Cottonised flax.

In this process the raw flax is first boiled in a solution of sodium hydroxide and then impregnated with sodium carbonate; it is then treated with dilute acid, when the stalks are disintegrated by the liberation of carbon dioxide, leaving the flax fibres free. Flax so treated does not require retting or scutching. Cottonised flax is generally bleached.

(E) Hackled (combed) flax.

Hackling splits up the bast and lays the fibres parallel, eliminating any remaining foreign matter and any short or ruptured fibres (machine tow). Flax is normally in the form of a continuous loose bundle of fibres when it leaves the hackling machines. The fibres are then passed through spreaders and emerge as a continuous sliver. These slivers are subjected to a series of doubling and drawing operations and transformed into rovings. Slivers and rovings are included in this heading **provided** they have not yet been spun into yarn. In their final stage rovings may be drawn out very fine to approximately the thickness of a single yarn, usually with a slight twist but are nevertheless classified here and should not be confused with the single yarns covered by **heading 53.06**.

(F) Flax tow and waste (including yarn waste and garnetted stock).

Tow consists generally of flax wastes of different qualities suitable for spinning; it consists mainly of short, knotted, broken or tangled fibres obtained during the various processes such as scutching, hackling (combing) and spinning.

The heading also covers yarn waste obtained during the spinning, reeling or weaving operations, and waste fibres obtained by tearing up waste pieces of fabric or made up articles into their constituent fibres; these are generally intended for re-spinning into yarns.

In view of the shortness of their component fibres, tow and other waste intended for spinning are usually carded and not hackled (combed). The slivers and rovings obtained after carding are also covered by this heading.

This heading also covers wastes unsuitable for spinning into yarns, mainly obtained from the scutching or carding operations, and used as padding or stuffing, as a binding in mortars, or as raw material in the manufacture of certain kinds of paper.

The products referred to above remain in this heading whether or not they have been bleached or dyed.

The heading **excludes** :

- (a) Broken woody pieces arising from the scutching operations (**heading 44.01**).
- (b) Certain fibrous vegetable materials sometimes known as flax, e.g., Indian flax (*Abroma augusta*) (**heading 53.03**) and New Zealand hemp or flax (*Phormium tenax*) (**heading 53.05**).
○
○ ○

Subheading Explanatory Note.

Subheading 5301.21

This subheading includes scutched flax obtained from tow.

53.02 - True hemp (*Cannabis sativa L.*), raw or processed but not spun; tow and waste of true hemp (including yarn waste and garnetted stock).

5302.10 - True hemp, raw or retted

5302.90 - Other

This heading covers **only** true hemp (*Cannabis sativa L.*), a plant which grows in very varied climates and very varied soils. The fibres occur in the bast of the plant and are separated by a series of operations similar to those applied in the case of flax (see Explanatory Note to heading 53.01).

This heading covers :

- (1) **Raw hemp** as harvested, whether or not the leaves and seeds have been removed.
- (2) **Retted hemp** in which the fibres are still attached to the woody part of the plant, but have been loosened by the retting.
- (3) **Scutched hemp** which comprises the isolated fibres, sometimes 2 m or more in length, separated from the plant by scutching.
- (4) **Combed hemp** or hemp fibres otherwise prepared for spinning, generally in the form of slivers or rovings.
- (5) **Tow and waste of hemp.** This includes waste obtained during scutching or combing processes, waste yarns obtained during spinning, weaving, etc., operations, and garnetted stock obtained from rags, scrap rope or cordage, etc. The tow and waste are classified here whether suitable for spinning into yarns (whether or not in the form of slivers or rovings) or suitable only for use as caulking material, for padding or stuffing, paper-making, etc.

Cottonisation (similar to that sometimes applied to flax), bleaching or dyeing does not affect classification in this heading.

The heading **does not cover** :

- (a) Other fibrous vegetable materials sometimes known as hemsps, e.g. :
 - (1) Tampico hemp (istle) (**heading 14.04** or **53.05**).
 - (2) Gambo or Ambari hemp (*Hibiscus cannabinus*), Rosella hemp (*Hibiscus sabdariffa*), abutilon hemp or China jute (*Abutilon avicennae*), Indian, sunn, Madras, Calcutta, Bombay or Benares hemp (*Crotalaria juncea*) and Queensland hemp (*Sida*) (**heading 53.03**).
 - (3) Haiti hemp (*Agave foetida*), Manila hemp (abaca), Mauritius hemp (*Furcraea gigantea*) and New Zealand hemp or flax (*Phormium tenax*) (**heading 53.05**).
- (b) The hard woody part of the plant removed during scutching (**heading 44.01**).
- (c) Yarn of true hemp (**heading 53.08**).
- (d) Rags or scrap pieces of rope or cordage (**Chapter 63**).

53.03 - Jute and other textile bast fibres (excluding flax, true hemp and ramie), raw or processed but not spun; tow and waste of these fibres (including yarn waste and garnetted stock).

5303.10 - Jute and other textile bast fibres, raw or retted

5303.90 - Other

This heading covers all textile fibres extracted from the stems of dicotyledonous plants, **other than flax (heading 53.01)**, **true hemp (heading 53.02)** and **ramie (heading 53.05)**.

The textile bast fibres classified here are softer to the touch than most of the vegetable fibres of heading 53.05 and are also finer.

The fibres of this heading include :

- (1) **True jute**, the two principal varieties of which are *Corchorus capsularis* or white jute and *Corchorus olitorius* or red jute, also known as Tossa.
- (2) **Hibiscus cannabinus**, known in trade as Hibiscus hemp, Gambo hemp, Siam jute, Kenaf, Bimlipatam or Bimli jute, Ambari hemp, Papoula de Sao Francisco, Dah, Meshta, etc.
- (3) **Hibiscus sabdariffa**, known in trade as Roselle or Rosella hemp, Siam jute, Kenaf, Java jute, etc.
- (4) **Abutilon avicinnae**, also known as abutilon hemp, China jute, Tien-Tsin, Ching-ma, King-ma, etc.
- (5) **Broom** fibres, from the bast of the Spanish broom (*Spartium junceum*) or common broom (*Cytisus scoparius*).
- (6) **Urena lobata** and **Urena sinuata**, which are known by different names according to the various countries of origin : Congo jute, Madagascar jute or Paka, Malva blanca or Cadillo (Cuba), Guaxima, Aramina or Malva roxa (Brazil), Caesarweed (Florida).
- (7) **Crotalaria juncea**, known as Indian, Sunn, Madras, Calcutta, Bombay or Benares hemp, or as Julburpur jute.
- (8) **Sida**, mainly known as Escobilla, Malvaisco, Queensland hemp or Cuba jute.
- (9) **Thespesia**, known as Polompon (Vietnam).
- (10) **Abroma augusta**, known as Devil's cotton or Indian flax.
- (11) **Clappertonia ficifolia**, known as Punga (Congo) or Guaxima (Brazil).
- (12) **Triumphetta**, known as Punga (Congo) or Carapicho (Brazil).
- (13) **Nettles**.

The heading covers :

- (I) Raw fibrous materials (in stalks, not yet retted or stripped); retted fibres; stripped fibres (extracted by machine), i.e., the fibres, sometimes 2 m or more in length, as extracted from the plant by retting and stripping; "cuttings" (the butt ends of the fibres which are cut off and marketed separately). However, vegetable materials, which when raw or in certain forms fall in Chapter 14 (for example, stalks of broom), are classified here **only** when they have undergone treatment indicating their use as textile materials (e.g., when they have been crushed, carded or combed in preparation for spinning).
- (II) Fibres carded or combed or otherwise prepared for spinning, usually in the form of slivers.
- (III) Fibrous tow and waste obtained mainly during the carding or combing of bast fibres; bast fibre yarn waste left during spinning, weaving, etc., and garnetted stock obtained from rags or scrap rope or cordage. Tow and waste are classified here whether suitable for spinning into yarns (whether or not in the form of slivers) or suitable only for use as caulking material, padding or stuffing or in felt-making, paper-making, etc.

Bleaching or dyeing does not affect the classification of the products covered by this heading.

The heading also **excludes** :

- (a) Stalks of broom (**heading 14.04**).
- (b) Tow, medicated or put up in packings for retail sale for medical or surgical purposes (**heading 30.05**).
- (c) Yarn of jute or of other textile bast fibres of this heading (**heading 53.07**).
- (d) Rags or scrap pieces of rope, cable or cordage (**Chapter 63**).

[53.04]

53.05 - Coconut, abaca (Manila hemp or *Musa textilis Nee*), ramie and other vegetable textile fibres, not elsewhere specified or included, raw or processed but not spun; tow, noils and waste of these fibres (including yarn waste and garnetted stock).

This heading covers vegetable textile fibres obtained from the leaves or fruit of certain monocotyledonous plants (e.g., coconut, abaca or sisal) or, in the case of ramie, obtained from the stems of dicotyledonous plants of the family *urticaceae*, and not specified or included in any other heading.

These fibres are in most cases coarser and thicker than the textile bast fibres of heading 53.03.

Generally they are classified here whether raw, prepared for spinning (e.g., carded or combed into slivers), or in the form of tow or fibrous waste (obtained mainly during combing), yarn waste (obtained mainly during spinning or weaving) or garnetted stock (obtained from rags or scrap rope or cordage, etc.).

However, fibres obtained from vegetable materials which, when raw or in certain other forms, fall in Chapter 14 (in particular kapok), are classified here **only** when they have undergone treatment indicating their use as textile materials, e.g., when they have been crushed, carded or combed in preparation for spinning.

The vegetable textile fibres classified here include :

Coconut. Coconut fibres (coir) are obtained from the external covering of the nut and are coarse, brittle and brown in colour. They are classified here whether in the mass or in bundles.

Abaca. Abaca (or Manila hemp) fibres are obtained from the sheathing leaf stalks of a certain type of banana tree (the *Musa textilis Nee*) cultivated mainly in the Philippine Islands. The fibres are obtained by scraping away the non-fibrous matter with knives or mechanically, and are classified here whether or not combed or otherwise prepared for spinning (e.g., in the form of slivers or rovings).

Manila hemp fibres are very resistant to the action of weather and sea water and their main use is therefore for the making of ships' cables or fishing nets. They are also spun into yarns for weaving into coarse fabrics or for making hat braids.

Ramie. Ramie fibres are obtained from the bast of various plants, mainly the *Boehmeria tenacissima* (Rhea, green ramie) and the *Boehmeria nivea* (China grass, white ramie), cultivated mainly in the Far East.

The stalks are cut at ground level. Then, sometimes after preliminary drying, they are decorticated either by hand or mechanically to remove the skin of the stalk and to break and remove the inner woody part, the ramie then being obtained in the form of long ribbons. Decortication is followed by a process (generally by boiling in alkali) to remove the gummy pectic substance which binds the fibres together. The resulting fibres are then wrung out and dried and become pearly white.

Alfa or esparto. Alfa or esparto fibres are obtained from the leaves of the plants. They are, however, classified here only when they have been rolled, crushed, combed or otherwise processed in a way indicating their use for textile purposes. The untreated leaves are **excluded (Chapter 14)**.

Aloe fibre.

Haiti hemp (*Agave foetida*).

Henequen (*Agave fourcroydes*).

Istle or Ixtle (Tampico or Mexican hemp). These fibres, extracted from the *Agave funkiana* or the *Agave lechugilla*, are used mainly in brush-making and usually fall in **heading 14.04**, but they are classified here when they have been processed in a way indicating their use for textile purposes.

Maguey or Cantala. These fibres are obtained from the *Agave cantala* (Philippines or Indonesia) or the *Agave tequilana* (Mexico).

Mauritius hemp (*Furcraea gigantea*), also known as piteira (Brazil).

New Zealand hemp or flax (*Phormium tenax*).

Peat fibre (sometimes known as Berandine or Beraudine peat). The fibres are obtained from a ligneous peat. They only fall here, however, when they have been treated in a manner indicating their use for textile purposes; otherwise they are **excluded (heading 27.03)**.

Pineapple. The fibres, also known as Curana (Amazonas), Pina (Mexico) or Silkgrass, are obtained from leaves of pineapple plants of the *Bromeliaceae* family, which also includes fibres of Pita floja or Colombia pita or Arghan, Caroa (Brazil), Karates, etc.

Pita (*Agave americana*).

Sansevieria, also known as Bowstring hemp or Ife hemp.

Sisal (*Agave sisalana*).

Typha. The fibres are obtained from leaves of the *Typha* or cattail plant. These fibres should not be confused with the short seed hairs from the same plant which are used as a stuffing material in life-jackets, toys, etc., and are **excluded (heading 14.04)**.

Yucca.

Bleaching or dyeing does not affect classification of the products in this heading.

53.06 - Flax yarn.

5306.10 - Single

5306.20 - Multiple (folded) or cabled

This heading covers the single yarns obtained by spinning the rovings of flax fibres of heading 53.01, and multiple (folded) or cabled yarns produced by various combinations of such single yarns.

They are, however, **excluded** if within the definition of twine, cordage, etc. (**heading 56.07**) (see Part (I) (B) (2) of the General Explanatory Note to Section XI).

Yarn remains in this heading whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

Metallised yarn, including flax yarn combined with metal thread in any proportion, is **excluded** (**heading 56.05**).

53.07 - Yarn of jute or of other textile bast fibres of heading 53.03.

5307.10 - Single

5307.20 - Multiple (folded) or cabled

This heading covers yarns, whether single or multiple (folded), obtained by spinning slivers of jute or other textile bast fibres of heading 53.03.

However, if they are within the definition of twine, cordage, rope or cables (see Part (I) (B) (2) of the General Explanatory Note to Section XI) they are **excluded (heading 56.07)**.

Yarn remains in this heading whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

53.08 - Yarn of other vegetable textile fibres; paper yarn.

5308.10 - Coir yarn

5308.20 - True hemp yarn

5308.90 - Other

(A) Yarn of other vegetable textile fibres.

This group covers yarns, whether single or multiple (folded), obtained by spinning the fibres of true hemp of heading 53.02, of the vegetable textile fibres of heading 53.05, or of the vegetable fibres not classified in Section XI (in particular those of Chapter 14, e.g., kapok or istle).

However, if they are within the definition of twine, cordage, rope or cables (see Part (I) (B) (2) of the General Explanatory Note to Section XI) they are classified in **heading 56.07**.

Yarns of true hemp are used for sewing thread (e.g., in shoe or leather goods manufacture), or for weaving.

Yarn remains in this group whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

Metallised yarns, including yarns of this group, combined with metal thread in any proportion, are excluded (**heading 56.05**).

(B) Paper yarn.

This group covers yarns, whether single or multiple (folded), of paper. They are classified here whether or not put up for retail sale, and whether or not in the form of twine, cordage, rope or cables, but excluding plaited cordage, rope and cables.

Yarns remain in this group whether or not processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

Single yarns are obtained by twisting or rolling lengthwise strips of moist paper (sometimes coated); multiple (folded) yarns are obtained by doubling two or more single yarns.

The heading **does not include** :

- (a) Paper simply folded one or more times lengthwise (**Chapter 48**).
- (b) Paper yarns spun with metal thread or covered with metal by any process (metallised yarns) (**heading 56.05**).
- (c) Paper yarns simply reinforced with metal, and plaited cordage, rope and cables, of paper yarn (**heading 56.07**).

53.09 - Woven fabrics of flax.

- Containing 85 % or more by weight of flax :

5309.11 -- Unbleached or bleached

5309.19 -- Other

- Containing less than 85 % by weight of flax :

5309.21 -- Unbleached or bleached

5309.29 -- Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of flax yarn.

These fabrics include fine lingerie and dress materials, materials for sheets, table linen, etc. Linen fabrics are also used for mattress covers, sacks, tarpaulins, sails, etc.

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

53.10 - Woven fabrics of jute or of other textile bast fibres of heading 53.03.

5310.10 - Unbleached

5310.90 - Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made from yarns of jute or of other textile bast fibres of heading 53.03.

Jute fabrics are used for sacks or packings, as base fabrics in the manufacture of linoleum, for lining furnishings, etc.

53.11 - Woven fabrics of other vegetable textile fibres; woven fabrics of paper yarn.

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made from the yarns of heading 53.08.

These fabrics are used principally for packing, for sailcloth, for the manufacture of tarpaulins, sacks, tablecloths, matting, as base fabrics for linoleum, etc.

The heading **does not cover** woven fabrics made by interlacing paper strips (**heading 46.01**).

Chapter 54

Man-made filaments; strip and the like of man-made textile materials

Notes.

- 1.- Throughout the Nomenclature, the term “ man-made fibres ” means staple fibres and filaments of organic polymers produced by manufacturing processes, either :
 - (a) By polymerisation of organic monomers to produce polymers such as polyamides, polyesters, polyolefins or polyurethanes, or by chemical modification of polymers produced by this process (for example, poly(vinyl alcohol) prepared by the hydrolysis of poly(vinyl acetate)); or
 - (b) By dissolution or chemical treatment of natural organic polymers (for example, cellulose) to produce polymers such as cuprammonium rayon (cupro) or viscose rayon, or by chemical modification of natural organic polymers (for example, cellulose, casein and other proteins, or alginic acid), to produce polymers such as cellulose acetate or alginates.

The terms “synthetic” and “artificial”, used in relation to fibres, mean : synthetic : fibres as defined at (a); artificial : fibres as defined at (b). Strip and the like of heading 54.04 or 54.05 are not considered to be man-made fibres.

The terms “ man-made ”, “ synthetic ” and “ artificial ” shall have the same meanings when used in relation to “ textile materials ”.

- 2.- Headings 54.02 and 54.03 do not apply to synthetic or artificial filament tow of Chapter 55.

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Note to this Chapter.

Under Note 1 to Chapter 54, the term “ man-made fibres ”, when used in Chapters 54 and 55 or elsewhere in the Nomenclature, means filaments or staple fibres composed of organic polymers produced by manufacturing processes, either by :

- (1) Polymerisation of organic monomers or chemical modification of the resulting polymers (see the General Explanatory Note to Chapter 39) (synthetic fibres); or by
- (2) Dissolution or chemical treatment of natural organic polymers, or chemical modification of natural organic polymers (artificial fibres).

(I) SYNTHETIC FIBRES

The basic materials for the manufacture of these fibres are generally derived from coal or oil distillation products or from natural gas. The substances produced by polymerisation are either melted or dissolved in a suitable solvent and then extruded through spinnerets (jets) into air or into a suitable coagulating bath where they solidify on cooling or evaporation of the solvent, or they may be precipitated from their solution in the form of filaments.

At this stage their properties are normally inadequate for direct use in subsequent textile processes, and they must then undergo a drawing process which orientates the molecules in the direction of the filament, thus considerably improving certain technical characteristics (e.g., strength).

The main **synthetic fibres** are :

- (1) **Acrylic** : Fibres composed of linear macromolecules having in the macromolecular composition at least 85 % by weight of the acrylonitrilic unit.
- (2) **Modacrylic** : Fibres composed of linear macromolecules having in the macromolecular composition at least 35 % but less than 85 % by weight of the acrylonitrilic unit.
- (3) **Polypropylene** : Fibres composed of acyclic saturated hydrocarbon linear macromolecules having in the macromolecular composition at least 85 % by weight of units with every other carbon atom carrying a methyl side group in an isotactic position and without further substitution.
- (4) **Nylon or other polyamides** : Fibres composed of synthetic linear macromolecules having in the macromolecular composition either at least 85 % of recurring amide linkages joined to acyclic or cyclic groups or at least 85 % of aromatic groups joined by amide linkages directly to two aromatic rings and in which imide groups may be substituted for up to 50 % of the amide groups.

The term "nylon or other polyamides" includes **aramids** (see Note 12 to the Section).

- (5) **Polyester** : Fibres composed of linear macromolecules having in the macromolecular composition at least 85 % by weight of an ester of a diol and terephthalic acid.
- (6) **Polyethylene** : Fibres composed of linear macromolecules having in the macromolecular composition at least 85 % by weight of the ethylene unit.
- (7) **Polyurethane** : Fibres resulting from the polymerisation of polyfunctional isocyanates with polyhydroxy compounds, such as, castor oil, butane-1,4-diol, polyether polyols, polyester polyols.

Other synthetic fibres include : chlorofibre, fluorofibre, polycarbamide, trivinyl and vinylal.

Where the constituent matter of the fibres is a copolymer or a mixture of homopolymers as understood for Chapter 39, e.g., a copolymer of ethylene and propylene, for the classification of the fibres, the respective percentages of each of the constituents must be taken into consideration. With the exception of polyamides these percentages refer to weight.

(II) ARTIFICIAL FIBRES

The basic materials for the manufacture of these fibres are organic polymers extracted from natural raw materials by processes which may involve dissolution or chemical treatment, or chemical modification.

The main **artificial fibres** are :

(A) **Cellulosic fibres**, namely :

- (1) **Viscose rayon**, which is produced by treating cellulose (generally in the form of sulphite wood pulp) with sodium hydroxide; the resulting alkali-cellulose is then treated with carbon disulphide and transformed into sodium cellulose xanthate. The latter is in turn transformed into a thick solution known as viscose by dissolving it in dilute sodium hydroxide.

After purification and maturing, the viscose is then extruded through spinnerets into a coagulating acid bath to form filaments of regenerated cellulose. **Viscose rayon** also covers modal fibres, which are produced from regenerated cellulose by a modified viscose process.

- (2) **Cuprammonium rayon (cupro)**, obtained by dissolving cellulose (generally in the form of linters or chemical wood pulp) in a cuprammonium solution; the resulting viscous solution is extruded into a bath where filaments of precipitated cellulose are formed.
- (3) **Cellulose acetate (including tri-acetate)** : Fibres obtained from cellulose acetate wherein at least 74 % of the hydroxyl groups are acetylated. These are manufactured by treating cellulose (in the form of cotton linters or chemical wood pulp) with a mixture of acetic anhydride, acetic acid and sulphuric acid. The resulting primary cellulose acetate is modified to a soluble form and dissolved in a volatile solvent such as acetone, then extruded (generally into warm air); the solvent then evaporates leaving filaments of cellulose acetate.

(B) **Protein fibres** of animal or vegetable origin, including :

- (1) Those produced by dissolving milk casein in an alkali (generally sodium hydroxide); after maturing, the solution is extruded into an acid coagulating bath. The resulting filaments are subsequently hardened by treatment with formaldehyde, tannin, chromium salts or other chemical compounds.
- (2) Other fibres produced in similar manner from the proteins of ground-nuts, soya beans, maize (zein), etc.

(C) **Alginate fibres**. Chemical treatment of various types of seaweed gives a viscous solution, generally of sodium alginate; this is extruded into a bath which converts it into certain metallic alginates. These include :

- (1) Calcium chromium alginate fibres; these are non-inflammable.
- (2) Calcium alginate fibres. These are readily soluble in a weak alkaline solution of soap; this makes them unsuitable for ordinary textile use, and they are most often used as temporary threads in certain manufacturing operations.

*
* * *

The Chapter covers man-made filaments and yarns and woven fabrics of such filaments, including yarns and woven fabrics of mixed textile fibres classified by application of Note 2 to Section XI as yarns and woven fabrics of man-made filaments. It also covers monofilament and other products of heading 54.04 or 54.05 and woven fabrics of such products.

Filament tow, **other than** that defined in Note 1 to Chapter 55, is included. This is generally used for the manufacture of cigarette filters, whereas filament tow of Chapter 55 is used for the manufacture of staple fibres.

This Chapter **excludes** :

- (a) Yarn used to clean between the teeth (dental floss), in individual retail packages, of **heading 33.06**.
- (b) Products of **Chapter 40**, in particular thread and cord of **heading 40.07**.
- (c) Products of **Chapter 55**, in particular staple fibres, yarns and woven fabrics of staple fibres and waste (including noils, yarn waste and garnetted stock) of man-made filaments.
- (d) Carbon fibres and articles of carbon fibres, of **heading 68.15**.
- (e) Glass fibres and articles of glass fibres, of **heading 70.19**.

54.01 - Sewing thread of man-made filaments, whether or not put up for retail sale.

5401.10 - Of synthetic filaments

5401.20 - Of artificial filaments

This heading covers sewing thread of man-made filaments in the forms and subject to the conditions described in Part (I) (B) (4) of the General Explanatory Note to Section XI.

However, if such thread is within the definition of twine, etc. (see Part (I) (B) (2) of the General Explanatory Note to Section XI) it is **excluded (heading 56.07)**.

Sewing thread remains in this heading whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

This heading also **excludes** single yarn and monofilament, even if used as sewing thread (**heading 54.02, 54.03, 54.04 or 54.05** as the case may be).

54.02 - Synthetic filament yarn (other than sewing thread), not put up for retail sale, including synthetic monofilament of less than 67 decitex (+).

- High tenacity yarn of nylon or other polyamides, whether or not textured :

5402.11 -- Of aramids

5402.19 -- Other

5402.20 - High tenacity yarn of polyesters, whether or not textured

- Textured yarn :

5402.31 -- Of nylon or other polyamides, measuring per single yarn not more than 50 tex

5402.32 -- Of nylon or other polyamides, measuring per single yarn more than 50 tex

5402.33 -- Of polyesters

5402.34 -- Of polypropylene

5402.39 -- Other

- Other yarn, single, untwisted or with a twist not exceeding 50 turns per metre :

5402.44 -- Elastomeric

5402.45 -- Other, of nylon or other polyamides

5402.46 -- Other, of polyesters, partially oriented

5402.47 -- Other, of polyesters

5402.48 -- Other, of polypropylene

5402.49 -- Other

- Other yarn, single, with a twist exceeding 50 turns per metre :

5402.51 -- Of nylon or other polyamides

5402.52 -- Of polyesters

5402.53 -- Of polypropylene

5402.59 -- Other

- Other yarn, multiple (folded) or cabled :

5402.61 -- Of nylon or other polyamides

5402.62 -- Of polyesters

5402.63 -- Of polypropylene

5402.69 -- Other

This heading covers synthetic filament yarn (**other than** sewing thread). It includes :

- (1) **Monofilament** (monofil) of less than 67 decitex.
- (2) **Multifilament** obtained by grouping together a number of monofilaments (varying from two filaments to several hundred) generally as they emerge from the spinnerets. These yarns may be without twist or twisted (single, multiple (folded) or cabled). They therefore include :
 - (i) Single yarns consisting of the filaments reeled parallel without twist. Filament tow not provided for in Chapter 55 is also included.
 - (ii) Single yarns of such filaments twisted as they are taken from the spinnerets or in a subsequent twisting operation.
 - (iii) Multiple (folded) or cabled yarns produced by combining such single yarns, including those obtained from the monofilament of heading 54.04 (see Part (I) (B) (1) of the General Explanatory Note to Section XI).

The above yarns are, however, **excluded** if they constitute twine of **heading 56.07** or yarn put up for retail sale of **heading 54.06** (see Parts (I) (B) (2) and (3) of the General Explanatory Note to Section XI).

In addition to the normal forms in which textile yarns may be put up other than for retail sale, some yarns of this heading may also be put up in forms without internal support (cakes, etc.).

Apart from the exclusions already mentioned, the heading **does not include** :

- (a) Synthetic monofilament and strip and the like of synthetic textile materials, of **heading 54.04**.
- (b) Synthetic filament tow of a length exceeding 2 m of **heading 55.01**.
- (c) Synthetic filament tow of a length not exceeding 2 m of **heading 55.03**.
- (d) Tops (ruptured tow) of **heading 55.06**.
- (e) Metallised yarns, including yarns of this heading combined with metal thread in any proportion or covered with metal (**heading 56.05**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheadings 5402.31 to 5402.39

Textured yarns are yarns that have been altered by a mechanical or physical process (e.g., twisting, untwisting, false-twisting, compression, ruffling, heat-setting or a combination of several of these processes), which results in individual fibres being set with introduced curls, crimps, loops, etc. These distortions may be partially or completely straightened by a stretching force but resume the shape into which they have been set upon being released.

Textured yarns are characterised by having either a high bulk or a very high extensibility. The high elasticity of both types makes them especially suitable for use in the manufacture of stretch garments (e.g., tights, hose, underwear) while the high bulk yarns give fabrics softness and warmth of touch.

Textured yarns may be distinguished from non-textured (flat) filament yarns by the presence of special twist characteristics, small loops or reduced parallel orientation of the filaments in the yarn.

Subheading 5402.46

This subheading covers yarns consisting of fibres whose molecules are partially oriented. These yarns, which are generally in a flat form, are not used directly for the production of fabric and must first undergo a drawing or draw-texturing process. They are also known under the name "POY".

54.03 - Artificial filament yarn (other than sewing thread), not put up for retail sale, including artificial monofilament of less than 67 decitex.

5403.10 - High tenacity yarn of viscose rayon

- Other yarn, single :

5403.31 -- Of viscose rayon, untwisted or with a twist not exceeding 120 turns per metre

5403.32 -- Of viscose rayon, with a twist exceeding 120 turns per metre

5403.33 -- Of cellulose acetate

5403.39 -- Other

- Other yarn, multiple (folded) or cabled :

5403.41 -- Of viscose rayon

5403.42 -- Of cellulose acetate

5403.49 -- Other

The Explanatory Note to heading 54.02 applies, *mutatis mutandis*, to the products of this heading.

54.04 - Synthetic monofilament of 67 decitex or more and of which no cross-sectional dimension exceeds 1 mm; strip and the like (for example, artificial straw) of synthetic textile materials of an apparent width not exceeding 5 mm.

- Monofilament :

5404.11 -- Elastomeric

5404.12 -- Other, of polypropylene

5404.19 -- Other

5404.90 - Other

This heading covers :

- (1) **Synthetic monofilament.** These are filaments extruded as single filaments. They are classified here **only** if they measure 67 decitex or more and do not exceed 1 mm in any cross-sectional dimension. Monofilaments of this heading may be of any cross-sectional configuration and may be obtained not only by extrusion but by lamination or fusion.
- (2) **Strip and the like, of synthetic textile materials.** The strips of this heading are flat, of a width not exceeding 5 mm, either produced as such by extrusion or cut from wider strips or from sheets.

Provided their apparent width (i.e., in the folded, flattened, compressed or twisted state) does not exceed 5 mm, this heading also covers :

- (i) Strip folded along the length.
- (ii) Flattened tubes, whether or not folded along the length.
- (iii) Strip, and articles referred to in (i) and (ii) above, compressed or twisted.

If the width (or apparent width) is not uniform, classification is to be decided by reference to the average width.

This heading also includes multiple (folded) or cabled strip and the like.

All these products are generally in long lengths, but remain classified here even if cut into short lengths and whether or not put up for retail sale. They are used according to their different characteristics in the manufacture of brushes, sports rackets, fishing lines, surgical sutures, upholstery fabrics, belts, millinery, braids, etc.

The heading **does not include** :

- (a) Sterile synthetic monofilament (**heading 30.06**).
- (b) Synthetic monofilament of which any cross-sectional dimension exceeds 1 mm, or strip and flattened tubes (including strip and flattened tubes folded along the length), whether or not compressed or twisted (for example, artificial straw), **provided** that the apparent width (i.e., in the folded, flattened, compressed or twisted state) exceeds 5 mm (**Chapter 39**).
- (c) Synthetic monofilament measuring less than 67 decitex of **heading 54.02**.
- (d) Strip and the like of **Chapter 56**.

- (e) Synthetic monofilament, with hooks attached or otherwise made up into fishing lines (**heading 95.07**).
- (f) Prepared knots and tufts for brush-making (**heading 96.03**).

54.05 - Artificial monofilament of 67 decitex or more and of which no cross-sectional dimension exceeds 1 mm; strip and the like (for example, artificial straw) of artificial textile materials of an apparent width not exceeding 5 mm.

The Explanatory Note to heading 54.04 applies, *mutatis mutandis*, to the products of this heading.

54.06 - Man-made filament yarn (other than sewing thread), put up for retail sale.

This heading covers man-made filament yarn (other than sewing thread), when put up for retail sale, i.e., in the forms and subject to the conditions described in Part (I) (B) (3) of the General Explanatory Note to Section XI.

54.07 - Woven fabrics of synthetic filament yarn, including woven fabrics obtained from materials of heading 54.04.

5407.10 - Woven fabrics obtained from high tenacity yarn of nylon or other polyamides or of polyesters

5407.20 - Woven fabrics obtained from strip or the like

5407.30 - Fabrics specified in Note 9 to Section XI

- Other woven fabrics, containing 85 % or more by weight of filaments of nylon or other polyamides :

5407.41 -- Unbleached or bleached

5407.42 -- Dyed

5407.43 -- Of yarns of different colours

5407.44 -- Printed

- Other woven fabrics, containing 85 % or more by weight of textured polyester filaments :

5407.51 -- Unbleached or bleached

5407.52 -- Dyed

5407.53 -- Of yarns of different colours

5407.54 -- Printed

- Other woven fabrics, containing 85 % or more by weight of polyester filaments :

5407.61 -- Containing 85 % or more by weight of non-textured polyester filaments

5407.69 -- Other

- Other woven fabrics, containing 85 % or more by weight of synthetic filaments :

5407.71 -- Unbleached or bleached

5407.72 -- Dyed

5407.73 -- Of yarns of different colours

5407.74 -- Printed

- Other woven fabrics, containing less than 85 % by weight of synthetic filaments, mixed mainly or solely with cotton :

5407.81 -- Unbleached or bleached

5407.82 -- Dyed

5407.83 -- Of yarns of different colours

5407.84 -- Printed

- Other woven fabrics :

5407.91 -- Unbleached or bleached

5407.92 -- Dyed

5407.93 -- Of yarns of different colours

5407.94 -- Printed

This heading covers woven fabrics (as described in Part (I) (C) of the General Explanatory Note to Section XI) made of synthetic filament yarn or of monofilament or strip of heading 54.04; it includes a very large variety of dress fabrics, linings, curtain materials, furnishing fabrics, tent fabrics, parachute fabrics, etc.

This heading **does not include** :

- (a) Bandages medicated or put up for retail sale (**heading 30.05**).
- (b) Woven fabrics of synthetic monofilament of which any cross-sectional dimension exceeds 1 mm or of strip or the like of an apparent width exceeding 5 mm, of synthetic textile materials (**heading 46.01**).
- (c) Woven fabrics of synthetic staple fibres (**headings 55.12 to 55.15**).
- (d) Tyre cord fabric of **heading 59.02**.
- (e) Woven fabrics for technical uses, of **heading 59.11**.

54.08 - Woven fabrics of artificial filament yarn, including woven fabrics obtained from materials of heading 54.05.

5408.10 - Woven fabrics obtained from high tenacity yarn of viscose rayon

- Other woven fabrics, containing 85 % or more by weight of artificial filament or strip or the like :

5408.21 -- Unbleached or bleached

5408.22 -- Dyed

5408.23 -- Of yarns of different colours

5408.24 -- Printed

- Other woven fabrics :

5408.31 -- Unbleached or bleached

5408.32 -- Dyed

5408.33 -- Of yarns of different colours

5408.34 -- Printed

This heading covers woven fabrics (as described in Part (I) (C) of the General Explanatory Note to Section XI) made of artificial filament yarn or of monofilament or strip of heading 54.05; it includes a very large variety of dress fabrics, linings, curtain materials, furnishing fabrics, tent fabrics, parachute fabrics, etc.

This heading **does not include** :

- (a) Bandages medicated or put up for retail sale (**heading 30.05**).
 - (b) Woven fabrics of artificial monofilament of which any cross-sectional dimension exceeds 1 mm or of strip or the like of an apparent width exceeding 5 mm, of artificial textile materials (**heading 46.01**).
 - (c) Woven fabrics of artificial staple fibres (**heading 55.16**).
 - (d) Tyre cord fabric of **heading 59.02**.
 - (e) Woven fabrics for technical uses, of **heading 59.11**.
-

Chapter 55

Man-made staple fibres

Note.

1.- Headings 55.01 and 55.02 apply only to man-made filament tow, consisting of parallel filaments of a uniform length equal to the length of the tow, meeting the following specifications :

- (a) Length of tow exceeding 2 m;
- (b) Twist less than 5 turns per metre;
- (c) Measuring per filament less than 67 decitex;
- (d) Synthetic filament tow only : the tow must be drawn, that is to say, be incapable of being stretched by more than 100 % of its length;
- (e) Total measurement of tow more than 20,000 decitex.

Tow of a length not exceeding 2 m is to be classified in heading 55.03 or 55.04.

GENERAL

The General Explanatory Note to Section XI should be taken into account in reading the Explanatory Notes to this Chapter.

The Chapter covers the man-made fibres described in the General Explanatory Note to Chapter 54 when in the form of staple fibres (i.e., discontinuous fibres) or of certain filament tow; it also covers the products arising at the various stages of working these fibres or tow, up to and including yarn and woven fabrics. It further includes mixed textile products classified as products of man-made staple fibres by application of Note 2 to Section XI.

Man-made staple fibres are usually manufactured by extrusion through spinnerets (jets) having a large number of holes (sometimes several thousand); the filaments from a large number of spinnerets (jets) are then collected together in the form of a tow. This tow may be stretched and then cut into short lengths, either immediately or after having undergone various processes (washing, bleaching, dyeing, etc.) while in the tow form. The length into which the fibres are cut is usually between 25 mm and 180 mm and varies according to the particular man-made fibre concerned, the type of yarn to be manufactured and the nature of any other textile fibres with which they are to be mixed.

Waste (including noils, yarn waste and garnetted stock) of man-made filaments or staple fibres is also included in this Chapter.

This Chapter **does not include** :

- (a) Textile fibres, not exceeding 5 mm in length (flock), of **heading 56.01**.
- (b) Asbestos of **heading 25.24** and articles of asbestos and other products of **heading 68.12** or **68.13**.
- (c) Carbon fibres and articles of carbon fibres, of **heading 68.15**.
- (d) Glass fibres and articles of glass fibres, of **heading 70.19**.

55.01 - Synthetic filament tow.

5501.10 - Of nylon or other polyamides

5501.20 - Of polyesters

5501.30 - Acrylic or modacrylic

5501.40 - Of polypropylene

5501.90 - Other

This heading covers synthetic filament tow produced as described in the General Explanatory Note to this Chapter, **only** if it meets the following specifications (see also Chapter Note 1) :

- (A) The tow must exceed 2 m in length.
- (B) The tow must be untwisted or be twisted less than 5 turns per metre.
- (C) Each filament must measure less than 67 decitex.
- (D) The tow must have been drawn, i.e., it must be incapable of being stretched by more than 100 % of its length.
- (E) The total measurement of the tow must exceed 20,000 decitex.

The requirement under paragraph (D) is designed to ensure that the tow is in a state ready for conversion into staple fibres. After extrusion synthetic filaments are insufficiently oriented and must be drawn in order to effect orientation of their molecules and give them their required properties. Drawn tow still retains a certain elasticity but normally breaks on being stretched by considerably less than 100 % of its length. On the other hand, undrawn tow can be stretched to between three and four times its length before it breaks.

Tow of this heading is generally used for the manufacture of yarn of synthetic staple fibres either by being :

- (1) Cut into staple fibres and then converted into slivers, rovings and yarn by processes generally similar to those used for cotton or wool; or
- (2) Converted into tops by the "tow-to-top" process (see Explanatory Note to heading 55.06) and subsequently into yarns.

The heading **does not cover** :

- (a) Assemblies of synthetic filaments satisfying conditions (A), (B) and (C) above of a total measurement not exceeding 20,000 decitex or whatever the total measurement in the case of undrawn filaments (**heading 54.02**).
- (b) Assemblies of synthetic filaments (each filament measuring 67 decitex or more) untwisted or twisted less than 5 turns per metre, whether or not drawn and whatever the total measurement (**heading 54.04** if no cross-sectional dimension of the individual filaments exceeds 1 mm or **Chapter 39** otherwise).
- (c) Synthetic filament tow satisfying conditions (B) and (C) above, but of a length not exceeding 2 m, whether or not drawn and whatever the total measurement (**heading 55.03**).

55.02 - Artificial filament tow.

5502.10 - Of cellulose acetate

5502.90 - Other

With the exception of Note 1 (d) to the Chapter, the Explanatory Note to heading 55.01 applies, *mutatis mutandis*, to the products of this heading.

55.03 - Synthetic staple fibres, not carded, combed or otherwise processed for spinning.

- Of nylon or other polyamides :

5503.11 -- Of aramids

5503.19 -- Other

5503.20 - Of polyesters

5503.30 - Acrylic or modacrylic

5503.40 - Of polypropylene

5503.90 - Other

The fibres of this heading are manufactured as described in the General Explanatory Note to this Chapter.

Synthetic staple fibres are usually press-packed in bales. The fibres are generally of uniform length, which distinguishes them from the waste material of **heading 55.05**.

The heading also covers synthetic filament tow of a length not exceeding 2 m **provided** that each filament measures less than 67 decitex. Synthetic filament tow of a length exceeding 2 m is **excluded (heading 54.02 or 55.01)**.

Synthetic staple fibres which have been carded, combed or otherwise processed for spinning are also **excluded (heading 55.06)**.

55.04 - Artificial staple fibres, not carded, combed or otherwise processed for spinning.

5504.10 - Of viscose rayon

5504.90 - Other

The Explanatory Note to heading 55.03 applies, *mutatis mutandis*, to the products of this heading.

55.05 - Waste (including noils, yarn waste and garnetted stock) of man-made fibres.

5505.10 - Of synthetic fibres

5505.20 - Of artificial fibres

This heading covers waste of man-made fibres (filaments and staple fibres - see the General Explanatory Note to Chapter 54) and includes :

- (1) **Fibre wastes (soft waste)**, such as relatively long fibres obtained as waste during the formation and processing of filaments; short fibres obtained as waste from the carding, combing and other processes preparatory to the spinning of staple fibres (e.g., noils, small broken pieces of laps, slivers or rovings).
- (2) **Yarn wastes (hard waste)**, i.e., broken, knotted or tangled yarns collected as waste during the spinning, doubling, reeling, weaving, knitting, etc., operations.
- (3) **Garnetted stock**, i.e., fibres obtained by tearing rags or yarns into their component fibres.

Such wastes are classified in this heading whether or not they have been bleached or dyed, **provided** that they have not been carded, combed or otherwise processed for spinning.

The heading **does not include** :

- (a) Wadding (**heading 30.05** or **56.01**).
- (b) Waste fibres, carded, combed or otherwise processed for spinning (**heading 55.06** or **55.07**).
- (c) Textile flock and dust and mill neps (**heading 56.01**).
- (d) New or used rags (**Chapter 63**).

55.06 - Synthetic staple fibres, carded, combed or otherwise processed for spinning.

5506.10 - Of nylon or other polyamides

5506.20 - Of polyesters

5506.30 - Acrylic or modacrylic

5506.40 - Of polypropylene

5506.90 - Other

This heading covers synthetic staple fibres (including waste of synthetic staple fibres or filaments) after they have been carded, combed or otherwise processed for spinning.

In carding, staple and waste fibres are passed through machines which render the fibres more or less parallel, and deliver them in the form of a wide web or lap which is then generally condensed into a sliver (a strand of fibres loosely combined without twist).

In combing, the carded sliver is passed through further machines which render the fibres almost perfectly parallel and, in the case of waste, remove the shorter fibres (noils). The combed sliver is usually wound in coils or balls, known as "tops".

Tops are also made directly from filament tow by what are known as "tow-to-top" processes.

The tow is passed through a device which breaks or cuts the filaments without disturbing their continuity or their parallel arrangement. The operation may be carried out, for example, by passing the tow through rollers operating at different speeds thus causing a tension which breaks the filaments; or toothed rollers may break the filaments by direct pressure; or the tow may be cut diagonally with knife mechanisms. During passage through the machine the tow is drawn out into slivers. These processes avoid the necessity for cutting up the tow into staple fibres and eliminate carding or, usually, both carding and combing.

Slivers, whether produced by carding, combing or by the "tow-to-top" processes, are drawn out into rovings - thinner strands of parallel fibres with a slight twist - which can be spun in one operation into yarn.

The heading **does not cover** wadding (**heading 30.05 or 56.01**).

55.07 - Artificial staple fibres, carded, combed or otherwise processed for spinning.

The Explanatory Note to heading 55.06 applies, *mutatis mutandis*, to the products of this heading.

55.08 - Sewing thread of man-made staple fibres, whether or not put up for retail sale.

5508.10 - Of synthetic staple fibres

5508.20 - Of artificial staple fibres

This heading covers sewing thread in the forms and subject to the conditions described in Part (I) (B) (4) of the General Explanatory Note to Section XI.

However, if such thread is within the definition of twine, etc. (see Part (I) (B) (2) of the General Explanatory Note to Section XI) it is **excluded (heading 56.07)**.

Sewing thread remains in this heading whether or not put up for retail sale or processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

55.09 - Yarn (other than sewing thread) of synthetic staple fibres, not put up for retail sale.

- Containing 85 % or more by weight of staple fibres of nylon or other polyamides :

5509.11 -- Single yarn

5509.12 -- Multiple (folded) or cabled yarn

- Containing 85 % or more by weight of polyester staple fibres :

5509.21 -- Single yarn

5509.22 -- Multiple (folded) or cabled yarn

- Containing 85 % or more by weight of acrylic or modacrylic staple fibres :

5509.31 -- Single yarn

5509.32 -- Multiple (folded) or cabled yarn

- Other yarn, containing 85 % or more by weight of synthetic staple fibres :

5509.41 -- Single yarn

5509.42 -- Multiple (folded) or cabled yarn

- Other yarn, of polyester staple fibres :

5509.51 -- Mixed mainly or solely with artificial staple fibres

5509.52 -- Mixed mainly or solely with wool or fine animal hair

5509.53 -- Mixed mainly or solely with cotton

5509.59 -- Other

- Other yarn, of acrylic or modacrylic staple fibres :

5509.61 -- Mixed mainly or solely with wool or fine animal hair

5509.62 -- Mixed mainly or solely with cotton

5509.69 -- Other

- Other yarn :

5509.91 -- Mixed mainly or solely with wool or fine animal hair

5509.92 -- Mixed mainly or solely with cotton

5509.99 -- Other

This heading covers yarns (**other than** sewing thread), whether single or multiple (folded), obtained by spinning rovings of synthetic staple fibres of heading 55.06.

Yarn of synthetic staple fibres is, however, **excluded** if put up for retail sale (**heading 55.11**) or if within the definition of twine, cordage, etc. (**heading 56.07**) (see Parts (I) (B) (2) and (3) of the General Explanatory Note to Section XI).

The heading includes yarn which has been processed as indicated in Part (I) (B) (1) of the General Explanatory Note to Section XI.

55.10 - Yarn (other than sewing thread) of artificial staple fibres, not put up for retail sale.

- Containing 85 % or more by weight of artificial staple fibres :

5510.11 - - Single yarn

5510.12 - - Multiple (folded) or cabled yarn

5510.20 - Other yarn, mixed mainly or solely with wool or fine animal hair

5510.30 - Other yarn, mixed mainly or solely with cotton

5510.90 - Other yarn

The Explanatory Note to heading 55.09 applies, *mutatis mutandis*, to the products of this heading.

55.11 - Yarn (other than sewing thread) of man-made staple fibres, put up for retail sale.

5511.10 - Of synthetic staple fibres, containing 85 % or more by weight of such fibres

5511.20 - Of synthetic staple fibres, containing less than 85 % by weight of such fibres

5511.30 - Of artificial staple fibres

This heading covers yarns (other than sewing thread) of man-made staple fibres when put up for retail sale, i.e., in the forms and subject to the conditions described in Part (I) (B) (3) of the General Explanatory Note to Section XI.

55.12 - Woven fabrics of synthetic staple fibres, containing 85 % or more by weight of synthetic staple fibres.

- Containing 85 % or more by weight of polyester staple fibres :

5512.11 -- Unbleached or bleached

5512.19 -- Other

- Containing 85 % or more by weight of acrylic or modacrylic staple fibres :

5512.21 -- Unbleached or bleached

5512.29 -- Other

- Other :

5512.91 -- Unbleached or bleached

5512.99 -- Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI), containing 85 % or more by weight of synthetic staple fibres. Such fabrics include a very large variety of dress materials, curtain or other furnishing fabrics, and materials for table cloths, blankets, towels, etc.

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

55.13 - Woven fabrics of synthetic staple fibres, containing less than 85 % by weight of such fibres, mixed mainly or solely with cotton, of a weight not exceeding 170 g/m².

- Unbleached or bleached :

5513.11 -- Of polyester staple fibres, plain weave

5513.12 -- 3-thread or 4-thread twill, including cross twill, of polyester staple fibres

5513.13 -- Other woven fabrics of polyester staple fibres

5513.19 -- Other

- Dyed :

5513.21 -- Of polyester staple fibres, plain weave

5513.23 -- Other woven fabrics of polyester staple fibres

5513.29 -- Other woven fabrics

- Of yarns of different colours :

5513.31 -- Of polyester staple fibres, plain weave

5513.39 -- Other woven fabrics

- Printed :

5513.41 -- Of polyester staple fibres, plain weave

5513.49 -- Other woven fabrics

This heading covers woven fabrics as defined in Part (I) (C) of the General Explanatory Note to Section XI.

It covers these fabrics provided they are classified as fabrics of synthetic staple fibres by the application of Note 2 to Section XI (see also Part (I) (A) of the General Explanatory Note to Section XI) and provided they meet the following specifications :

- (a) Contain less than 85 % by weight of synthetic staple fibres;
- (b) Are mixed mainly or solely with cotton;
- (c) Weigh not more than 170 g/m².

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

55.14 - Woven fabrics of synthetic staple fibres, containing less than 85 % by weight of such fibres, mixed mainly or solely with cotton, of a weight exceeding 170 g/m².

- Unbleached or bleached :

5514.11 -- Of polyester staple fibres, plain weave

5514.12 -- 3 thread or 4-thread twill, including cross twill, of polyester staple fibres

5514.19 -- Other woven fabrics

- Dyed :

5514.21 -- Of polyester staple fibres, plain weave

5514.22 -- 3-thread or 4-thread twill, including cross twill, of polyester staple fibres

5514.23 -- Other woven fabrics of polyester staple fibres

5514.29 -- Other woven fabrics

5514.30 - Of yarns of different colours

- Printed :

5514.41 -- Of polyester staple fibres, plain weave

5514.42 -- 3-thread or 4-thread twill, including cross twill, of polyester staple fibres

5514.43 -- Other woven fabrics of polyester staple fibres

5514.49 -- Other woven fabrics

The Explanatory Note to heading 55.13 applies, *mutatis mutandis*, to the products of this heading.

55.15 - Other woven fabrics of synthetic staple fibres.

- Of polyester staple fibres :

5515.11 -- Mixed mainly or solely with viscose rayon staple fibres

5515.12 -- Mixed mainly or solely with man-made filaments

5515.13 -- Mixed mainly or solely with wool or fine animal hair

5515.19 -- Other

- Of acrylic or modacrylic staple fibres :

5515.21 -- Mixed mainly or solely with man-made filaments

5515.22 -- Mixed mainly or solely with wool or fine animal hair

5515.29 -- Other

- Other woven fabrics :

5515.91 -- Mixed mainly or solely with man-made filaments

5515.99 -- Other

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of yarns of synthetic staple fibres. However it should be noted that it covers only mixed woven fabrics as defined in Note 2 to Section XI, **other than** those of the preceding headings of this Chapter or specified or included in the second part of this Section (**Chapter 58 or 59**, usually).

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

55.16 - Woven fabrics of artificial staple fibres.

- Containing 85 % or more by weight of artificial staple fibres :

5516.11 -- Unbleached or bleached

5516.12 -- Dyed

5516.13 -- Of yarns of different colours

5516.14 -- Printed

- Containing less than 85 % by weight of artificial staple fibres, mixed mainly or solely with man-made filaments :

5516.21 -- Unbleached or bleached

5516.22 -- Dyed

5516.23 -- Of yarns of different colours

5516.24 -- Printed

- Containing less than 85 % by weight of artificial staple fibres, mixed mainly or solely with wool or fine animal hair :

5516.31 -- Unbleached or bleached

5516.32 -- Dyed

5516.33 -- Of yarns of different colours

5516.34 -- Printed

- Containing less than 85 % by weight of artificial staple fibres, mixed mainly or solely with cotton :

5516.41 -- Unbleached or bleached

5516.42 -- Dyed

5516.43 -- Of yarns of different colours

5516.44 -- Printed

- Other :

5516.91 -- Unbleached or bleached

5516.92 -- Dyed

5516.93 -- Of yarns of different colours

5516.94 -- Printed

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) made of yarns of artificial staple fibres. Such fabrics include a very large variety of dress materials, curtain or other furnishing fabrics, and materials for table cloths, blankets, towels, etc.

Bandages, medicated or put up for retail sale, are **excluded (heading 30.05)**.

Chapter 56

Wadding, felt and nonwovens; special yarns; twine, cordage, ropes and cables and articles thereof

Notes.

1.- This Chapter does not cover :

- (a) Wadding, felt or nonwovens, impregnated, coated or covered with substances or preparations (for example, perfumes or cosmetics of Chapter 33, soaps or detergents of heading 34.01, polishes, creams or similar preparations of heading 34.05, fabric softeners of heading 38.09) where the textile material is present merely as a carrying medium;
- (b) Textile products of heading 58.11;
- (c) Natural or artificial abrasive powder or grain, on a backing of felt or nonwovens (heading 68.05);
- (d) Agglomerated or reconstituted mica, on a backing of felt or nonwovens (heading 68.14);
- (e) Metal foil on a backing of felt or nonwovens (generally Section XIV or XV); or;
- (f) Sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles of **heading 96.19**.

2.- The term " felt " includes needleloom felt and fabrics consisting of a web of textile fibres the cohesion of which has been enhanced by a stitch-bonding process using fibres from the web itself.

3.- Headings 56.02 and 56.03 cover respectively felt and nonwovens, impregnated, coated, covered or laminated with plastics or rubber whatever the nature of these materials (compact or cellular).

Heading 56.03 also includes nonwovens in which plastics or rubber forms the bonding substance.

Headings 56.02 and 56.03 do not, however, cover :

- (a) Felt impregnated, coated, covered or laminated with plastics or rubber, containing 50 % or less by weight of textile material or felt completely embedded in plastics or rubber (Chapter 39 or 40);
- (b) Nonwovens, either completely embedded in plastics or rubber, or entirely coated or covered on both sides with such materials, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour (Chapter 39 or 40); or
- (c) Plates, sheets or strip of cellular plastics or cellular rubber combined with felt or nonwovens, where the textile material is present merely for reinforcing purposes (Chapter 39 or 40).

4.- Heading 56.04 does not cover textile yarn, or strip or the like of heading 54.04 or 54.05, in which the impregnation, coating or covering cannot be seen with the naked eye (usually Chapters 50 to 55); for the purpose of this provision, no account should be taken of any resulting change of colour.

GENERAL

This Chapter covers a number of textile products of a special character, e.g., wadding, felt, nonwovens, special yarns, cordage and certain articles of these materials.

56.01 - Wadding of textile materials and articles thereof; textile fibres, not exceeding 5 mm in length (flock), textile dust and mill neps.

- Wadding of textile materials and articles thereof :

5601.21 -- Of cotton

5601.22 -- Of man-made fibres

5601.29 -- Other

5601.30 - Textile flock and dust and mill neps

(A) WADDING OF TEXTILE MATERIALS AND ARTICLES THEREOF

The **wadding** referred to here is made by superimposing several layers of carded or air-laid textile fibres one on the other, and then compressing them in order to increase the cohesion of the fibres. Wadding is sometimes lightly punched in order to increase the cohesion of the fibres and, in some cases, to fix the layer of wadding on a support of woven or other textile fabrics.

Wadding takes the form of a flexible, spongy, high-bulk sheet, of even thickness, the fibres in which are readily separable. It is generally made of cotton fibres (absorbent or other cotton waddings) or of artificial staple fibres. Low-grade wadding, made from waste from carding or garnetting, usually contains a proportion of neps or yarn waste.

Wadding is classified here whether or not bleached, dyed or printed. The heading also covers wadding on which a small quantity of agglutinating substance has been dispersed in order to improve the cohesion of the surface fibres; in contrast to nonwovens, the fibres of the inner layers of such wadding are readily separable.

It should, however, be noted that wadding treated with an agglutinating substance and in which that substance has penetrated into the inner layers is classified as a nonwoven in **heading 56.03**, even if the fibres of the inner layers are readily separable.

Wadding which has been fixed to an internal or external textile support by lightly punching, and wadding covered on one or both sides with paper, textile or other material (either by sewing or glueing), also remain classified here **provided** their essential character is that of wadding and that they do not constitute products of **heading 58.11**.

Wadding is largely used for padding (e.g., in the manufacture of shoulder pads, interlinings for clothing, pads for jewel boxes, etc., in upholstery and in laundry pressing machines), as packing material, or for sanitary use.

This heading also covers wadding in the piece or cut to length, and articles of wadding **other than** those covered more specifically by other headings of the Nomenclature (see exclusions below).

The articles of wadding classified here include :

- (1) Window, door or similar draught excluders consisting of rolls of wadding spirally covered with yarns, but **excluding** those completely covered with textile fabric (**heading 63.07**).
- (2) Articles of wadding used for decoration, **other than** those having the character of articles of **Chapter 95**.

Among the articles of wadding **not classified** here are :

- (a) Wadding or articles of wadding, impregnated or coated with pharmaceutical substances, or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes (**heading 30.05**).
- (b) Wadding, impregnated, coated or covered with substances or preparations (e.g., perfumes or cosmetics (**Chapter 33**), soaps or detergents (**heading 34.01**), polishes, creams or similar preparations (**heading 34.05**), fabric softeners (**heading 38.09**)) where the textile material is present merely as a carrying medium.
- (c) Cellulose wadding and articles thereof (generally **Chapter 48**).
- (d) Carded cotton in sliver form as used by hairdressers (e.g., barbers' "wadding") (**heading 52.03**).
- (e) Quilted textile products in the piece, composed of one or more layers of textile materials assembled with wadding by stitching or otherwise, **other than** embroidery of heading 58.10 (**heading 58.11**).
- (f) Clothing pads (**heading 61.17** or **62.17**).
- (g) Artificial flowers, foliage or fruit and parts thereof (**heading 67.02**).
- (h) Theatrical wigs, false beards and other articles of **heading 67.04**.
- (ij) Festive, carnival or other entertainment articles, Christmas tree decorations and other articles (e.g., dolls' wigs) of **Chapter 95**.
- (k) Sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles of **heading 96.19**.

(B) TEXTILE FIBRES, NOT EXCEEDING 5 mm IN LENGTH (FLOCK) AND TEXTILE DUST

"Textile flock" consists of textile fibres not exceeding 5 mm in length (silk, wool, cotton, man-made fibres, etc.). It is obtained as waste during various finishing operations and, in particular, from the shearing of velvets. It is also produced by cutting textile tow or fibres. Textile dust is obtained as waste, or by grinding textile fibres to a powder. Textile flock and dust fall in this heading even if bleached or dyed or if the fibres have been artificially curled.

These products are used for a wide variety of purposes (e.g., for blending with other fibres and spinning into yarns, for making imitation suèdes, for coating or decorating wallpaper, as a basis for face powder or "make-up").

Perfumed textile flock and dust, however, are **excluded** (**heading 33.07**).

The flock of this heading must not be confused with the flocks made from rags and used for the stuffing of bedding, cushions, etc. Such flocks are classified in the appropriate "waste" heading of **Chapters 50 to 55**.

(C) MILL NEPS

These are small, regular sized balls (sometimes somewhat elongated), of silk, wool, cotton, man-made staple fibres, etc., generally made by rolling fibres between two discs. They may be bleached or dyed and are used in the manufacture of fancy yarns such as those imitating homespuns.

56.02 - Felt, whether or not impregnated, coated, covered or laminated.

5602.10 - Needleloom felt and stitch-bonded fibre fabrics

- Other felt, not impregnated, coated, covered or laminated :

5602.21 -- Of wool or fine animal hair

5602.29 -- Of other textile materials

5602.90 - Other

Felt is usually obtained by superimposing, one on the other, a number of layers of textile fibres (usually the laps as produced by carding or by air-laying); these are then moistened (generally with steam or hot soapy water) and subjected to heavy pressure and a rubbing or beating action. This causes the fibres to interlock and produces sheets of even thickness, much more compact and difficult to disintegrate than wadding, and quite distinct from felted woven fabrics (generally **Chapters 50 to 55**).

Felt is usually produced from wool or other animal hair, or from mixtures of these fibres with other natural fibres (e.g., vegetable fibres, horsehair) or with man-made fibres.

Felt is used in the manufacture of clothing, hats, shoes, shoe soles, piano hammers, furnishing articles, fancy articles, etc., for various technical uses, as heat or sound insulating materials, etc.

This heading also includes **needleloom felt** which is made either :

- (1) by punching a sheet or web of textile staple fibres (natural or man-made), without a textile fabric base, with notched needles; or
- (2) by needling such textile fibres through a base of textile fabric or other material which is finally more or less hidden by the fibres.

The needleloom technique makes it possible to obtain felt from non-felting vegetable fibres (for example, jute) or man-made fibres.

Needled webs of staple fibres in which the needling is complementary to other types of bonding and needled filament-based webs are regarded as nonwovens (**heading 56.03**).

This heading also covers those **stitch-bonded fabrics** the essential feature of which is that they consist of a web of textile fibres the cohesion of which has been enhanced by picking up fibres from the web itself, and not by means of textile yarns. The fibres are drawn by needles through the web, and form on the surface rows of chain stitches. Some of these fabrics may have a pile surface (whether or not cut) and may be reinforced by a ground of textile or other material. The stitch-bonding knitting process is described in the General Explanatory Note to Chapter 60.

Except where it is covered more specifically by other headings in the Nomenclature, the heading includes felt in the piece or cut to length or simply cut to rectangular (including square) shape from larger pieces without other working (e.g., certain dusters or blankets), whether or not presented folded or put up in packings (e.g., for retail sale).

Felt may be dyed, printed, impregnated, coated, covered, laminated or reinforced (e.g., with textile threads, or wire). It may be covered on one or both surfaces with paper, cardboard, textile fabric, etc. (e.g., sewn or glued), **provided** the essential character of the product is that of felt.

However, the heading **does not cover** the following products which fall in **Chapter 39 or 40** :

- (a) Felt impregnated, coated, covered or laminated with plastics or rubber, containing 50 % or less by weight of textile material, or felt completely embedded in plastics or rubber;
- (b) Plates, sheets or strip of cellular plastics or cellular rubber combined with felt, where the textile material is present merely for reinforcing purposes (see the General Explanatory Note to Chapter 39, part entitled "**Plastics and textile combinations**", and Item (A) of the Explanatory Note to heading 40.08).

The heading includes **roofing felt** made by the normal felting process and subsequently impregnated with tar or similar substances.

The heading also **excludes** :

- (a) Felt, impregnated, coated or covered with substances or preparations (e.g., perfumes or cosmetics (**Chapter 33**), soaps or detergents (**heading 34.01**), polishes, creams or similar preparations (**heading 34.05**), fabric softeners (**heading 38.09**)) where the textile material is present merely as a carrying medium.
- (b) Saddle cloths and pads (**heading 42.01**).
- (c) Carpets and other floor coverings of felt of **Chapter 57**.
- (d) Tufted felt of **heading 58.02**.
- (e) Embroidered felt in the piece, in strips or in motifs (**heading 58.10**).
- (f) Quilted textile products in the piece, composed of one or more layers of textile materials assembled by stitching or otherwise with padding material **other than** embroidery of heading 58.10 (**heading 58.11**).
- (g) Floor coverings consisting of a coating or covering on a backing of felt, whether or not cut to shape (**heading 59.04**).
- (h) Felt coated, covered or laminated with rubber, leather or other material, of a kind used for card clothing, and other similar fabric of a kind used for other technical purposes, of **heading 59.11**.
- (ij) Felt covered with abrasive powder or grain (**heading 68.05**) or with agglomerated or reconstituted mica (**heading 68.14**).
- (k) Building board made of several layers of textile fibres completely enveloped in asphalt or similar material (**heading 68.07**).
- (l) Metal foil on a backing of felt (**generally Section XIV or XV**).

56.03 - Nonwovens, whether or not impregnated, coated, covered or laminated.

- Of man-made filaments :

5603.11 -- Weighing not more than 25 g/m²

5603.12 -- Weighing more than 25 g/m² but not more than 70 g/m²

5603.13 -- Weighing more than 70 g/m² but not more than 150 g/m²

5603.14 -- Weighing more than 150 g/m²

- Other :

5603.91 -- Weighing not more than 25 g/m²

5603.92 -- Weighing more than 25 g/m² but not more than 70 g/m²

5603.93 -- Weighing more than 70 g/m² but not more than 150 g/m²

5603.94 -- Weighing more than 150 g/m²

A **nonwoven** is a sheet or web of predominantly textile fibres oriented directionally or randomly and bonded. These fibres may be of natural or man-made origin. They may be staple fibres (natural or man-made) or man-made filaments or be formed in situ.

Nonwovens can be produced in various ways and production can be conveniently divided into the three stages : web formation, bonding and finishing.

I. Web formation

Four basic methods exist :

- (a) by carding or air-laying fibres in order to form a sheet. These fibres may be parallel, cross or random oriented (dry-laid process);
- (b) by extruding filaments which are directionally oriented, cooled and laid down directly into a web or which are coagulated, washed and laid down directly into a web in a wet form of the process (spun laid process);
- (c) by suspending and dispersing fibres in water, depositing the resultant slurry onto a wire screen and forming a web by removal of the water (wet-laid process);
- (d) by various specialised technologies in which fibre production, web formation and usually bonding occur simultaneously (in situ process).

II. Bonding

After web formation the fibres are assembled throughout the thickness and width of the web (continuous method) or in spots or patches (intermittent method).

This bonding can be divided into three types :

- (a) Chemical bonding, in which the fibres are assembled by means of a bonding substance. This may be done by impregnation with an adhesive binder such as rubber, gum, starch, glue or plastics, in solution or emulsion, by heat treatment with plastics in powder form, by solvents, etc. Binding fibres can also be used for chemical bonding.
- (b) Thermal bonding, in which the fibres are assembled by submitting them to a heat (or ultrasonic) treatment, passing the web through ovens or between heated rollers (area bonding) or through heated embossing calenders (point bonding). Binding fibres can also be used for thermal bonding.
- (c) Mechanical bonding, in which webs are strengthened by the physical entanglement of the constituent fibres. This may be achieved by means of high pressure air or water jets. It may also be achieved by needling but not by stitch-bonding. However, needled products regarded as nonwovens are restricted to :
 - filament-based webs;
 - staple fibre webs where the needling is complementary to other types of bonding.

These various bonding processes may also frequently be combined.

III. Finishing

Nonwovens may be dyed, printed, impregnated, coated, covered or laminated. Those covered on one or both surfaces (by gumming, sewing or by any other process) with textile fabric or with sheets of any other material are classified in this heading only if they derive their essential character from the nonwoven.

The heading includes, *inter alia*, adhesive tape consisting of a nonwoven coated with an adhesive of rubber, of plastics or of a mixture of these materials.

The heading also covers certain " roofing felts " in which the textile fibres are agglomerated with tar or similar substances, and certain products known as " bitumen felts " obtained in the same way but incorporating a small quantity of cork fragments.

However, the heading **does not cover** the following products which fall in **Chapter 39 or 40** :

- (a) Nonwovens, either completely embedded in plastics or rubber, or entirely coated or covered on both sides with such materials, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour.
- (b) Plates, sheets or strip of cellular plastics or cellular rubber combined with nonwovens, where the textile material is present merely for reinforcing purposes (see the General Explanatory Note to Chapter 39, part entitled "**Plastics and textile combinations**", and Item (A) of the Explanatory Note to heading 40.08).

*
* *

Nonwovens differ in thickness and in their characteristic features (flexibility, elasticity, resistance to tearing, absorbency, stability, etc.) according to the manufacturing or bonding process, the density of the fibres or filaments and the number of webs. Some nonwovens resemble paper, paperboard, cellulose wadding, chamois leather, or wadding of heading 56.01. They can be distinguished from paper, paperboard or cellulose wadding by the fact that the textile fibres are not digested during the process of manufacture.

Finally, the fact that the textile fibres or filaments are bonded throughout the thickness, and generally throughout the width, of the web or sheet also helps to distinguish these fabrics from certain types of wadding of heading 56.01 (see the Explanatory Note to that heading).

Certain nonwovens can be washed or wrung like other textile fabrics.

Except where they are covered more specifically by other headings in the Nomenclature, the heading covers nonwovens in the piece, cut to length or simply cut to rectangular (including square) shape from larger pieces without other working, whether or not presented folded or put up in packings (e.g., for retail sale). These include : facing webs (overlay) for incorporation in laminated plastics; top-sheets for the manufacture of disposable baby napkins (diapers) or sanitary towels; fabrics for the manufacture of protective clothing or garment linings; sheets for filtering liquids or air, for use as stuffing materials, for sound insulation, for filtration or separation in road building or other civil engineering works; substrates for manufacturing bituminous roofing fabrics; primary or secondary backing for tufted carpets, etc.; handkerchiefs, bed linen, table linen, etc.

The heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Nonwovens, impregnated, coated or covered with substances or preparations (e.g., perfumes or cosmetics (**Chapter 33**), soaps or detergents (**heading 34.01**), polishes, creams or similar preparations (**heading 34.05**), fabric softeners (**heading 38.09**)) where the textile material is present merely as a carrying medium.
- (c) Needleloom felts (**heading 56.02**).
- (d) Carpets and other floor coverings of nonwovens of **Chapter 57**.
- (e) Tufted nonwovens of **heading 58.02**.
- (f) Bolducs (**heading 58.06**).
- (g) Embroidered nonwovens in the piece, in strips or in motifs (**heading 58.10**).
- (h) Quilted textile products in the piece, composed of one or more layers of textile materials assembled by stitching or otherwise with padding material of nonwovens, **other than** embroidery of heading 58.10 (**heading 58.11**).
- (ij) Nonwovens for technical uses, of **heading 59.11**.
- (k) Nonwovens covered with abrasive powder or grain (**heading 68.05**) or with agglomerated or reconstituted mica (**heading 68.14**).
- (l) Metal foil on a backing of nonwovens (**generally Section XIV or XV**).

56.04 - Rubber thread and cord, textile covered; textile yarn, and strip and the like of heading 54.04 or 54.05, impregnated, coated, covered or sheathed with rubber or plastics.

5604.10 - Rubber thread and cord, textile covered

5604.90 - Other

(A) RUBBER THREAD AND CORD, TEXTILE COVERED

Provided they are covered with textiles (e.g., by gimping or plaiting), this group includes, thread (single strand) of rubber, of any cross-section, and cord (multiple strand) of rubber, made of these threads.

(B) TEXTILE YARN, AND STRIP AND THE LIKE OF HEADING 54.04 OR 54.05, IMPREGNATED, COATED, COVERED OR SHEATHED WITH RUBBER OR PLASTICS

This group covers textile yarn, and strip and the like of heading 54.04 or 54.05, which have been impregnated, coated, covered or sheathed with rubber or plastics, **provided that**, in the case of impregnated, coated or covered yarns, etc., the impregnation, coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour.

Impregnated textile yarn includes dipped yarn consisting of textile yarn surface-treated to improve its adhesion to the rubber in which it is subsequently incorporated during the manufacture of articles such as tyres, machinery belts or belting, and tubes.

Among the products included in this group are imitation catguts consisting of textile yarn with a heavy dressing of plastics, which are used according to their different characteristics in the manufacture of sports rackets, fishing lines, belts, braids, upholstery fabrics, surgical sutures, etc., and clothes-lines consisting of textile yarn incorporated in a sheath of plastics.

The heading **does not include** :

- (a) Fabrics composed of parallel textile yarns agglomerated with rubber (**heading 59.06**).
- (b) Imitation catgut with hooks attached or otherwise made up into fishing lines (**heading 95.07**).

56.05 - Metallised yarn, whether or not gimped, being textile yarn, or strip or the like of heading 54.04 or 54.05, combined with metal in the form of thread, strip or powder or covered with metal.

This heading covers :

- (1) **Yarn consisting of any textile material (including monofilament, strip and the like and paper yarn) combined with metal thread or strip**, whether obtained by a process of twisting, cabling or by gimping, whatever the proportion of the metal present. The gimped yarns are obtained by wrapping metal thread or strip spirally round the textile core which does not twist with the metal. Precious metals or plated metals are frequently used.
- (2) **Yarn of any textile material (including monofilament, strip and the like, and paper yarn) covered with metal by any other process**. This category includes yarn covered with metal by electro-deposition, or by giving it a coating of adhesive (e.g., gelatin) and then sprinkling it with metal powder (e.g., aluminium or bronze).

The heading also covers products consisting of a core of metal foil (generally of aluminium), or of a core of plastic film coated with metal dust, sandwiched by means of an adhesive between two layers of plastic film.

The heading covers multiple (folded) or cabled yarn containing plies of the yarn referred to above (e.g., fancy cords as used by confectioners, obtained by twisting together two or more metallised yarns as described above). It further includes certain other forms of yarn made in the same way and used for similar purposes, consisting of two or more parallel metallised yarns held together with a binding of metal thread or strip, and yarn or bundles of yarn gimped with yarn of this heading.

Metallised yarn may be gimped. It is used in the manufacture of trimmings and lace and of certain fabrics, as fancy cords, etc.

The heading **does not include** :

- (a) Yarn composed of a mixture of textile materials and metal fibres conferring on them an antistatic effect (**Chapters 50 to 55**, as the case may be).
- (b) Yarn reinforced with metal thread (**heading 56.07**).
- (c) Cords, galloons or other articles having the character of ornamental trimmings (**heading 58.08**).
- (d) Wire or strip of gold, silver, copper, aluminium or other metals (**Sections XIV and XV**).

56.06 - Gimped yarn, and strip and the like of heading 54.04 or 54.05, gimped (other than those of heading 56.05 and gimped horsehair yarn); chenille yarn (including flock chenille yarn); loop wale-yarn.

**(A) GIMPED YARN, AND STRIP AND THE LIKE OF HEADING 54.04
OR 54.05, GIMPED (OTHER THAN THOSE OF HEADING
56.05 AND GIMPED HORSEHAIR YARN)**

These products are composed of a core, usually of one or more textile yarns, around which other yarn or yarns are wound spirally. Most frequently the covering threads completely cover the core, but in some cases the turns of the spiral are spaced; in the latter case, the product may have somewhat the appearance of certain multiple (folded), cabled or fancy yarns of **Chapters 50 to 55**, but may be distinguished from them by the characteristic of gimped yarn that the core does not itself undergo a twisting with the cover threads.

The core of the gimped yarn of this heading is usually of cotton, other vegetable fibres or man-made fibres and the covering threads are usually finer and more glossy (e.g., silk, mercerised cotton or man-made fibres).

Gimped yarns with cores of other materials are not necessarily excluded **provided** the product has the essential character of a textile article.

Gimped yarns are used as a trimming and also very largely for the manufacture of such trimmings. Some, however, are also suitable for other uses, for example, as buttonhole cord, in embroidery or for tying parcels.

The heading **excludes** :

- (a) Gimped horsehair yarn (**heading 51.10**).
- (b) Rubber thread gimped with textiles (**heading 56.04**).
- (c) Gimped metallised yarn (**heading 56.05**).
- (d) Milanaise and similar cords and other gimped textile products of **heading 58.08**.
- (e) Gimped metal wire, e.g. :
 - (i) Iron or steel wire for the manufacture of hat frames (milliners' wire) and stems of iron or steel wire for artificial flowers or hair curlers (**heading 72.17**).
 - (ii) Insulated electric wire (**heading 85.44**).

(B) CHENILLE YARN (INCLUDING FLOCK CHENILLE YARN)

Chenille yarn consists generally of two or more strands of textile yarn twisted together and gripping short ends of textile yarn that may be practically perpendicular to them; the strands are sometimes maintained in loops formed on a hosiery loom. In all cases, it looks like yarn tufted with pile threads throughout its length. It is usually manufactured directly on special looms (ring twister and Raschel knitting machines, for example) or by cutting up special leno fabric; in the latter process, after the fabric has been cut along either side of each group of warp threads, it is these warp threads (ground and crossing threads) which serve as support in the chenille yarn, and the weft which forms the pile.

The heading also covers chenille yarn obtained by fixing textile flock to a core of textile yarn. In this process the core yarn passes through a glue bath and subsequently through a chamber where the textile flock is fixed radially to the core under influence of a high-tension electrostatic field.

Chenille yarn is used, *inter alia*, in the manufacture of chenille fabrics (**heading 58.01**) or of numerous articles such as furnishings, bedding, carpets, trimmings, apparel.

(C) LOOP WALE-YARN

Loop wale-yarn is a tubular yarn made on a circular knitting machine and is 1.5 to 2 mm wide when pressed flat. This yarn is used for making fringes and other textile accessories and for making woven fabrics on conventional warp and weft looms.

56.07 - Twine, cordage, ropes and cables, whether or not plaited or braided and whether or not impregnated, coated, covered or sheathed with rubber or plastics (+).

- Of sisal or other textile fibres of the genus *Agave* :

5607.21 -- Binder or baler twine

5607.29 -- Other

- Of polyethylene or polypropylene :

5607.41 -- Binder or baler twine

5607.49 -- Other

5607.50 - Of other synthetic fibres

5607.90 - Other

This heading covers twine, cordage, ropes and cables, produced by twisting or by plaiting or braiding.

(1) Twine, cordage, ropes and cables, not plaited or braided.

Parts (I) (B) (1) and (2) (particularly the Table) of the General Explanatory Note to Section XI set out the circumstances in which single, multiple (folded) or cabled yarns are regarded as twine, cordage, ropes or cables of this heading.

Textile yarn reinforced with metal thread is always classified here and differs from metallised yarn of **heading 56.05** in that the metal strand is usually thicker and acts as a reinforcing agent only and not for any ornamental purpose.

This group also includes twine, cordage, ropes and cables obtained from fibrillating strip which has been more or less completely split into filaments by twisting.

(2) Plaited or braided twine, cordage, ropes and cables.

These are in all cases classified here regardless of their weight per metre. They are usually tubular braids which are generally made of coarser materials than the braids of heading 58.08. However, the plaited goods of this heading differ from those of heading 58.08 less by the nature of the yarn used than by the fact that they are tightly plaited, with a compact structure, making them suitable for use as twine, cordage, ropes or cables. In addition, they are usually uncoloured.

The most important fibres used in the manufacture of twine, cordage, ropes or cables are hemp, jute, sisal, cotton, coir and synthetic fibres.

Twine, cordage, ropes and cables of paper yarn are classified here **only** if plaited or reinforced with metal thread.

Twine, cordage, ropes and cables are used as binder twine, for tying packages, towing, loading, etc. Their cross-section is usually round but some (e.g., some transmission cables) have a square, trapezoidal or triangular section. They are normally unbleached, but may be dyed, impregnated to make them rot-proof, formed of different coloured strands, or impregnated, coated, covered or sheathed with rubber or plastics.

These products are classified here whether or not cut to length.

The heading **excludes** :

- (a) Fancy cords as used by confectioners, florists, etc., of **heading 56.05**.
- (b) Gimped yarn, chenille yarn and loop wale-yarn of **heading 56.06**.
- (c) Articles of **heading 56.09**.
- (d) Milanaise and similar cords and other gimped textile products of **heading 58.08**.
- (e) Cords, braids and the like, whether or not coated, impregnated or reinforced with metal, of a kind used in industry as packing or lubricating materials (**heading 59.11**).
- (f) Scrap twine, cordage, ropes and cables of **heading 63.10**.
- (g) Abrasive coated twine, cord, etc. (**heading 68.05**).
- (h) Articles for gymnastics (**heading 95.06**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheading 5607.21

This subheading covers single twine of sisal or other textile fibres of the genus *Agave* having a "Z" twist and a minimum twine breaking force calculated by means of the following formula :

$$R = \frac{17,400}{n} - 18$$

(R being the twine breaking force in dekanewtons (daN) and n being the runnage of twine in metres per kg.)

For example, the minimum breaking force for twine number 150 (150 m per kg) is 98 daN, for twine number 200 (200 m per kg) is 69 daN and for twine number 300 (300 m per kg) is 40 daN.

Subheading 5607.41

This subheading covers single twine of polyethylene or polypropylene, stabilised against degradation by sunlight, having a "Z" twist, and :

- (a) a minimum twine breaking force calculated by means of the following formula :

$$R = \frac{32,400}{n}$$

(R being the twine breaking force in dekanewtons (daN) and n being the runnage of the twine in metres per kg);

- (b) an average minimum knot breaking force calculated by means of the following formula :

$$R' = 0.58 R$$

(R' being the average knot breaking force in daN).

For example, a minimum twine breaking force of 98 daN and an average knot breaking force of 57 daN would apply for twine number 330 (330 m per kg).

56.08 - Knotted netting of twine, cordage or rope; made up fishing nets and other made up nets, of textile materials.

- Of man-made textile materials :

5608.11 -- Made up fishing nets

5608.19 -- Other

5608.90 - Other

(1) Knotted netting of twine, cordage or rope.

These products are simply lengths of netting, i.e., open mesh knotted fabric made either by hand or by machine. They differ from the net fabrics of heading 58.04 in that they are made of the twine, cordage or rope of heading 56.07.

(2) Made up fishing nets and other made up nets, of textile materials.

As distinct from the products referred to in paragraph (1) above, made up articles of this group may be made of yarn and the open mesh may be obtained by knotting or otherwise.

Made up nets are nets, whether or not ready for use, made directly to shape or assembled from pieces of netting. The presence of handles, rings, weights, floats, cords or other accessories does not affect the classification of the goods of this group.

Made up nets of this heading are **restricted** to those nets not covered more specifically by other headings of the Nomenclature. The heading includes fishing nets, camouflage nets, theatrical scenery nets, safety nets, net shopping bags and similar carrying nets (e.g., for tennis balls or footballs), hammocks, balloon or air-ship nets, nets for protection against insects, etc.

The products of this heading remain here even if impregnated (e.g., to preserve them against the weather, water).

The heading **does not cover** :

- (a) Netting in the piece produced by knitting or crochet work (**headings 60.02 to 60.06**).
- (b) Hair nets (**heading 65.05**).
- (c) Sports nets (e.g., goal nets and tennis nets), fish landing nets and other nets of **Chapter 95**.

56.09 - Articles of yarn, strip or the like of heading 54.04 or 54.05, twine, cordage, rope or cables, not elsewhere specified or included.

This heading covers articles of the yarns of Chapters 50 to 55, articles of strip or the like of heading 54.04 or 54.05, and also articles of twine, cordage, rope or cables of heading 56.07, **other than** those covered by a more specific heading in the Nomenclature.

It includes yarns, cordage, rope, etc., cut to length and looped at one or both ends, or fitted with tags, rings, hooks, etc., (e.g., shoe laces, clothes lines, towing ropes), ships' fenders, unloading cushions, rope ladders, loading slings, dish " cloths " made of a bundle of yarns folded in two and bound together at the folded end, etc.

The heading **does not cover** :

- (a) Bridles, reins, halters, harness, etc. (**heading 42.01**).
- (b) Cords cut to length, with knots, loops, or metal or glass eyelets, of a kind used on Jacquard or other machines (**heading 59.11**).
- (c) Textile fabrics and articles made from such fabrics, which are classified in their appropriate headings (e.g., shoe laces made from braids are classified in **heading 63.07**).
- (d) Rope soles for sandals (**heading 64.06**).
- (e) Articles for gymnastics and other articles of **Chapter 95**.

Chapter 57

Carpets and other textile floor coverings

Notes.

- 1.- For the purposes of this Chapter, the term " carpets and other textile floor coverings " means floor coverings in which textile materials serve as the exposed surface of the article when in use and includes articles having the characteristics of textile floor coverings but intended for use for other purposes.
- 2.- This Chapter does not cover floor covering underlays.

GENERAL

This Chapter covers carpets and other textile floor coverings in which textile materials serve as the exposed surface of the article when in use. It includes articles having the characteristics of textile floor coverings (e.g., thickness, stiffness and strength) but intended for use for other purposes (for example, as wall hangings or table covers or for other furnishing purposes).

The above products are classified in this Chapter whether made up (i.e., made directly to size, hemmed, lined, fringed, assembled, etc.), in the form of carpet squares, bedside rugs, hearth rugs, or in the form of carpeting for installation in rooms, corridors, passages or stairs, in the length for cutting and making up.

They may also be impregnated (e.g., with latex) or backed with woven or nonwoven fabrics or with cellular rubber or plastics.

The Chapter **does not cover** :

- (a) Floor covering underlays, i.e., coarse fabric or felt padding placed between the floor and the carpet (classified according to its constituent material).
- (b) Linoleum and other floor coverings consisting of a coating or covering applied on a textile backing (**heading 59.04**).

57.01 - Carpets and other textile floor coverings, knotted, whether or not made up.

5701.10 - Of wool or fine animal hair

5701.90 - Of other textile materials

Knotted carpets and other knotted textile floor coverings are composed of a taut warp around which the pile threads are knotted or twisted in a complete turn round at least one warp thread, the pile threads being kept in place by the insertion of tightly woven weft threads. This knotting or twisting characterises the articles of this heading.

The knots most commonly used are :

- (1) **Ghiordes or Turkish knot** : the pile thread is placed over two adjacent warp threads and its two ends brought back between these two threads so as to make a complete turn round them (see Figure 1), the two ends standing up to form the surface of the carpet.

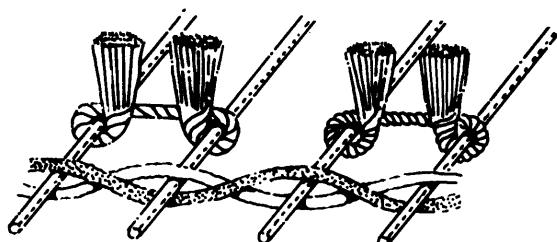

Fig. 1

- (2) **Senna or Persian knot** : the pile thread is twisted round one warp thread and then passed under a following warp thread (see Figure 2), the two ends standing up to form the surface of the carpet.

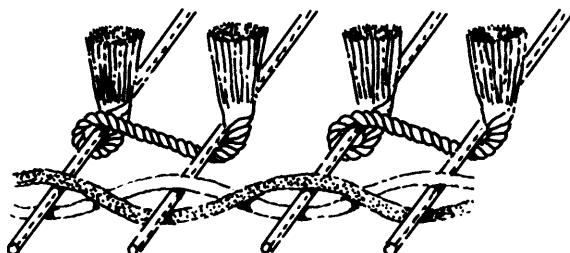

Fig. 2

In the Ghiordes and Senna knots the pile threads may also cover four warp threads.

- (3) **Single warp knots** in which each pile thread is twisted or knotted on to one warp thread; each pile thread makes one and a half turns round a warp thread (see Figure 3), the two ends standing up to form the surface of the carpet.

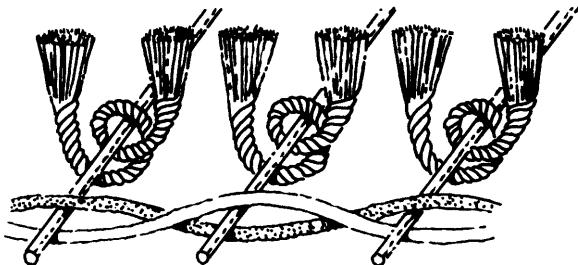

Fig. 3

There is thus a series of such knots, adjacent but completely independent of each other, over the whole width of the carpet thus covering the ground fabric.

The heading also includes certain carpets made by knotting pile threads on to a loosely woven backing.

Most knotted carpets, carpeting and rugs are hand made to size ready for use, with different coloured pile threads forming a pattern. They are, however, also made on mechanical looms and are then generally of more even texture and the selvedges are more parallel than in the case of those hand made. The pile threads are usually of wool or silk but sometimes of mohair or Kashmir (cashmere) goat hair. The ground fabric is generally of cotton, wool or hair in the case of hand-made carpets, and of cotton, flax, hemp or jute in the case of machine-made carpets.

The products of this heading are normally used for floor covering but are also sometimes used otherwise for furnishings (e.g., as wall hangings or table covers) (see General Explanatory Note to this Chapter).

These carpets remain classified here if they are edged with fringes (produced during weaving or added subsequently) or if they are otherwise finished for use.

These products are mainly of Oriental origin (Iran, Turkey, Turkestan, Afghanistan, Pakistan, China, India), or from North Africa (Algeria, Tunisia, Morocco, Egypt).

The heading **excludes** carpets in which the pile threads are simply looped under the warp threads without making a turn round them (see Figures 4 and 5 below) (**heading 57.02**).

57.02 - Carpets and other textile floor coverings, woven, not tufted or flocked, whether or not made up, including "Kelem", "Schumacks", "Karamanie" and similar hand-woven rugs.

5702.10 - "Kelem", "Schumacks", "Karamanie" and similar hand-woven rugs

5702.20 - Floor coverings of coconut fibres (coir)

- Other, of pile construction, not made up :

5702.31 -- Of wool or fine animal hair

5702.32 -- Of man-made textile materials

5702.39 -- Of other textile materials

- Other, of pile construction, made up :

5702.41 -- Of wool or fine animal hair

5702.42 -- Of man-made textile materials

5702.49 -- Of other textile materials

5702.50 - Other, not of pile construction, not made up

- Other, not of pile construction, made up :

5702.91 -- Of wool or fine animal hair

5702.92 -- Of man-made textile materials

5702.99 -- Of other textile materials

The carpets and other textile floor coverings of this heading include :

- (1) **Wilton and similar carpets.** These have a strong, heavy ground fabric covered by a pile surface (i.e., a right side formed by adjacent threads or tufts standing upright) or by a looped surface.

The surface of these carpets is formed by additional warp threads which are made to form loops on the right side of the fabric during the weaving process by the temporary insertion of metal rods or wires. When these loops are cut the result is a pile carpet (such as a Wilton, see Figure 4); in this type the pile is simply looped under the weft threads. If, on the contrary, the loops are left uncut, the resulting carpets have a looped pile, such as a Brussels carpet (see Figures 4 and 5).

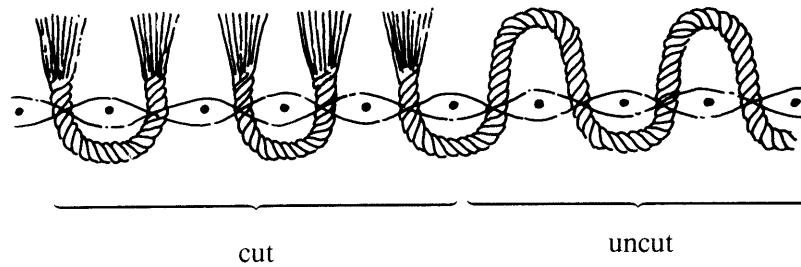

Fig. 4

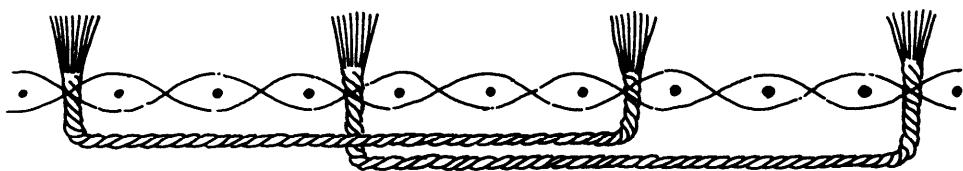

Fig. 5

These carpets may be plain or patterned, the pattern being woven on a loom (e.g., Jacquard loom) specially equipped so as to be able to produce a design obtained by the use of two to five different coloured yarns.

Wilton carpets are also produced by weaving two fabrics with a common pile thread which is cut after weaving to form two pile carpets (face-to-face Wilton).

The pile yarn is usually of wool or a wool/nylon mixture, but it may also be of cotton, polyamide, acrylic, viscose or a blend of these fibres. The ground fabric is usually of cotton, jute or polypropylene.

- (2) **Axminster carpets.** These are machine-woven carpets in which successive weft-wise rows of pile are inserted during weaving according to a predetermined arrangement of colours.
- (3) **Chenille carpets.** The principal characteristic of these is that their pile surface is produced by the use of chenille yarns (see Explanatory Note to heading 56.06). These yarns may be used as an additional weft woven in the normal way; in some cases short pieces of chenille yarn are inserted as an extra discontinuous warp held in place by the ground fabric.
- (4) **Flat weave carpets** which have no loops or pile but can be distinguished from the textile fabrics of Chapters 50 to 55 in that, being heavy and strong, they are clearly intended for use as floor coverings.

These include Kidderminster or so-called "Belgian" carpets which are double fabrics, the design being produced by the interchange at intervals of the two fabrics. Apart from these relatively fine house carpets, the heading also covers coarse carpets or carpeting (such as drugget) of jute, coir, hair, paper yarns, etc. (usually plain, twill or chevron weaves), and rag carpets with a warp of jute yarn and a weft made of strips of waste fabric tied end to end.

- (5) **Door mats and matting.** These are essentially composed of rigid tufts, usually of coconut fibre or sisal, simply looped under the warp threads of the ground fabric; they are produced in small sizes appropriate for their intended uses.

(6) **Terry towelling or similar bath-mats.**

It should be noted that certain carpets are obtained in a way similar to many pile or chenille fabrics of **heading 58.01**, but being essentially intended as floor coverings, they are distinguished by their solidity, by the coarseness of the materials used in their manufacture or by the stiffness of the ground fabric, which generally has an additional warp (stuffer).

- (7) **"Kelem", "Schumacks", "Karamanie" and similar hand-woven rugs.** Kelem (or Khilim), also called Karamanie, is obtained by the same method of manufacture as the hand-woven tapestries described in the Explanatory Note to heading 58.05, Part (A). Its texture is, therefore, comparable to that of the above-mentioned tapestries and generally the same gaps are to be found with the line of the warp. Nevertheless, as far as the pattern is concerned, Kelem generally has no flowers or foliage, but mostly rectilinear designs. Although the front may be distinguished from the reverse, the difference is so slight that both sides may be used.

Kelem is sometimes made up of two long strips sewn together, the design being worked in such a way as to conceal the stitching. That is why it has a border (woven ends) only on its short edges or even none at all. This clearly does not exclude added borders.

Generally, the warp is woollen and the weft is wool or cotton.

The heading also covers items manufactured according to Kelem techniques (in central Europe in particular) which are patterned with decorative designs of the same type as those of the light, oriental Kelem.

Schumacks is woven in the same way as Kelem but differs from the latter in the following ways :

- as soon as one or two weft lines forming the pattern are completely finished, a supplementary weft thread is inserted throughout the width of the piece, which prevents gaps in the warp;
- as regards the pattern, the background is usually decorated with three to five flat multicoloured stars which look like medallions; the border generally consists of one wide main band and from two to three secondary bands. The reverse side has a hairy appearance caused by the ends, several centimetres in length, which remain after the weft threads have been broken off.

The weft of Schumacks is woollen while the warp may be woollen or cotton, or even goat hair.

The similar carpets include in particular Sileh which is manufactured in a similar way to Schumacks. The pattern of Sileh is basically made up of S-shaped motifs either the right way round or back to front, and animal figure motifs dotted across the whole of the surface. The warp and the weft of the Sileh are woollen (the warp is, in rare cases, of cotton).

The heading **excludes** mats and matting of plaiting materials (**Chapter 46**).

57.03 - Carpets and other textile floor coverings, tufted, whether or not made up.

- 5703.10 - Of wool or fine animal hair
- 5703.20 - Of nylon or other polyamides
- 5703.30 - Of other man-made textile materials
- 5703.90 - Of other textile materials

This heading covers tufted carpets and other tufted textile floor coverings produced on tufting machines which, by means of a system of needles and hooks, insert textile yarn into a pre-existing backing (usually a woven fabric or a nonwoven) thus producing loops, or, if the needles and hooks are combined with a cutting device, tufts. The yarns forming the pile are then normally fixed by a coating of rubber or plastics. Usually before the coating is allowed to dry it is either covered by a secondary backing of loosely woven textile material, e.g., jute, or by foamed rubber.

The heading also covers tufted carpets and other tufted textile floor coverings made using a tufting gun or made by hand.

Products of this heading are distinguished from the tufted textile fabrics of heading 58.02 by, for example, their stiffness, thickness and strength, which render them suitable for use as floor coverings.

57.04 - Carpets and other textile floor coverings, of felt, not tufted or flocked, whether or not made up.

5704.10 - Tiles, having a maximum surface area of 0.3 m²

5704.20 - Tiles, having a maximum surface area exceeding 0.3 m² but not exceeding 1 m²

5704.90 - Other

This heading covers carpets and other textile floor coverings, of felt. For the meaning of the term "felt", see the Explanatory Note to heading 56.02.

The heading includes :

- (1) Tiles, usually of felt of wool or other animal hair.
- (2) Textile floor coverings of needleloom felt, generally backed or impregnated on the underside with rubber or plastics in order to strengthen the products or give them anti-slip properties.

57.05 - Other carpets and other textile floor coverings, whether or not made up.

This heading covers carpets and textile floor coverings, **other than** those covered by a more specific heading of this Chapter.

The heading includes :

- (1) Bonded pile carpets, where the pile use surface is bonded either to a substrate or directly to an adhesive which forms the substrate. The bonding may be achieved by adhesion or heat or a combination of both or by ultrasonic welding. The pile can be bonded either to a single backing surface or between two backing surfaces, in the latter case for separation into two carpets.
 - (2) Nonwoven carpets, consisting of a layer of carded textile fibres crimped between grooved rollers to form loops, which may either be held in position by a thick coating of rubber, plastics, etc., which also serves as a backing, or be bonded to a backing fabric by similar adhesives.
 - (3) Carpets made by "flocking", i.e., by implanting textile fibres upright in a textile backing, coated with rubber, plastics, etc.
 - (4) Knitted carpets and carpeting. These generally have the appearance of moquette or, sometimes, of furskins.
-

Chapter 58

Special woven fabrics; tufted textile fabrics; lace; tapestries; trimmings; embroidery

Notes.

- 1.- This Chapter does not apply to textile fabrics referred to in Note 1 to Chapter 59, impregnated, coated, covered or laminated, or to other goods of Chapter 59.
- 2.- Heading 58.01 also includes woven weft pile fabrics which have not yet had the floats cut, at which stage they have no pile standing up.
- 3.- For the purposes of heading 58.03, “gauze” means a fabric with a warp composed wholly or in part of standing or ground threads and crossing or doup threads which cross the standing or ground threads making a half turn, a complete turn or more to form loops through which weft threads pass.
- 4.- Heading 58.04 does not apply to knotted net fabrics of twine, cordage or rope, of heading 56.08.
- 5.- For the purposes of heading 58.06, the expression “narrow woven fabrics” means :
 - (a) Woven fabrics of a width not exceeding 30 cm, whether woven as such or cut from wider pieces, provided with selvedges (woven, gummed or otherwise made) on both edges;
 - (b) Tubular woven fabrics of a flattened width not exceeding 30 cm; and
 - (c) Bias binding with folded edges, of a width when unfolded not exceeding 30 cm.
- Narrow woven fabrics with woven fringes are to be classified in heading 58.08.
- 6.- In heading 58.10, the expression “embroidery” means, *inter alia*, embroidery with metal or glass thread on a visible ground of textile fabric, and sewn appliquéd work of sequins, beads or ornamental motifs of textile or other materials. The heading does not apply to needlework tapestry (heading 58.05).
- 7.- In addition to the products of heading 58.09, this Chapter also includes articles made of metal thread and of a kind used in apparel, as furnishing fabrics or for similar purposes.

GENERAL

Except for **heading 58.09**, this Chapter covers a wide variety of textile products whose classification at heading level is independent of their constituent textile materials. Some of these products fall in this Chapter only if they are not “made up” in the sense of Part (II) of the General Explanatory Note to Section XI, but others are included whether or not made up.

It should be noted that, subject to the Notes of Chapter 59, gauze of heading 58.03, narrow woven fabrics of heading 58.06 and braids and ornamental trimmings in the piece of heading 58.08, impregnated, coated, covered or laminated, are **excluded** from Chapter 58 (usually **Chapter 39, 40 or 59**), whereas the other articles of this Chapter which have undergone the same treatments remain classified here, **provided** they have not thereby assumed the character of products of Chapter 39 or 40.

58.01 - Woven pile fabrics and chenille fabrics, other than fabrics of heading 58.02 or 58.06 (+).

5801.10 - Of wool or fine animal hair

- Of cotton :

5801.21 -- Uncut weft pile fabrics

5801.22 -- Cut corduroy

5801.23 -- Other weft pile fabrics

5801.26 -- Chenille fabrics

5801.27 -- Warp pile fabrics

- Of man-made fibres :

5801.31 -- Uncut weft pile fabrics

5801.32 -- Cut corduroy

5801.33 -- Other weft pile fabrics

5801.36 -- Chenille fabrics

5801.37 -- Warp pile fabrics

5801.90 - Of other textile materials

(A) WOVEN PILE FABRICS, OTHER THAN FABRICS OF HEADING 58.02

Woven pile fabrics are composed of at least three series of threads : tight warp and weft forming the ground fabric and a warp or weft forming a pile. This pile consists of either tufts or loops over the whole or part of the surface; it is generally on one side only, but sometimes on both.

Warp pile fabrics (velvets, pluses, moquettes, etc.) may be produced by raising the pile warp over wires inserted in the direction of the west. The loops thus formed are cut either during the weaving or subsequently, or occasionally left uncut for looped or uncut pile fabrics. The loops or tufts of cut pile are held in place by the weft threads.

Warp pile fabrics are also produced by weaving two fabrics face to face with a common pile warp; the two fabrics are then separated by cutting to produce two fabrics with a cut pile.

Cut weft pile fabrics (velveteens, corduroys, etc.) have a pile usually produced by weft threads which alternately pass under the warp and then float on the surface over two or more warp threads. After weaving, the portions floating on the surface are cut, the cut ends standing up to form the pile. A similar result is obtained by inserting wire parallel to the warp, the weft pile being cut during weaving. The tufts of pile are thus held in place by the warp threads.

Weft pile fabrics which have not yet had the floats cut, at which stage they have no pile standing up, are included in this heading (see Chapter Note 2).

(B) CHENILLE FABRICS

Chenille fabrics are very similar to the chenille carpets of heading 57.02; like these, their pile surface (usually on both sides) is produced by chenille yarns. They are generally manufactured by means of an additional weft of chenille yarn or by inserting chenille yarn, in different lengths and colours, into the warp during weaving of the ground fabric.

*
* * *

Pile fabrics and chenille fabrics are made of various materials but silk, wool, fine animal hair, cotton and man-made fibres are most commonly used for the pile.

All these fabrics may be plain, ribbed or figured or may be embossed after weaving; figured pile fabrics include those with a surface only partly covered with pile, or with a surface of partly cut or partly looped pile (ciselé velvets) thus producing very varied designs. Woven pile fabrics imitating furskins (e.g., astrakhan, caracul or imitation leopard skins) are also classified here, but imitation furskins made, for example, by sewing or gumming in the pile are **excluded (heading 43.04)**.

It should be noted that many of the fabrics of this heading are manufactured in the same way as the carpets of heading 57.02; they are, however, easily distinguished from carpets by the fact that, being designed primarily as furnishing or clothing fabrics and not as floor coverings, they are made with finer materials and have a much more supple ground fabric.

The heading **does not cover** :

- (a) Bouclé fabrics, ratines and other fabrics which present an appearance similar to pile fabrics, but which are woven with special yarn (e.g., bouclé yarn) or produced by treatment (e.g., scraping or teasing) of normal woven fabrics (in general **Chapters 50 to 55**).
- (b) Terry towelling and similar woven terry fabrics and tufted textile fabrics of **heading 58.02**.
- (c) Pile, etc., fabrics within the definition of narrow woven fabrics (**heading 58.06**).
- (d) Knitted fabrics or stitch-bonded goods with a cut or looped pile surface (**heading 60.01** or **56.02**, as the case may be).
- (e) Pile, etc., fabrics made up within the meaning of Part (II) of the General Explanatory Note to Section XI.

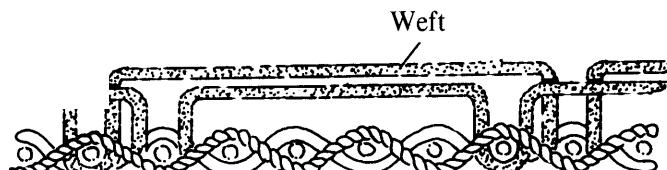

○

Subheading Explanatory Note.

Subheadings 5801.22 and 5801.32

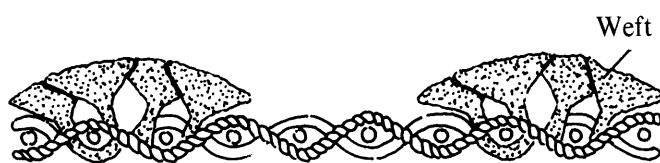

For the purposes of subheadings 5801.22 and 5801.32, the following illustrations of the section through the warp should be used to distinguish cut corduroy from other cut weft pile fabrics:

Corduroy :

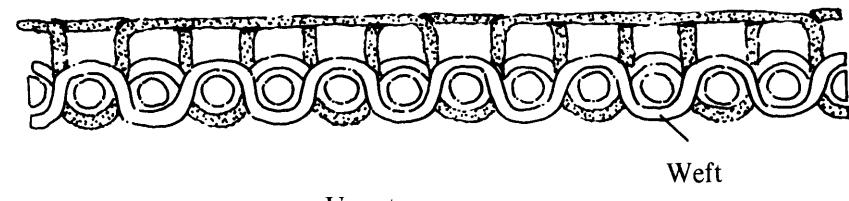

Uncut

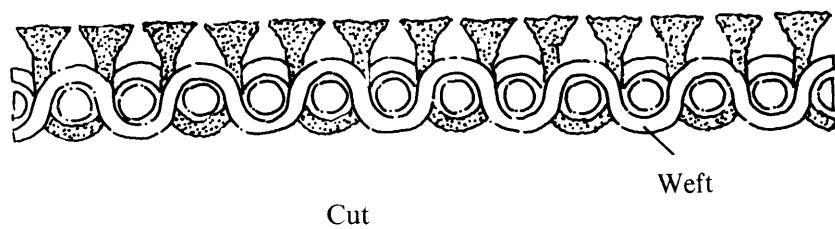

Velveteen :

Cut

Uncut

Cut

58.02 - Terry towelling and similar woven terry fabrics, other than narrow fabrics of heading 58.06; tufted textile fabrics, other than products of heading 57.03.

- Terry towelling and similar woven terry fabrics, of cotton :

5802.11 -- Unbleached

5802.19 -- Other

5802.20 - Terry towelling and similar woven terry fabrics, of other textile materials

5802.30 - Tufted textile fabrics

(A) TERRY TOWELLING AND SIMILAR WOVEN TERRY FABRICS

These fabrics are those looped pile fabrics such as are used for towelling, bathrobes, beachrobes, leisure robes, toilet gloves, etc. They have a tight weft and two series of warp threads, one tight and one slack, the latter forming loops on the surface of the fabric. The proportion of the two kinds of warp threads in the fabric may differ, but usually there are the same number of ground warp threads as of pile warp threads.

The loops often appear twisted and are generally produced on both sides of the cloth, but sometimes on one only; they may sometimes be cut. The loops may cover the entire surface uniformly or form stripes, checks, diamonds or more complicated patterns. However this heading **does not cover** fabrics having pile on one side only, all of the loops of which are cut (**heading 58.01**).

The heading also **excludes** :

- (a) Terry fabrics, knitted or crocheted (**heading 60.01**).
- (b) Fabric in the piece which, by the simple process of cutting along defined lines indicated by the absence of weft threads, may be converted into separate fringed articles (**heading 63.02**).

(B) TUFTED TEXTILE FABRICS

These fabrics are made by inserting yarns, by means of a system of needles and hooks, into a pre-existing textile ground fabric (woven, knitted or crocheted, felt, nonwoven, etc.) so as to form loops or, if the hooks are combined with a cutting device, tufts of cut pile.

Products of this heading are distinguished from the tufted carpets and floor coverings of heading 57.03 by, for example, their lack of stiffness, thickness and strength which renders them unsuitable for use as floor coverings.

Furthermore, these fabrics can be distinguished from the pile fabrics of heading 60.01, which have rows of chain stitches on the back of the fabric, by their characteristic rows of stitches having the appearance of running stitches along the length of the back of the fabric.

58.03 - Gauze, other than narrow fabrics of heading 58.06.

Gauze (sometimes known as leno weave) is defined in Note 3 to this Chapter.

In plain gauze the crossing threads run alternately to the right and left of each standing thread passing over the weft every time but crossing under the standing threads; the standing warp threads are always on one side of the weft, and the standing warp and the weft are not interlaced but are held together by the crossing warp.

Variations can be obtained by the crossing threads crossing with each other (so-called crocheted gauze, Marly gauze), by inserting two or more weft threads together through the loops formed by the standing and crossing threads, by using two or more standing threads per crossing thread and *vice versa*, etc.

This heading also includes :

- (1) Broch  gauze, manufactured with an extra thread (broch  thread) introduced during the weaving process to give the effect of designs on a gauze background.
- (2) Fabrics comprising parts of gauze and parts woven by any other weave whatever their relative proportions. These usually have the effect of stripes running warpwise, checks or other varied designs.

Gauze is usually loosely woven and therefore lightweight; it is chiefly used for curtaining; certain varieties are manufactured into chenille yarn by cutting into narrow strips in the direction of the warp.

The different types of gauze vary greatly in appearance, and the designs produced during the weaving process are also very varied, and they should not be confused with the broch  or other fabrics of **Chapters 50 to 55**, hand or machine made lace, embroidery, tulle or other net fabrics of this Chapter.

The heading **does not apply** to plain loosely woven fabrics of plain weave, such as those chiefly used for bandages and dressings; these are often called gauze but fall in **heading 30.05** (if medicated or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes) or **Chapters 50 to 55**.

The heading also **excludes** bolting cloth (**heading 59.11**).

58.04 - Tulles and other net fabrics, not including woven, knitted or crocheted fabrics; lace in the piece, in strips or in motifs, other than fabrics of headings 60.02 to 60.06 (+).

5804.10 - Tulles and other net fabrics

- Mechanically made lace :

5804.21 - - Of man-made fibres

5804.29 - - Of other textile materials

5804.30 - Hand-made lace

(I) TULLES AND OTHER NET FABRICS

These products are used for making curtains, bedspreads or similar household furnishings, veils, ladies' garments, in embroidery, etc. They are generally of silk, man-made fibres, cotton or linen.

(A) **Tulle and other bobbin-net fabrics** consist of warp threads with weft threads which twist round each warp thread and run diagonally from selvedge to selvedge, half the weft being inclined in one direction and the other half inclined in the other direction (see Figure 1). These wefts form an open mesh with the warp; the meshes may be in regular hexagonal form, square, or diamond-shaped (Neuville net). Another variety of tulle in hexagonal form (Mechlin net) consists of warp threads and a system of bobbin threads which pass longitudinally between two warp threads only (see Figure 2).

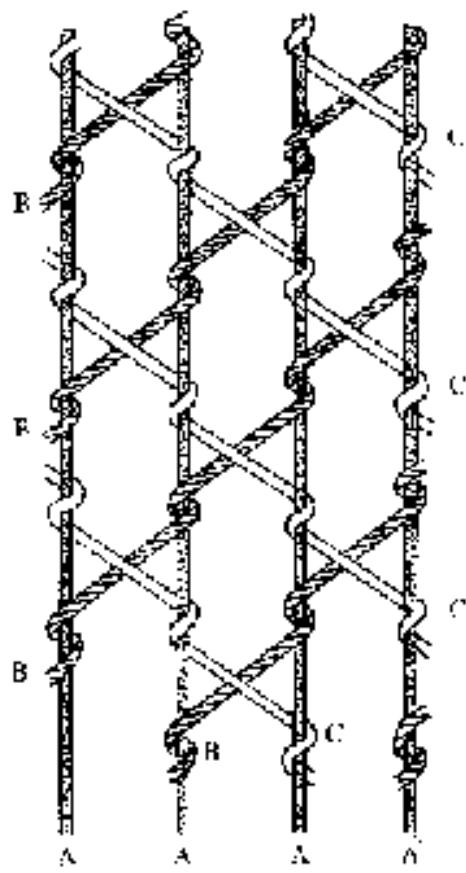

Fig. 1
TULLE

A - Warp threads
B and C - Oblique weft threads

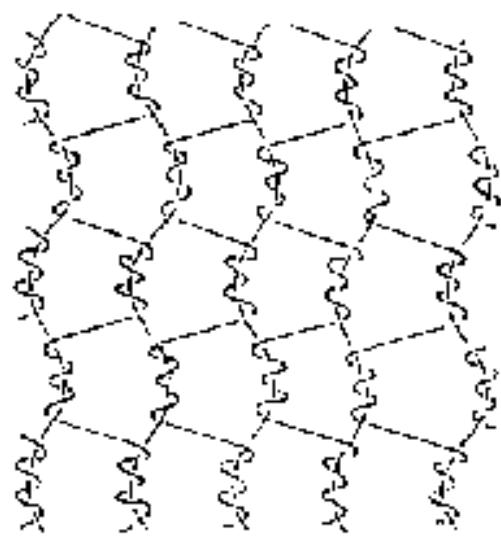

Fig. 2
MECHELIN NET

- (B) **Tulle bobinot** is a special tulle composed of three series of threads : certain straight parallel warp threads as in ordinary tulle, pattern threads (so called because they produce the pattern) running alternately alongside the straight threads and temporarily away from them to another (usually adjacent) straight thread, thus producing triangular meshes interspersed with spaces of trapezoid or other form, and crossing threads which twist round the straight warp and bind the pattern threads to it (see Figure 3). Opaque parts in the design are produced by grouping together closely a number of such triangular meshes.

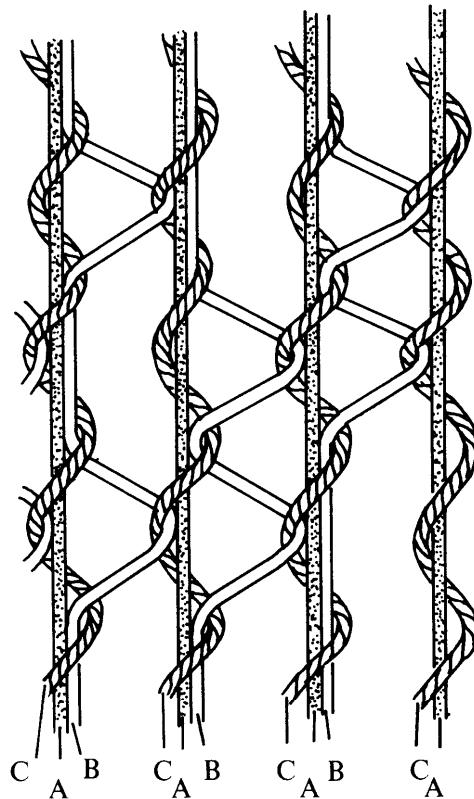

Fig. 3
TULLE BOBINOT.
A - Warp thread.
B - Pattern thread.
C - Crossing thread.

- (C) **Net fabrics** have three series of threads : parallel warp threads, mesh threads and binding threads (e.g., filet net). Each mesh thread runs alternately alongside different warps forming square meshes as it passes from one to the other. The binding threads hold the fabric together by binding the mesh threads to the warp threads in certain places (see Figure 4).

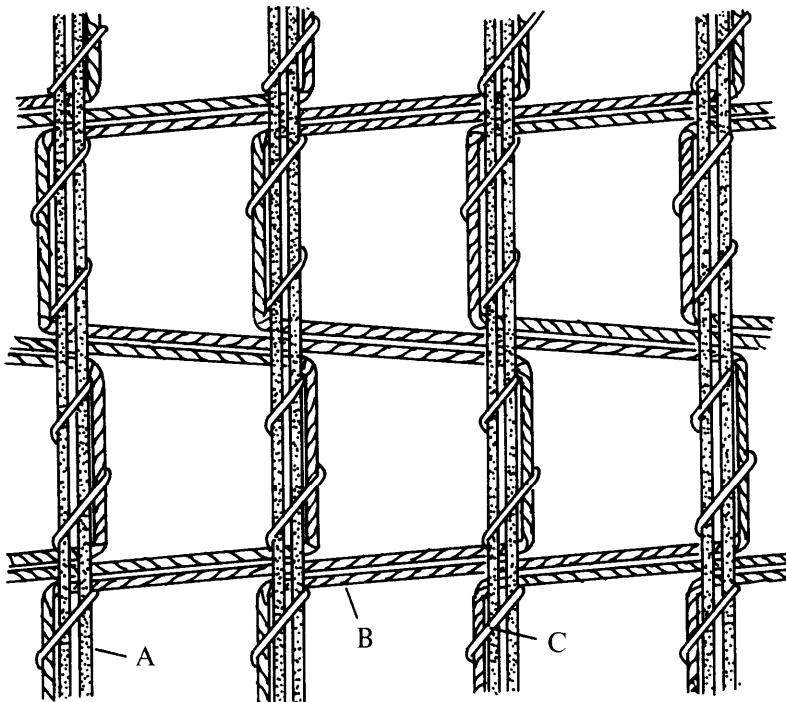

Fig. 4
PLAIN FILET NET.

A - Warp thread.
B - Mesh thread.
C - Binding thread.

- (D) **Knotted net fabrics** have a uniform square or diamond shaped mesh knotted at each corner so that the threads cannot be pulled apart. They may be hand or machine made.

The heading **does not include** :

- (a) Loosely woven fabrics of **Chapters 50 to 55**, and gauze of **heading 58.03**.
- (b) Nets or netting of **heading 56.08**.
- (c) Bolting cloth (**heading 59.11**).

- (d) Knitted or crocheted fabrics of **Chapter 60**.
- (e) Tulle and other net fabrics made up as indicated in Part (II) of the General Explanatory Note to Section XI.

(II) LACE

Lace is an ornamental or decorative openwork fabric in which design elements (more or less intricate) formed by the intertwining of threads are joined either by meshes, usually of regular size and shape, forming an apparent openwork ground fabric, or by ornamental links (brides) which themselves give pattern effects. The design elements and background of mesh or brides are usually produced simultaneously but sometimes the design elements are made separately and assembled afterwards.

It is an essential characteristic of lace that the design element is not worked on a **pre-existing** ground. For the purposes of this heading the term therefore **does not extend** to products of similar appearance and, indeed, sometimes known as lace (e.g. filet lace), made by filling in or decorating the meshes of a pre-existent ground of tulle or net, or by sewn appliquéd work on a ground, whether or not the ground is subsequently wholly or partly removed. Such products are classified as embroidery in **heading 58.10**, as are also true laces which have been subsequently embroidered, and encrusted lace produced by sewn appliquéd work.

The heading also **excludes** openwork products of any kind produced by knitting by hand or machine (**Chapter 60**); these can be recognised usually by the characteristic knitting stitch, particularly at the solid parts.

Unlike tulles, gauzes or other loosely woven fabrics, lace does not have distinct warp and weft. It is often executed with a single thread and when more than one thread is used it fulfils the same function.

Lace may be made by hand or machine.

The principal classes of **hand-made** lace are :

- (A) **Needlepoint lace**, executed with a needle on a sheet of paper or parchment bearing the design. The lace follows the outline of the pattern, its component threads lying on the paper but not piercing it; the frame threads, i.e., those forming the initial skeleton of the lace are temporarily attached to the pattern by crossing stitches in order to facilitate the work.

Needlepoint lace includes Alençon, Argentan, Venetian, etc.

- (B) **Bobbin lace** (pillow lace) worked with several threads wound on bobbins and twisted together on a "pillow" or "cushion" on which the pattern is fastened and in which are temporarily inserted pins to facilitate production of the lace.

Bobbin or pillow laces include Valenciennes, Chantilly, Malines, Bruges, Duchesse, Puy, etc.

- (C) **Crochet lace** (e.g., that known as Irish crochet lace). Unlike the varieties described above, crochet lace is not laid on a design or support when being made; it is made by hand with a crochet hook.
- (D) **Various other kinds of lace**, more or less resembling the other varieties, e.g. :
 - (1) **Teneriffe lace**, made in the same manner as needlepoint lace.
 - (2) **Lacet work**, needlepoint lace in which certain parts are obtained by the use of lacet braid; made on a pillow or mechanically.
 - (3) **Tatting lace**, similar to crochet lace but with round designs and knotted by means of a shuttle.
 - (4) **Macramé lace**, a heavy lace made by knotting in various ways a series of threads fixed at right angles to a leading thread.

Machine-made lace is similar to hand-made lace in general appearance but, except in the case of bobbin laces, the method of interlacing the threads is different and machine-made lace is more uniform than hand-made.

Hand or machine made lace is classified here whether :

- (i) **In the piece or in strips of any length.**
- or (ii) **In the form of motifs**, i.e., individual pieces designed solely to be incorporated in, or appliqued on, other articles such as nightdresses, slips, blouses or other articles of apparel, handkerchiefs, table cloths or other furnishings.

These goods are classified in this heading whether made directly in one piece by the lace maker, or cut from larger pieces or assembled from several separate lace elements.

The heading **does not cover** articles of lace; these are classified according to their character, generally in **Chapter 62 or 63** (e.g., lace mantillas in **heading 62.14**, lace yokes and collars for women's garments in **heading 62.17**, and lace table mats in **heading 63.04**).

Subheading Explanatory Note.

Subheadings 5804.21, 5804.29 and 5804.30

Mechanically made imitations of hand-made lace, are similar in general appearance to hand-made lace but can be distinguished on the basis of the following criteria :

Mechanically made lace is often produced in fairly wide pieces which are cut into strips during the finishing process. In this case, the lace edges of the cut strips nearly always retain the stitches or parts of stitches from the openwork fabric which joined one strip to the next on the loom. These stitches or parts of stitches are found on the outside of the lace. They are usually seen where the line on the edge forms a recessed angle, i.e., where it is difficult to reach them without at the same time destroying the edge itself. The presence of these stitches or parts of stitches is a clear indication that the lace is mechanically made.

A distinction can also be made by examination of the decorative motifs of the lace, the flow of the relief (or contour) threads and of the filling-in threads. In hand-made lace, these threads can run in any direction and may in fact be returned to their original direction. In mechanically made lace, such reverse stitching is not possible; these threads can therefore slant to the right or to the left, but they must follow the progressive direction of the work.

The method of filling in the opaque parts of the design is a third factor to be borne in mind in distinguishing between hand-made lace and mechanically made lace. In hand-made lace, only the following are used :

- the lock-stitch, i.e., the scallop stitch or buttonhole stitch if it is needlepoint lace
- the cloth or gate stitch if it is bobbin lace.

The cloth stitch reproduces exactly the plain weave. In a gate stitch, the threads serve as warp threads and are divided into two superimposed series which between them form an angle of approximately 90°; the weft thread passes across this surface, passing alternately on top of one thread of the first series (top series) and under the thread(s) of the second series immediately following.

In mechanically made lace, the most widely used methods of filling are as follows :

- the cloth stitch, but with one peculiarity in that the threads which form the weft do not necessarily run from one edge of the design to the other. In some cases, they run only part of the way across and another thread meets the first to complete the section;
- a method of mounting similar to that used in obtaining the full parts in tulle bobinot (straight threads, pattern threads, tie threads);
- inserting through the net, a thread which forms with the warp threads a plain weave. In the above two procedures, the net ends at the point where the design begins, but this is not so in this case.

The following considerations can also help to distinguish hand-made lace from mechanically made lace. Indeed, in some cases such considerations provide the only means by which a distinction can be made, particularly when distinguishing between hand-made bobbin lace and mechanically made bobbin lace :

- (a) Small faults or imperfections found in hand-made lace are irregularly spaced and are rarely similar in appearance, whereas in mechanically made lace they are repeated regularly, due to the action of the mechanical device used in their manufacture.
- (b) The picot loops which often trim the edges of hand-made lace are always formed by the threads which make up the net, whereas they are sometimes added to mechanically made lace. In such cases they are much less firmly attached and can be pulled away without destroying the lace itself. This is not possible with hand-made lace.
- (c) The method of dispatch and packing is also a means of distinguishing hand-made lace from mechanically made lace. Hand-made lace is not usually dispatched in lengths greater than 20 metres, and each piece in a consignment is generally of a different pattern. Mechanically made lace is always longer and may be as much as 500 metres in length; such consignments always include a considerable number of pieces of the same pattern.

In addition there is "mixed" lace, known as lacet lace, renaissance lace, Luxeuil lace and princess lace. The manufacture of such lace begins from a lacet (braid) obtained mechanically, which is laid flat on a tracing and follows the lines of the design. At the angles the braid is folded again so as to follow the tracing; the parts which overlap are sewn together; the ends of the cut braids are delicately sewn into place. The loops and filling-in stitches are then made with the needle.

In addition to the fact that the braid has been folded over, cut, and sewn as described above, such lace may sometimes be recognised by the gathers in the braid on the concave edges of the design.

This lace is regarded as hand-made lace.

58.05 - Hand-woven tapestries of the type Gobelins, Flanders, Aubusson, Beauvais and the like, and needle-worked tapestries (for example, petit point, cross stitch), whether or not made up.

This heading covers tapestries either woven by hand or needle-worked on a ground fabric (usually canvas). Their essential characteristic is that they are made in the form of panels bearing a complete, individual design, frequently of a pictorial character.

(A) HAND-WOVEN TAPESTRIES

Hand-woven tapestries are produced by stretching warp threads on a weaving loom and interlacing weft threads of different colours which cover the warp, produce the designs and also form the woven fabric.

Contrary to the procedure used for ordinary warp and weft fabrics the different coloured weft threads are no longer than are needed to produce the design, so that in general these weft threads do not cross the whole width of the fabric; thus along each line of weft the warp threads are covered by a succession of different coloured weft threads, the loose ends of the weft threads appearing on the reverse of the design. Unwoven gaps left in the warp through this method of weaving are usually reinforced by sewing.

Such tapestries include the types Gobelins, Flanders, Aubusson or Beauvais.

Tapestries produced by machine (on a Jacquard or similar loom) in imitation of these hand-woven tapestries are normal warp and weft fabrics in which the coloured weft threads run from one selvedge to the other, and are classified as **woven fabrics** in their relative headings or as **made up articles** as the case may be.

(B) NEEDLE-WORKED TAPESTRIES

Needle-worked tapestries (also known as point tapestries) are characterised by the fact that they are made with a fabric ground (usually square meshed canvas), on which the desired design is filled in by needle-work using a great many different coloured threads.

Needle-worked tapestries are sometimes over-worked with further stitches but remain in this heading and are **not** regarded as embroidery.

Contrary to the case of most embroideries of **heading 58.10**, the ground fabric (usually canvas) is completely covered except perhaps at the edges. The stitches used are differently named according to the way in which they are executed : petit point, gros point, cross stitch, double cross stitch, Gobelins stitch, etc.

*
* * *

Tapestries are used mainly for furnishing purposes, as wall coverings or for upholstering chairs, etc., and are usually made of silk, wool, man-made fibres or even metallised yarn.

They remain in this heading even if hemmed, bordered, lined, etc., but if made up into articles such as evening handbags, cushions, slippers, etc., they are, of course, **excluded**.

The heading also **excludes** :

- (a) Kelem, Schumacks, Karamanie and similar rugs (**heading 57.02**).
- (b) Sets consisting of woven fabric and yarn for making up into tapestries (**heading 63.08**).
- (c) Tapestries of an age exceeding one hundred years (**Chapter 97**).

58.06 - Narrow woven fabrics, other than goods of heading 58.07; narrow fabrics consisting of warp without weft assembled by means of an adhesive (bolducs).

5806.10 - Woven pile fabrics (including terry towelling and similar terry fabrics) and chenille fabrics

5806.20 - Other woven fabrics, containing by weight 5 % or more of elastomeric yarn or rubber thread

- Other woven fabrics :

5806.31 -- Of cotton

5806.32 -- Of man-made fibres

5806.39 -- Of other textile materials

5806.40 - Fabrics consisting of warp without weft assembled by means of an adhesive (bolducs)

(A) NARROW WOVEN FABRICS

In accordance with Note 5 to this Chapter, this heading includes as **narrow woven fabrics** :

- (1) Warp and weft fabrics in strips of a width not exceeding 30 cm, provided with selvedges (flat or tubular) on both edges. These articles are produced on special ribbon looms several ribbons often being produced simultaneously; in some cases the ribbons may be woven with wavy edges on one or both sides.
- (2) Strips of a width not exceeding 30 cm, cut (or slit) from wider pieces of warp and weft fabric (whether cut (or slit) longitudinally or on the cross) and provided with false selvedges on both edges, or a normal woven selvedge on one edge and a false selvedge on the other. False selvedges are designed to prevent unravelling of a piece of cut (or slit) fabric and may, for example, consist of a row of gauze stitches woven into the wider fabric before cutting (or slitting), of a simple hem, or they may be produced by gumming the edges of strips, or by fusing the edges in the case of certain ribbons of man-made fibres. They may also be created when a fabric is treated before it is cut into strips in a manner that prevents the edges of those strips from unravelling. No demarcation between the narrow fabric and its false selvedges need be evident in that case. Strips cut (or slit) from fabric but not provided with a selvedge, either real or false, on each edge, are **excluded** from this heading and classified with ordinary woven fabrics. (As regards bias binding, see paragraph (4) below.)
- (3) Seamless tubular warp and weft fabrics, of a width when flattened, not exceeding 30 cm. Fabrics consisting of strips with the edges joined to form a tube (by sewing, gumming or otherwise) are, however, **excluded** from this heading.
- (4) Bias binding consisting of strips, with folded edges, of a width, when unfolded, not exceeding 30 cm, cut on the cross from warp and weft fabrics. These products are cut from wide fabrics and not provided, therefore, with a selvedge, either real or false.

The products referred to above include both ribbons and webbing as well as certain galloons having the characteristics of woven ribbons.

Ribbons are usually of silk, wool, cotton or man-made fibres, whether or not containing elastomeric yarn or rubber thread, and are used in underwear, in women's apparel, in the manufacture of hats and fancy collars, as medal ribbons, as a decorative binding material, in furnishing, etc.

The heading also includes narrow woven fabrics made from metal thread provided such fabrics are clearly of a kind used for apparel, furnishing or similar purposes (see Chapter Note 7).

The galloons classified here are narrow ribbons; webbings are thick, strong, narrow woven fabrics, usually of cotton, flax, hemp or jute, used in saddlery, harness-making, for the manufacture of straps, belting or waist bands, chair seats, etc.

The heading also includes webbing for blinds, consisting of two tapes connected at regular intervals by narrow bands, the whole being obtained by a single, continuous weaving operation.

The goods covered by this heading are usually woven with the same weaves as the fabrics of **Chapters 50 to 55** or **heading 58.01** (velvets), and they differ from these fabrics only as regards the criteria referred to in paragraphs (1) to (4) above.

These products remain classified here when watered ("moiré"), embossed, printed, etc.

(B) BOLDUCS

This heading also covers narrow fabrics (**bolducs**) of a width usually ranging from a few mm to 1 cm, consisting of warp (parallelised yarns, monofilaments or textile fibres) without weft but assembled by means of an adhesive. These are mainly used for tying parcels; some are used for making millinery plaits.

They sometimes bear the trade name of the user printed at regular intervals. This does not affect their classification.

This heading **excludes** :

- (a) Bandages, medicated or put up in forms or packings for retail sale (**heading 30.05**).
- (b) Narrow woven fabrics with woven fringes, braided galloons and braids (**heading 58.08**).
- (c) Narrow woven fabrics more specifically covered by other headings, e.g., those having the character of :
 - (1) Woven labels, badges and similar articles, in strips (**heading 58.07** or **58.10**).
 - (2) Wicks for lamps, stoves, lighters, candles or the like (**heading 59.08**).
 - (3) Textile hosepiping or similar tubing (**heading 59.09**).
 - (4) Transmission or conveyor belts or belting of **heading 59.10**.
- (d) Impregnated, coated, covered or laminated narrow woven fabrics of **Chapter 59**, in particular narrow fabrics made of velvet impregnated with rubber, for covering weaving spindles (weaving beams) (**heading 59.11**).
- (e) Narrow woven fabrics (**other than** those referred to at Part (A) (2) above) made up as described in Part (II) of the General Explanatory Note to Section XI.
- (f) Slide fasteners (**heading 96.07**) and hooks and eyes or press fasteners, of base metal, fixed at intervals on tape, provided that the hooks and eyes or press fasteners give the goods their essential character (**heading 83.08** or **96.06** as the case may be).
- (g) Typewriter ribbons (**heading 96.12**).

58.07 - Labels, badges and similar articles of textile materials, in the piece, in strips or cut to shape or size, not embroidered.

5807.10 - Woven

5807.90 - Other

Subject to the conditions specified below this heading covers :

- (A) **Labels of any textile material** (including knitted). These include labels of a kind used for marking wearing apparel, household linen, mattresses, tents, soft toys, or other goods. They are utilitarian labels bearing individual inscriptions or motifs. Such labels include, *inter alia*, commercial labels bearing the trade name or trade mark of the manufacturer or the nature of the constituent textile ("silk", "viscose rayon", etc.) and labels used by private individuals (boarding school pupils, soldiers, etc.) to identify their personal property; the latter variety sometimes bear initials or figures or comprise sometimes a framed space to take a hand-written inscription.
- (B) **Badges and similar articles of any textile material** (including knitted). This category includes badges, emblems, "flashes", etc., of a kind normally sewn to the outer part of wearing apparel (sporting, military, local or national badges, etc., badges bearing the names of youth associations, sailors' cap badges with the name of a ship, etc.).

The above articles are classified in this heading **only** if they fulfil the following conditions :

- (1) They must not be embroidery. The inscriptions or motifs on the articles classified here are generally produced by weaving (usually broché work) or by printing.
- (2) They must be in the piece, in strips (as is usually the case) or in separate units obtained by cutting to size or shape but must not be otherwise made up.

This heading **does not include** labels, badges and similar articles, which have been embroidered (**heading 58.10**) or made up otherwise than by cutting to shape or size (**heading 61.17, 62.17 or 63.07**).

58.08 - Braids in the piece; ornamental trimmings in the piece, without embroidery, other than knitted or crocheted; tassels, pompons and similar articles.

5808.10 - Braids in the piece

5808.90 - Other

**(A) BRAIDS IN THE PIECE; ORNAMENTAL TRIMMINGS
IN THE PIECE, WITHOUT EMBROIDERY, OTHER THAN
KNITTED OR CROCHETED**

In addition to braids, this part of the heading covers a variety of products in the length, designed for the ornamentation or decoration of articles of apparel (e.g., ladies' garments, military uniforms, ecclesiastical vestments, theatrical costumes) or of furnishing articles (including furnishings for ships or vehicles).

They may be fitted with hooks, clasps, eyelets, rings and the like of purely accessory nature, **provided** their character as piece goods is not affected; they may also be trimmed with sequins, beads and similar accessories, **provided** these are not attached by sewn appliquéd work in which case they are classified as embroidery in **heading 58.10**.

The products classified here include :

(1) Flat or tubular braids.

These are obtained by interlacing diagonally yarns, or the monofilament, strip and the like of Chapter 54.

In flat braid the threads run diagonally from one edge to the other in a zig-zag or more complex fashion, whereas in tubular braid they run spirally; in both cases half of the threads run in one direction and half in the other and interlace according to a fixed pattern which is usually quite simple. In some braids extra threads may be interlaced along the length of the fabric either to give firmness to the edge, or in any ordered sequence to produce pattern effects.

Braid is made on special machines known as braiding or spindle machines.

Varieties of braid include lacing (e.g., for boot or shoe laces), piping, soutache, ornamental cords, braided galloons, etc. Tubular braid may have a textile core.

Braid is used for edging or ornamenting certain articles of apparel (e.g., decorative trim and piping) or furnishing articles (e.g., tiebacks for curtains), as sheathing for electrical wiring, for the manufacture of certain shoes laces, anorak or track suit cords, cord belts for dressing gowns, etc.

Such braid differs from the plaited or braided articles of heading 56.07 on account of its looser plaiting and less compact structure.

However, the heading **excludes** braids more specifically covered by other headings and, in particular :

- (a) Braids made with monofilament of which any cross-sectional dimension exceeds 1 mm or with strip and the like of a width exceeding 5 mm, of plastics or with other plaiting materials (**heading 46.01**).
- (b) Twine, cordage, rope, cables and braided imitation catgut of **heading 56.07**.
- (c) Braided wicks for lamps, stoves, lighters, candles or the like (**heading 59.08**).
- (d) Hosepiping and similar tubing (**heading 59.09**).
- (e) Transmission or conveyor belts or belting of **heading 59.10**.
- (f) Articles for technical uses, of **heading 59.11** (e.g., braids of a kind used in industry as packing or lubricating material).
- (g) Slide fasteners (**heading 96.07**) and hooks, eyes and press fasteners, of base metal, fixed at intervals on braided tape, provided that the hooks and eyes and press fasteners give the goods their essential character (**heading 83.08** or **96.06** as the case may be).

(2) **Milanaise and similar cord.**

These are gimped products similar to gimped yarn but with a thicker core composed of a bundle of threads or textile rovings which are twisted during the gimping process. Often they are gimped with yarns already themselves gimped. They are classified here when in the length and are used as ornamentation in made up articles, for manufacturing dressing gown girdles, curtain pulls, etc.

This group **excludes** metal wire covered with textile material, e.g. :

- (a) Iron or steel wire for the manufacture of hat frames (milliners' wire) and stems of iron or steel wire for artificial flowers or hair curlers (**heading 72.17**).
- (b) Insulated electric wire (**heading 85.44**).

(3) **Narrow woven fabrics with fringes (looped or cut) woven into their edges.**

These products are produced on ribbon looms, the trimming on the edges being produced by manipulation of the weft, or by the use of slack coarse warp yarns known as roquetins.

In the first case the weft does not form a selvedge with the two outer warp threads but extends beyond them to form loops; these loops are obtained by passing the weft threads round two or more strands of wire placed on the loom parallel to the warp and removed once the fabric is completed.

In the second case, slack coarse yarns are incorporated into the selvedge at intervals by certain weft threads, while wires hold them from the fabric at the intervening sections, thus forming loops.

The loops produced by these processes may be more or less widely spaced and at regular or irregular intervals. Sometimes they are cut to form a fringed edge which may subsequently be knotted or adorned with tassels, pompons, etc.

These narrow woven fabrics are chiefly used for bordering or ornamenting furnishings or articles of apparel.

Picot or purl edged ribbons and rat tooth ribbons are **excluded (heading 58.06)**.

- (4) **Other ornamental trimmings in the piece.** The heading also covers a variety of miscellaneous narrow width products in the length suitable for use in the ornamentation of apparel, furnishings, etc.

These are usually produced from ribbons or braids or the other products referred to above. They may be made by sewing or otherwise working one such product, or by assembling two or more of them together in an ornamental manner (e.g., ribbons or braids with ornamental borders or galloons or soutache braid; ribbons or braids with tassels or other ornamental effects inserted at intervals along the length, other than by appliquéd embroidery work).

The heading **does not cover** knitted or crocheted ornamental trimmings of **headings 60.02 to 60.06**.

(B) TASSELS, POMPONS AND SIMILAR ARTICLES

Unlike the products of Part (A) above, these are separate individual articles and include tassels of all sizes and shapes and ornamental ends for furnishing cords, etc., for example :

- (1) **Cores** (of wood or other material) covered with textile threads with the ends of these threads sometimes left hanging - large varieties may be trimmed with lace or with rows of small tassels.
- (2) **Simple bundles of textile threads** folded or bound with the ends hanging loose.
- (3) **Olive or nut-shaped cores** (of wood, paper, etc.) covered with textile material, sometimes with an open core allowing for use as a sliding ring.
- (4) **Pompoms**, i.e., short threads secured together in the middle and fluffed out in all directions.

All these articles may be provided with a loop for attachment purposes; they are of general use mainly in furnishing but also to a lesser extent for clothing. They are predominantly ornamental in character.

The heading **does not cover** individual articles other than those mentioned above.

Rosettes made of the braids and trimmings of this heading are classified in **heading 62.17 or 63.07**. Frogs, epaulettes and lanyards of the same materials are classified in **heading 62.17**, and shoe laces, corset laces, etc., of those materials, with their ends spliced or otherwise treated to prevent unravelling, as well as swordknots made of those materials, are classified in **heading 63.07**.

The textile materials used in making the products of this heading are very varied. They include silk, wool, fine animal hair, cotton, flax, man-made fibres and metallised yarn.

In addition to the exclusions already mentioned, the heading **does not include** balloons and other trimmings which are simple woven strips corresponding to the definition of narrow woven fabrics (**heading 58.06**).

58.09 - Woven fabrics of metal thread and woven fabrics of metallised yarn of heading 56.05, of a kind used in apparel, as furnishing fabrics or for similar purposes, not elsewhere specified or included.

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) of the metallised yarns of heading 56.05, and also woven fabrics of the metal threads of Section XIV or XV, **provided** they are fabrics of a kind used for clothing, furnishing or similar purposes, and are not specified or included elsewhere, in particular in any of the preceding headings of this Chapter.

Fabrics containing metal thread or metallised yarns together with other textile yarns are classified here **provided** the metal thread or metallised yarn exceeds the weight of any other textile. For this purpose the metallised yarn is taken as a single textile material and its weight taken as the aggregate of the weight of the textile fibres and metal it contains (see Part (I) (A) of the General Explanatory Note to Section XI).

The heading **excludes** woven fabrics **not** of a kind used for clothing, furnishing or similar purposes, e.g., wire gauze or woven cloth of iron, steel, copper, aluminium, precious metals, etc. (**headings 71.15, 73.14, 74.19, 76.16**, etc.).

58.09 - Woven fabrics of metal thread and woven fabrics of metallised yarn of heading 56.05, of a kind used in apparel, as furnishing fabrics or for similar purposes, not elsewhere specified or included.

This heading covers woven fabrics (as defined in Part (I) (C) of the General Explanatory Note to Section XI) of the metallised yarns of heading 56.05, and also woven fabrics of the metal threads of Section XIV or XV, **provided** they are fabrics of a kind used for clothing, furnishing or similar purposes, and are not specified or included elsewhere, in particular in any of the preceding headings of this Chapter.

Fabrics containing metal thread or metallised yarns together with other textile yarns are classified here **provided** the metal thread or metallised yarn exceeds the weight of any other textile. For this purpose the metallised yarn is taken as a single textile material and its weight taken as the aggregate of the weight of the textile fibres and metal it contains (see Part (I) (A) of the General Explanatory Note to Section XI).

The heading **excludes** woven fabrics **not** of a kind used for clothing, furnishing or similar purposes, e.g., wire gauze or woven cloth of iron, steel, copper, aluminium, precious metals, etc. (**headings 71.15, 73.14, 74.19, 76.16**, etc.).

58.10 - Embroidery in the piece, in strips or in motifs (+).

5810.10 - Embroidery without visible ground

- Other embroidery :

5810.91 -- Of cotton

5810.92 -- Of man-made fibres

5810.99 -- Of other textile materials

Embroidery is obtained by working with embroidering threads on a pre-existing ground of tulle, net, velvet, ribbon, knitted or crocheted fabric, lace or woven fabric, or of felt or nonwovens, in order to produce an ornamental effect on that ground. The embroidery threads are usually of textiles, but the heading also includes those executed with other materials (for example, metal, glass or raffia). The ground fabric usually forms part of the completed embroidery, but in certain cases it is removed (e.g., chemically or by cutting) after being embroidered and only the design remains. Certain embroidery is not made with embroidery threads but with strips or braids.

Thus the manufacture starting with a **pre-existing** ground fabric distinguishes embroidery from lace, and lace should not be confused with embroidery from which the ground fabric has been eliminated after execution. Neither should embroidery be confused with woven fabrics bearing designs produced by broché threads during the weaving process (plumetis and other broché work). Features distinguishing embroidery from these other products will be found later in this Explanatory Note.

Embroidery may be hand or machine made. Hand-made embroidery is of comparatively small dimensions. Machine-made embroidery, on the other hand, is very often in long lengths.

The embroidery classified here comprises mainly the following three groups :

(I) EMBROIDERY WITHOUT VISIBLE GROUND

This is embroidery in which the ground fabric has been eliminated (e.g., by a chemical process, by cutting out). Thus the material consists entirely of the embroidered designs.

Since it has no background certain machine embroidery of this type might be confused with lace of heading 58.04 but can, however, be distinguished by taking into account the following points :

- (A) Whereas lace is made up of a single continuous thread or by the interlacing of two or more continuous threads with the same functions, and generally has the same appearance on both sides, machine embroidery of this kind comprises two threads with different functions; one, the embroidery thread, the other a shuttle thread underneath the fabric, the latter usually finer than the former. Thus the right and wrong sides of the embroidery appear different, the right side showing a certain relief whereas the wrong side is flat.

- (B) The edges of cut out embroidery often show small ends of the ground fabric threads which have not been completely eliminated.

(II) EMBROIDERY WITH THE GROUND RETAINED AFTER EMBROIDERING

This is embroidery in which the embroidering thread does not usually cover the whole of the ground fabric, but appears in the form of patterns on the surface or around its edges. The stitches used are varied and include running stitch, chain-stitch, back or lock-stitch, herring-bone stitch, *point de poste*, seed-stitch, loop-stitch, buttonhole stitch. As a rule the entire design can only be seen on the right side of the fabric. Many varieties of embroidery have small holes or openwork produced by cutting, by boring the ground fabric with a stiletto or by withdrawing certain warp or weft threads (or both) from the ground fabric and then finishing or embellishing the fabrics with embroidery stitches. This adds lightness to the embroidery or may even constitute its principal attraction; examples are broderie anglaise and drawn thread work.

Materials which have been submitted **only** to the simple process of withdrawing the threads are **excluded** from this heading.

In certain kinds of embroidery the desired design is first outlined or filled in with a padding thread to give the embroidered design greater relief.

Some varieties of machine-made embroidery, in particular satin stitch embroidery and certain embroidered muslins, appear very similar to broché muslins and other broché fabrics (e.g., plumetis) classified in **Chapters 50 to 55**. They can be distinguished, however, by the following characteristics arising from their method of manufacture. In broché fabrics, since the designs are produced by broché threads introduced during the course of the weaving process, each item of a row of design is always between exactly the same weft threads or exactly the same warp threads of the ground fabric; in embroidered fabrics, on the contrary, the ground fabric is woven before the designs are produced on the surface. In order to obtain these designs, the ground fabric is stretched on an embroidery machine, so the tension and position of the fabric cannot be sufficiently perfect for the needles of the machine to insert all the corresponding parts of the embroidery exactly between the same weft or warp threads of the ground fabric. Moreover, the needles often pierce the threads of the ground fabric, which cannot happen in broché fabrics.

These distinguishing features of broché fabrics and embroidered fabrics can be seen on fraying up the edges of the design.

(III) APPLIQUE WORK

This consists of a ground of textile fabric or felt on which are sewn, by embroidery or ordinary stitches :

- (A) Beads, sequins or similar ornamental accessories; these accessories are generally made of glass, gelatin, metal or wood, and are sewn so as to produce a pattern or a scattered design on the ground fabric.
- (B) Ornamental motifs of textile or other materials. These motifs are usually a textile fabric (including lace), of a texture different from that of the ground fabric and cut in various patterns which are sewn to the ground fabric; in certain cases, the ground fabric is removed at the places covered by the applied motif.
- (C) Braid, chenille yarn or other trimmings, etc., in the form of a design on the ground fabric.

All varieties of embroidery described remain within this heading when in the following forms:

- (1) **In the piece or in strips of various widths.** These pieces or strips may bear a series of identical designs, whether or not intended for subsequent separation to be made up into finished articles (e.g., strips of embroidered labels for marking articles of apparel, or pieces embroidered at regular intervals intended to be cut up and made up into bibs).

(2) **In the form of motifs,** i.e., individual pieces of embroidered design serving no other function than to be incorporated or appliquéd as elements of embroidery in, for example, underwear or articles of apparel or furnishings. They may be cut to any shape, backed or otherwise assembled. They include badges, emblems, "flashes", initials, numbers, stars, national or sporting insignia, etc.

The heading **does not cover**:

- (a) Embroidery on non-textile materials (for example, leather, wickerwork, plastics, cardboard).
 - (b) Needle-worked tapestries (**heading 58.05**).
 - (c) Sets consisting of woven fabric and yarn for making up into embroidered tablecloths or serviettes, or similar articles (**heading 63.08**).
 - (d) Embroidery (**other than** motifs) made up within the meaning of Part (II) of the General Explanatory Note to Section XI, whether or not in the form of finished articles ready for use. Also individual articles of embroidery, completely finished, ready for use as such, which are embroidered directly in their final shape without any further fabrication. This wide range of articles is classified as made up articles (e.g., **Chapter 61, 62, 63 or 65**) and includes, for example, handkerchiefs, bibs, cuffs, collars, bodices, dresses, tray-cloths, table-centres, mantlepiece covers, table-mats and curtains.
 - (e) Embroidery with glass thread without visible ground (**heading 70.19**).

Subheading Explanatory Note.

Subheading 5810.10

This subheading **does not include** broderie anglaise.

58.11 - Quilted textile products in the piece, composed of one or more layers of textile materials assembled with padding by stitching or otherwise, other than embroidery of heading 58.10.

This heading covers textile products in the piece consisting of :

- (1) a layer of fabric, normally knitted or woven or of nonwovens, and a layer of padding material (of textile fibres frequently in the form of a web, of felt, of cellulose wadding, of foam plastics or of foam rubber, for example), or
- (2) two layers of fabric, normally knitted or woven or of nonwovens, or of combinations thereof, separated by a layer of padding.

These layers are usually held together by needling or stitching (including stitch-bonding) either with straight rows of stitches or by stitching in a decorative pattern, **provided** the stitches are used principally to quilt and do not constitute designs giving the product the character of embroidery. They may also be held together by knotted ties, or by adhesive, by heat bonding or other means, provided the product also has a quilted effect, that is, has a raised or puffed effect similar to quilting by stitching, needling or stitch-bonding.

The products of this heading may be impregnated, coated or covered, or the fabrics used in their production may be impregnated, coated or covered.

These materials are commonly used in the manufacture of quilted garments, bedding or bedspreads, mattress pads, clothing, curtains, place-mats, underpads (silencers) for table linen, etc.

The heading **does not cover** :

- (a) Plastic sheets quilted, whether by stitching or heat sealing, to a padded core (**Chapter 39**).
 - (b) Stitches or quilted textile products in which the stitches constitute designs giving them the character of embroidery (**heading 58.10**).
 - (c) **Made up** goods of this Section (see Section Note 7).
 - (d) Articles of bedding or similar furnishing of **Chapter 94**, padded or internally fitted.
-

Chapter 59

Impregnated, coated, covered or laminated textile fabrics; textile articles of a kind suitable for industrial use

Notes.

1.- Except where the context otherwise requires, for the purposes of this Chapter the expression “textile fabrics” applies only to the woven fabrics of Chapters 50 to 55 and headings 58.03 and 58.06, the braids and ornamental trimmings in the piece of heading 58.08 and the knitted or crocheted fabrics of headings 60.02 to 60.06.

2.- Heading 59.03 applies to :

- (a) Textile fabrics, impregnated, coated, covered or laminated with plastics, whatever the weight per square metre and whatever the nature of the plastic material (compact or cellular), other than :
 - (1) Fabrics in which the impregnation, coating or covering cannot be seen with the naked eye (usually Chapters 50 to 55, 58 or 60); for the purpose of this provision, no account should be taken of any resulting change of colour;
 - (2) Products which cannot, without fracturing, be bent manually around a cylinder of a diameter of 7 mm, at a temperature between 15 °C and 30 °C (usually Chapter 39);
 - (3) Products in which the textile fabric is either completely embedded in plastics or entirely coated or covered on both sides with such material, provided that such coating or covering can be seen with the naked eye with no account being taken of any resulting change of colour (Chapter 39);
 - (4) Fabrics partially coated or partially covered with plastics and bearing designs resulting from these treatments (usually Chapters 50 to 55, 58 or 60);
 - (5) Plates, sheets or strip of cellular plastics, combined with textile fabric, where the textile fabric is present merely for reinforcing purposes (Chapter 39); or
 - (6) Textile products of heading 58.11;
- (b) Fabrics made from yarn, strip or the like, impregnated, coated, covered or sheathed with plastics, of heading 56.04.

3.- For the purposes of heading 59.05, the expression “textile wall coverings” applies to products in rolls, of a width of not less than 45 cm, suitable for wall or ceiling decoration, consisting of a textile surface which has been fixed on a backing or has been treated on the back (impregnated or coated to permit pasting).

This heading does not, however, apply to wall coverings consisting of textile flock or dust fixed directly on a backing of paper (heading 48.14) or on a textile backing (generally heading 59.07).

4.- For the purposes of heading 59.06, the expression “rubberised textile fabrics” means :

- (a) Textile fabrics impregnated, coated, covered or laminated with rubber,
 - (i) Weighing not more than 1,500 g/m²; or
 - (ii) Weighing more than 1,500 g/m² and containing more than 50 % by weight of textile material;
- (b) Fabrics made from yarn, strip or the like, impregnated, coated, covered or sheathed with rubber, of heading 56.04; and

- (c) Fabrics composed of parallel textile yarns agglomerated with rubber, irrespective of their weight per square metre.

This heading does not, however, apply to plates, sheets or strips of cellular rubber, combined with textile fabric, where the textile fabric is present merely for reinforcing purposes (Chapter 40), or textile products of heading 58.11.

5.- Heading 59.07 does not apply to :

- (a) Fabrics in which the impregnation, coating or covering cannot be seen with the naked eye (usually Chapters 50 to 55, 58 or 60); for the purpose of this provision, no account should be taken of any resulting change of colour;
- (b) Fabrics painted with designs (other than painted canvas being theatrical scenery, studio back-cloths or the like);
- (c) Fabrics partially covered with flock, dust, powdered cork or the like and bearing designs resulting from these treatments; however, imitation pile fabrics remain classified in this heading;
- (d) Fabrics finished with normal dressings having a basis of amylaceous or similar substances;
- (e) Wood veneered on a backing of textile fabrics (heading 44.08);
- (f) Natural or artificial abrasive powder or grain, on a backing of textile fabrics (heading 68.05);
- (g) Agglomerated or reconstituted mica, on a backing of textile fabrics (heading 68.14); or
- (h) Metal foil on a backing of textile fabrics (generally Section XIV or XV).

6.- Heading 59.10 does not apply to :

- (a) Transmission or conveyor belting, of textile material, of a thickness of less than 3 mm; or
- (b) Transmission or conveyor belts or belting of textile fabric impregnated, coated, covered or laminated with rubber or made from textile yarn or cord impregnated, coated, covered or sheathed with rubber (heading 40.10).

7.- Heading 59.11 applies to the following goods, which do not fall in any other heading of Section XI :

- (a) Textile products in the piece, cut to length or simply cut to rectangular (including square) shape (other than those having the character of the products of headings 59.08 to 59.10), the following only :
 - (i) Textile fabrics, felt and felt-lined woven fabrics, coated, covered or laminated with rubber, leather or other material, of a kind used for card clothing, and similar fabrics of a kind used for other technical purposes, including narrow fabrics made of velvet impregnated with rubber, for covering weaving spindles (weaving beams);
 - (ii) Bolting cloth;
 - (iii) Straining cloth of a kind used in oil presses or the like, of textile material or of human hair;
 - (iv) Flat woven textile fabrics with multiple warp or weft, whether or not felted, impregnated or coated, of a kind used in machinery or for other technical purposes;
 - (v) Textile fabrics reinforced with metal, of a kind used for technical purposes;
 - (vi) Cords, braids and the like, whether or not coated, impregnated or reinforced with metal, of a kind used in industry as packing or lubricating materials;
- (b) Textile articles (other than those of headings 59.08 to 59.10) of a kind used for technical purposes (for example, textile fabrics and felts, endless or fitted with linking devices, of a kind used in paper-making or similar machines (for example, for pulp or asbestos-cement), gaskets, washers, polishing discs and other machinery parts).

59.01 - Textile fabrics coated with gum or amylaceous substances, of a kind used for the outer covers of books or the like; tracing cloth; prepared painting canvas; buckram and similar stiffened textile fabrics of a kind used for hat foundations.

5901.10 - Textile fabrics coated with gum or amylaceous substances, of a kind used for the outer covers of books or the like

5901.90 - Other

(1) **Textile fabrics coated with gum or amylaceous substances, of a kind used for the outer covers of books or the like.**

These are generally plain weave woven fabrics, usually of cotton, linen or man-made fibres, heavily coated with gum or amylaceous substances (e.g., starch), of a kind used in the manufacture of book outer covers, boxes, spectacle or cutlery cases, knife sheaths, etc.

They may be unbleached, bleached, dyed or printed and the surface is often goffered, pleated, shagreened (given a rough surface), embossed or otherwise worked.

Fabrics for similar uses, impregnated or coated with plastics (e.g., imitation leathers) are **excluded (heading 59.03)**.

(2) **Tracing cloth.**

Tracing cloths are fine close woven fabrics, usually of cotton or linen, which have been treated (e.g., with a solution of natural resin) so as to be smooth surfaced and more or less transparent and suitable for tracing by architects, draughtsmen, etc.

(3) **Prepared painting canvas.**

Prepared painting canvas, usually of linen, hemp or cotton, sized and then coated on one surface with a mixture of linseed oil with other substances (e.g., zinc oxide). It is usually in pieces of a size suitable for use stretched on frames, but remains classified here even if backed with wood or cardboard.

(4) **Buckram and similar stiffened textile fabrics of a kind used for hat foundations.**

These are stiffened textile fabrics made by impregnating lightweight open textile fabrics with adhesives and fillers (e.g., with glue or amylaceous substances mixed with kaolin). Certain varieties of buckram or similar fabrics are made by pasting together two such stiffened fabrics. These fabrics are used mainly in the manufacture of the hat foundations of heading 65.07.

Fabrics for similar uses, impregnated or coated with plastics, are **excluded (heading 59.03)**.

The heading **does not cover** the products described in paragraphs (1), (2) and (4) above when made up as described in Part (II) of the General Explanatory Note to Section XI.

59.02 - Tyre cord fabric of high tenacity yarn of nylon or other polyamides, polyesters or viscose rayon.

5902.10 - Of nylon or other polyamides

5902.20 - Of polyesters

5902.90 - Other

This heading covers tyre cord fabric, whether or not dipped or impregnated with rubber or plastics.

These fabrics are used in the manufacture of tyres and consist of a warp of parallel filament yarns, held in place, at specific distances, by weft yarns. The warp always consists of high tenacity yarns of nylon or other polyamides, polyesters or viscose rayon, while the weft, widely-spaced and intended solely to hold the warp in place, may consist of other yarns. For the description of high tenacity yarn, see Note 6 to Section XI.

The heading **does not cover** other woven fabrics used in the manufacture of tyres nor fabrics of yarns which do not meet the specification of Note 6 to Section XI (**Chapter 54** or **heading 59.03** or **59.06**, as the case may be).

59.03 - Textile fabrics impregnated, coated, covered or laminated with plastics, other than those of heading 59.02.

5903.10 - With poly(vinyl chloride)

5903.20 - With polyurethane

5903.90 - Other

This heading covers textile fabrics which have been impregnated, coated, covered or laminated with plastics (e.g., poly(vinyl chloride)).

Such products are classified here whatever their weight per m² and whatever the nature of the plastic component (compact or cellular), **provided** :

- (1) That, in the case of impregnated, coated or covered fabrics, the impregnation, coating or covering can be seen with the naked eye otherwise than by a resulting change in colour.

Textile fabrics in which the impregnation, coating or covering cannot be seen with the naked eye or can be seen only by reason of a resulting change in colour usually fall in **Chapters 50 to 55, 58 or 60**. Examples of such fabrics are those impregnated with substances designed solely to render them crease-proof, moth-proof, unshrinkable or waterproof (e.g., waterproof gabardines and poplins). Textile fabrics partially coated or partially covered with plastics and bearing designs resulting from these treatments are also classified in **Chapters 50 to 55, 58 or 60**.

- (2) That the products are not rigid, i.e., they can, without fracturing, be bent manually around a cylinder of a diameter of 7 mm, at a temperature between 15 °C and 30 °C.
- (3) That the textile fabric is not completely embedded in, nor coated or covered on both sides with, plastics.

Products not meeting the requirements of subparagraph (2) or (3) above usually fall in **Chapter 39**. However, textile fabric coated or covered on both sides with plastics where the coating or covering cannot be seen with the naked eye, or can be seen only by reason of a resulting change in colour, usually falls in **Chapters 50 to 55, 58 or 60**. Except in the case of textile products of heading 58.11, textile fabrics combined with plates, sheets or strip of cellular plastics, where the textile fabric is present merely for reinforcing purposes, are also classified in **Chapter 39** (see the General Explanatory Note to Chapter 39, part entitled “**Plastics and textile combinations**”, penultimate paragraph).

The laminated fabrics of this heading should not be confused with fabrics which are simply assembled in layers by means of a plastic adhesive. These fabrics, which have no plastics showing in cross-section, generally fall in **Chapters 50 to 55**.

In many of the textile fabrics classified here, the plastic material, usually coloured, forms a surface layer which may be smooth or be embossed to simulate, e.g., the grain of leather (“leathercloth”).

This heading also covers dipped fabrics (**other than** those of **heading 59.02**), impregnated to improve their adhesion to rubber, and textile fabrics which are spattered by spraying with visible particles of thermoplastic material and are capable of providing a bond to other fabrics or materials on the application of heat and pressure.

This heading also includes textile fabrics made from yarn, strip or the like, impregnated, coated, covered or sheathed with plastics, of heading 56.04.

The fabrics of this heading are used for a variety of purposes including furnishing materials, the manufacture of handbags and travel goods, garments, slippers, toys, etc., in book binding, as adhesive tapes, in the manufacture of electrical equipment, etc.

The heading also **excludes** :

- (a) Quilted textile products of **heading 58.11**.
- (b) Textile fabrics coated or covered with plastics for use as floor coverings (**heading 59.04**).
- (c) Textile fabrics, impregnated or coated, having the character of wall coverings (**heading 59.05**).
- (d) Textile fabrics impregnated, coated, covered or laminated with plastics made up as described in Part (II) of the General Explanatory Note to Section XI.

59.04 - Linoleum, whether or not cut to shape; floor coverings consisting of a coating or covering applied on a textile backing, whether or not cut to shape.

5904.10 - Linoleum

5904.90 - Other

(1) **Linoleum.**

Linoleum consists of a textile backing (usually jute canvas but sometimes cotton, etc.) coated on one side with a compact paste composed of oxidised linseed oil, resins and gums and fillers (usually ground cork, but sometimes sawdust or wood flour); in most cases coloured pigments are also added to the paste. It may be plain or patterned; in the latter case the patterns may be obtained by printing or, in the case of inlaid linoleums, by the use of different coloured pastes.

When the paste is made with ground cork but without pigment, the resulting material may be known as cork carpet. This material should not be confused with the textile-backed carpeting or other articles of agglomerated cork of **heading 45.04** which are not made with the linoleum mixture referred to above and are generally rougher and less pliable.

Linoleum is made in various thicknesses and is used as floor coverings and also as coverings for walls, shelves, etc.

The heading also includes textile fabrics, principally woven cotton fabrics, covered with linoleum paste without pigments. These products have the appearance of cork and are used for the manufacture of in-soles for footwear.

(2) **Floor coverings consisting of a coating or covering applied on a textile backing.**

These floor coverings are fairly rigid, hard-wearing materials consisting of a textile backing (including felt) coated on one side so that the backing is completely masked. The mixture usually consists of oil and chalk which after application is coated with paint. They may also consist of a thick layer of plastics (e.g., poly(vinyl chloride)) or even simply several coats of paint applied directly to the textile backing.

In many cases the products of this heading are also coated on the back to strengthen them. They remain classified here whether in rolls or cut to shape ready for use.

The heading **excludes** sheets and plates of linoleum compounds and floor coverings, presented without backings; these are classified according to their constituent materials (**Chapters 39, 40, 45**, etc.).

The heading also **excludes** in-soles (**heading 64.06**).

59.05 - Textile wall coverings.

This heading covers textile wall coverings which satisfy the definition in Note 3 to Chapter 59, that is to say, products in rolls, of a width of not less than 45 cm, suitable for wall or ceiling decoration, consisting of a textile surface which has been fixed on a backing of any material (e.g., paper) or has been treated on the back (impregnated or coated to permit pasting).

The heading includes :

- (1) Yarns laid parallel, woven fabrics, felts, knitted or crocheted fabrics (including stitch-bonded fabrics), fixed on a backing of any material.
- (2) Yarns laid parallel, woven fabrics or lace, on a thin plastic layer fixed on a backing of any material.
- (3) Yarns laid parallel (top layer), attached by chain-stitching to a thin nonwoven (middle layer), glued on a backing of any material.
- (4) A web of textile fibres (top layer) assembled by chain-stitching, with superimposed sets of yarns (middle layer) glued on a backing of any material.
- (5) Nonwovens, surface-covered with textile flock (imitation suède) and glued onto a backing of any material.
- (6) Woven fabrics decorated with hand-painted designs, fixed on a backing of any material.

In the wall coverings of this heading the textile surface may be coloured, printed or otherwise decorated and, where there is a backing, may cover the surface of that backing **entirely or in part**.

The heading **does not cover** :

- (a) Wall coverings of plastics as defined in Note 9 to Chapter 39 (**heading 39.18**).
- (b) Wall coverings consisting of paper or plastics-covered paper, directly surface-decorated with textile flock or dust (**heading 48.14**).
- (c) Woven fabrics covered with textile flock, whether or not provided with an additional backing or impregnated or coated to permit pasting (**heading 59.07**).

59.06 - Rubberised textile fabrics, other than those of heading 59.02.

5906.10 - Adhesive tape of a width not exceeding 20 cm

- Other :

5906.91 -- Knitted or crocheted

5906.99 -- Other

This heading covers :

(A) Textile fabrics impregnated, coated, covered or laminated with rubber, including dipped fabrics (**other than** those of **heading 59.02**), of a weight :

- (1) not exceeding 1,500 g/m², irrespective of the proportions of textile and rubber; or
- (2) if exceeding 1,500 g/m², containing more than 50 % by weight of textile material.

These rubberised fabrics are used principally for the manufacture of waterproof apparel, special radiation protection garments, pneumatic articles, camping equipment, sanitary goods, etc.

Certain upholstery fabrics, lightly coated on one side with rubber latex, are not necessarily waterproof but nevertheless remain in this heading.

These fabrics should not be confused with fabrics assembled in layers with rubber adhesives, such as those used for coachwork or for footwear. A cross-section of these latter fabrics shows no thickness of rubber and they normally fall in **Chapters 50 to 55**.

- (B) Fabrics made from yarn, strip or the like, impregnated, coated, covered or sheathed with rubber, of heading 56.04.
- (C) Weftless fabrics composed of parallel textile yarns agglomerated by gumming or calendering with rubber, irrespective of their weight per square metre. These products are used for the manufacture of tyres, rubber tubes, transmission or conveyor belts or belting, etc.
- (D) Adhesive tape, including electrical insulating tape, in which the backing is of textile fabric, whether or not previously rubberised, and the adhesive of rubber.

The heading **excludes** :

- (a) Adhesive tapes impregnated or coated with pharmaceutical substances or put up in forms or packings for retail sale for medical, surgical, dental or veterinary purposes (**heading 30.05**).
- (b) Rubberised fabrics of the kind described in paragraph (A) (2) above but containing not more than 50 % by weight of textile material (**heading 40.05** or **40.08**).
- (c) Plates, sheets or strip of cellular rubber, combined with textile fabric, where the textile fabric is present merely for reinforcing purposes (**heading 40.08**). As regards criteria for distinguishing between these products and similar products of heading 59.06, see Item (A) of the Explanatory Note to heading 40.08.

- (d) Conveyor or transmission belts and belting, generally consisting of a carcass composed of several plies of textile fabric (whether or not rubberised) covered with vulcanised rubber (**heading 40.10**).
- (e) Carpets, linoleum and other floor coverings backed with rubber to ensure greater flexibility and adhesion to the floor (**Chapter 57** or **heading 59.04** as the case may be).
- (f) Quilted textile products of **heading 58.11**.
- (g) Textile fabrics (whether or not felt-lined) consisting of several layers of fabric assembled with rubber and vulcanised under pressure, of the kind used for the manufacture of card clothing, printing blankets or other similar articles of a kind used for technical purposes, including narrow fabrics made of velvet impregnated with rubber, for covering weaving spindles (weaving beams), of **heading 59.11**.
- (h) Rubberised fabrics made up as described in Part (II) of the General Explanatory Note to Section XI (generally **Chapters 61 to 63**).

59.07 - Textile fabrics otherwise impregnated, coated or covered; painted canvas being theatrical scenery, studio back-cloths or the like.

**(I) TEXTILE FABRICS OTHERWISE IMPREGNATED,
COATED OR COVERED**

This group covers textile fabrics (**excluding** those of **headings 59.01 to 59.06**), which have been impregnated, coated or covered, **provided** the impregnation, coating or covering can be seen with the naked eye; for that purpose, no account should be taken of any resulting change of colour.

Textile fabrics in which the impregnation, coating or covering cannot be seen or can be seen only by reason of a resulting change in colour, and fabrics finished with normal dressings having a basis of amylaceous or similar substances, are **excluded** (see Note 5 to this Chapter); these usually fall in **Chapters 50 to 55, 58 or 60**. Examples of these **excluded** fabrics are those impregnated with size, starch or similar dressings (e.g., organdies, muslin), or with substances designed solely to render them crease-proof, moth-proof, unshrinkable or waterproof (e.g., waterproof gabardines or poplins).

The fabrics covered here include :

- (A) Fabrics coated with tar, bitumen or similar products, of a kind used for making tarpaulins or packing cloths.
- (B) Fabrics coated with wax.
- (C) Fine fabrics coated or impregnated with a preparation based on natural resin and camphor or rendered impermeable by impregnation or coating with oil (sometimes known as "taffetas cirés").
- (D) Other textile fabrics coated or impregnated with oil or preparations with a basis of drying oil.

This group covers **oilcloth** which is a fabric, usually of cotton or linen, coated on one or both sides with a paste essentially composed of oxidised linseed oil, fillers and colouring matter.

It also includes packing cloths, strong coarse fabrics of hemp, jute, cotton, linen, or man-made fibres made waterproof by a heavy coating based on a mixture of drying oil and lamp black.

- (E) Fabrics coated with silicates to render them noninflammable (e.g., for fire-proof screens).
- (F) Fabrics completely coated with a uniform coloured layer of paint or metallic powder.
- (G) Fabric, the surface of which is coated with glue (rubber glue or other), plastics, rubber or other materials and sprinkled with a fine layer of other material such as :
 - (1) Textile flock or dust to produce imitation suèdes. (Fabrics produced in a similar manner with longer textile fibres are **excluded** if they have the character of artificial fur of **heading 43.04**). Fabrics covered with textile flock or dust to produce imitation pile (for example, corduroy) remain classified in this heading.

- (2) Powdered cork (e.g., for wall coverings).
 - (3) Powder or small granules of glass (e.g., " microspheres " for cinematograph screens).
 - (4) Powdered mica.
- (H) Fabrics impregnated with a mastic based on petroleum jelly or with other mastics, used to seal glazing, to waterproof roofing, repair guttering, etc.

The heading **does not cover** patterned fabrics with a design produced by painting or coating (e.g., with textile dust - see Chapter Note 5) (generally **heading 59.05** or **Chapters 50 to 55, 58 or 60**).

The heading also **excludes** :

- (a) Oil silk and other similar oiled fabrics put up in forms or packings for retail sale for medical, surgical or veterinary purposes; medicated plasters and dressings; plaster-coated fracture bandages put up in forms or packings for retail sale (**heading 30.05**).
- (b) Sensitised textile fabrics (**headings 37.01 to 37.04**).
- (c) Wood veneered onto a backing of textile fabric (**heading 44.08**).
- (d) Impregnated, coated or covered fabrics made up as described in Part (II) of the General Explanatory Note to Section XI.
- (e) Prepared painting canvas (**heading 59.01**).
- (f) Linoleum and other products of **heading 59.04**.
- (g) Natural or artificial abrasive powder or grain, on a backing of textile fabric (**heading 68.05**).
- (h) Roofing boards consisting of a substrate of textile fabric completely enveloped in, or covered on both sides by, a layer of asphalt or similar material (**heading 68.07**).
- (ij) Metal foil on a backing of textile fabric (**generally Section XVI or XV**).

(II) PAINTED CANVAS BEING THEATRICAL SCENERY, STUDIO BACK-CLOTHS OR THE LIKE

This group covers sheets of canvas or similar textile material painted with interior or exterior scenes or with decorative effects, of a kind used as scenery in theatres or as back-cloths in portrait or cinema studios, etc. These may be cut to shape, in rolls or mounted on wooden or metal frames.

59.08 - Textile wicks, woven, plaited or knitted, for lamps, stoves, lighters, candles or the like; incandescent gas mantles and tubular knitted gas mantle fabric therefor, whether or not impregnated.

(A) Textile wicks.

The wicks covered by this heading are lengths of flat, round or tubular textile fabric, usually of cotton, and either woven, knitted or plaited. They vary in size and shape from those suitable for use as wicks for candles or mechanical lighters to larger types for oil burning lamps, stoves, etc.

They are classified here whether or not cut to size or fitted with wire or metal tags, to facilitate insertion.

The heading **does not include** :

- (a) Waxed tapers (**heading 34.06**).
- (b) Safety fuses and detonating fuses (**heading 36.03**).
- (c) Wicks obtained by simple twisting or doubling of textile yarns, twine, cordage, etc. Such wicks remain classified as yarns in **Chapters 50 to 55** or as twine, cordage, etc., in **heading 56.07**.
- (d) Wicks of glass fibre (**heading 70.19**).

(B) Tubular knitted gas-mantle fabric.

Gas-mantle fabric is a closely knitted narrow tubular fabric usually of ramie, cotton or viscose rayon and is classified in this heading whether or not impregnated with chemicals (especially thorium or cerium nitrate).

(C) Incandescent gas mantles.

The gas mantles classified here may be semi-finished (e.g., consisting of a short cylinder or sack of the fabric, whether or not impregnated with the chemicals mentioned in paragraph (B) above), or finished, i.e., after burning to remove the textile base and convert the nitrates into oxides, in the shape of the original fabric, the mantle is impregnated with collodion to ensure stability until use. They are classified here whether or not containing asbestos thread or fitted with supports.

59.09 - Textile hosepiping and similar textile tubing, with or without lining, armour or accessories of other materials.

This heading covers hosepiping, e.g., fire hose and similar tubing of textile material of a kind used for the passage of fluids. It is usually made of heavy, closely woven fabric of cotton, linen, hemp or man-made fibres, woven or sewn in tubular form, and may or may not be coated or impregnated with oil, tar or chemical preparations.

Textile tubing is also classified here if coated on the inside with rubber or plastics, armoured with metal (e.g., with a spiral of metal wire) or fitted with non-textile accessories such as fittings for joining one section to another, nozzles, etc.

Tubes, pipes and hoses of vulcanised rubber reinforced internally with textile material or covered with an external sheath of thin fabric are to be classified in **heading 40.09**.

59.10 - Transmission or conveyor belts or belting, of textile material, whether or not impregnated, coated, covered or laminated with plastics, or reinforced with metal or other material.

These transmission or conveyor belts or belting are used for the transmission of power or the conveyance of goods. They are usually woven or plaited from yarns of wool, cotton, man-made fibres, etc. They are in various widths and may be in the form of two or more plies of such material woven or bonded together; sometimes they are woven with a short looped pile surface or with corded edges. They may be impregnated with linseed oil, Stockholm tar, etc., and may be coated with varnish, red lead, etc., to counter deterioration caused by atmospheric conditions, acid fumes, etc.

This heading also includes belts and belting made from woven synthetic fibres, in particular polyamides, coated, covered or laminated with plastics.

They may also be reinforced with strips or threads of metal or of leather.

In accordance with Chapter Note 6, belting of a thickness of less than 3 mm is **excluded**; this remains classified in **Chapters 50 to 55**, as narrow woven fabrics (**heading 58.06**), as braids (**heading 58.08**), etc. Transmission or conveyor belts (i.e., lengths of belting cut to size and either with the ends joined together or furnished with fastenings for joining them together) are classified here irrespective of the thickness of the material.

This heading also covers transmission belts of textile rope or cord ready for use; these may be endless or with joined ends.

The heading also **excludes** :

- (a) Transmission or conveyor belts or belting, presented with the machines or apparatus for which they are designed, whether or not actually mounted (classified with that machine or apparatus – e.g., **Section XVI**).
- (b) Belts or belting of textile fabric impregnated, coated, covered or laminated with rubber or made from textile yarn or cord impregnated, coated, covered or sheathed with rubber (**heading 40.10**, see Note 6 (b) to this Chapter).

59.11 - Textile products and articles, for technical uses, specified in Note 7 to this Chapter (+).

5911.10 - Textile fabrics, felt and felt-lined woven fabrics, coated, covered or laminated with rubber, leather or other material, of a kind used for card clothing, and similar fabrics of a kind used for other technical purposes, including narrow fabrics made of velvet impregnated with rubber, for covering weaving spindles (weaving beams)

5911.20 - Bolting cloth, whether or not made up

- Textile fabrics and felts, endless or fitted with linking devices, of a kind used in paper-making or similar machines (for example, for pulp or asbestos-cement) :

5911.31 -- Weighing less than 650 g/m²

5911.32 -- Weighing 650 g/m² or more

5911.40 - Straining cloth of a kind used in oil presses or the like, including that of human hair

5911.90 - Other

The textile products and articles of this heading present particular characteristics which identify them as being for use in various types of machinery, apparatus, equipment or instruments or as tools or parts of tools.

The heading includes, in particular, those textile articles which are excluded from other headings and directed to heading 59.11 by any specific provision of the Nomenclature (for example, Note 1 (e) to Section XVI). It should be noted however, that certain textile parts and accessories of the goods of Section XVII, such as safety seat belts, shaped motor car body linings and insulating panels (**heading 87.08**) and carpets for motor cars (**Chapter 57**), are not classified in this heading.

(A) TEXTILE FABRICS AND OTHER TEXTILE PRODUCTS, FOR TECHNICAL USES, IN THE PIECE, CUT TO LENGTH OR SIMPLY CUT TO RECTANGULAR (INCLUDING SQUARE) SHAPE

Provided they do not have the character of the products of **headings 59.08 to 59.10**, these products are classified here (and **not** in any other heading of Section XI), whether in the piece, cut to length or simply cut to rectangular (including square) shape.

This group covers **only** the textile fabrics and other textile products as defined in Note 7 (a) to the Chapter, and listed at (1) to (6) below.

- (1) Textile fabrics, felt and felt-lined woven fabrics, coated, covered or laminated with rubber, leather or other material (e.g., plastics), of a kind used for card clothing, and similar fabrics of a kind used for other technical purposes, including narrow fabrics made of velvet impregnated with rubber, for covering weaving spindles (weaving beams).

- (2) Bolting cloths. These are porous fabrics (for example, with a gauze, leno or plain weave), geometrically accurate as to size and shape (usually square) of the meshes, which must not be deformed by use. They are mainly used for sifting (e.g., flour, abrasive powders, powdered plastics, cattle food), filtering or for screen printing. Bolting cloths are generally made of hard twisted undischarged silk yarn or of synthetic filament yarn.
- (3) Straining cloth (e.g., woven filter fabrics and needle filter fabrics), whether or not impregnated, of a kind used in oil presses or for similar filtering purposes (e.g., in sugar refineries or breweries) and for gas cleaning or similar technical applications in industrial dust collecting systems. The heading includes oil filtering cloth, certain thick heavy fabrics of wool or of other animal hair, and certain unbleached fabrics of synthetic fibres (e.g., nylon) thinner than the foregoing but of a close weave and having a characteristic rigidity. It also includes similar straining cloth of human hair.
- (4) Flat woven textile fabrics with multiple warp or weft, whether or not felted, impregnated or coated, of a kind used in machinery or for other technical purposes.
- (5) Textile fabrics, reinforced with metal, of a kind used for technical purposes; the metal thread (bare metal, wire twisted or gimped with textile yarn, etc.) may, for example, be incorporated during weaving (in particular, as warp) or introduced between plies of the material.

Felt reinforced with metal is, however, **excluded (heading 56.02)**.

- (6) Cords, braids and the like of a kind used in industry as packing or lubricating materials; these are usually of square section, coated or impregnated with grease, graphite, talc, etc., and sometimes reinforced with metal. Cords, etc., not coated or impregnated, remain classified here **provided** they are clearly recognisable as products used in industry as packing or lubricating materials.

(B) TEXTILE ARTICLES OF A KIND USED FOR TECHNICAL PURPOSES

All textile articles of a kind used for technical purposes (**other than** those of **headings 59.08 to 59.10**) are classified in this heading and **not** elsewhere in Section XI (see Note 7 (b) to the Chapter); for example :

- (1) Any of the fabrics of (A) above which have been made up (cut to shape, assembled by sewing, etc.), for example, straining cloths for oil presses made by assembly of several pieces of fabric; bolting cloth cut to shape and trimmed with tapes or furnished with metal eyelets or cloth mounted on a frame for use in screen printing.
- (2) Textile fabrics and felts, endless or fitted with linking devices, of a kind used in paper-making or similar machines (for example, for pulp or asbestos-cement) (**excluding** machinery belts of **heading 59.10**).
- (3) Articles formed of linked monofilament yarn spirals and having similar uses to the textile fabrics and felts of a kind used in paper-making or similar machines referred to in (2) above.
- (4) Gaskets and diaphragms for pumps, motors, etc., and washers (**excluding** those of **heading 84.84**).
- (5) Discs, sleeves and pads for shoe polishing and other machines.
- (6) Textile bags for oil presses.

- (7) Cords cut to length, with knots, loops, or metal or glass eyelets, for use on Jacquard or other looms.
- (8) Loom pickers.
- (9) Bags for vacuum cleaners, filter bags for air filtration plant, oil filters for engines, etc.

The textile articles of this heading may incorporate accessories in other material **provided** the articles remain essentially articles of textile.

○
○ ○

Subheading Explanatory Note.

Subheading 5911.90

Articles formed of linked monofilament yarn spirals and having similar uses to the textile fabrics and felts of a kind used in paper-making or similar machines fall in this subheading and not in subheading 5911.31 or 5911.32.

Chapter 60

Knitted or crocheted fabrics

Notes.

- 1.- This Chapter does not cover :
 - (a) Crochet lace of heading 58.04;
 - (b) Labels, badges or similar articles, knitted or crocheted, of heading 58.07; or
 - (c) Knitted or crocheted fabrics, impregnated, coated, covered or laminated, of Chapter 59. However, knitted or crocheted pile fabrics, impregnated, coated, covered or laminated, remain classified in heading 60.01.
- 2.- This Chapter also includes fabrics made of metal thread and of a kind used in apparel, as furnishing fabrics or for similar purposes.
- 3.- Throughout the Nomenclature any reference to "knitted" goods includes a reference to stitch-bonded goods in which the chain stitches are formed of textile yarn.

"o
o o

Subheading Note.

- 1.- Subheading 6005.35 covers fabrics of polyethylene monofilament or of polyester multifilament, weighing not less than 30 g/m² and not more than 55 g/m², having a mesh size of not less than 20 holes/cm² and not more than 100 holes/cm², and impregnated or coated with alphacypermethrin (ISO), chlорfenапyr (ISO), deltamethrin (INN, ISO), lambda-cyhalothrin (ISO), permethrin (ISO) or pirimiphos-methyl (ISO).

GENERAL

This Chapter covers textile fabrics which are manufactured, not like woven fabrics by interlacing warp and weft threads, but by the production of a series of interlinking loops. In general, these goods comprise :

(A) Knitted fabrics (weft knits and warp knits)

- (I) Weft knits consist of a continuously winding thread, forming rows of loops lying in the same direction across the fabric, the loops in adjacent rows interlocking to form the mesh. There is free play between the stitches of these fabrics which allows them to stretch easily in all directions; when a thread is broken they tend to "ladder".
- (II) Warp knits consist of a number of threads running in the direction of the warp (i.e., along the length of the fabric) each thread forming loops interlocking alternatively with loops in rows to the left and right. The loops in warp knits usually appear to be across the width of the fabric. In certain warp knitted fabrics the warp threads are in two series running diagonally in opposite directions to and from across the fabric. These fabrics do not "ladder". If a small square is cut from a warp knit fabric, yarns

cannot easily be pulled from any side; when yarns can be pulled from the sample, they pull out in the warp direction (at right angles to the apparent rows of loops).

The warp knits further include :

- (1) Stitch-bonded goods, **provided** they have chain stitches formed by textile yarn.

The stitch-bonding process uses a machine similar to a warp knitting machine which operates with pointed, open-hooked needles (sliding needles) and heald wire. These needles make it possible to form stitches with textile yarns which produce fabrics from a web of textile fibres or one or more layers of textile yarns, or from a ground of, for example, a woven fabric or a sheet of plastics. In some cases, the stitches may form or fix a pile (whether or not cut). Quilted products assembled by stitch-bonding are **excluded (heading 58.11)**.

- (2) Fabrics made on a warp knitting machine so that the warp consists of a chain of crocheted loops which hold the weft yarns in position, sometimes forming a pattern.

All the fabrics of paragraphs (I) and (II) above may be of simple or more or less complex stitches; in certain cases they produce an open-work effect similar to lace, but nevertheless remain classified here. They can generally be distinguished from lace by their characteristic knitting stitch (particularly in the solid parts).

- (B) **Crocheted fabrics**, formed by a continuous thread worked by hand with a crochet hook to produce a series of loops pulled one through the other and forming, according to the manner of grouping the loops, either a plain or an ornamental fabric of close or open-work design. Certain open-work fabrics have chains of loops formed into squares, hexagons or other ornamental patterns.

*
* *

The products of this Chapter may be made by hand on two or more knitting needles or with a crochet hook. They may also be made on rectilinear or circular knitting machines fitted with small specially shaped, hooked needles (bearded or spring needles, hosiery latch needles and tubular needles).

The headings of this Chapter cover knitted or crocheted fabrics, **regardless of which of the textiles of Section XI** are used to make the goods and whether or not they incorporate elastomeric yarn or rubber thread. It also includes knitted or crocheted fabrics made from **fine metallic threads provided** that such fabrics are clearly of a kind used for clothing, furnishing or similar purposes.

This Chapter covers knitted or crocheted fabrics in the piece (including tubular pieces) or simply cut to rectangular (including square) shape. These fabrics include plain and ribbed fabrics, and double fabrics assembled by sewing or gumming.

All these fabrics may be dyed, printed or made of different coloured yarns. The fabrics of headings 60.02 to 60.06 are sometimes teased so that the nature of the fabric is masked.

The Chapter **does not cover** :

- (a) Stitch-bonded fabrics obtained by picking up textile fibres from a web of such fibres (**heading 56.02**).
- (b) Nets and netting of **heading 56.08**.
- (c) Knitted carpets and carpeting (**heading 57.05**).
- (d) Net fabrics and crochet lace (**heading 58.04**).
- (e) Pieces of fabric cut to rectangular (including square) shape which have been subjected to a further operation (e.g., hemming), articles produced in the finished state ready for use (e.g., mufflers) and fabrics knitted or crocheted to shape, whether presented as separate items or in the form of a number of items in the length (made up articles of **Chapters 61, 62 and 63**, in particular).

◦◦◦

Subheading Explanatory Note.

Subheadings 6005.21 to 6005.44 and 6006.21 to 6006.44

Knitted or crocheted fabrics, unbleached, bleached, dyed, of yarns of different colours, or printed

The provisions of Subheading Note 1 to Section XI, (d) to (h), apply *mutatis mutandis* to knitted or crocheted fabrics, unbleached, bleached, dyed, of yarns of different colours, or printed.

Fabrics consisting either wholly or partly of printed yarns of different colours or of printed yarns of different shades of the same colour are regarded as **fabrics of yarns of different colours** and not as dyed fabrics or printed fabrics.

60.01 - Pile fabrics, including “long pile” fabrics and terry fabrics, knitted or crocheted.

6001.10 - “ Long pile ” fabrics

- Looped pile fabrics :

6001.21 -- Of cotton

6001.22 -- Of man-made fibres

6001.29 -- Of other textile materials

- Other :

6001.91 -- Of cotton

6001.92 -- Of man-made fibres

6001.99 -- Of other textile materials

Unlike the woven fabrics of heading 58.01, the products of this heading are obtained by knitting. The following methods of production are those mainly used :

- (1) a circular knitting machine produces a knitted fabric in which, by means of an additional yarn, protruding loops are formed; afterwards the loops are cut to form pile and thus give a velvet-like surface;
- (2) a special warp knitting machine knits two fabrics face to face with a common pile yarn; the two fabrics are then separated by cutting to produce two knitted fabrics with a cut pile;
- (3) textile fibres from a carded sliver are inserted into the loops of a knitted ground fabric as it is formed (“ long pile ” fabrics);
- (4) textile yarn to form loops (“ imitation terry fabrics ”) (see General Explanatory Note). Such fabrics have rows of chain stitches on the back of the fabric and they differ from the pile fabrics of heading 58.02, which are characterised by rows of stitches having the appearance of running stitches along the length of the back of the fabric.

Knitted or crocheted pile fabrics, impregnated, coated, covered or laminated, remain classified in this heading.

The heading **does not include** :

- (a) Artificial fur of **heading 43.04**.
- (b) Woven pile fabrics (**heading 58.01**).
- (c) Knitted or crocheted fabrics, tufted (**heading 58.02**).

60.02 - Knitted or crocheted fabrics of a width not exceeding 30 cm, containing by weight 5 % or more of elastomeric yarn or rubber thread, other than those of heading 60.01.

6002.40 - Containing by weight 5 % or more of elastomeric yarn but not containing rubber thread

6002.90 - Other

Other than the pile fabrics of **heading 60.01**, this heading covers knitted or crocheted fabrics of a width not exceeding 30 cm, containing by weight 5 % or more of elastomeric yarn or rubber thread.

Elastomeric yarn is defined in Note 13 to Section XI. The textured yarns mentioned in that Note are defined in the Subheading Explanatory Note at the end of the Explanatory Note to heading 54.02.

This heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Loop wale-yarn (**heading 56.06**).
- (c) Labels, badges and similar articles, knitted or crocheted, of **heading 58.07**.
- (d) Embroidered fabrics of **heading 58.10**.
- (e) Fabrics of **Chapter 59** (e.g., impregnated, coated, covered or laminated fabrics of **heading 59.03** or **59.07**, and rubberised fabrics of **heading 59.06**).
- (f) Made up articles within the meaning of Note 7 to Section XI (see also Part (II) of the General Explanatory Note to the Section).

60.03 - Knitted or crocheted fabrics of a width not exceeding 30 cm, other than those of heading 60.01 or 60.02.

6003.10 - Of wool or fine animal hair

6003.20 - Of cotton

6003.30 - Of synthetic fibres

6003.40 - Of artificial fibres

6003.90 - Other

Other than the pile fabrics of **heading 60.01**, this heading covers knitted or crocheted fabrics of a width not exceeding 30 cm, containing no elastomeric yarn or rubber thread or containing by weight less than 5 % of such yarn or thread.

This heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Loop wale-yarn (**heading 56.06**).
- (c) Labels, badges and similar articles, knitted or crocheted, of **heading 58.07**.
- (d) Embroidered fabrics of **heading 58.10**.
- (e) Fabrics of **Chapter 59** (e.g., impregnated, coated, covered or laminated fabrics of **heading 59.03** or **59.07**, rubberised fabrics of **heading 59.06**, and wicks or gas mantle fabric of **heading 59.08**).
- (f) Made up articles within the meaning of Note 7 to Section XI (see also Part (II) of the General Explanatory Note to the Section).

60.04 - Knitted or crocheted fabrics of a width exceeding 30 cm, containing by weight 5 % or more of elastomeric yarn or rubber thread, other than those of heading 60.01.

6004.10 - Containing by weight 5 % or more of elastomeric yarn but not containing rubber thread

6004.90 - Other

Other than the pile fabrics of **heading 60.01**, this heading covers knitted or crocheted fabrics of a width exceeding 30 cm, containing by weight 5 % or more of elastomeric yarn or rubber thread.

Elastomeric yarn is defined in Note 13 to Section XI. The textured yarns mentioned in that Note are defined in the Subheading Explanatory Note at the end of the Explanatory Note to heading 54.02.

This heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Labels, badges and similar articles, knitted or crocheted, of **heading 58.07**.
- (c) Embroidered fabrics of **heading 58.10**.
- (d) Fabrics of Chapter 59 (e.g., impregnated, coated, covered or laminated fabrics of heading 59.03 or 59.07, and rubberised fabrics of **heading 59.06**).
- (e) Made up articles within the meaning of Note 7 to Section XI (see also Part (II) of the General Explanatory Note to the Section).

60.05 - Warp knit fabrics (including those made on galloon knitting machines), other than those of headings 60.01 to 60.04.

- Of cotton :

6005.21 -- Unbleached or bleached

6005.22 -- Dyed

6005.23 -- Of yarns of different colours

6005.24 -- Printed

- Of synthetic fibres :

6005.35 -- Fabrics specified in Subheading Note 1 to this Chapter

6005.36 -- Other, unbleached or bleached

6005.37 -- Other, dyed

6005.38 -- Other, of yarns of different colours

6005.39 -- Other, printed

- Of artificial fibres :

6005.41 -- Unbleached or bleached

6005.42 -- Dyed

6005.43 -- Of yarns of different colours

6005.44 -- Printed

6005.90 - Other

Other than the pile fabrics of **heading 60.01**, this heading covers warp knits of a width exceeding 30 cm, containing no elastomeric yarn or rubber thread or containing less than 5% of such yarn or thread. Details concerning the manufacture of warp knits (including those made on galloon knitting machines) are to be found in the General Explanatory Note to Chapter 60, Part (A) (II). It also covers fabrics of polyethylene monofilament or of polyester multifilament, weighing not less than 30 g/m² and not more than 55 g/m², having a mesh size of not less than 20 holes/cm² and not more than 100 holes/cm², and impregnated or coated with alpha-cypermethrin (ISO), chlорfenапyr (ISO), deltamethrin (INN, ISO), lambdacyhalothrin (ISO), permethrin (ISO) or pirimiphos-methyl (ISO) (See Subheading Note 1 to this Chapter).

Warp knit fabrics can take various forms. Apart from the traditional fabrics without openings, such as those used for making garments, they include open-work fabrics. These fabrics, made on warp knitting machines (especially Raschel machines), are often similar to net fabrics or lace (but should not be mistaken for the latter : see the Explanatory Note to **heading 58.04**) and are often used for making curtains. Like machine-made lace, such knitted or crocheted imitations of lace are often produced in fairly wide pieces which are cut into strips during the finishing process. Such strips, of indeterminate length, fall in this heading provided that their edges are straight and parallel and that their width exceeds 30 cm.

This heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
- (b) Labels, badges and similar articles, knitted or crocheted, of **heading 58.07**.
- (c) Embroidered fabrics of **heading 58.10**.
- (d) Fabrics of **Chapter 59** (e.g., impregnated, coated, covered or laminated fabrics of **heading 59.03** or **59.07**, rubberised fabrics of **heading 59.06**, and wicks or gas mantle fabric of **heading 59.08**).
- (e) Made up articles within the meaning of Note 7 to Section XI (see also Part (II) of the General Explanatory Note to the Section).

60.06 - Other knitted or crocheted fabrics.

6006.10 - Of wool or fine animal hair

- Of cotton :

6006.21 -- Unbleached or bleached

6006.22 -- Dyed

6006.23 -- Of yarns of different colours

6006.24 -- Printed

- Of synthetic fibres :

6006.31 -- Unbleached or bleached

6006.32 -- Dyed

6006.33 -- Of yarns of different colours

6006.34 -- Printed

- Of artificial fibres :

6006.41 -- Unbleached or bleached

6006.42 -- Dyed

6006.43 -- Of yarns of different colours

6006.44 -- Printed

6006.90 - Other

This heading covers knitted or crocheted fabrics **other than** those of the preceding headings of this Chapter.

It covers, for example, weft knits and crocheted fabrics of a width exceeding 30 cm, containing no elastomeric yarn or rubber thread or containing by weight less than 5 % of such yarn or thread. The Explanatory Note to this Chapter explains the meaning of "weft knits" and "crocheted fabrics" (see General, Parts (A) (I) and (B), respectively).

This heading also **excludes** :

- (a) Bandages, medicated or put up for retail sale (**heading 30.05**).
 - (b) Labels, badges and similar articles, knitted or crocheted, of **heading 58.07**.
 - (c) Embroidered fabrics of **heading 58.10**.
 - (d) Fabrics of **Chapter 59** (e.g., impregnated, coated, covered or laminated fabrics of **heading 59.03** or **59.07**, rubberised fabrics of **heading 59.06**, and wicks or gas mantle fabric of **heading 59.08**).
 - (e) Made up articles within the meaning of Note 7 to Section XI (see also Part (II) of the General Explanatory Note to the Section).
-

Chapter 61

Articles of apparel and clothing accessories, knitted or crocheted

Notes.

- 1.- This Chapter applies only to made up knitted or crocheted articles.
- 2.- This Chapter does not cover :
 - (a) Goods of heading 62.12;
 - (b) Worn clothing or other worn articles of heading 63.09; or
 - (c) Orthopaedic appliances, surgical belts, trusses or the like (heading 90.21).
- 3.- For the purposes of headings 61.03 and 61.04 :
 - (a) The term " suit " means a set of garments composed of two or three pieces made up, in respect of their outer surface, in identical fabric and comprising :
 - one suit coat or jacket the outer shell of which, exclusive of sleeves, consists of four or more panels, designed to cover the upper part of the body, possibly with a tailored waistcoat in addition whose front is made from the same fabric as the outer surface of the other components of the set and whose back is made from the same fabric as the lining of the suit coat or jacket; and
 - one garment designed to cover the lower part of the body and consisting of trousers, breeches or shorts (other than swimwear), a skirt or a divided skirt, having neither braces nor bibs.All of the components of a " suit " must be of the same fabric construction, colour and composition; they must also be of the same style and of corresponding or compatible size. However, these components may have piping (a strip of fabric sewn into the seam) in a different fabric.
If several separate components to cover the lower part of the body are presented together (for example, two pairs of trousers or trousers and shorts, or a skirt or divided skirt and trousers), the constituent lower part shall be one pair of trousers or, in the case of women's or girls' suits, the skirt or divided skirt, the other garments being considered separately.
The term " suit " includes the following sets of garments, whether or not they fulfil all the above conditions :
 - morning dress, comprising a plain jacket (cutaway) with rounded tails hanging well down at the back and striped trousers;
 - evening dress (tailcoat), generally made of black fabric, the jacket of which is relatively short at the front, does not close and has narrow skirts cut in at the hips and hanging down behind;
 - dinner jacket suits, in which the jacket is similar in style to an ordinary jacket (though perhaps revealing more of the shirt front), but has shiny silk or imitation silk lapels.
 - (b) The term " ensemble " means a set of garments (other than suits and articles of heading 61.07, 61.08 or 61.09), composed of several pieces made up in identical fabric, put up for retail sale, and comprising :

- one garment designed to cover the upper part of the body, with the exception of pullovers which may form a second upper garment in the sole context of twin sets, and of waistcoats which may also form a second upper garment, and
- one or two different garments, designed to cover the lower part of the body and consisting of trousers, bib and brace overalls, breeches, shorts (other than swimwear), a skirt or a divided skirt.

All of the components of an ensemble must be of the same fabric construction, style, colour and composition; they also must be of corresponding or compatible size. The term "ensemble" does not apply to track suits or ski suits, of heading 61.12.

- 4.- Headings 61.05 and 61.06 do not cover garments with pockets below the waist, with a ribbed waistband or other means of tightening at the bottom of the garment, or garments having an average of less than 10 stitches per linear centimetre in each direction counted on an area measuring at least 10 cm x 10 cm. Heading 61.05 does not cover sleeveless garments.
- 5.- Heading 61.09 does not cover garments with a drawstring, ribbed waistband or other means of tightening at the bottom of the garment.
- 6.- For the purposes of heading 61.11 :
 - (a) The expression "babies' garments and clothing accessories" means articles for young children of a body height not exceeding 86 cm;
 - (b) Articles which are, *prima facie*, classifiable both in heading 61.11 and in other headings of this Chapter are to be classified in heading 61.11.
- 7.- For the purposes of heading 61.12, "ski suits" means garments or sets of garments which, by their general appearance and texture, are identifiable as intended to be worn principally for skiing (cross-country or alpine). They consist either of :
 - (a) a "ski overall", that is, a one-piece garment designed to cover the upper and the lower parts of the body; in addition to sleeves and a collar the ski overall may have pockets or footstraps; or
 - (b) a "ski ensemble", that is, a set of garments composed of two or three pieces, put up for retail sale and comprising :
 - one garment such as an anorak, wind-cheater, wind-jacket or similar article, closed by a slide fastener (zipper), possibly with a waistcoat in addition, and
 - one pair of trousers whether or not extending above waist-level, one pair of breeches or one bib and brace overall.

The "ski ensemble" may also consist of an overall similar to the one mentioned in paragraph (a) above and a type of padded, sleeveless jacket worn over the overall.

All the components of a "ski ensemble" must be made up in a fabric of the same texture, style and composition whether or not of the same colour; they also must be of corresponding or compatible size.
- 8.- Garments which are, *prima facie*, classifiable both in heading 61.13 and in other headings of this Chapter, excluding heading 61.11, are to be classified in heading 61.13.
- 9.- Garments of this Chapter designed for left over right closure at the front shall be regarded as men's or boys' garments, and those designed for right over left closure at the front as women's or girls' garments. These provisions do not apply where the cut of the garment clearly indicates that it is designed for one or other of the sexes.

Garments which cannot be identified as either men's or boys' garments or as women's or girls' garments are to be classified in the headings covering women's or girls' garments.

- 10.- Articles of this Chapter may be made of metal thread.

GENERAL

This Chapter covers made up knitted or crocheted men's boys', women's or girls' articles of apparel and made up knitted or crocheted accessories for articles of apparel. It also includes made up knitted or crocheted parts of apparel or clothing accessories. However, it **does not include** brassières, girdles, corsets, braces, suspenders, garters or similar articles or parts thereof, knitted or crocheted (**heading 62.12**).

The classification of goods in this Chapter is not affected by the presence of parts or accessories of, for example, woven fabrics, furskin, feathers, leather, plastics or metal. Where, however, the presence of these materials constitutes **more than mere trimming** the articles are classified in accordance with the relative Chapter Notes (particularly Note 4 to Chapter 43 and Note 2 (b) to Chapter 67, relating to the presence of furskin and feathers, respectively), or failing that, according to the General Interpretative Rules.

Electrically heated articles remain in this Chapter.

By application of the provisions of Note 9 to this Chapter garments having a front opening which fastens or overlaps left over right are considered to be garments for men or boys. When the opening fastens or overlaps right over left these garments are considered to be garments for women or girls.

These provisions do not apply where the cut of the garment clearly indicates that it is designed for one or the other of the sexes. Garments which cannot be identified as either men's or boys' garments or women's or girls' garments are to be classified in the headings covering women's or girls' garments.

Shirts and shirt-blouses are garments designed to cover the upper part of the body, having long or short sleeves and a full or partial opening starting at the neckline. They may also have pockets, but only above the waist, and a collar.

By application of Note 14 to Section XI, garments of different headings are to be classified in their own headings even if put up in sets for retail sale. This, however, does not apply to garments put up in sets which are specifically mentioned in the heading texts, for example, suits, pyjamas, swimwear. It should be noted that, for the application of Note 14 to Section XI, the expression "textile garments" means garments of headings 61.01 to 61.14.

This Chapter also covers unfinished or incomplete articles of the kind described therein, including shaped knitted or crocheted fabric for making such articles. Provided these products have the essential character of the articles concerned, they fall in the same headings as the finished articles. However, crocheted parts of garments or of clothing accessories (**other than** those of **heading 62.12**) are classified in **heading 61.17**.

Garments, clothing, accessories, or parts thereof, knitted or crocheted to shape, whether presented as separate items or in the form of a number of items in the length, are regarded as made up articles (Notes 7 (b) and 7 (g) to Section XI).

The Chapter also **excludes** :

- (a) Articles of apparel and clothing accessories of **heading 39.26, 40.15, 42.03 or 68.12**.
- (b) Pieces of knitted or crocheted fabric which have undergone some working (such as hemming or the formation of necklines), intended for the manufacture of garments but not yet sufficiently completed to be identifiable as garments or parts of garments (**heading 63.07**).
- (c) Worn clothing and other worn articles of **heading 63.09**.
- (d) Garments for dolls (**heading 95.03**).

◦
◦ ◦

Subheading Explanatory Note.

Classification of articles made from quilted textile products in the piece of heading 58.11

Articles made from the quilted textile products in the piece of heading 58.11 are to be classified within the subheadings of the headings of this Chapter under the provisions of Subheading Note 2 to Section XI. For the purposes of their classification, it is the textile material of the outer fabric which gives these articles their essential character. This means that where, for example, a man's quilted anorak has a knitted outer fabric of 60 % cotton and 40 % polyester, the garment falls in subheading 6101.20. It should be noted that, even if the outer fabric by itself falls in heading 59.03, 59.06 or 59.07, the garment does not fall in heading 61.13.

61.01 - Men's or boys' overcoats, car-coats, capes, cloaks, anoraks (including ski-jackets), wind-cheaters, wind-jackets and similar articles, knitted or crocheted, other than those of heading 61.03.

6101.20 - Of cotton

6101.30 - Of man-made fibres

6101.90 - Of other textile materials

This heading covers a category of knitted or crocheted garments for men or boys, characterised by the fact that they are generally worn over all other clothing for protection against the weather.

It includes :

Overcoats, raincoats, car-coats, capes including ponchos, cloaks, anoraks including ski-jackets, wind-cheaters, wind-jackets and similar articles, such as three-quarter coats, greatcoats, hooded capes, duffel coats, trench coats, gabardines, parkas, padded waistcoats.

The heading **does not include** :

- (a) Garments of **heading 61.03**.
- (b) Garments made up of knitted or crocheted fabrics of heading 59.03, 59.06 or 59.07 (**heading 61.13**).

61.02 - Women's or girls' overcoats, car-coats, capes, cloaks, anoraks (including ski-jackets), wind-cheaters, wind-jackets and similar articles, knitted or crocheted, other than those of heading 61.04.

6102.10 - Of wool or fine animal hair

6102.20 - Of cotton

6102.30 - Of man-made fibres

6102.90 - Of other textile materials

The provisions of the Explanatory Note to heading 61.01 apply *mutatis mutandis* to the articles of this heading.

61.03 - Men's or boys' suits, ensembles, jackets, blazers, trousers, bib and brace overalls, breeches and shorts (other than swimwear), knitted or crocheted.

6103.10 - Suits

- Ensembles :

6103.22 -- Of cotton

6103.23 -- Of synthetic fibres

6103.29 -- Of other textile materials

- Jackets and blazers :

6103.31 -- Of wool or fine animal hair

6103.32 -- Of cotton

6103.33 -- Of synthetic fibres

6103.39 -- Of other textile materials

- Trousers, bib and brace overalls, breeches and shorts :

6103.41 -- Of wool or fine animal hair

6103.42 -- Of cotton

6103.43 -- Of synthetic fibres

6103.49 -- Of other textile materials

This heading covers only men's or boy's knitted or crocheted suits and ensembles, jackets, blazers, trousers, breeches and shorts (other than swimwear) and bib and brace type overalls.

(A) For the purposes of Chapter Note 3 (a), it should be noted that :

- (a) the "suit coat or jacket" designed to cover the upper part of the body has a full front opening without a closure or with a closure other than a slide fastener (zipper). It does not extend below the mid-thigh area and is not for wear over another coat, jacket or blazer;
- (b) the "panels" (at least two in front and two at the back) making up the outer shell of the suit coat or jacket must be sewn together lengthwise. For this purpose the term "panels" does not include sleeves, facings or collar, if any;
- (c) a "tailored waistcoat", whose front is made from the same fabric as the outer surface of the other components of the set and whose back is made from the same fabric as the lining of the suit coat or jacket, may also be included in the set.

All of the components of a " suit " must be of the same fabric construction, colour and composition; they must also be of the same style and of corresponding or compatible size. However, these components may have piping (a strip of fabric sewn into the seam) in a different fabric.

If several separate components to cover the lower part of the body are presented together (e.g., two pairs of trousers or trousers and shorts), the constituent lower part shall be one pair of trousers, the other garments being considered separately.

For the purposes of Chapter Note 3 (a), the expression " identical fabric " means a single identical fabric, i.e., the fabric must be :

- of the same construction, i.e., it must be obtained by the same yarn-bonding technique (having the same stitch size) and the structure and measurement (e.g., the decitex number) of the yarns used must also be the same;
- of the same colour (even the same shade and pattern of colour); this includes fabrics of different-coloured yarns and printed fabrics;
- of the same composition, i.e., the percentage of the textile materials used (e.g., 100 % by weight of wool, 51 % by weight of synthetic fibres, 49 % by weight of cotton) must be the same.

(B) The term " men's or boys' ensemble " means a set of garments (**other than** suits and articles of **heading 61.07, 61.08 or 61.09**), composed of several pieces made up in identical fabric, put up for retail sale, and comprising :

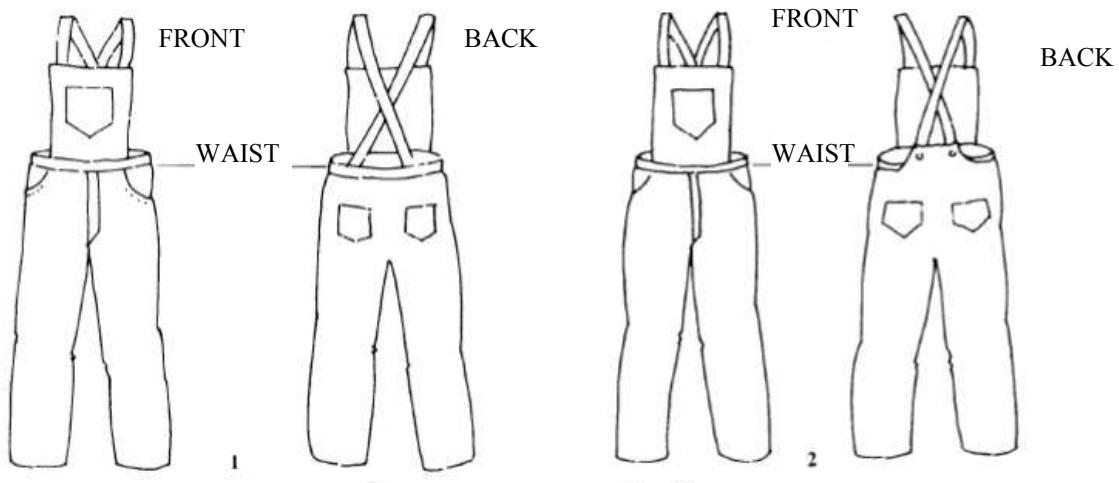

- one garment designed to cover the upper part of the body, with the exception of pullovers which may form a second upper garment in the sole context of twin sets, and of waistcoats which may also form a second upper garment, and
- one or two different garments, designed to cover the lower part of the body and consisting of trousers, bib and brace overalls, breeches or shorts (other than swimwear).

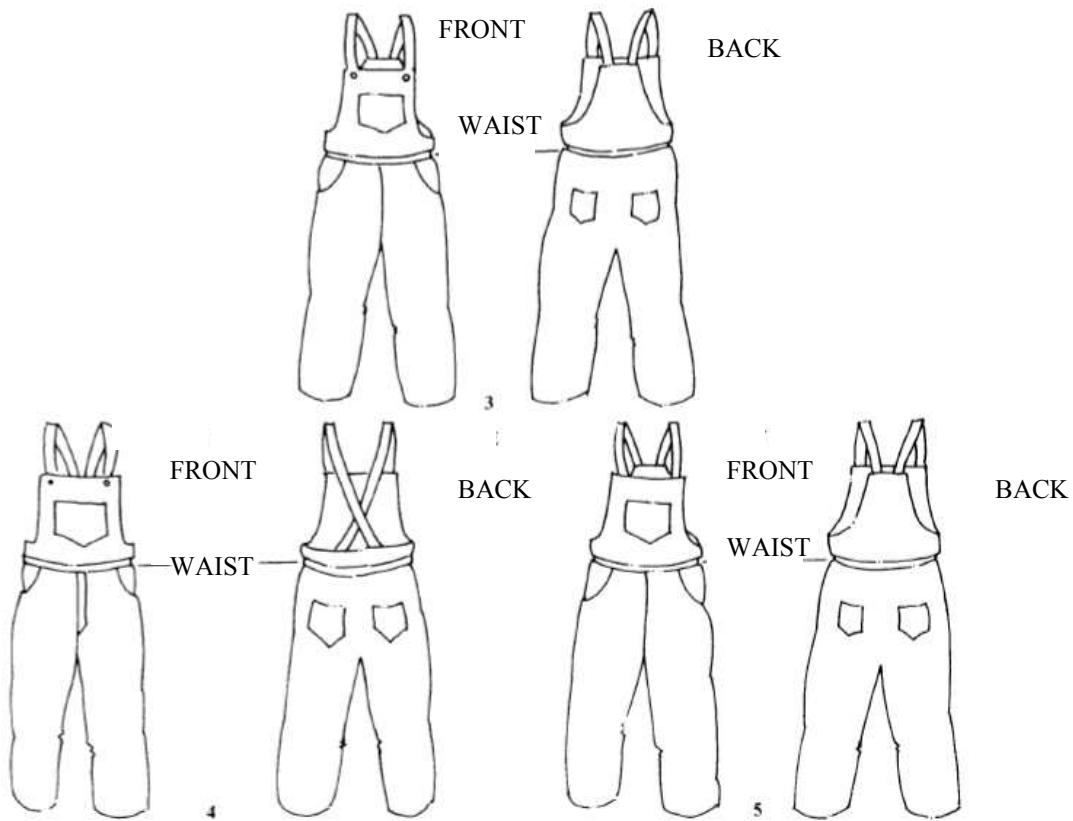

All of the components of an ensemble must be of the same fabric construction, style, colour and composition; they also must be of corresponding or compatible size. The term " ensemble " **does not apply** to track suits and ski suits, of **heading 61.12** (see Chapter Note 3 (b)).

In addition :

- (C) The " jackets or blazers " have the same characteristics as the suit coats and suit jackets described in Chapter Note 3 (a) and in Part (A) above, except that the outer shell (exclusive of sleeves, and facings or collar, if any) may consist of three or more panels (of which two are at the front) sewn together lengthwise. The heading **does not**, however, **include** anoraks, wind-cheaters, ski-jackets and similar garments of **heading 61.01 or 61.02**.
- (D) " Trousers " means garments which envelop each leg separately, covering the knees and usually reaching down to or below the ankles; these garments usually stop at the waist; the presence of braces does not cause these garments to lose the essential character of trousers.

(E) "Bib and brace overalls" means garments of the type illustrated below in figures 1 to 5 and similar garments which do not cover the knee.

(F) "Shorts" means "trousers" which do not cover the knee.

The heading **does not include** :

- (a) Tailored waistcoats presented separately (**heading 61.10**).
- (b) Track suits, ski suits and swimwear (**heading 61.12**).

61.04 - Women's or girls' suits, ensembles, jackets, blazers, dresses, skirts, divided skirts, trousers, bib and brace overalls, breeches and shorts (other than swimwear), knitted or crocheted.

- Suits :

6104.13 -- Of synthetic fibres

6104.19 -- Of other textile materials

- Ensembles :

6104.22 -- Of cotton

6104.23 -- Of synthetic fibres

6104.29 -- Of other textile materials

- Jackets and blazers :

6104.31 -- Of wool or fine animal hair

6104.32 -- Of cotton

6104.33 -- Of synthetic fibres

6104.39 -- Of other textile materials

- Dresses :

6104.41 -- Of wool or fine animal hair

6104.42 -- Of cotton

6104.43 -- Of synthetic fibres

6104.44 -- Of artificial fibres

6104.49 -- Of other textile materials

- Skirts and divided skirts :

6104.51 -- Of wool or fine animal hair

6104.52 -- Of cotton

6104.53 -- Of synthetic fibres

6104.59 -- Of other textile materials

- Trousers, bib and brace overalls, breeches and shorts :

6104.61 -- Of wool or fine animal hair

6104.62 -- Of cotton

6104.63 -- Of synthetic fibres

6104.69 -- Of other textile materials

The provisions of the Explanatory Note to heading 61.03 apply *mutatis mutandis* to the articles of this heading.

All of the components of a women's or girls' " suit " must be of the same fabric construction, colour and composition; they must also be of the same style and of corresponding or compatible size. However, these components may have piping (a strip of fabric sewn into the seam) in a different fabric.

If several separate components to cover the lower part of the body are presented together (e.g., a skirt or divided skirt and trousers), the constituent lower part shall be the skirt or divided skirt, the other garments being considered separately.

However, for the purposes of this heading, the term " women's or girls' ensemble " means a set of garments (**other than** suits and articles of **heading 61.07, 61.08 or 61.09**), composed of several pieces made up in identical fabric, put up for retail sale, and comprising :

- one garment designed to cover the upper part of the body, with the exception of pullovers which may form a second upper garment in the sole context of twin sets, and of waistcoats which may also form a second upper garment, and
- one or two different garments, designed to cover the lower part of the body and consisting of trousers, bib and brace overalls, breeches, shorts (other than swimwear), a skirt or a divided skirt, with or without braces or a bib.

All of the components of an ensemble must be of the same fabric construction, style, colour and composition; they also must be of corresponding or compatible size. The term " ensemble " **does not apply** to track suits or ski suits, of **heading 61.12** (see Chapter Note 3 (b)).

Furthermore, the heading **excludes** petticoats and slips of **heading 61.08**.

61.05 - Men's or boys' shirts, knitted or crocheted.

6105.10 - Of cotton

6105.20 - Of man-made fibres

6105.90 - Of other textile materials

With the exception of nightshirts of **heading 61.07** and T-shirts, singlets and other vests of **heading 61.09**, this heading covers knitted or crocheted shirts for men or boys, including shirts with detachable collars, dress shirts, sports shirts and leisure shirts.

This heading **does not cover** sleeveless garments **nor does it cover** garments with pockets below the waist, with a ribbed waistband or other means of tightening at the bottom of the garment, or garments having an average of less than 10 stitches per linear centimetre in each direction counted on an area measuring at least 10 cm x 10 cm (see Chapter Note 4).

Garments not regarded as men's or boys' shirts and excluded from this heading in accordance with Note 4 are generally classified as follows :

- Having pockets below the waist; as jackets of **heading 61.03**, or as cardigans of **heading 61.10**.
- Having a ribbed waistband or other means of tightening at the bottom of the garment, or having an average of less than 10 stitches per linear centimetre; **heading 61.01** or **61.10**.
- Men's or boys' sleeveless garments; **heading 61.09**, **61.10** or **61.14**.

61.06 - Women's or girls' blouses, shirts and shirt-blouses, knitted or crocheted.

6106.10 - Of cotton

6106.20 - Of man-made fibres

6106.90 - Of other textile materials

This heading covers the group of knitted or crocheted women's or girls' clothing which comprises blouses, shirts and shirt-blouses.

This heading **does not cover** garments with pockets below the waist, with a ribbed waistband or other means of tightening at the bottom of the garment, or garments having an average of less than 10 stitches per linear centimetre in each direction counted on an area measuring at least 10 cm x 10 cm (see Chapter Note 4).

Garments not regarded as women's or girls' blouses, shirts or shirt-blouses and **excluded** from this heading in accordance with Chapter Note 4 are generally classified as follows :

- Having pockets below the waist; as jackets of **heading 61.04** or as cardigans of **heading 61.10**.
- Having a ribbed waistband or other means of tightening at the bottom of the garment, or having an average of less than 10 stitches per linear centimetre; **heading 61.02** or **61.10**.

Furthermore, the heading **does not include** :

- (a) T-shirts, singlets and other vests (**heading 61.09**).
- (b) Garments made up of fabrics of heading 59.03, 59.06 or 59.07 (**heading 61.13**).
- (c) Smocks and similar protective garments of **heading 61.14**.

61.07 - Men's or boys' underpants, briefs, nightshirts, pyjamas, bathrobes, dressing gowns and similar articles, knitted or crocheted.

- Underpants and briefs :

6107.11 -- Of cotton

6107.12 -- Of man-made fibres

6107.19 -- Of other textile materials

- Nightshirts and pyjamas :

6107.21 -- Of cotton

6107.22 -- Of man-made fibres

6107.29 -- Of other textile materials

- Other :

6107.91 -- Of cotton

6107.99 -- Of other textile materials

This heading covers two separate categories of knitted or crocheted clothing for men or boys, namely, underpants, briefs and similar articles (underclothing) and nightshirts, pyjamas, bathrobes (including beachrobes), dressing gowns and similar articles.

The heading **does not include** singlets and other vests (**heading 61.09**).

61.08 - Women's or girls' slips, petticoats, briefs, panties, nightdresses, pyjamas, negligees, bathrobes, dressing gowns and similar articles, knitted or crocheted.

- Slips and petticoats :

6108.11 -- Of man-made fibres

6108.19 -- Of other textile materials

- Briefs and panties :

6108.21 -- Of cotton

6108.22 -- Of man-made fibres

6108.29 -- Of other textile materials

- Nightdresses and pyjamas :

6108.31 -- Of cotton

6108.32 -- Of man-made fibres

6108.39 -- Of other textile materials

- Other :

6108.91 -- Of cotton

6108.92 -- Of man-made fibres

6108.99 -- Of other textile materials

This heading covers two separate categories of knitted or crocheted clothing for women or girls, namely slips, petticoats, briefs, panties and similar articles (underclothing) and nightdresses, pyjamas, negligées, bathrobes (including beachrobes), dressing gowns and similar articles.

The heading **does not include** singlets and other vests (**heading 61.09**).

61.09 - T-shirts, singlets and other vests, knitted or crocheted.

6109.10 - Of cotton

6109.90 - Of other textile materials

The term "T-shirts" means lightweight knitted or crocheted garments of the vest type, of cotton or man-made fibre, not napped, nor of pile or terry fabric, in one or more colours, with or without pockets, with long or short close-fitting sleeves, without buttons or other fastenings, without collar, without opening in the neckline, having a close-fitting or lower neckline (round, square, boat-shaped or V-shaped). These garments may have decoration, other than lace, in the form of advertising, pictures or an inscription in words, obtained by printing, knitting or other process. The bottom of these garments is usually hemmed.

This heading also includes singlets and other vests.

It should be noted that the above-mentioned articles are classified in this heading without distinction between male or female wear.

In accordance with Chapter Note 5, garments with a drawstring, ribbed waistband or other means of tightening at the bottom of the garment are **excluded** from this heading.

Furthermore, the heading **does not include** :

- (a) Men's or boys' shirts of **heading 61.05**.
- (b) Women's or girls' blouses, shirts and shirt-blouses of **heading 61.06**.

61.10 - Jerseys, pullovers, cardigans, waistcoats and similar articles, knitted or crocheted (+).

- Of wool or fine animal hair

6110.11 -- Of wool

6110.12 -- Of Kashmir (cashmere) goats

6110.19 -- Other

6110.20 - Of cotton

6110.30 - Of man-made fibres

6110.90 - Of other textile materials

This heading covers a category of knitted or crocheted articles, without distinction between male or female wear, designed to cover the upper parts of the body (jerseys, pullovers, cardigans, waistcoats and similar articles). Articles incorporating incidentally protective components such as elbow pads sewn on sleeves and used for certain sports (e.g., soccer goalkeeper jerseys) remain classified in this heading.

It also covers tailored waistcoats **except** when these are presented with and constitute one of the components of a man's or boy's or woman's or girl's suit of **heading 61.03** or **61.04**, as the case may be.

The heading also **excludes** padded waistcoats of **heading 61.01** or **61.02**.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 6110.12

The provisions of the Explanatory Note to subheading 5102.11 apply, *mutatis mutandis*, to the products of this subheading.

61.11 - Babies' garments and clothing accessories, knitted or crocheted.

6111.20 - Of cotton

6111.30 - Of synthetic fibres

6111.90 - Of other textile materials

In accordance with Note 6 (a) to this Chapter the expression “ babies' garments and clothing accessories ” applies to articles for young children of a body height not exceeding 86 cm.

This heading includes, *inter alia*, knitted or crocheted matinée coats, pixie suits, rompers, infants' bibs, gloves, mittens and mitts, tights and babies' bootees without an outer sole glued, sewn or otherwise affixed or applied to the upper.

It should be noted that articles which are, *prima facie*, classifiable both in heading 61.11 and in other headings of this Chapter are to be classified in **heading 61.11** (see Note 6 (b) to this Chapter).

This heading **does not include** :

- (a) Babies' bonnets, knitted or crocheted (**heading 65.05**).
- (b) Napkins (diapers) and napkin liners for babies (**heading 96.19**).
- (c) Babies' clothing accessories covered more specifically by other Chapters of the Nomenclature.

61.12 - Track suits, ski suits and swimwear, knitted or crocheted.

- Track suits :

6112.11 -- Of cotton

6112.12 -- Of synthetic fibres

6112.19 -- Of other textile materials

6112.20 - Ski suits

- Men's or boys' swimwear :

6112.31 -- Of synthetic fibres

6112.39 -- Of other textile materials

- Women's or girls' swimwear :

6112.41 -- Of synthetic fibres

6112.49 -- Of other textile materials

This heading includes :

(A) Track suits, i.e., knitted articles consisting of two pieces, not lined but sometimes with a raised inner surface (nap) which, because of their general appearance and the nature of the fabric, are clearly meant to be worn exclusively or mainly in the pursuit of sporting activities.

Track suits consist of two garments, namely :

- A garment meant to cover the upper part of the body down to or slightly below the waist. It has long sleeves, with ribbed or elasticated bands, zip fasteners or other tightening elements at the cuffs. Similar tightening elements, including drawstrings, are generally to be found at the bottom of this garment. When it has a partial or complete opening at the front, it is generally fastened by means of a slide fastener (zipper). It may or may not be fitted with a hood, a collar and pockets.
- A second garment (a pair of trousers) which may be either close or loose fitting, with or without pockets, with an elasticated waistband, drawstring or other means of tightening at the waist, with no opening at the waist and therefore no buttons or other fastening system. However, such trousers may be fitted with ribbed or elasticated bands, slide fasteners (zippers) or other tightening elements at the bottom of the trouser-legs which generally go down to ankle level. They may or may not have footstraps.

(B) "Ski suits", i.e., garments or sets of garments which, by their general appearance and texture, are identifiable as intended to be worn principally for skiing (cross-country or alpine).

They consist either of :

- (1) a "ski overall" that is, a one-piece garment designed to cover the upper and the lower parts of the body; in addition to sleeves and a collar, the ski overall may have pockets or footstraps; or

(2) a "ski ensemble", that is, a set of garments composed of two or three pieces, put up for retail sale and comprising :

- one garment such as an anorak, wind-cheater, wind-jacket or similar article, closed by a slide fastener (zipper), possibly with a waistcoat in addition, and
- one pair of trousers whether or not extending above waist-level, one pair of breeches or one bib and brace overall.

The "ski ensemble" may also consist of an overall similar to the one mentioned in paragraph (1) above and a type of padded, sleeveless jacket worn over the overall.

All the components of a "ski ensemble" must be made up in a fabric of the same texture, style and composition whether or not of the same colour; they also must be of corresponding or compatible size (see Note 7 to this Chapter).

(C) Swimwear (knitted or crocheted one-piece or two-piece bathing costumes, swimming shorts and trunks, whether or not elastic).

61.13 - Garments, made up of knitted or crocheted fabrics of heading 59.03, 59.06 or 59.07.

With the exception of babies' garments of **heading 61.11**, this heading covers all garments made up of knitted or crocheted fabrics of heading 59.03, 59.06 or 59.07, without distinction between male or female wear.

The heading includes raincoats, oilskins, divers' suits and anti-radiation protective suits, not combined with breathing apparatus.

It should be noted that articles which are, *prima facie*, classifiable both in this heading and in other headings of this Chapter, excluding heading 61.11, are to be classified in this heading (see Note 8 to this Chapter).

Furthermore, the heading **does not include** :

- (a) Garments made from the quilted textile products in the piece of heading 58.11 (generally **heading 61.01** or **61.02**). See Subheading Explanatory Note at the end of the General Explanatory Note to this Chapter.
- (b) Gloves, mittens and mitts, knitted or crocheted (**heading 61.16**) and other clothing accessories, knitted or crocheted (**heading 61.17**).

61.14 - Other garments, knitted or crocheted.

6114.20 - Of cotton

6114.30 - Of man-made fibres

6114.90 - Of other textile materials

This heading covers knitted or crocheted garments which are not included more specifically in the preceding headings of this Chapter.

The heading includes, *inter alia* :

- (1) Aprons, boiler suits (coveralls), smocks and other protective clothing of a kind worn by mechanics, factory workers, surgeons, etc.
- (2) Clerical or ecclesiastical garments and vestments (e.g., monks' habits, cassocks, copes, soutanes, surplices).
- (3) Professional or scholastic gowns and robes.
- (4) Specialised clothing for airmen, etc. (e.g., airmen's electrically heated clothing).
- (5) Special articles of apparel, whether or not incorporating incidentally protective components such as pads or padding in the elbow, knee or groin areas, used for certain sports or for dancing or gymnastics (e.g., fencing clothing, jockeys' silks, ballet skirts, leotards). However, protective equipment for sports or games (e.g., fencing masks and breast plates, ice hockey pants, etc.) are **excluded (heading 95.06)**.

61.15 - Panty hose, tights, stockings, socks and other hosiery, including graduated compression hosiery (for example, stockings for varicose veins) and footwear without applied soles, knitted or crocheted (+).

6115.10 - Graduated compression hosiery (for example, stockings for varicose veins)

- Other panty hose and tights :

6115.21 -- Of synthetic fibres, measuring per single yarn less than 67 decitex

6115.22 -- Of synthetic fibres, measuring per single yarn 67 decitex or more

6115.29 -- Of other textile materials

6115.30 - Other women's full-length or knee-length hosiery, measuring per single yarn less than 67 decitex

- Other :

6115.94 -- Of wool or fine animal hair

6115.95 -- Of cotton

6115.96 -- Of synthetic fibres

6115.99 -- Of other textile materials

This heading covers the following knitted or crocheted goods, without distinction between those for women or girls and those for men or boys :

- (1) Panty hose and tights designed to cover the feet and legs (hose) and the lower part of the body up to the waist (panty), including those without feet.
- (2) Stockings and socks (including ankle-socks).
- (3) Under stockings, used mainly as a protection against the cold.
- (4) Graduated compression hosiery, e.g., stockings for varicose veins.
- (5) Sockettes intended to protect the feet or toes of stockings from friction or wear.
- (6) Footwear without an outer sole glued, sewn or otherwise affixed or applied to the upper, **other than** babies' bootees.

The heading also covers unfinished stockings, socks, etc., of knitted or crocheted fabric, provided they have the essential character of the finished article.

The heading **excludes** :

- (a) Stockings, socks and bootees without an outer sole glued, sewn or otherwise affixed or applied to the upper, for babies (**heading 61.11**).
- (b) Stockings, socks, etc., **other than** knitted or crocheted (usually **heading 62.17**).

- (c) Knitted footwear with an outer sole glued, sewn or otherwise affixed or applied to the upper (**Chapter 64**).
- (d) Leggings and gaiters (including “mountain stockings” without feet) (**heading 64.06**).

○
○ ○

Subheading Explanatory Note.

Subheading 6115.10

For the purposes of subheading 6115.10, “graduated compression hosiery” means hosiery in which the compression is greatest at the ankle and reduces gradually along its length up the leg, so that blood flow is encouraged.

61.16 - Gloves, mittens and mitts, knitted or crocheted.

6116.10 - Impregnated, coated or covered with plastics or rubber

- Other :

6116.91 -- Of wool or fine animal hair

6116.92 -- Of cotton

6116.93 -- Of synthetic fibres

6116.99 -- Of other textile materials

This heading covers all knitted or crocheted gloves, without distinction between those for women or girls and those for men or boys. It includes ordinary short gloves with separate fingers, mittens covering only part of the fingers, mitts with separation for the thumb only and gauntlet or other long gloves that may cover the forearm or even part of the upper arm.

The heading also covers unfinished gloves, knitted or crocheted, provided they have the essential character of the finished article.

The heading **does not cover** :

- (a) Knitted or crocheted gloves, mittens and mitts lined with furskin or artificial fur, or with furskin or artificial fur on the outside (**other than** as mere trimming) (**heading 43.03 or 43.04**).
- (b) Gloves, mitts and mittens for babies (**heading 61.11**).
- (c) Textile gloves, mittens and mitts, not knitted or crocheted (**heading 62.16**).
- (d) Friction “gloves” for massage or toilet use (**heading 63.02**).

61.17 - Other made up clothing accessories, knitted or crocheted; knitted or crocheted parts of garments or of clothing accessories.

6117.10 - Shawls, scarves, mufflers, mantillas, veils and the like

6117.80 - Other accessories

6117.90 - Parts

This heading covers made up knitted or crocheted clothing accessories, not specified or included in the preceding headings of this Chapter or elsewhere in the Nomenclature. The heading also covers knitted or crocheted parts of garments or of clothing accessories, (**other than** parts of articles of **heading 62.12**).

The heading covers, *inter alia* :

- (1) **Shawls, scarves, mufflers, mantillas, veils** and the like.
 - (2) **Ties, bow ties and cravats.**
 - (3) **Dress shields, shoulder or other pads.**
 - (4) **Belts of all kinds (including bandoliers) and sashes (e.g., military or ecclesiastical),** whether or not elastic. These articles are included here even if they incorporate buckles or other fittings of precious metal or are decorated with pearls, precious or semi-precious stones (natural, synthetic or reconstructed).
 - (5) **Muffs,** including muffs with mere trimmings of furskin or artificial fur on the outside.
 - (6) **Sleeve protectors.**
 - (7) **Kneebands, other than those of heading 95.06** used for sport.
 - (8) **Labels, badges, emblems, "flashes" and the like (excluding** embroidered motifs of **heading 58.10)** made up **otherwise** than by cutting to shape or size. (When made up only by cutting to shape or size these articles are **excluded - heading 58.07**.)
 - (9) **Separately presented removable linings for raincoats or similar garments.**
 - (10) **Pockets, sleeves, collars, collarettes, wimples, fallals of various kinds** (such as rosettes, bows, ruches, frills and flounces), **bodice-fronts, jabots, cuffs, yokes, lapels and similar articles.**
 - (11) **Handkerchiefs.**
 - (12) **Headbands,** used as protection against the cold, to hold the hair in place, etc.
- The heading **does not include** :
- (a) Clothing accessories for babies, knitted or crocheted, of **heading 61.11**.
 - (b) Brassières, girdles, corsets, braces, suspenders, garters and similar articles, and parts thereof (**heading 62.12**).
 - (c) Belts for occupational use (e.g., window-cleaners' or electricians' belts) or rosettes **not** for garments (**heading 63.07**).
 - (d) Knitted or crocheted headgear (**heading 65.05**) and fittings for headgear (**heading 65.07**).

- (e) Feather trimmings (**heading 67.01**).
 - (f) Trimmings of artificial flowers, foliage or fruit of **heading 67.02**.
 - (g) Strips of press fasteners and hooks and eyes on knitted tape (**heading 60.01, 60.02, 60.03, 83.08** or **96.06**, as the case may be).
 - (h) Slide fasteners (zippers) (**heading 96.07**).
-

Chapter 62

Articles of apparel and clothing accessories, not knitted or crocheted

Notes.

1.- This Chapter applies only to made up articles of any textile fabric other than wadding, excluding knitted or crocheted articles (other than those of heading 62.12).

2.- This Chapter does not cover :

- (a) Worn clothing or other worn articles of heading 63.09; or
- (b) Orthopaedic appliances, surgical belts, trusses or the like (heading 90.21).

3.- For the purposes of headings 62.03 and 62.04 :

- (a) The term " suit " means a set of garments composed of two or three pieces made up, in respect of their outer surface, in identical fabric and comprising :
 - one suit coat or jacket the outer shell of which, exclusive of sleeves, consists of four or more panels, designed to cover the upper part of the body, possibly with a tailored waistcoat in addition whose front is made from the same fabric as the outer surface of the other components of the set and whose back is made from the same fabric as the lining of the suit coat or jacket; and
 - one garment designed to cover the lower part of the body and consisting of trousers, breeches or shorts (other than swimwear), a skirt or a divided skirt, having neither braces nor bibs.

All of the components of a " suit " must be of the same fabric construction, colour and composition; they must also be of the same style and of corresponding or compatible size. However, these components may have piping (a strip of fabric sewn into the seam) in a different fabric.

If several separate components to cover the lower part of the body are presented together (for example, two pairs of trousers or trousers and shorts, or a skirt or divided skirt and trousers), the constituent lower part shall be one pair of trousers or, in the case of women's or girls' suits, the skirt or divided skirt, the other garments being considered separately.

The term " suit " includes the following sets of garments, whether or not they fulfil all the above conditions :

- morning dress, comprising a plain jacket (cutaway) with rounded tails hanging well down at the back and striped trousers;
 - evening dress (tailcoat), generally made of black fabric, the jacket of which is relatively short at the front, does not close and has narrow skirts cut in at the hips and hanging down behind;
 - dinner jacket suits, in which the jacket is similar in style to an ordinary jacket (though perhaps revealing more of the shirt front), but has shiny silk or imitation silk lapels.
- (b) The term " ensemble " means a set of garments (other than suits and articles of heading 62.07 or 62.08) composed of several pieces made up in identical fabric, put up for retail sale, and comprising :
 - one garment designed to cover the upper part of the body, with the exception of waistcoats which may also form a second upper garment, and

- one or two different garments, designed to cover the lower part of the body and consisting of trousers, bib and brace overalls, breeches, shorts (other than swimwear), a skirt or a divided skirt.

All of the components of an ensemble must be of the same fabric construction, style, colour and composition; they also must be of corresponding or compatible size. The term "ensemble" does not apply to track suits or ski suits, of heading 62.11.

4.- For the purposes of heading 62.09 :

- (a) The expression "babies' garments and clothing accessories" means articles for young children of a body height not exceeding 86 cm;
- (b) Articles which are, *prima facie*, classifiable both in heading 62.09 and in other headings of this Chapter are to be classified in heading 62.09.

5.- Garments which are, *prima facie*, classifiable both in heading 62.10 and in other headings of this Chapter, excluding heading 62.09, are to be classified in heading 62.10.

6.- For the purposes of heading 62.11, "ski suits" means garments or sets of garments which, by their general appearance and texture, are identifiable as intended to be worn principally for skiing (cross-country or alpine). They consist either of :

- (a) a "ski overall", that is, a one-piece garment designed to cover the upper and the lower parts of the body; in addition to sleeves and a collar the ski overall may have pockets or footstraps; or
- (b) a "ski ensemble", that is, a set of garments composed of two or three pieces, put up for retail sale and comprising :
 - one garment such as an anorak, wind-cheater, wind-jacket or similar article, closed by a slide fastener (zipper), possibly with a waistcoat in addition, and
 - one pair of trousers whether or not extending above waist-level, one pair of breeches or one bib and brace overall.

The "ski ensemble" may also consist of an overall similar to the one mentioned in paragraph (a) above and a type of padded, sleeveless jacket worn over the overall.

All the components of a "ski ensemble" must be made up in a fabric of the same texture, style and composition whether or not of the same colour; they also must be of corresponding or compatible size.

7.- Scarves and articles of the scarf type, square or approximately square, of which no side exceeds 60 cm, are to be classified as handkerchiefs (heading 62.13). Handkerchiefs of which any side exceeds 60 cm are to be classified in heading 62.14.

8.- Garments of this Chapter designed for left over right closure at the front shall be regarded as men's or boys' garments, and those designed for right over left closure at the front as women's or girls' garments. These provisions do not apply where the cut of the garment clearly indicates that it is designed for one or other of the sexes.

Garments which cannot be identified as either men's or boys' garments or as women's or girls' garments are to be classified in the headings covering women's or girls' garments.

9.- Articles of this Chapter may be made of metal thread.

GENERAL

This Chapter covers men's, women's or children's articles of apparel, clothing accessories and parts of apparel or of clothing accessories, made up of the fabrics (excluding wadding but including felt or nonwovens) of Chapters 50 to 56, 58 and 59. With the **exception** of the articles of heading 62.12, articles of apparel, clothing accessories and parts made of knitted or crocheted material are **excluded** from this Chapter.

The classification of goods in this Chapter is not affected by the presence of parts or accessories of, for example, knitted or crocheted fabrics, furskin, feather, leather, plastics or metal. Where, however, the presence of such materials constitutes **more than mere trimming** the articles are classified in accordance with the relative Chapter Notes (particularly Note 4 to Chapter 43 and Note 2 (b) to Chapter 67, relating to the presence of furskin and feathers, respectively), or failing that, according to the General Interpretative Rules.

Electrically heated articles remain in this Chapter.

By application of the provisions of Note 8 to this Chapter garments having a front opening which fastens or overlaps left over right are considered to be garments for men or boys. When the opening fastens or overlaps right over left these garments are considered to be garments for women or girls.

These provisions do not apply where the cut of the garment clearly indicates that it is designed for one or the other of the sexes. Garments which cannot be identified as either men's or boys' garments or women's or girls' garments are to be classified in the headings covering women's or girls' garments.

Shirts and shirt-blouses are garments designed to cover the upper part of the body, having long or short sleeves and a full or partial opening starting at the neckline. Blouses are also designed to cover the upper part of the body but may be sleeveless and without an opening at the neckline.

By application of Note 14 to Section XI, garments of different headings are to be classified in their own headings even if put up in sets for retail sale. This, however, does not apply to garments put up in sets which are specifically mentioned in the heading texts, for example, suits, pyjamas, swimwear. It should be noted that, for the application of Note 14 to Section XI, the expression "textile garments" means garments of headings 62.01 to 62.11.

This Chapter also covers unfinished or incomplete articles of the kind described therein, including shaped textile fabric for making such articles and shaped knitted or crocheted fabrics for making articles or parts of articles of heading 62.12. Provided these products have the essential character of the articles concerned, they are classified in the same headings as the finished articles. However, parts of garments or of clothing accessories, not knitted or crocheted (**other than** those of **heading 62.12**) are classified in **heading 62.17**.

The Chapter also **excludes** :

- (a) Articles of apparel and clothing accessories of **heading 39.26, 40.15, 42.03 or 68.12**.
- (b) Pieces of textile fabric which have undergone some working (such as hemming or the formation of necklines), intended for the manufacture of garments but not yet sufficiently completed to be identifiable as garments or parts of garments (**heading 63.07**).

- (c) Worn clothing and other worn articles of **heading 63.09**.
 - (d) Garments for dolls (**heading 95.03**).

1

Subheading Explanatory Note.

Classification of articles made from quilted textile products in the piece of heading 58.11

Articles made from the quilted textile products in the piece of heading 58.11 are to be classified within the subheadings of the headings of this Chapter under the provisions of Subheading Note 2 to Section XI. For the purposes of their classification, it is the textile material of the outer fabric which gives these articles their essential character. This means that where, for example, a man's quilted anorak has an outer fabric of 60 % cotton and 40 % polyester, the garment falls in subheading 6201.92. It should be noted that, even if this outer fabric by itself falls in heading 59.03, 59.06 or 59.07, the garment does not fall in heading 62.10.

62.01 - Men's or boys' overcoats, car-coats, capes, cloaks, anoraks (including ski-jackets), wind-cheaters, wind-jackets and similar articles, other than those of heading 62.03.

- Overcoats, raincoats, car-coats, capes, cloaks and similar articles :

6201.11 -- Of wool or fine animal hair

6201.12 -- Of cotton

6201.13 -- Of man-made fibres

6201.19 -- Of other textile materials

- Other :

6201.91 -- Of wool or fine animal hair

6201.92 -- Of cotton

6201.93 -- Of man-made fibres

6201.99 -- Of other textile materials

The provisions of the Explanatory Note to heading 61.01 apply, *mutatis mutandis*, to the articles of this heading.

However, the heading **does not cover** garments made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07 (**heading 62.10**).

62.02 - Women's or girls' overcoats, car-coats, capes, cloaks, anoraks (including ski-jackets), wind-cheaters, wind-jackets and similar articles, other than those of heading 62.04.

- Overcoats, raincoats, car-coats, capes, cloaks and similar articles :

6202.11 -- Of wool or fine animal hair

6202.12 -- Of cotton

6202.13 -- Of man-made fibres

6202.19 -- Of other textile materials

- Other :

6202.91 -- Of wool or fine animal hair

6202.92 -- Of cotton

6202.93 -- Of man-made fibres

6202.99 -- Of other textile materials

The provisions of the Explanatory Note to heading 61.02 apply, *mutatis mutandis*, to the articles of this heading.

However, the heading **does not cover** garments made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07 (**heading 62.10**).

62.03 - Men's or boys' suits, ensembles, jackets, blazers, trousers, bib and brace overalls, breeches and shorts (other than swimwear).

- Suits :

6203.11 -- Of wool or fine animal hair

6203.12 -- Of synthetic fibres

6203.19 -- Of other textile materials

- Ensembles :

6203.22 -- Of cotton

6203.23 -- Of synthetic fibres

6203.29 -- Of other textile materials

- Jackets and blazers :

6203.31 -- Of wool or fine animal hair

6203.32 -- Of cotton

6203.33 -- Of synthetic fibres

6203.39 -- Of other textile materials

- Trousers, bib and brace overalls, breeches and shorts :

6203.41 -- Of wool or fine animal hair

6203.42 -- Of cotton

6203.43 -- Of synthetic fibres

6203.49 -- Of other textile materials

The provisions of the Explanatory Note to heading 61.03 apply, *mutatis mutandis*, to the articles of this heading.

However, the heading **does not cover** garments made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07 (**heading 62.10**).

62.04 - Women's or girls' suits, ensembles, jackets, blazers, dresses, skirts, divided skirts, trousers, bib and brace overalls, breeches and shorts (other than swimwear).

- Suits :

6204.11 -- Of wool or fine animal hair

6204.12 -- Of cotton

6204.13 -- Of synthetic fibres

6204.19 -- Of other textile materials

- Ensembles :

6204.21 -- Of wool or fine animal hair

6204.22 -- Of cotton

6204.23 -- Of synthetic fibres

6204.29 -- Of other textile materials

- Jackets and blazers :

6204.31 -- Of wool or fine animal hair

6204.32 -- Of cotton

6204.33 -- Of synthetic fibres

6204.39 -- Of other textile materials

- Dresses :

6204.41 -- Of wool or fine animal hair

6204.42 -- Of cotton

6204.43 -- Of synthetic fibres

6204.44 -- Of artificial fibres

6204.49 -- Of other textile materials

- Skirts and divided skirts :

6204.51 -- Of wool or fine animal hair

6204.52 -- Of cotton

6204.53 -- Of synthetic fibres

6204.59 -- Of other textile materials

- Trousers, bib and brace overalls, breeches and shorts :

6204.61 - - Of wool or fine animal hair

6204.62 - - Of cotton

6204.63 - - Of synthetic fibres

6204.69 - - Of other textile materials

The provisions of the Explanatory Note to heading 61.04 apply, *mutatis mutandis*, to the articles of this heading.

However, the heading **does not cover** garments made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07 (**heading 62.10**).

62.05 - Men's or boys' shirts.

6205.20 - Of cotton

6205.30 - Of man-made fibres

6205.90 - Of other textile materials

With the exception of nightshirts, singlets and other vests of **heading 62.07**, this heading covers shirts not knitted or crocheted for men or boys including shirts with detachable collars, dress shirts, sports shirts and leisure shirts.

The heading **does not cover** garments having the character of wind-cheaters, wind-jackets, etc., of **heading 62.01**, which generally have a tightening at the bottom, or of jackets of **heading 62.03**, which generally have pockets below the waist. Sleeveless garments are also **excluded**.

62.06 - Women's or girls' blouses, shirts and shirt-blouses.

- 6206.10 - Of silk or silk waste
- 6206.20 - Of wool or fine animal hair
- 6206.30 - Of cotton
- 6206.40 - Of man-made fibres
- 6206.90 - Of other textile materials

This heading covers the group of women's or girls' clothing, not knitted or crocheted, which comprises blouses, shirts and shirt-blouses.

This heading **does not cover** garments with pockets below the waist or with a ribbed waistband or other means of tightening at the bottom of the garment.

Furthermore, the heading **does not include** :

- (a) Singlets or other vests (**heading 62.08**).
- (b) Garments made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07 (**heading 62.10**).
- (c) Smocks or similar protective garments of **heading 62.11**.

62.07 - Men's or boys' singlets and other vests, underpants, briefs, nightshirts, pyjamas, bathrobes, dressing gowns and similar articles.

- Underpants and briefs :

6207.11 -- Of cotton

6207.19 -- Of other textile materials

- Nightshirts and pyjamas :

6207.21 -- Of cotton

6207.22 -- Of man-made fibres

6207.29 -- Of other textile materials

- Other :

6207.91 -- Of cotton

6207.99 -- Of other textile materials

This heading covers underclothing for men or boys (singlets and other vests, underpants, briefs and similar articles), not knitted or crocheted.

The heading also includes nightshirts, pyjamas, bathrobes (including beachrobes), dressing gowns and similar articles for men or boys (garments usually worn indoors).

It should be noted that **knitted or crocheted** articles of this kind are to be classified in **heading 61.07** or **61.09**, as the case may be.

62.08 - Women's or girls' singlets and other vests, slips, petticoats, briefs, panties, nightdresses, pyjamas, negligees, bathrobes, dressing gowns and similar articles.

- Slips and petticoats :

6208.11 -- Of man-made fibres

6208.19 -- Of other textile materials

- Nightdresses and pyjamas :

6208.21 -- Of cotton

6208.22 -- Of man-made fibres

6208.29 -- Of other textile materials

- Other :

6208.91 -- Of cotton

6208.92 -- Of man-made fibres

6208.99 -- Of other textile materials

This heading covers underclothing for women or girls (singlets and other vests, slips, petticoats, briefs, panties and similar articles), not knitted or crocheted.

The heading also includes nightdresses, pyjamas, négligés, bathrobes (including beachrobes), dressing gowns and similar articles for women or girls (garments usually worn indoors).

It should be noted that **knitted or crocheted** articles of this kind are to be classified in **heading 61.08** or **61.09**, as the case may be.

This heading also **excludes** brassières, girdles, corsets and similar articles (**heading 62.12**).

62.09 - Babies' garments and clothing accessories.

6209.20 - Of cotton

6209.30 - Of synthetic fibres

6209.90 - Of other textile materials

In accordance with Chapter Note 4 (a) the expression “babies’ garments and clothing accessories” applies to articles for young children of a body height not exceeding 86 cm.

This heading includes, *inter alia*, matinée coats, pixie suits, rompers, infants’ bibs, gloves, mittens and mitts, tights and babies’ bootees without an outer sole glued, sewn or otherwise affixed or applied to the upper, not knitted or crocheted.

It should be noted that articles which are, *prima facie*, classifiable both in heading 62.09 and in other headings of this Chapter are to be classified in **heading 62.09** (see Chapter Note 4 (b)).

This heading **does not include** :

- (a) Babies’ bonnets (**heading 65.05**).
- (b) Napkins (diapers) and napkin liners for babies (**heading 96.19**).
- (c) Babies’ clothing accessories covered more specifically by other Chapters of the Nomenclature.

62.10 - Garments, made up of fabrics of heading 56.02, 56.03, 59.03, 59.06 or 59.07.

6210.10 - Of fabrics of heading 56.02 or 56.03

6210.20 - Other garments, of the type described in subheadings 6201.11 to 6201.19

6210.30 - Other garments, of the type described in subheadings 6202.11 to 6202.19

6210.40 - Other men's or boys' garments

6210.50 - Other women's or girls' garments

With the exception of babies' garments of heading 62.09, this heading covers all garments made up of felt or nonwovens, whether or not impregnated, coated, covered or laminated, or of textile fabrics (**other than** knitted or crocheted fabrics) of heading 59.03, 59.06 or 59.07, without distinction between male or female wear.

The heading includes raincoats, oilskins, divers' suits and anti-radiation protective suits, not combined with breathing apparatus.

It should be noted that articles which are, *prima facie*, classifiable both in this heading and in other headings of this Chapter, **excluding heading 62.09**, are to be classified in this heading (see Chapter Note 5).

The heading **does not include** :

- (a) Garments of paper, cellulose wadding or webs of cellulose fibres (**heading 48.18**).
- (b) Garments made from the quilted textile products in the piece of heading 58.11 (generally **heading 62.01** or **62.02**). See Subheading Explanatory Note at the end of the General Explanatory Notes to this Chapter.
- (c) Clothing accessories (e.g., gloves, mittens and mitts of **heading 62.16**).

62.11 - Track suits, ski suits and swimwear; other garments.

- Swimwear :

6211.11 -- Men's or boys'

6211.12 -- Women's or girls'

6211.20 - Ski suits

- Other garments, men's or boys' :

6211.32 -- Of cotton

6211.33 -- Of man-made fibres

6211.39 -- Of other textile materials

- Other garments, women's or girls' :

6211.42 -- Of cotton

6211.43 -- Of man-made fibres

6211.49 -- Of other textile materials

The provisions of the Explanatory Note to heading 61.12 concerning track suits, ski suits and swimwear and of the Explanatory Note to heading 61.14 concerning other garments apply, *mutatis mutandis*, to the articles of this heading. However, the track suits of this heading may be lined.

It should be noted that, **unlike heading 61.14** this heading also covers tailored waistcoats separately presented, **not** knitted or crocheted.

This heading also includes fabric in the piece, with the weft threads omitted at regular intervals, from which loin-cloths can be obtained by simple cutting and without further fabrication. Separate loin-cloths are also included.

62.12 - Brassières, girdles, corsets, braces, suspenders, garters and similar articles and parts thereof, whether or not knitted or crocheted.

6212.10 - Brassières

6212.20 - Girdles and panty-girdles

6212.30 - Corselettes

6212.90 - Other

This heading covers articles of a kind designed for wear as body-supporting garments or as supports for certain other articles of apparel, and parts thereof. These articles may be made of any textile material including knitted or crocheted fabrics (whether or not elastic).

The heading includes, *inter alia* :

- (1) Brassières of all kinds.
- (2) Girdles and panty-girdles.
- (3) Corselettes (combinations of girdles or panty-girdles and brassières).
- (4) Corsets and corset-belts. These are usually reinforced with flexible metallic or plastic stays, and are generally fastened by lacing or by hooks.
- (5) Suspender-belts, hygienic belts, suspensory bandages, suspender jock-straps, braces, suspenders, garters, shirt-sleeve supporting arm-bands and armlets.
- (6) Body belts for men (including those combined with underpants).
- (7) Maternity, post-pregnancy or similar supporting or corrective belts, **not being** orthopaedic appliances of **heading 90.21** (see Explanatory Note to that heading).

All the above articles may be furnished with trimmings of various kinds (ribbons, lace, etc.), and may incorporate fittings and accessories of non-textile materials (e.g., metal, rubber, plastics or leather).

The heading also includes knitted or crocheted articles and parts thereof obtained by manufacture directly to shape by increasing or decreasing the number or size of the stitches and designed to be used for the manufacture of articles of this heading, even when presented in the form of a number of items in the length.

The heading **does not include** corsets and belts made wholly of rubber (**heading 40.15**).

62.13 - Handkerchiefs.

6213.20 - Of cotton

6213.90 - Of other textile materials

The articles included in this heading are square, or approximately square, with no side exceeding 60 cm in length (see Chapter Note 7). They may be ordinary handkerchiefs, or squares of the scarf type worn either as head covering, round the neck or as an ornament at the waist. The edges of these handkerchiefs and squares, which may be straight or scalloped, are hemmed, rolled, bordered or provided with fringes, the latter usually consisting of projecting warp or weft threads. In the case of fringed articles the length of the side is to be taken to include the fringe.

Handkerchiefs of this heading may also be made wholly of lace.

The heading also includes fabric in the piece consisting of a number of squares having the character of handkerchiefs or scarves woven together and which, by simply cutting along defined lines (indicated by the absence of warp or weft threads), can be converted into separate fringed articles suitable for use as handkerchiefs or scarves without further operation.

Similarly fabric which, in addition to being simply cut to the required size and shape, has been subjected to a process of "drawn-thread work" giving the **unfinished** article the character of a handkerchief or scarf is classified in this heading.

The heading **does not include** :

- (a) Handkerchiefs of paper, cellulose wadding or webs of cellulose fibres (**heading 48.18**).
- (b) Nonwovens simply cut into squares or rectangles (**heading 56.03**).
- (c) Fabrics simply cut in the form of squares and embroidered, but with unfinished or unfringed edges (**heading 58.10**).
- (d) Articles of the nature of handkerchiefs or square scarves of which any side exceeds 60 cm and scarves of a shape other than square or approximately square (**heading 62.14**).

62.14 - Shawls, scarves, mufflers, mantillas, veils and the like.

- 6214.10 - Of silk or silk waste
- 6214.20 - Of wool or fine animal hair
- 6214.30 - Of synthetic fibres
- 6214.40 - Of artificial fibres
- 6214.90 - Of other textile materials

This heading includes :

- (1) **Shawls.** These are usually square, triangular or circular, and large enough to cover the head and shoulders.
- (2) **Scarves and mufflers.** These are usually square or rectangular and are normally worn round the neck.
- (3) **Mantillas.** These are kinds of light shawls or scarves, usually of lace, worn by women over the head and shoulders.
- (4) **Veils.** This description applies to a variety of articles, generally made of light, transparent or net material, or sometimes of lace, whether worn for ornamental or utilitarian purposes (e.g., wedding, mourning, communion or similar veils and hat or face veils).

The edges of these articles are usually hemmed, rolled, bordered or fringed.

The heading also covers fabrics in the piece with bands of unwoven threads at regular intervals and so designed that, by simple cutting of the unwoven threads, fringed articles of the kind classified in the heading are obtained.

The heading **does not include** :

- (a) Nonwovens simply cut into squares or rectangles (**heading 56.03**).
- (b) Fabrics simply cut in the form of shawls, scarves, etc., and embroidered, but with unfinished or unfringed edges (**heading 58.10**).
- (c) Shawls, scarves, etc., knitted or crocheted (**heading 61.17**).
- (d) Articles of the nature of square scarves of which no side exceeds 60 cm (**heading 62.13**).
- (e) Sashes, e.g., military or ecclesiastical (**heading 62.17**).

62.15 - Ties, bow ties and cravats.

6215.10 - Of silk or silk waste

6215.20 - Of man-made fibres

6215.90 - Of other textile materials

This heading covers ties, bow ties, cravats and stocks, of the kinds generally worn by men (including those mounted on plastic, metal, etc., fittings to facilitate attachment to the collar).

Fabrics cut to pattern for manufacture into ties, etc., are also included in this heading, but **not** strips of tie material simply cut “on the cross”.

The heading **does not cover** :

- (a) Ties, bow ties and cravats, knitted or crocheted (**heading 61.17**).
- (b) Rabats, jabots and similar articles of **heading 62.17**.

62.16 - Gloves, mittens and mitts.

This heading covers gloves, mittens and mitts, of textile fabrics (including lace) **other than** knitted or crocheted fabric.

The provisions of the Explanatory Note to heading 61.16 apply, *mutatis mutandis*, to the articles of this heading.

The heading also covers gloves used for protection in industry, etc.

However, the heading **excludes** :

- (a) Loofah friction gloves, lined or not (**heading 46.02**).
- (b) Gloves, mittens and mitts, of paper, cellulose wadding or webs of cellulose fibres (**heading 48.18**).

62.17 - Other made up clothing accessories; parts of garments or of clothing accessories, other than those of heading 62.12.

6217.10 - Accessories

6217.90 - Parts

This heading covers made up textile clothing accessories, **other than** knitted or crocheted, not specified or included in other headings of this Chapter or elsewhere in the Nomenclature. The heading also covers parts of garments or of clothing accessories, not knitted or crocheted, **other than** parts of articles of **heading 62.12**.

The heading covers, *inter alia* :

- (1) **Dress shields**, usually of rubberised fabric or of rubber covered with textile material. Dress shields wholly of plastics or of rubber are **excluded (headings 39.26 and 40.15 respectively)**.
- (2) **Shoulder or other pads**. These are usually made of wadding, felt, or textile waste covered with textile fabric. Shoulder and other pads consisting of rubber (usually cellular rubber) not covered with textile material are **excluded (heading 40.15)**.
- (3) **Belts of all kinds (including bandoliers) and sashes** (e.g., **military or ecclesiastical**), of textile fabric, whether or not elastic or rubberised, or of woven metal thread. These articles are included here even if they incorporate buckles or other fittings of precious metal, or are decorated with pearls, precious or semi-precious stones (natural, synthetic or reconstructed).
- (4) **Muffs**, including muffs with mere trimmings of furskin or artificial fur on the outside.
- (5) **Sleeve protectors**.
- (6) **Sailors' collars**.
- (7) **Epaulettes, brassards, etc.**
- (8) **Labels, badges, emblems, "flashes" and the like (excluding embroidered motifs of heading 58.10)** made up **otherwise** than by cutting to shape or size. (When made up only by cutting to shape or size these articles are **excluded - heading 58.07**.)
- (9) **Frogs, lanyards, etc.**
- (10) **Separately presented removable linings for raincoats and similar garments**.
- (11) **Pockets, sleeves, collars, collarettes, wimples, fallals of various kinds** (such as rosettes, bows, ruches, frills and flounces), **bodice-fronts, jabots** (including those combined with collars), **cuffs, yokes, lapels and similar articles**.
- (12) **Stockings, socks and sockettes** (including those of lace) and footwear without an outer sole glued, sewn or otherwise affixed or applied to the upper, excluding babies' booties.

Certain made up trimmings (e.g., pompons and tassels, and motifs of lace or embroidery) are classified in **Chapter 58**, as are also, generally, trimmings in the piece.

The articles of this heading are frequently made of lace or embroidery and remain here whether made directly to shape or made up from lace or embroidered fabrics of heading 58.04 or 58.10.

The heading **does not include** :

- (a) Babies' clothing accessories of **heading 62.09**.
 - (b) Belts for occupational use (e.g., window-cleaners' or electricians' belts) or rosettes not for garments (**heading 63.07**).
 - (c) Feather trimmings (**heading 67.01**).
 - (d) Trimmings of artificial flowers, foliage or fruit of **heading 67.02**.
 - (e) Strips of press fasteners and hooks and eyes on tape (**heading 58.06, 83.08** or **96.06** as the case may be).
 - (f) Slide fasteners (zippers) (**heading 96.07**).
-

Chapter 63

Other made up textile articles; sets; worn clothing and worn textile articles; rags

Notes.

- 1.- Sub-Chapter I applies only to made up articles, of any textile fabric.
- 2.- Sub-Chapter I does not cover :
 - (a) Goods of Chapters 56 to 62; or
 - (b) Worn clothing or other worn articles of heading 63.09.
- 3.- Heading 63.09 applies only to the following goods :
 - (a) Articles of textile materials :
 - (i) Clothing and clothing accessories, and parts thereof;
 - (ii) Blankets and travelling rugs;
 - (iii) Bed linen, table linen, toilet linen and kitchen linen;
 - (iv) Furnishing articles, other than carpets of headings 57.01 to 57.05 and tapestries of heading 58.05;
 - (b) Footwear and headgear of any material other than asbestos.

In order to be classified in this heading, the articles mentioned above must comply with both of the following requirements :

- (i) they must show signs of appreciable wear, and
- (ii) they must be presented in bulk or in bales, sacks or similar packings.

◦
◦◦

Subheading Note.

- 1.- Subheading 6304.20 covers articles made from warp knit fabrics, impregnated or coated with alpha-cypermethrin (ISO), chlorfenapyr (ISO), deltamethrin (INN, ISO), lambda-cyhalothrin (ISO), permethrin (ISO) or pirimiphos-methyl (ISO).

GENERAL

This Chapter includes :

- (1) Under headings 63.01 to 63.07 (sub-Chapter I) made up textile articles of any textile fabric (woven or knitted fabric, felt, nonwovens, etc.) which are **not** more specifically described in other Chapters of Section XI or elsewhere in the Nomenclature. (The expression “ made

up textile articles " means articles made up in the sense defined in Note 7 to Section XI (see also Part (II) of the General Explanatory Note to Section XI.)

This sub-Chapter includes articles of tulles or other net fabrics, lace or embroidery, whether made directly to shape or made up from the tulles or other net fabrics, lace or embroidered fabrics of heading 58.04 or 58.10.

The classification of articles in this sub-Chapter is not affected by the presence of minor trimmings or accessories of furskin, metal (including precious metal), leather, plastics, etc.

Where, however, the presence of these other materials constitutes **more than** mere trimming or accessories, the articles are classified in accordance with the relative Section or Chapter Notes (General Interpretative Rule 1), or in accordance with the other General Interpretative Rules as the case may be.

In particular, this sub-Chapter **does not include** :

- (a) Articles of wadding of **heading 56.01**.
 - (b) Nonwovens merely cut into squares or rectangles (e.g., disposable bed sheets) (**heading 56.03**).
 - (c) Made up nets of **heading 56.08**.
 - (d) Motifs of lace or embroidery of **heading 58.04** or **58.10**.
 - (e) Articles of apparel and clothing accessories of **Chapter 61** or **62**.
- (2) Under heading 63.08 (sub-Chapter II) certain sets consisting of woven fabric and yarn, whether or not with accessories, for making up into rugs, tapestries, embroidered table cloths or serviettes, or similar textile articles, put up in packings for retail sale.
- (3) Under heading 63.09 or 63.10 (sub-Chapter III) worn clothing and other worn articles as defined in Chapter Note 3, and used or new rags, scrap twine, etc.

Sub-Chapter I

OTHER MADE UP TEXTILE ARTICLES

63.01 - Blankets and travelling rugs.

6301.10 - Electric blankets

6301.20 - Blankets (other than electric blankets) and travelling rugs, of wool or of fine animal hair

6301.30 - Blankets (other than electric blankets) and travelling rugs, of cotton

6301.40 - Blankets (other than electric blankets) and travelling rugs, of synthetic fibres

6301.90 - Other blankets and travelling rugs

Blankets and travelling rugs are usually made of wool, animal hair, cotton or man-made fibres, frequently with a raised pile surface, and generally of thick heavy-texture material for protection against the cold. The heading also covers rugs and blankets for cots or prams.

Travelling rugs usually have fringes (generally formed by projecting warp or weft threads), but the edges of blankets are normally preserved by blanket stitching or binding.

The heading includes fabrics in the piece which, by the simple process of cutting along defined lines indicated by the absence of weft threads, may be converted into separate articles having the character of finished blankets or travelling rugs.

Electrically heated blankets are also included in the heading.

The heading **does not include** :

- (a) Specially shaped blankets for covering animals (**heading 42.01**).
- (b) Bedspreads and counterpanes (**heading 63.04**).
- (c) Quilted or stuffed bed coverings of **heading 94.04**.

63.02 - Bed linen, table linen, toilet linen and kitchen linen.

- 6302.10 - Bed linen, knitted or crocheted
 - Other bed linen, printed :
- 6302.21 -- Of cotton
- 6302.22 -- Of man-made fibres
- 6302.29 -- Of other textile materials
 - Other bed linen :
- 6302.31 -- Of cotton
- 6302.32 -- Of man-made fibres
- 6302.39 -- Of other textile materials
- 6302.40 - Table linen, knitted or crocheted
 - Other table linen :
- 6302.51 -- Of cotton
- 6302.53 -- Of man-made fibres
- 6302.59 -- Of other textile materials
- 6302.60 - Toilet linen and kitchen linen, of terry towelling or similar terry fabrics, of cotton
 - Other :
- 6302.91 -- Of cotton
- 6302.93 -- Of man-made fibres
- 6302.99 -- Of other textile materials

These articles are usually made of cotton or flax, but sometimes also of hemp, ramie or man-made fibres, etc.; they are normally of a kind suitable for laundering. They include :

- (1) **Bed linen**, e.g., sheets, pillowcases, bolster cases, eiderdown cases and mattress covers.
- (2) **Table linen**, e.g., table cloths, table mats and runners, tray-cloths, table-centres, serviettes, tea napkins, sachets for serviettes, doilies, drip mats.

It should be noted, however, that certain articles of the above descriptions (e.g., table-centres made from lace, velvet or brocaded materials) are not regarded as articles of table linen; they are usually classified in **heading 63.04**.

- (3) **Toilet linen**, e.g., hand or face towels (including roller towels), bath towels, beach towels, face cloths and toilet gloves.

- (4) **Kitchen linen** such as tea towels and glass cloths. Articles such as floor cloths, dish cloths, scouring cloths, dusters and similar cleaning cloths, generally made of coarse thick material, are not regarded as falling within the description "kitchen linen" and are excluded (**heading 63.07**).

Besides the individual articles described above, the heading also includes fabrics in the piece which, by the simple process of cutting along defined lines indicated by the absence of weft threads, may be converted into separate fringed articles (e.g., towels).

63.03 - Curtains (including drapes) and interior blinds; curtain or bed valances.

- Knitted or crocheted :

6303.12 -- Of synthetic fibres

6303.19 -- Of other textile materials

- Other :

6303.91 -- Of cotton

6303.92 -- Of synthetic fibres

6303.99 -- Of other textile materials

This heading includes :

- (1) Curtains (including drapes), which are used, for example, inside windows or to close recesses, theatre stages, etc. The expression "curtains" covers lightweight and transparent or semi-transparent articles and articles made of thick fabrics.
- (2) Interior blinds, which are usually opaque and of the roller variety (e.g., those for railway carriages).
- (3) Curtain valances (or pelmets), which consist of strips of fabric designed to be fitted above windows to hide the tops of curtains, and bed valances for attachment to beds for concealment and decoration.

The heading also covers material in the length so processed after weaving that it is clearly suitable for conversion, by a minor operation, into finished articles of this heading (e.g., fabric in the length to one edge of which has been added a frilled border and which, by simply cutting to required lengths and hemming, is converted into curtains).

The heading **does not include** exterior sunblinds (**heading 63.06**).

63.04 - Other furnishing articles, excluding those of heading 94.04.

- Bedspreads :

6304.11 -- Knitted or crocheted

6304.19 -- Other

6304.20 - Bed nets specified in Subheading Note 1 to this Chapter

- Other :

6304.91 -- Knitted or crocheted

6304.92 -- Not knitted or crocheted, of cotton

6304.93 -- Not knitted or crocheted, of synthetic fibres

6304.99 -- Not knitted or crocheted, of other textile materials

This heading covers furnishing articles of textile materials, **other than** those of the preceding headings or of **heading 94.04**, for use in the home, public buildings, theatres, churches, etc., and similar articles used in ships, railway carriages, aircraft, trailer caravans, motor-cars, etc.

These articles include wall hangings and textile furnishings for ceremonies (e.g., weddings or funerals); mosquito nets or bed nets (including bed nets specified in Subheading Note 1 to this Chapter); bedspreads (but **not including** bed coverings of **heading 94.04**); cushion covers, loose covers for furniture, antimacassars; table covers (**other than** those having the characteristics of floor coverings - see Note 1 to Chapter 57); mantelpiece runners; curtain loops; valances (**other than** those of **heading 63.03**).

The heading **does not include** lampshades (**heading 94.05**).

63.05 - Sacks and bags, of a kind used for the packing of goods (+).

6305.10 - Of jute or of other textile bast fibres of heading 53.03

6305.20 - Of cotton

- Of man-made textile materials :

6305.32 -- Flexible intermediate bulk containers

6305.33 -- Other, of polyethylene or polypropylene strip or the like

6305.39 -- Other

6305.90 - Of other textile materials

This heading covers textile sacks and bags of a kind normally used for the packing of goods for transport, storage or sale.

These articles, which vary in size and shape, include in particular flexible intermediate bulk containers, coal, grain, flour, potato, coffee or similar sacks, mail bags, and small bags of the kind used for sending samples of merchandise by post. The heading also includes such articles as tea sachets.

Packing cloths which, after use as bale wrappings, are roughly or loosely stitched together at the edges, but which do not constitute finished or unfinished sacks or bags, are **excluded (heading 63.07)**.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 6305.32

Flexible intermediate bulk containers are usually made of polypropylene or polyethylene woven fabrics and generally have a capacity ranging from 250 kg to 3,000 kg. They may have lifting straps at the four top corners and may be fitted with openings at the top and bottom to facilitate loading and unloading. They are generally used for packing, storage, transport and handling of dry, flowable materials.

63.06 - Tarpaulins, awnings and sunblinds; tents; sails for boats, sailboards or landcraft; camping goods.

- Tarpaulins, awnings and sunblinds :

6306.12 -- Of synthetic fibres

6306.19 -- Of other textile materials

- Tents :

6306.22 -- Of synthetic fibres

6306.29 -- Of other textile materials

6306.30 - Sails

6306.40 - Pneumatic mattresses

6306.90 - Other

This heading covers a range of textile articles usually made from strong, close-woven canvas.

- (1) **Tarpaulins.** These are used to protect goods stored in the open or loaded on ships, wagons, lorries, etc., against bad weather. They are generally made of coated or uncoated man-made fibre fabrics, or heavy to fairly heavy canvas (of hemp, jute, flax or cotton). They are waterproof. Those made of canvas are usually rendered waterproof or rotproof by treatment with tar or chemicals. Tarpaulins are generally in the form of rectangular sheets, hemmed along the sides, and may be fitted with eyelets, cords, straps, etc. Tarpaulins which are specially shaped (e.g., for covering hayricks, decks of small vessels, lorries, etc.) also fall in this heading **provided** they are flat.

Tarpaulins should not be confused with loose covers for motor-cars, machines, etc., made of tarpaulin material to the shape of these articles, nor with flat protective sheets of lightweight material made up in a similar manner to tarpaulins (**heading 63.07**).

- (2) **Sails** (for yachts, dinghies, fishing-smacks or other vessels, for sailboards or for landcraft). These are of strong textile material (e.g., of high tenacity yarn of man-made fibres) cut to particular shapes and hemmed, and usually fitted with eyelets or other fastening devices.
- (3) **Awnings, sunblinds** (for shops, cafés, etc.). These are designed for protection against the sun; they are generally made of strong plain or striped canvas, and may be mounted on roller or folding mechanisms. They remain classified in this heading even when provided with frames, as is sometimes the case with sunblinds.

- (4) **Tents** are shelters made of lightweight to fairly heavy fabrics of man-made fibres, cotton or blended textile materials, whether or not coated, covered or laminated, or of canvas. They usually have a single or double roof and sides or walls (single or double), which permit the formation of an enclosure. The heading covers tents of various sizes and shapes, e.g., marquees and tents for military, camping (including backpack tents), circus, beach use. They are classified in this heading, whether or not they are presented complete with their tent poles, tent pegs, guy ropes or other accessories.

Caravan "awnings" (sometimes known as caravan annexes) which are tent-like structures are also regarded as tents. They are generally made of man-made fibre fabrics or of fairly thick canvas. They consist of three walls and a roof and are designed to augment the living space provided by a caravan.

The heading **excludes** umbrella tents of **heading 66.01**.

- (5) **Camping goods.** This group includes canvas buckets, water bags, wash basins; ground-sheets; pneumatic mattresses, pillows and cushions (**other than** those of **heading 40.16**); hammocks (**other than** those of **heading 56.08**).

The heading also **excludes** :

- (a) Knapsacks, rucksacks and similar containers (**heading 42.02**).
- (b) Padded sleeping bags and stuffed mattresses, pillows and cushions (**heading 94.04**).
- (c) Play tents for use by children indoors or outdoors (**heading 95.03**).

63.07 - Other made up articles, including dress patterns.

6307.10 - Floor-cloths, dish-cloths, dusters and similar cleaning cloths

6307.20 - Life-jackets and life-belts

6307.90 - Other

This heading covers made up articles of any textile material which are **not included** more specifically in other headings of Section XI or elsewhere in the Nomenclature.

It includes, in particular :

- (1) Floor-cloths, dish-cloths, dusting cloths and similar cleaning cloths (whether or not impregnated with a cleaning preparation, but **excluding** those of **heading 34.01 or 34.05**).
- (2) Life-jackets and life-belts.
- (3) Dress patterns, usually made of stiff canvas; these are sometimes supplied with the various parts stitched together in the form of the garment.
- (4) Flags, pennants and banners, including bunting for entertainments, galas or other purposes.
- (5) Domestic laundry or shoe bags, stocking, handkerchief or slipper sachets, pyjama or nightdress cases and similar articles.
- (6) Garment bags (portable wardrobes) **other than** those of **heading 42.02**.
- (7) Loose covers for motor-cars, machines, suitcases, tennis rackets, etc.
- (8) Flat protective sheets (**excluding** tarpaulin and ground sheets of **heading 63.06**).
- (9) Textile coffee-filters, icing bags, etc.
- (10) Shoe-polishing pads (**excluding** those of **heading 34.05**).
- (11) Pneumatic cushions (**excluding** camping goods of **heading 63.06**).
- (12) Tea cosy covers.
- (13) Pincushions.
- (14) Boot, shoe, corset, etc. laces with fitted ends; but laces consisting of spun yarns or cords with fitted ends are **excluded** (**heading 56.09**).

- (15) Belts which, although worn around the waist, do not have the character of belts of **heading 62.17**, e.g., belts for occupational use (electricians', aviators', parachutists', etc.); webbing carrier straps and similar articles. (Straps having the character of articles of saddlery or harness are **excluded - heading 42.01**.)
- (16) Carry cots, portable cradles and similar carriers for children.
- Infants' seats of the type intended to be hooked, for example, over the backs of car seats are **excluded (heading 94.01)**.
- (17) Umbrella or sun umbrella covers and cases.
- (18) Fans and hand screens, with textile mounts (leaves) and frames of any material, and mounts presented separately. However, fans or hand screens with frames of precious metal are classified in **heading 71.13**.
- (19) Packing cloths which, after use as bale wrappings, are roughly or loosely stitched together at the edges, but which do not constitute sacks or bags or unfinished sacks or bags of **heading 63.05**.
- (20) Cheese-cloths, cut into rectangles, with the ends of the warp threads knotted to prevent unravelling. (Cheese-cloths woven in the piece prepared for cutting to size or shape, but requiring further fabrication before use, are to be classified as piece goods.)
- (21) Trimmings for umbrellas, sun umbrella, walking-sticks, etc; sword-knots and the like.
- (22) Textile face-masks of a kind worn by surgeons during operations.
- (23) Face-masks for protection against dust, odours, etc., not equipped with a replaceable filter, but consisting of several layers of nonwovens, whether or not treated with activated carbon or having a central layer of synthetic fibres.
- (24) Rosettes (e.g. those awarded at competitions), other than those for garments.
- (25) Pieces of textile fabric which have undergone some working (such as hemming or the formation of necklines), intended for the manufacture of garments but not yet sufficiently completed to be identifiable as garments or parts of garments.
- (26) Support articles of the kind referred to in Note 1 (b) to Chapter 90 for joints (e.g., knees, ankles, elbows or wrists) or muscles (e.g., thigh muscles), **other than** those falling in other headings of Section XI.
- (27) Nonwoven articles, cut to a specific shape, coated on one side with an adhesive protected by a sheet of paper or other material and designed to adhere around the lower part of the breast in order to form or shape the breast.

Besides the finished articles listed above, this heading covers articles in the length, made up within the meaning of Note 7 to Section XI, **provided** they are not included in other headings of Section XI. For instance, it applies to textile draught excluders for doors or windows (including those stuffed with wadding).

The heading **excludes** textile articles classified in more specific headings of this Chapter or of Chapters 56 to 62. It further **excludes** :

- (a) Saddlery and harness for any kind of animal (**heading 42.01**).
 - (b) Travel goods (suit-cases, rucksacks, etc.), shopping-bags, toilet-cases, etc., and all similar containers of **heading 42.02**.
 - (c) Printed matter (**Chapter 49**).
 - (d) Labels, badges and similar articles of **heading 58.07, 61.17 or 62.17**.
 - (e) Knitted headbands (**heading 61.17**).
 - (f) Sacks and bags of **heading 63.05**.
 - (g) Footwear, parts of footwear (including removable in-soles), and other articles (gaiters, spats, leggings, etc.) of **Chapter 64**.
 - (h) Headgear and parts and fittings thereof of **Chapter 65**.
 - (ij) Umbrellas and sun umbrellas (**heading 66.01**).
 - (k) Artificial flowers, foliage or fruit and parts thereof, and articles made of artificial flowers, foliage or fruit (**heading 67.02**).
 - (l) Pneumatic canoes, kayaks and other craft (**heading 89.03**).
 - (m) Measuring tapes (**heading 90.17**).
 - (n) Watch straps (**heading 91.13**).
 - (o) Toys, games and entertainment articles, etc., of **Chapter 95**.
 - (p) Mops (**heading 96.03**), hand sieves and hand riddles (**heading 96.04**) and powder-puffs (**heading 96.16**).
 - (q) Sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles of **heading 96.19**.
-

Sub-Chapter II

SETS

63.08 - Sets consisting of woven fabric and yarn, whether or not with accessories, for making up into rugs, tapestries, embroidered table cloths or serviettes, or similar textile articles, put up in packings for retail sale.

The sets of this heading are used for needlework, rug-making, etc.

They must comprise at least a piece of woven fabric (for example, canvas, whether or not printed with the design to be executed) and yarn, whether or not cut to length (embroidery yarn, yarn for rug pile, etc.). They may also include accessories such as needles and hooks.

The woven fabric may be in any form and even be made up as, for example, in the case of hemmed canvas used in the manufacture of needleworked tapestries; it should be noted, however, that the woven fabric should nevertheless retain the character of a raw material with regard to the work to be carried out and should never constitute an " article " in a state suitable for use without any further finishing, such as, for example, a hemmed table cloth to be embellished with a few embroidered designs.

It should be noted that in order to be classified in this heading the sets must be presented in packings for retail sale.

The heading **does not include** sets comprising woven fabric, whether or not cut to shape, for making up garments; these are classified in their appropriate headings.

Sub-Chapter III

WORN CLOTHING AND WORN TEXTILE ARTICLES; RAGS

63.09 - Worn clothing and other worn articles.

In order to be classified in this heading the articles, of which a **limitative** list is given in paragraphs (1) and (2) of this Explanatory Note, must comply with both of the following requirements. If they do not meet these requirements they are classified in their appropriate headings.

- (A) **They must show signs of appreciable wear**, whether or not they require cleaning or repair before use.

New articles with faults in weaving, dyeing, etc., and shop-soiled articles are **excluded** from this heading.

- (B) **They must be presented in bulk (e.g., in railway goods wagons) or in bales, sacks or similar bulk packings**, or in bundles tied together without external wrapping, or packed roughly in crates.

These articles are normally traded in large consignments, usually for resale, and are less carefully packed than is generally the case with new articles.

*
* * *

Subject to compliance with the above requirements, this heading covers the goods in the following **limitative** list only :

- (1) The following articles of textile materials of Section XI : clothing and clothing accessories (e.g., garments, shawls, scarves, stockings and socks, gloves and collars), blankets and travelling rugs, household linen (e.g., bed sheets and table linen) and furnishing articles (e.g., curtains and table covers). The heading also includes parts of such clothing or clothing accessories.

However, the heading **excludes** furnishing articles specified in **Chapter 57** or **heading 58.05** (carpets and other textile floor coverings including "Kelem", "Schumacks", "Karamanie", and similar hand woven rugs, and tapestries) even when showing signs of appreciable wear and irrespective of their packing. The articles falling in **Chapter 94** and in particular those specified in **heading 94.04** (mattress supports; articles of bedding and similar furnishing articles fitted with springs or stuffed or internally fitted, for example, mattresses, quilts, eiderdowns, cushions, pouffes, pillows) are also **excluded** from this heading irrespective of their degree of wear or their packing.

- (2) Footwear and headgear of all kinds and of any material **other than** of asbestos (e.g., leather, rubber, textile materials, straw or plastics).

All other articles (e.g., sacks and bags, tarpaulins, tents and camping goods) showing signs of wear are **excluded** from this heading and are to be classified with the corresponding new articles.

63.10 - Used or new rags, scrap twine, cordage, rope and cables and worn out articles of twine, cordage, rope or cables, of textile materials (+).

6310.10 - Sorted

6310.90 - Other

This heading covers the following textile products :

- (1) Rags of textile fabrics (including knitted or crocheted fabrics, felt or nonwovens). Rags may consist of articles of furnishing or clothing or of other old textile articles so worn out, soiled or torn as to be beyond cleaning or repair, or of small new cuttings (e.g., dressmakers' or tailors' snippings).
 - (2) Scrap pieces of twine, cordage, rope or cables, used or unused (e.g., scrap pieces resulting from the manufacture of twine, cordage, rope or cables, or of articles thereof), and old twine, cordage, rope and cables and worn out articles of such materials.

To fall in the heading, these products **must** be worn, dirty or torn, or in small pieces. They are generally fit only for the recovery (e.g., by pulling) of the fibres (which are usually re-spun), for the manufacture of paper or plastics, for the manufacture of polishing materials (e.g., polishing wheels), or for use as industrial wipers (e.g., machine wipers).

All other textile waste and scrap, however, is **excluded** from this heading. This exclusion applies particularly to tangled yarn obtained during the process of manufacturing knitted and crocheted fabrics, or by unravelling worn out knitted or crocheted articles; any other waste or scrap textile yarns or fibres (including those obtained from the padding of old mattresses, cushions, bedspreads, etc.); garnetted stock. These products are classified in **Chapters 50 to 55** in the relevant headings relating to "waste" or "garnetted stock".

The heading also **excludes** fabrics showing faults in weaving, dyeing, etc., but which do not fulfil the conditions mentioned above. These fabrics are classified in the headings appropriate to new fabrics.

10

Subheading Explanatory Note.

Subheading 6310.10

Products of heading 63.10 are considered "sorted" when graded according to specific criteria or when resulting from the use of a particular textile product (e.g., goods of the same nature or the same textile material, twine of uniform textile composition, new snippings all of the same colour).

Section XII

FOOTWEAR, HEADGEAR, UMBRELLAS, SUN UMBRELLAS, WALKING-STICKS, SEAT-STICKS, WHIPS, RIDING-CROPS AND PARTS THEREOF; PREPARED FEATHERS AND ARTICLES MADE THEREWITH; ARTIFICIAL FLOWERS; ARTICLES OF HUMAN HAIR

Chapter 64

Footwear, gaiters and the like; parts of such articles

Notes.

1.- This Chapter does not cover :

- (a) Disposable foot or shoe coverings of flimsy material (for example, paper, sheeting of plastics) without applied soles. These products are classified according to their constituent material;
- (b) Footwear of textile material, without an outer sole glued, sewn or otherwise affixed or applied to the upper (Section XI);
- (c) Worn footwear of heading 63.09;
- (d) Articles of asbestos (heading 68.12);
- (e) Orthopaedic footwear or other orthopaedic appliances, or parts thereof (heading 90.21); or
- (f) Toy footwear or skating boots with ice or roller skates attached; shin-guards or similar protective sportswear (Chapter 95).

2.- For the purposes of heading 64.06, the term " parts " does not include pegs, protectors, eyelets, hooks, buckles, ornaments, braid, laces, pompons or other trimmings (which are to be classified in their appropriate headings) or buttons or other goods of heading 96.06.

3.- For the purposes of this Chapter :

- (a) the terms " rubber " and " plastics " include woven fabrics or other textile products with an external layer of rubber or plastics being visible to the naked eye; for the purpose of this provision, no account should be taken of any resulting change of colour; and
- (b) the term " leather " refers to the goods of headings 41.07 and 41.12 to 41.14.

4.- Subject to Note 3 to this Chapter :

- (a) The material of the upper shall be taken to be the constituent material having the greatest external surface area, no account being taken of accessories or reinforcements such as ankle patches, edging, ornamentation, buckles, tabs, eyelet stays or similar attachments;
- (b) The constituent material of the outer sole shall be taken to be the material having the greatest surface area in contact with the ground, no account being taken of accessories or reinforcements such as spikes, bars, nails, protectors or similar attachments.

○
○ ○

Subheading Note.

1.- For the purposes of subheadings 6402.12, 6402.19, 6403.12, 6403.19 and 6404.11, the expression " sports footwear " applies only to :

- (a) Footwear which is designed for a sporting activity and has, or has provision for the attachment of, spikes, sprigs, stops, clips, bars or the like;

- (b) Skating boots, ski-boots and cross-country ski footwear, snowboard boots, wrestling boots, boxing boots and cycling shoes.

GENERAL

With certain **exceptions** (see particularly those mentioned at the end of this General Note) this Chapter covers, under headings 64.01 to 64.05, various types of footwear (including overshoes) irrespective of their shape and size, the particular use for which they are designed, their method of manufacture or the materials of which they are made.

For the purposes of this Chapter, the term "footwear" **does not**, however, **include** disposable foot or shoe coverings of flimsy material (paper, sheeting of plastics, etc.) without applied soles. These products are classified according to their constituent material.

(A) Footwear may range from sandals with uppers consisting simply of adjustable laces or ribbons to thigh-boots (the uppers of which cover the leg and thigh, and which may have straps, etc., for fastening the uppers to the waist for better support). The Chapter includes :

- (1) Flat or high-heeled shoes for ordinary indoor or outdoor wear.
- (2) Ankle-boots, half-boots, knee-boots and thigh-boots.
- (3) Sandals of various types, " espadrilles " (shoes with canvas uppers and soles of plaited vegetable material), tennis shoes, jogging shoes, bathing slippers and other casual footwear.
- (4) Special sports footwear which is designed for a sporting activity and has, or has provision for, the attachment of spikes, sprigs, stops, clips, bars or the like and skating boots, ski-boots and cross-country ski footwear, snowboard boots, wrestling boots, boxing boots and cycling shoes (see Subheading Note 1 to the Chapter).

Roller-skating or ice-skating boots with skates fixed to the soles, are, however, **excluded** (**heading 95.06**).

- (5) Dancing slippers.
- (6) House footwear (e.g., bedroom slippers).
- (7) Footwear obtained in a single piece, particularly by moulding rubber or plastics or by carving from a solid piece of wood.
- (8) Other footwear specially designed to protect against oil, grease, chemicals or cold.
- (9) Overshoes worn over other footwear; in some cases, they are heel-less.
- (10) Disposable footwear, with applied soles, generally designed to be used only once.

- (B) The footwear covered by this Chapter may be of any material (rubber, leather, plastics, wood, cork, textiles including felt and nonwovens, furskin, plaiting materials, etc.) **except** asbestos, and may contain, in any proportion, the materials of Chapter 71.

Within the limits of the Chapter itself, however, it is the constituent material of the outer sole and of the upper which determines classification in headings 64.01 to 64.05.

- (C) The term "outer sole" as used in headings 64.01 to 64.05 means that part of the footwear (other than an attached heel) which, when in use, is in contact with the ground. The constituent material of the outer sole for purposes of classification shall be taken to be the material having the greatest surface area in contact with the ground. In determining the constituent material of the outer sole, no account should be taken of attached accessories or reinforcements which partly cover the sole (see Note 4 (b) to this Chapter). These accessories or reinforcements include spikes, bars, nails, protectors or similar attachments (including a thin layer of textile flocking (e.g., for creating a design) or a detachable textile material, applied to but not embedded in the sole).

In the case of footwear made in a single piece (e.g., clogs) without applied soles, no separate outer sole is required; such footwear is classified with reference to the constituent material of its lower surface.

- (D) For the purposes of the classification of footwear in this Chapter, the constituent material of the uppers must also be taken into account. The upper is the part of the shoe or boot above the sole. However, in certain footwear with plastic moulded soles or in shoes of the American Indian moccasin type, a single piece of material is used to form the sole and either the whole or part of the upper, thus making it difficult to identify the demarcation between the outer sole and the upper. In such cases, the upper shall be considered to be that portion of the shoe which covers the sides and top of the foot. The size of the uppers varies very much between different types of footwear, from those covering the foot and the whole leg, including the thigh (for example, fishermen's boots), to those which consist simply of straps or thongs (for example, sandals).

If the upper consists of two or more materials, classification is determined by the constituent material which has the greatest external surface area, no account being taken of accessories or reinforcements such as ankle patches, protective or ornamental strips or edging, other ornamentation (e.g., tassels, pompons or braid), buckles, tabs, eyelet stays, laces or slide fasteners. The constituent material of any lining has no effect on classification.

- (E) It should be noted that for the purposes of this Chapter, the terms "rubber" and "plastics" include woven fabrics or other textile products with an external layer of rubber or plastics being visible to the naked eye, no account being taken of any resulting change of colour.
- (F) Subject to the provisions of (E) above, for the purposes of this Chapter the expression "textile materials" covers the fibres, yarns, fabrics, felts, nonwovens, twine, cordage, ropes, cables, etc., of Chapters 50 to 60.
- (G) For the purposes of this Chapter, the term "leather" refers to the goods of headings 41.07 and 41.12 to 41.14.

- (H) Boot or shoe bottoms, consisting of an outer sole affixed to an incomplete or unfinished upper, which do not cover the ankle are to be regarded as footwear (and not as parts of footwear). These articles may be finished simply by trimming their top edge with a border and adding a fastening device.

This Chapter also **excludes** :

- (a) Footwear of textile material, without an outer sole glued, sewn or otherwise affixed or applied to the upper (**Section XI**).
- (b) Footwear showing signs of appreciable wear and presented in bulk or in bales, sacks or similar packings (**heading 63.09**).
- (c) Footwear of asbestos (**heading 68.12**).
- (d) Orthopaedic footwear (**heading 90.21**).
- (e) Toy footwear and skating boots with ice or roller skates attached; shin-guards and similar protective sportswear (**Chapter 95**).

64.01 - Waterproof footwear with outer soles and uppers of rubber or of plastics, the uppers of which are neither fixed to the sole nor assembled by stitching, riveting, nailing, screwing, plugging or similar processes.

6401.10 - Footwear incorporating a protective metal toe-cap

- Other footwear :

6401.92 -- Covering the ankle but not covering the knee

6401.99 -- Other

This heading covers waterproof footwear with both the outer soles and the uppers (see General Explanatory Note, paragraphs (C) and (D)), of rubber (as defined in Note 1 to Chapter 40), plastics or textile material with an external layer of rubber or plastics being visible to the naked eye (see Note 3 (a) to this Chapter), **provided** the uppers are neither fixed to the sole nor assembled by the processes named in the heading.

The heading includes footwear constructed to protect against penetration by water or other liquids and would include, *inter alia*, certain snow-boots, galoshes, overshoes and ski-boots.

Footwear remains in this heading even if it is made partly of one and partly of another of the specified materials (e.g., the soles may be of rubber and the uppers of woven fabric with an external layer of plastics being visible to the naked eye; for the purpose of this provision no account should be taken of any resulting change of colour).

The heading covers, *inter alia*, footwear obtained by any of the processes described below :

(1) **Press moulding**

In this process, a core, sometimes covered by a textile " sock " which later forms the lining of the article, is placed in a mould with either preforms or granules.

The mould is closed and placed between the platens of a press, which are heated to a high temperature.

Under the influence of the heat, the preforms or granules acquire a certain degree of viscosity and completely fill the space between the core and the walls of the mould; the excess material escapes through vents. The material then vulcanises (rubber) or gels (poly(vinyl chloride)).

When the moulding process is complete, the shoe is taken out of the mould and the core is removed.

(2) **Injection moulding**

This process is similar to press moulding, except that the preforms or granules used in the press moulding process are replaced by a rubber-based or poly(vinyl chloride)-based mix, preheated to give it the viscosity required for injection into the mould.

(3) **Slush moulding**

In this process, poly(vinyl chloride) or polystyrene paste is injected into a mould to form a complete coating which gels, excess material escaping through vents.

(4) **Rotational casting**

This process is similar to slush moulding, except that the coating is formed by rotating the paste in a closed mould.

(5) **“ Dip moulding ”**

In this process, a hot mould is dipped into the paste (this process is rarely used in the footwear industry).

(6) **Assembly by vulcanising**

In this process, the raw material (usually rubber or thermoplastics) is prepared with sulphur powder and passed through a press to produce a flat sheet. The sheet is cut (and sometimes calendered) into the shape of the various parts of the outer sole and upper (i.e., vamps, quarters, counters, toe pieces, etc.). The parts are slightly heated to make the material tacky and are then assembled on a last, the shape of which conforms to the shape of the footwear. The assembled footwear is pressed against the last, so that the parts adhere to one another, and then vulcanised. Footwear obtained by this process is known in the trade as “ built-up footwear ”.

(7) **Bonding and vulcanising**

This process is used for moulding and vulcanising an outer sole and heel of rubber on a **preassembled upper** in one operation. The sole is firmly bonded to the upper with cement which hardens during vulcanisation.

(8) **High frequency welding**

In this process, materials are bonded by heat and pressure, without the use of cement.

(9) **Cementing**

In this process, **soles which have been previously moulded** or cut from a sheet are stuck to the uppers **with an adhesive; pressure** is applied, and the article is left to **dry**. Although pressure may be applied at a raised temperature, the material used for the sole is in its final form before the sole is stuck to the upper, and its physical qualities are in no way modified by this operation.

64.02 - Other footwear with outer soles and uppers of rubber or plastics.

- Sports footwear :

6402.12 -- Ski-boots, cross-country ski footwear and snowboard boots

6402.19 -- Other

6402.20 - Footwear with upper straps or thongs assembled to the sole by means of plugs

- Other footwear :

6402.91 -- Covering the ankle

6402.99 -- Other

This heading covers footwear with outer soles and uppers of rubber or plastics, **other than those of heading 64.01**.

Footwear remains in this heading even if it is made partly of one and partly of another of the specified materials (e.g., the soles may be of rubber and the uppers of woven fabric with an external layer of plastics being visible to the naked eye; for the purpose of this provision no account should be taken of any resulting change of colour).

The heading covers, *inter alia* :

- (a) Ski-boots consisting of several moulded parts hinged on rivets or similar devices;
- (b) Clogs without quarter or counter, the uppers of which are produced in one piece usually attached to the base or platform by riveting;
- (c) Slippers or mules without quarter or counter, the uppers of which, being produced in one piece or assembled other than by stitching, are attached to the sole by stitching;
- (d) Sandals consisting of straps across the instep and of counter or heelstrap attached to the sole by any process;
- (e) *Thong-type* sandals in which the thongs are attached to the sole by plugs which lock into holes in the sole;
- (f) Non-waterproof footwear produced in one piece (for example, bathing slippers).

64.03 - Footwear with outer soles of rubber, plastics, leather or composition leather and uppers of leather.

- Sports footwear :

6403.12 -- Ski-boots, cross-country ski footwear and snowboard boots

6403.19 -- Other

6403.20 - Footwear with outer soles of leather, and uppers which consist of leather straps across the instep and around the big toe

6403.40 - Other footwear, incorporating a protective metal toe-cap

- Other footwear with outer soles of leather :

6403.51 -- Covering the ankle

6403.59 -- Other

- Other footwear :

6403.91 -- Covering the ankle

6403.99 -- Other

This heading covers footwear with uppers (see General Explanatory Note, Part (D)) made of leather and with outer soles (see General Explanatory Note, Part (C)) made of :

- (1) Rubber (as defined in Note 1 to Chapter 40).
- (2) Plastics.
- (3) Woven fabrics or other textile products with an external layer of rubber or plastics being visible to the naked eye, no account being taken of any resulting change of colour (see Note 3 (a) to this Chapter and General Explanatory Note, Part (E)).
- (4) Leather (see Note 3 (b) to this Chapter).
- (5) Composition leather (by virtue of Note 3 to Chapter 41, "composition leather" is restricted to substances with a basis of leather or leather fibre).

64.04 - Footwear with outer soles of rubber, plastics, leather or composition leather and uppers of textile materials.

- Footwear with outer soles of rubber or plastics :

6404.11 -- Sports footwear; tennis shoes, basketball shoes, gym shoes, training shoes and the like

6404.19 -- Other

6404.20 - Footwear with outer soles of leather or composition leather

This heading covers footwear with uppers (see General Explanatory Note, Part (D)) made of textile materials and with outer soles (see General Explanatory Note, Part (C)) made of the same materials as the footwear of heading 64.03 (see the Explanatory Note to that heading).

64.05 - Other footwear.

6405.10 - With uppers of leather or composition leather

6405.20 - With uppers of textile materials

6405.90 - Other

Subject to Notes 1 and 4 to this Chapter, this heading covers all footwear having outer soles and uppers of a material or combination of materials not referred to in the preceding headings of this Chapter.

The heading includes in particular :

- (1) Footwear, with outer soles of rubber or plastics, and the uppers made of material other than rubber, plastics, leather or textile material;
- (2) Footwear with outer soles of leather or of composition leather, and the uppers made of material other than leather or textile material;
- (3) Footwear with outer soles of wood, cork, twine or rope, paperboard, furskin, textile fabric, felt, nonwovens, linoleum, raffia, straw, loofah, etc. The uppers of such footwear may be of any material.

The heading **excludes** assemblies of parts (e.g., uppers, whether or not affixed to an inner sole) not yet constituting nor having the essential character of footwear as described in headings 64.01 to 64.05 (**heading 64.06**).

64.06 - Parts of footwear (including uppers whether or not attached to soles other than outer soles); removable in-soles, heel cushions and similar articles; gaiters, leggings and similar articles, and parts thereof.

6406.10 - Uppers and parts thereof, other than stiffeners

6406.20 - Outer soles and heels, of rubber or plastics

6406.90 - Other

(I) PARTS OF FOOTWEAR (INCLUDING UPERS WHETHER OR NOT ATTACHED TO SOLES OTHER THAN OUTER SOLES); REMOVABLE IN-SOLES, HEEL CUSHIONS AND SIMILAR ARTICLES

This heading covers :

- (A) The various component parts of footwear; these parts may be of any materials **except asbestos.**

Parts of footwear may vary in shape according to the types or styles of footwear for which they are intended. They include :

- (1) Parts of uppers (e.g., vamps, toecaps, quarters, legs, linings and clog straps), including pieces of leather for making footwear cut to the approximate shape of uppers.
- (2) Stiffeners. These may be inserted between the quarters and lining, or between the toecap and lining, to give firmness and solidity at these parts of the footwear.
- (3) Inner, middle and outer soles, including half soles or patins; also in-soles for glueing on the surface of the inner soles.
- (4) Arch supports or shanks and shank pieces (generally of wood, leather, fibreboard or plastics) for incorporation in the sole to form the curved arch of the footwear.
- (5) Various types of heels made of wood, rubber, etc., including glue-on, nail-on and screw-on types; parts of heels (e.g., top pieces).
- (6) Studs, spikes, etc., for sports footwear.
- (7) Assemblies of parts (e.g., uppers, whether or not affixed to an inner sole) not yet constituting nor having the essential character of footwear as described in headings 64.01 to 64.05.

- (B) The following fittings (of any material **except** asbestos) which may be worn inside the footwear : removable in-soles, hose protectors (of rubber, rubberised fabric, etc.) and removable interior heel cushions.

(II) GAITERS, LEGGINGS, AND SIMILAR ARTICLES, AND PARTS THEREOF

These articles are designed to cover the whole or part of the leg and in some cases part of the foot (e.g., the ankle and instep). They differ from socks and stockings, however, in that they do not cover the entire foot.

They may be made of any material (leather, canvas, felt, knitted or crocheted fabrics, etc.) **except** asbestos.

They include gaiters, leggings, spats, puttees, "mountain stockings" without feet, leg warmers and similar articles.

Certain of these articles may have a retaining strap or elastic band which fits under the arch of the foot.

The heading also covers identifiable parts of the above articles.

*
* * *

The heading also **excludes** :

- (a) Welts in the length of leather or composition leather (**heading 42.05**), of plastics (**Chapter 39**) or of rubber (**Chapter 40**).
 - (b) Knee and ankle supports (such as those consisting of elastic fabric designed simply to support or sustain weak joints); these are classified in their own appropriate headings according to the material of which they are made.
 - (c) One-piece leggings (tights) of the kind worn by very young children; these are garments which reach the waist, and fit closely round the leg and sometimes cover the entire foot (**Chapter 61** or **62**).
 - (d) Footwear parts and accessories of asbestos (**heading 68.12**).
 - (e) Special in-soles for arch supporting, made to measure, and orthopaedic appliances (**heading 90.21**).
 - (f) Cricket pads, shin-guards, knee-caps and other protective articles for sports activities (**heading 95.06**).
 - (g) Pegs, nails, eyelets, hooks, buckles, protectors, braid, pompons, laces, which are classified in their appropriate headings, buttons, snap-fasteners, press-studs, push-buttons (**heading 96.06**) and slide fasteners (zippers) (**heading 96.07**).
-

Chapter 65

Headgear and parts thereof

Notes.

- 1.- This Chapter does not cover :
 - (a) Worn headgear of heading 63.09;
 - (b) Asbestos headgear (heading 68.12); or
 - (c) Dolls' hats, other toy hats or carnival articles of Chapter 95.
- 2.- Heading 65.02 does not cover hat-shapes made by sewing other than those obtained simply by sewing strips in spirals.

GENERAL

With the **exception** of the articles listed below this Chapter covers hat-shapes, hat-forms, hat bodies and hoods, and hats and other headgear of all kinds, irrespective of the materials of which they are made and of their intended use (daily wear, theatre, disguise, protection, etc.).

It also covers hair-nets of any material and certain specified fittings for headgear.

The hats and other headgear of this Chapter may incorporate trimmings of various kinds and of any material, including trimmings made of the materials of Chapter 71.

This Chapter **does not include** :

- (a) Headgear for animals (**heading 42.01**).
- (b) Shawls, scarves, mantillas, veils and the like (**heading 61.17** or **62.14**).
- (c) Headgear showing signs of appreciable wear and presented in bulk, bales, sacks or similar bulk packings (**heading 63.09**).
- (d) Wigs and the like (**heading 67.04**).
- (e) Asbestos headgear (**heading 68.12**).
- (f) Dolls' hats, other toy hats or carnival articles (**Chapter 95**).
- (g) Various articles used as hat trimmings (buckles, clasps, badges, feathers, artificial flowers, etc.) when not incorporated in headgear (appropriate headings).

65.01 - Hat-forms, hat bodies and hoods of felt, neither blocked to shape nor with made brims; plateaux and manchons (including slit manchons), of felt.

(A) Hat-forms, hat bodies and hoods of felt, neither blocked to shape nor with made brims.

Fur-felt hat-forms, hat bodies and hoods are usually made from the fur of the rabbit, hare, musk-rat, nutria or beaver; wool-felt hat-forms, etc., are usually of wool or the hair of the vicuna, camel (including dromedary), etc. In some cases felts are made of mixtures of these materials, sometimes mixed with man-made fibres.

After suitable processing the fur is applied evenly to a cone-shaped former by suction and, in the case of wool, by entwining the carded fibres on a double cone. (This latter form when cut in two at the widest part provides two cone-shaped hat-forms.) After spraying with hot water or steam, the shaped forms are removed from the cones. These forms, which are still in a loosely-felted state (not normally found in international trade), undergo a series of hardening and shrinking processes to produce fully-felted, approximately cone-shaped hat bodies.

The heading also covers hat bodies which have been tip-stretched to form rounded crowns, sometimes with parallel sides but more usually with sloping sides and an incipient brim. These latter may be distinguished from blocked hoods because, when placed upright on a flat surface, the brim does not project from the crown at approximately a right angle (see heading 65.05). Certain of these unblocked hat bodies, hoods, etc., of this heading are sometimes described as half capelines. (The articles known as full capelines, however, have been subjected to a blocking process and fall in **heading 65.05**.)

Classification in this heading is not affected by processes such as pouncing, dyeing or stiffening.

The heading includes certain very light and thin hoods known as "chemises" or handkerchief felts, used for fixing to rigid hat foundations.

(B) The heading also includes :

- (1) Felt plateaux** made initially in the form of wide-based cones, and then stretched to the form of flat discs about 60 cm in diameter. These felt discs are often cut into pieces and then sewn into the shape of a hat or cap. Military or other uniform dress caps are sewn from this type of felt.
- (2) Felt manchons** usually made of fur on a cylindrical form (between 40 and 50 cm in height and about 100 cm in circumference) by a suction process similar to that used for making fur-felt cones. They are normally used by milliners, and are classified in this heading whether in cylinders or slit into rectangular form. The rectangular-formed felt is cut into pieces to be used as trimmings or sewn together into the shape of a hat or cap.

65.02 - Hat-shapes, plaited or made by assembling strips of any material, neither blocked to shape, nor with made brims, nor lined, nor trimmed.

This heading covers **hat-shapes, neither blocked to shape nor with made brims, nor lined, nor trimmed, made either :**

- (1) Directly by plaiting from fibres or strips of any material (particularly straw, reeds, palm fibres, raffia, sisal, strips of paper, strips of plastics or strips of wood). These materials may be plaited by various methods including "plaiting" by arranging one set of fibres or strips so that they radiate from the centre of the crown and interlacing them with other fibres or strips wound spirally. Additional radial fibres or strips are introduced in the "plaiting" as the distance from the centre increases.

or

- (2) Subject to Note 2 to this Chapter, by assembling strips (usually not more than 5 cm in width) of any material (e.g., plaited or other strips of felt or other textile fabric, monofilament or plastics), usually by sewing the strips spirally together, starting from the crown, in such a manner that each spiral overlaps the previous one, or by arranging plaits spirally so that the serrated edges intermesh and assembling them by threading.

Because of the method of plaiting or assembling the strips, the hat-shapes of this heading, unlike the articles of **heading 65.01**, frequently have a distinct line of demarcation between the crown and the brim which may sometimes be at approximately right angles to each other. Hat-shapes of this kind are sometimes worn as such (e.g., for beach or country wear), but as they are **not** blocked to shape nor with made brims they remain in this heading **provided** they are not lined or trimmed.

They can generally be distinguished from blocked shapes in that the latter usually have, as a result of blocking, an oval-shaped crown (see Explanatory Note to heading 65.04).

Classification in this heading is not affected by processes such as dyeing, bleaching, clipping or fixing the protruding ends of plaits, nor by minor processes designed simply to restore the original shape (e.g., round opening) of the article after bleaching, dyeing, etc.

It should be noted, however, that unblocked hat-shapes of the kind falling in this heading are classified as hats under **heading 65.04** if they have been lined or trimmed.

[65.03]

65.04 - Hats and other headgear, plaited or made by assembling strips of any material, whether or not lined or trimmed.

This heading covers essentially hats and other headgear made from the hat-shapes of heading 65.02 after they have been blocked to shape, have had their brim made or have been lined or trimmed.

The hat-shapes are blocked by pressing or ironing on a matrice, usually after having been stiffened by application of gelatin, size, gum, etc. In the process of blocking, the crown opening is given an oval shape of the required size and at the same time the brim becomes more clearly defined.

After blocking, the brim is fashioned to the required shape.

Hat-shapes which have been blocked should not be confused with shapes which have not been blocked (**heading 65.02**), notwithstanding that these latter are sometimes worn as such untrimmed (e.g., for beach or country wear).

After blocking and, where applicable, brim-shaping, hats and headgear may be subjected to further finishing operations (e.g., fitted with linings, head-bands, hat-bands, chinstraps, decorative accessories such as artificial flowers, fruit or foliage, pins and feathers).

In addition to the articles described above, the heading also covers :

- (1) Hats and other headgear, in a variety of forms, made by milliners from the hat-shapes of heading 65.02, neither blocked nor with made brims.
- (2) Hats and other headgear made directly by assembling strips (**other than** hat forms of **heading 65.02** assembled by sewing in spirals, which may be worn directly as hats) of any material.
- (3) Hat-shapes of heading 65.02, simply blocked or with made brims, and hat-shapes neither blocked to shape nor with made brims but lined or trimmed (with ribbon, cord, etc.).

65.05 - Hats and other headgear, knitted or crocheted, or made up from lace, felt or other textile fabric, in the piece (but not in strips), whether or not lined or trimmed; hair-nets of any material, whether or not lined or trimmed.

This heading covers hats and headgear (whether or not lined or trimmed) made directly by knitting or crocheting (whether or not fulled or felted), or made up from lace, felt or other textile fabric in the piece, whether or not the fabric has been oiled, waxed, rubberised or otherwise impregnated or coated.

It also includes hat-shapes made by sewing, but **not** hat-shapes or headgear made by sewing or otherwise assembling plaits or strips (**heading 65.04**). This heading also covers felt and other felt headgear, made from the hat bodies, hoods or plateaux (felt discs) of **heading 65.01**, including hoods which have simply been blocked to shape and hoods with made brims.

The articles are classified here whether or not they have been lined or trimmed.

They include :

- (1) Hats, whether or not trimmed with ribbons, hat pins, buckles, artificial flowers, foliage or fruit, feathers or other trimmings of any material.

Headgear of feathers or artificial flowers is **excluded** (**heading 65.06**).

- (2) Berets, bonnets, skull-caps and the like. These are usually made directly by knitting or crocheting, and are frequently fulled (e.g., basque berets).
- (3) Certain oriental headgear (e.g., fezzes). These are usually made directly by knitting or crocheting, and are frequently fulled .
- (4) Peaked caps of various kinds (uniform caps, etc.).
- (5) Professional and ecclesiastical headgear (mitres, birettas, mortar-boards, etc.).
- (6) Headgear made up from woven fabric, lace, net fabric, etc., such as chefs' hats, nuns' head-dresses, nurses' or waitresses' caps, etc., having clearly the character of headgear.
- (7) Cork or pith helmets, covered with textile fabric.
- (8) Sou'westers.
- (9) Hoods.

Detachable hoods for capes, cloaks, etc., presented with the garments to which they belong, are, however, **excluded** and are classified with the garments according to their constituent materials.

(10) Top hats and opera hats.

This heading also includes hair-nets, snoods and the like. These are of any material, generally of tulle or other net, knitted or crocheted fabric or of human hair.

65.06 - Other headgear, whether or not lined or trimmed.

6506.10 - Safety headgear

- Other :

6506.91 -- Of rubber or of plastics

6506.99 -- Of other materials

This heading covers all hats and headgear not classified in the preceding headings of this Chapter or in Chapter 63, 68 or 95. It covers, in particular safety headgear (e.g., for sporting activities, military or firemen's helmets, motor-cyclists', miners' or construction workers' helmets), whether or not fitted with protective padding or, in the case of certain helmets, with microphones or earphones.

The heading also covers :

- (1) Hats and headgear of rubber or plastics (e.g., bathing caps, hoods).
- (2) Hats and headgear of leather or composition leather.
- (3) Hats and headgear of furskin or artificial fur.
- (4) Hats and headgear of feathers or artificial flowers.
- (5) Hats and headgear of metal.

65.07 - Head-bands, linings, covers, hat foundations, hat frames, peaks and chinstraps, for headgear.

This heading covers **only** the following fittings for headgear :

(1) **Head-bands** for fitting on the inside edge of the crown. These are usually of leather, but may also be of composition leather, of oiled cloth or other coated fabric, etc. They are classified in this heading **only** when cut to length or otherwise ready for incorporation in the headgear. They frequently bear an inscription of the hat-maker's name, etc.

(2) **Linings and part linings** normally made of textile material but sometimes of plastics, leather, etc. These also usually bear a printed indication of the hat-maker's name, etc.

It should be noted that labels of the kind used for attaching to the inside crown of the hat, etc., are **not included** in this heading.

(3) **Covers**, generally of textile fabric or plastics.

(4) **Hat foundations**; these may consist of stiffened fabric (e.g., buckram), of paperboard, papier maché, cork, pith, metal, etc.

(5) **Hat frames**, e.g., wire frames (sometimes gimped with textile or other material) and spring frames for opera hats.

(6) **Peaks** (e.g., for uniform or other caps). Peaks designed for wear mainly as eyeshades are classified as headgear if they incorporate a head piece (crown) of any kind, otherwise they are classified according to their constituent material.

(7) **Chinstraps**; narrow strips or bands (including plaited strips) of leather, textile fabric, plastics, etc. They are usually made so that they may be adjusted to the required length. They may also serve as an ornamental trimming. Chinstraps are included in this heading **only** if they are ready for incorporation in headgear.

Chapter 66

Umbrellas, sun umbrellas, walking-sticks, seat-sticks, whips, riding-crops, and parts thereof

Notes.

- 1.- This Chapter does not cover :
 - (a) Measure walking-sticks or the like (heading 90.17);
 - (b) Firearm-sticks, sword-sticks, loaded walking-sticks or the like (Chapter 93); or
 - (c) Goods of Chapter 95 (for example, toy umbrellas, toy sun umbrellas).
- 2.- Heading 66.03 does not cover parts, trimmings or accessories of textile material, or covers, tassels, thongs, umbrella cases or the like, of any material. Such goods presented with, but not fitted to, articles of heading 66.01 or 66.02 are to be classified separately and are not to be treated as forming part of those articles.

66.01 - Umbrellas and sun umbrellas (including walking-stick umbrellas, garden umbrellas and similar umbrellas) (+).

6601.10 - Garden or similar umbrellas

- Other :

6601.91 - - Having a telescopic shaft

6601.99 - - Other

With the **exception** of umbrellas and sun umbrellas of a kind clearly designed for use as toys or as carnival articles (**Chapter 95**), this heading covers umbrellas and sun umbrellas of all kinds (e.g., "ceremonial" umbrellas, umbrella tents, walking-stick and seat-stick umbrellas, café, market, garden and similar umbrellas), regardless of the materials of which the various components (including fitted accessories and trimmings) are made. Thus the covers may be of any textile fabric, plastics, paper, etc., and they may be embroidered, trimmed with lace, fringed or otherwise decorated.

Walking-stick umbrellas are umbrellas with a rigid cover which gives the article the appearance of a walking-stick.

Umbrella tents consist of large umbrellas provided with a "curtain surround" which may be affixed to the ground (e.g., by means of pegs in the manner of a bell tent, or anchored by means of sand pockets on the inside of the "surround").

Umbrella shafts (sticks) are usually of wood, cane, plastics or metal. The handles may be of the same materials as the shafts (sticks), or they may consist wholly or partly of precious metal or metal clad with precious metal, ivory, horn, bone, amber, tortoise-shell, mother of pearl, etc., and they may incorporate precious or semi-precious stones (natural, synthetic or reconstructed), etc. The handles may also be covered with leather or other material, and may be furnished with tassels or sword-knots.

This heading **does not include** :

- (a) Cases for umbrellas or similar articles, whether or not presented with, but not fitted to the articles.
(These are classified in their appropriate headings.)
- (b) Beach tents not having the character of umbrellas or umbrella tents (**heading 63.06**).
○
○ ○

Subheading Explanatory Note.

Subheading 6601.10

Umbrellas which are designed not to be hand-held but to be fixed (e.g., to the ground, to a table or to a stand) are to be regarded as "garden or similar umbrellas". This subheading therefore includes umbrellas for outdoor seats, easels, garden tables, surveyors' tables, etc., and umbrella tents.

66.02 - Walking-sticks, seat-sticks, whips, riding-crops and the like.

With the **exception** of the goods mentioned in the exclusions below, this heading covers walking-sticks, canes, whips (including whip-leads), riding-crops and similar articles irrespective of the materials of which they are made.

(A) Walking-sticks, seat-sticks and similar articles.

In addition to ordinary walking-sticks, this group also includes seat-sticks (with handles designed to open out to form a seat), walking-sticks specially designed for disabled persons and senior citizens, boy scouts' poles, shepherds' crooks.

The group also includes unfinished walking-sticks of cane or wood which have been turned, bent or otherwise worked; but it **excludes** cane or wood suitable for the manufacture of walking-sticks which has been simply roughly trimmed or rounded (**heading 14.01** or **Chapter 44**). The heading also **excludes** blanks identifiable as unfinished handles (**heading 66.03**).

The handle and shaft (stick) portions of walking-sticks, etc., may be made of various materials and may incorporate precious metal or metal clad with precious metal, precious or semi-precious stones (natural, synthetic or reconstructed). They may also be wholly or partly covered with leather or other materials.

(B) Whips, riding-crops and similar articles.

This group includes :

- (1) Whips of all kinds generally consisting of combined stocks and lashes.
- (2) Riding-crops consisting of stocks with, generally, a short leather loop in place of a lash.

*
* * *

All these articles may be fitted with sword-knots or other accessories of any material.

This heading **excludes** :

- (a) Measure walking-sticks, gauging sticks and the like (**heading 90.17**).
- (b) Crutches and crutch sticks (**heading 90.21**).
- (c) Firearm-sticks, sword-sticks, loaded walking-sticks and the like (**Chapter 93**).
- (d) Articles of **Chapter 95** (e.g., golf clubs, hockey sticks, ski sticks, alpine ice-axes).

66.03 - Parts, trimmings and accessories of articles of heading 66.01 or 66.02.

6603.20 - Umbrella frames, including frames mounted on shafts (sticks)

6603.90 - Other

This heading **excludes** parts, trimmings and accessories, of textile material, and covers, tassels, thongs, umbrella cases and the like of any material; these are classified separately even when presented with, but not fitted to, umbrellas, sun umbrellas, walking-sticks, etc. (see Note 2 to this Chapter). With these **exceptions**, the heading covers identifiable parts, fittings and accessories for articles of heading 66.01 or 66.02.

These remain classified here regardless of their constituent material (including precious metal or metal clad with precious metal or natural, synthetic or reconstructed precious or semi-precious stones). They include :

- (1) Handles (including blanks identifiable as unfinished handles) and knobs for umbrellas, sun umbrellas, walking-sticks, whips, etc.
- (2) Frames, including frames mounted on sticks, and ribs and stretchers for frames.
- (3) Shafts (sticks), whether or not combined with handles or knobs, for umbrellas or sun umbrellas.
- (4) Stocks for whips or riding-crops.
- (5) Runners, rib tips, open cups and tip cups, ferrules, springs, collars, tilting devices for adjusting the top of the umbrella at an angle to the mast, spikes, ground plates for seat-sticks and the like, etc.

This heading **does not include** :

- (a) Unfinished walking-sticks (see Explanatory Note to **heading 66.02**).
 - (b) Iron or steel tubes, and iron or steel sections for ribs or stretchers, simply cut to length (**Chapter 72** or **73**).
-

Chapter 67

Prepared feathers and down and articles made of feathers or of down; artificial flowers; articles of human hair

Notes.

1.- This Chapter does not cover :

- (a) Straining cloth of human hair (heading 59.11);
- (b) Floral motifs of lace, of embroidery or other textile fabric (Section XI);
- (c) Footwear (Chapter 64);
- (d) Headgear or hair-nets (Chapter 65);
- (e) Toys, sports requisites or carnival articles (Chapter 95); or
- (f) Feather dusters, powder-puffs or hair sieves (Chapter 96).

2.- Heading 67.01 does not cover :

- (a) Articles in which feathers or down constitute only filling or padding (for example, bedding of heading 94.04);
- (b) Articles of apparel or clothing accessories in which feathers or down constitute no more than mere trimming or padding; or
- (c) Artificial flowers or foliage or parts thereof or made up articles of heading 67.02.

3.- Heading 67.02 does not cover :

- (a) Articles of glass (Chapter 70); or
- (b) Artificial flowers, foliage or fruit of pottery, stone, metal, wood or other materials, obtained in one piece by moulding, forging, carving, stamping or other process, or consisting of parts assembled otherwise than by binding, glueing, fitting into one another or similar methods.

67.01 - Skins and other parts of birds with their feathers or down, feathers, parts of feathers, down and articles thereof (other than goods of heading 05.05 and worked quills and scapes).

With the **exception** of certain goods more specifically mentioned or included elsewhere and listed in the exclusions below, this heading covers :

- (A) Skins and other parts of birds with their feathers or down, feathers and down, and parts of feathers, which though not yet constituting made up articles, have undergone a process **other than** a simple treatment of cleaning, disinfection or preservation (see Explanatory Note to **heading 05.05**); the goods of this heading may, for example, be bleached, dyed, curled or waved.
- (B) Articles made of skins or of other parts of birds with their feathers or down, articles made of feathers, of down or of parts of feathers, even if the feathers or down, etc., are unworked or merely cleaned, but **not including** articles made of scapes or quills. The heading therefore includes :
 - (1) Single feathers the quills of which have been wired or bound for use as, for example, millinery mounts, and also single composite feathers assembled from different elements.
 - (2) Feathers assembled in the form of clusters, and feathers or down assembled by glueing or fixing on textile fabric or other base.
 - (3) Trimmings made of birds, parts of birds, of feathers or down, for hats, boas, collars, capes or other articles of apparel or clothing accessories.
 - (4) Fans made of ornamental feathers, with frames of any material. However, fans with frames of precious metal are classified in **heading 71.13**.

The heading **does not**, however, **include** articles of apparel and clothing accessories in which feathers or down constitute no more than mere trimmings or padding.

The heading also **excludes** :

- (a) Footwear of feathers or down (**Chapter 64**).
- (b) Headgear of feathers or down (**Chapter 65**).
- (c) Articles of **heading 67.02**.
- (d) Articles of bedding, etc., in which feathers or down constitute only filling or padding (**heading 94.04**).
- (e) Articles of **Chapter 95** (e.g., shuttlecocks, feather darts or angling floats).
- (f) Worked quills and scapes (e.g., toothpicks, **heading 96.01**), feather dusters (**heading 96.03**), and powder-puffs and pads of down for the application of cosmetics or toilet preparations (**heading 96.16**).
- (g) Collectors' pieces (**heading 97.05**).

67.02 - Artificial flowers, foliage and fruit and parts thereof; articles made of artificial flowers, foliage or fruit.

6702.10 - Of plastics

6702.90 - Of other materials

This heading covers :

- (1) Artificial flowers, foliage and fruit in forms resembling the natural products, made by assembling various parts (by binding, glueing, assembling by fitting into one another or similar methods). This category also includes conventional representations of flowers, foliage or fruit made up in the manner of artificial flowers, etc.
- (2) Parts of artificial flowers, foliage or fruit (e.g., pistils, stamens, ovaries, petals, calyces, leaves and stems).
- (3) Articles made of artificial flowers, foliage or fruit (e.g., bouquets, garlands, wreaths, plants), and other articles, for use as trimmings or as ornaments, made by assembling artificial flowers, foliage or fruit.

The heading includes artificial flowers, foliage or fruit fitted with a pin or other minor fastening device.

The articles of this heading are mainly used for decoration (e.g., in houses or churches), or as ornaments for hats, apparel, etc.

Subject to the **exclusions** listed below, these goods may be made of textile materials, felt, paper, plastics, rubber, leather, metal foil, feathers, shells or of other materials of animal origin (for example, artificial foliage of marine animal origin, specially prepared and dyed, consisting of the limp remains of the bodies of hydrozoa or bryozoa), etc. **Provided** they meet the specifications of the preceding paragraphs, all such articles fall in this heading irrespective of their degree of finish.

This heading **does not include** :

- (a) Natural flowers and foliage of **heading 06.03 or 06.04** (e.g., dyed, silvered or gilded).
- (b) Floral motifs of lace, of embroidery or of other textile fabric, which though they can be used as trimmings for apparel, are not made up in the manner of artificial flowers (i.e. by assembly of the various parts (petals, stamens, stems, etc.) by binding with wire, textile material, paper, rubber, etc., or by glueing or similar methods) (**Section XI**).
- (c) Headgear of artificial flowers or foliage (**Chapter 65**).
- (d) Articles of glass (**Chapter 70**).
- (e) Artificial flowers, foliage or fruit, of pottery, stone, metal, wood, etc., obtained in one piece by moulding, forging, carving, stamping or other process, or consisting of parts assembled otherwise than by binding, glueing, fitting into one another or similar methods.
- (f) Wire simply cut to length and covered with textile material, paper, etc., for making stems for artificial flowers, etc. (**Section XV**).
- (g) Articles clearly identifiable as toys or carnival articles (**Chapter 95**).

67.03 - Human hair, dressed, thinned, bleached or otherwise worked; wool or other animal hair or other textile materials, prepared for use in making wigs or the like.

With the **exception** of human hair which has been simply washed, scoured or sorted to length (but **not** arranged so that the root ends and tips respectively are together) and waste of human hair (**heading 05.01**), this heading covers human hair which has been dressed or otherwise worked (for example, thinned, bleached, dyed, waved or curled) for use in postiche (e.g., manufacture of wigs, curls or switches) or for other purposes.

The expression “dressed” includes hair, the separate filaments of which have been arranged so that the root ends and tip ends are respectively together.

This heading also includes wool, other animal hair (e.g., the hair of the yak, angora or Tibetan goat) and other textile materials (e.g., man-made fibres), prepared for use in making wigs and the like, or dolls’ hair. Products prepared for the above purposes include, in particular :

- (1) Articles consisting of a sliver, generally of wool or other animal hair, interlaced on two parallel strings and having the appearance of a plait. These articles (known as “crape”) are normally presented in long lengths and weigh about 1 kg.
- (2) Waved (curled) slivers of textile fibres put up in small bundles each containing a length of 14 to 15 m and weighing about 500 g.
- (3) “Wefts” consisting of man-made fibres dyed in the mass, folded in two to form tufts which are bound together, at the folded ends, by a machine-made plait of textile yarns approximately 2 mm wide. These “wefts” have the appearance of a fringe in the length.

Wool, other animal hair or other textile fibres in the mass, in the form of tow or prepared for spinning fall in **Section XI**.

67.04 - Wigs, false beards, eyebrows and eyelashes, switches and the like, of human or animal hair or of textile materials; articles of human hair not elsewhere specified or included.

- Of synthetic textile materials :

6704.11 - - Complete wigs

6704.19 - - Other

6704.20 - Of human hair

6704.90 - Of other materials

This heading covers :

- (1) **Made up articles of postiche of all kinds manufactured of human or animal hair or of textile materials.** These articles include wigs, beards, eyebrows and eyelashes, switches, curls, chignons, moustaches and the like. They are usually of high-class workmanship intended for use either as aids to personal toilet or for professional work (e.g., theatrical wigs).

This category **does not include** :

- (a) Dolls' wigs (**heading 95.03**).
- (b) Carnival articles, generally of inferior material and finish (**heading 95.05**).

- (2) **Articles of human hair, not elsewhere specified or included**, in particular certain lightweight woven material of human hair.

This category **does not include** :

- (a) Hair straining cloth of **heading 59.11**.
 - (b) Hair-nets (**heading 65.05**).
 - (c) Hair hand sieves (**heading 96.04**).
-

Section XIII

**ARTICLES OF STONE, PLASTER, CEMENT, ASBESTOS,
MICA OR SIMILAR MATERIALS; CERAMIC PRODUCTS;
GLASS AND GLASSWARE**

Chapter 68

Articles of stone, plaster, cement, asbestos, mica or similar materials

Notes.

- 1.- This Chapter does not cover :
 - (a) Goods of Chapter 25;
 - (b) Coated, impregnated or covered paper and paperboard of heading 48.10 or 48.11 (for example, paper and paperboard coated with mica powder or graphite, bituminised or asphalted paper and paperboard);
 - (c) Coated, impregnated or covered textile fabric of Chapter 56 or 59 (for example, fabric coated or covered with mica powder, bituminised or asphalted fabric);
 - (d) Articles of Chapter 71;
 - (e) Tools or parts of tools, of Chapter 82;
 - (f) Lithographic stones of heading 84.42;
 - (g) Electrical insulators (heading 85.46) or fittings of insulating material of heading 85.47;
 - (h) Dental burrs (heading 90.18);
 - (ij) Articles of Chapter 91 (for example, clocks and clock cases);
 - (k) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings, prefabricated buildings);
 - (l) Articles of Chapter 95 (for example, toys, games and sports requisites);
 - (m) heading 96.06 (for example, buttons), of heading 96.09 (for example, slate pencils), heading 96.10 (for example, drawing slates) or of heading 96.20 (monopods, bipods, tripods and similar articles); or
 - (n) Articles of Chapter 97 (for example, works of art).
- 2.- In heading 68.02 the expression “ worked monumental or building stone ” applies not only to the varieties of stone referred to in heading 25.15 or 25.16 but also to all other natural stone (for example, quartzite, flint, dolomite and steatite) similarly worked; it does not, however, apply to slate.

GENERAL

This Chapter covers :

- (A) Various products of Chapter 25 worked to a degree **beyond** that permitted by Note 1 to that Chapter.
- (B) The products **excluded** from Chapter 25 by Note 2 (e) to that Chapter.
- (C) Certain goods made from mineral materials of Section V.

(D) Goods made from certain of the materials of Chapter 28 (e.g., the artificial abrasives).

Some of the goods in category (C) or (D) may be agglomerated by means of binders, contain fillers, be reinforced, or in the case of products such as abrasives or mica be put up on a backing or support of textile material, paper, paperboard or other materials.

Most of these products and finished articles are obtained by operations (e.g., shaping, moulding), which alter the form rather than the nature of the constituent material. Some are obtained by agglomeration (e.g., articles of asphalt, or certain goods such as grinding wheels which are agglomerated by vitrification of the binding material); others may have been hardened in autoclaves (sand-lime bricks). The Chapter also includes certain goods obtained by processes involving a more radical transformation of the original raw material (e.g., fusion to produce slag wool, fused basalt, etc.).

*
* *

Articles obtained by firing previously shaped earths (i.e., ceramic articles) generally fall in **Chapter 69**, except in the case of ceramic abrasive articles of **heading 68.04**. Glass and glassware, including articles of glass-ceramics, fused quartz or other fused silica, are classified in **Chapter 70**.

The Chapter further **excludes**, in addition to certain goods separately referred to in **exclusions** to the following Explanatory Notes, the following :

- (a) Diamonds, other precious stones and semi-precious stones (natural, synthetic or reconstructed), articles thereof and all other articles of **Chapter 71**.
- (b) Lithographic stones of **heading 84.42**.
- (c) Panels (e.g., of slate, marble, asbestos-cement) drilled or otherwise clearly prepared as control panels (**heading 85.38**); also insulators and fittings of insulating material, of **heading 85.46** or **85.47**.
- (d) Articles of **Chapter 94** (e.g., furniture, lamp and lighting fittings, prefabricated buildings).
- (e) Toys, games and sports requisites (**Chapter 95**).
- (f) Mineral carving materials specified in Note 2 (b) to Chapter 96, worked or in the form of articles (**heading 96.02**).
- (g) Original sculptures and statuary, collectors' pieces and antiques of **Chapter 97**.

68.01 - Setts, curbstones and flagstones, of natural stone (except slate).

This heading covers natural stone **other than** slate (e.g., sandstone, granite and porphyry) worked into the shapes commonly used for paving or bordering roads, pavements or the like; such stones remain in this heading even if they are also suitable for other uses. Shingle, pebbles and similar unshaped road metalling fall in **heading 25.17**.

The products of this heading are obtained by splitting, rough hewing or shaping quarry-stone, by hand or machine. Setts and flagstones usually have rectangular (including square) faces, but whereas flagstones are thin in relation to their length and width, setts are roughly cubical or take the form of truncated pyramids. Curbstones may be straight or curved; they are normally of rectangular (other than square) cross-section.

The heading includes stone in shapes identifiable as setts, curbstones or flagstones, even if obtained simply by splitting, sawing or roughly squaring; it also covers those which have been dressed, bushed, sand dressed, ground, rounded at the edges, chamfered, tenoned and mortised or specially worked for particular road uses (curbstones shaped to allow for road drainage or garage exits).

The heading **excludes** curbstones, etc., of concrete or artificial stone (**heading 68.10**) and ceramic flagstones (**Chapter 69**).

68.02 - Worked monumental or building stone (except slate) and articles thereof, other than goods of heading 68.01; mosaic cubes and the like, of natural stone (including slate), whether or not on a backing; artificially coloured granules, chippings and powder, of natural stone (including slate).

6802.10 - Tiles, cubes and similar articles, whether or not rectangular (including square), the largest surface area of which is capable of being enclosed in a square the side of which is less than 7 cm; artificially coloured granules, chippings and powder

-Other monumental or building stone and articles thereof, simply cut or sawn, with a flat or even surface :

6802.21 -- Marble, travertine and alabaster

6802.23 -- Granite

6802.29 -- Other stone

- Other :

6802.91 -- Marble, travertine and alabaster

6802.92 -- Other calcareous stone

6802.93 -- Granite

6802.99 -- Other stone

This heading covers natural monumental or building stone (**except** slate) which has been worked **beyond** the stage of the normal quarry products of Chapter 25. There are, however, certain **exceptions** where goods are covered more specifically by other headings of the Nomenclature and examples of these are given at the end of this Explanatory Note and in the General Note to the Chapter.

The heading therefore covers stone which has been **further processed** than mere shaping into blocks, sheets or slabs by splitting, roughly cutting or squaring, or squaring by sawing (square or rectangular faces).

The heading thus covers stone in the forms produced by the stone-mason, sculptor, etc., viz. :

- (A) Roughly sawn blanks; also non-rectangular sheets (one or more faces triangular, hexagonal, trapezoidal, circular, etc.).
- (B) Stone of any shape (including blocks, slabs or sheets), whether or not in the form of finished articles, which has been bossed (i.e., stone which has been given a "rock faced" finish by smoothing along the edges while leaving rough protuberant faces), dressed with the pick, bushing hammer, or chisel, etc., furrowed with the drag-comb, etc., planed, sand dressed, ground, polished, chamfered, moulded, turned, ornamented, carved, etc.

The heading therefore includes not only constructional stone (including facing slabs) worked as above, but also articles such as steps, cornices, pediments, balustrades, corbels and supports; door or window frames and lintels; thresholds; mantelpieces; window sills; doorsteps; tombstones; boundary stones and milestones, bollards; panoramic indicators (enamelled or not); guard posts and fenders; sinks, troughs, fountain basins; balls for crushing mills; flower pots; columns, bases and capitals for columns; statues, statuettes, pedestals; high or low reliefs; crosses; figures of animals; bowls, vases, cups; cachou boxes; writing-sets; ashtrays; paper weights; artificial fruit and foliage, etc. Ornamental goods of stone combined with other materials may be classified as jewellery or imitation jewellery, or as goldsmiths' or silversmiths' wares (see the Explanatory Note to Chapter 71); other ornamental goods essentially of stone are, in general, classified in this heading.

Stone slabs forming the tops of articles of furniture (sideboards, washstands, tables, etc.) are classified in **Chapter 94** if presented with the pieces of furniture (whether or not assembled) and clearly intended as parts thereof, but such furniture tops presented separately remain in this heading.

Articles of worked monumental or building stone are usually obtained from the stones of heading 25.15 or 25.16, but may also be obtained from any other natural stone **except** slate (e.g., quartzite, dolomite, flint, steatite). Steatite, for example, is used for industrial structural work where resistance to heat or chemical corrosion is required (e.g., in recuperative furnaces). It is also used in paper pulping and chemical plant.

The heading also covers small prepared mosaic cubes and the like of marble, etc., for various floor or wall coverings, etc., whether or not backed with paper or other materials. It further includes artificially coloured granules, chippings and powder of marble or of other natural stones (including slate) (e.g., for shop window displays), but untreated pebbles, granules, chippings and coloured natural sands fall in **Chapter 25**.

Articles such as slabs, tiles, etc., obtained by agglomerating pieces of natural stone with cement or other binders (e.g., plastics), and statuettes, pillars, cups, etc., made of moulded and agglomerated stone powder or granules, are classified as artificial stone articles in **heading 68.10**.

The heading also **excludes** :

- (a) Worked slate and articles of slate, other than mosaic cubes and the like (**headings 68.03, 96.09 and 96.10**).
- (b) Articles of fused basalt (**heading 68.15**).
- (c) Articles of fired steatite (**Chapter 69 or Chapter 85**).
- (d) Imitation jewellery (**heading 71.17**).
- (e) Articles of **Chapter 91** (e.g., clocks and clock cases and parts thereof).
- (f) Lamps, lighting fittings and parts thereof (**heading 94.05**).
- (g) Stone buttons (**heading 96.06**) and chalks of **heading 95.04 or 96.09**.
- (h) Original sculptures and statuary (**heading 97.03**).

68.03 - Worked slate and articles of slate or of agglomerated slate.

Natural slate falls in **heading 25.14** when in the mass, or in the form of blocks, slabs or sheets obtained by splitting, rough cutting or squaring or squaring by sawing. This heading covers similar products more highly processed (e.g., sawn or cut **otherwise** than rectangular (including square), ground, polished, chamfered, drilled, varnished, enamelled, moulded or otherwise ornamented).

It includes, *inter alia*, articles polished or otherwise worked such as wall tiles, flags and slabs (for paving, for buildings, for chemical installations, etc.); troughs, reservoirs, basins, sinks; guttering stones; mantelpieces.

The heading also covers identifiable roofing, facing and damp course slates, not only of special shapes (polygonal, rounded, etc.), but also in rectangular (including square) form.

The heading also includes articles of agglomerated slate.

The heading **excludes** :

- (a) Granules, chippings and powder of slate, not artificially coloured (**heading 25.14**).
- (b) Mosaic cubes and the like, artificially coloured granules, chippings and powder of slate (**heading 68.02**).
- (c) Slate pencils (**heading 96.09**), writing or drawing slates, ready for use, and boards, framed or not (**heading 96.10**).

68.04 - Millstones, grindstones, grinding wheels and the like, without frameworks, for grinding, sharpening, polishing, trueing or cutting, hand sharpening or polishing stones, and parts thereof, of natural stone, of agglomerated natural or artificial abrasives, or of ceramics, with or without parts of other materials (+).

6804.10 - Millstones and grindstones for milling, grinding or pulping

- Other millstones, grindstones, grinding wheels and the like :

6804.21 -- Of agglomerated synthetic or natural diamond

6804.22 -- Of other agglomerated abrasives or of ceramics

6804.23 -- Of natural stone

6804.30 - Hand sharpening or polishing stones

This heading covers, in particular :

- (1) **Millstones and grindstones**, often of considerable size, **for crushing, grinding, pulping**, etc., (e.g., for milling grain (upper or lower stones); pulping wood, asbestos, etc.; paper-makers' or paint mixers' grindstones).
- (2) **Grindstones for sharpening cutlery, tools, etc.**, and designed for mounting on hand, pedal or power operated machines.

The grindstones and millstones described in the two categories above are usually flat, cylindrical or in the shape of truncated cones.

- (3) **Grinding wheels, heads, discs, points, etc.**, as used on machine-tools, electro-mechanical or pneumatic hand tools, for the trimming, polishing, sharpening, trueing or sometimes for the cutting of metals, stone, glass, plastics, ceramics, rubber, leather, mother of pearl, ivory, etc.

Except for some cutting discs, which may be of considerable diameter, these goods are usually much smaller than those described above, and they may be of any shape, (e.g., flat, conical, spherical, dished, ring-shaped, recessed or stepped); they may also be planed or profiled at the edges.

The heading covers such tools not only when they are predominantly of abrasive materials, but also when they consist of only a very small abrasive head on a metal shank, or of a centre or core of rigid material (metal, wood, plastics, cork, etc.) on to which compact layers of agglomerated abrasive have been permanently bonded (e.g., cutting discs of metal, etc., fitted with rims or with a series of peripheral inserts of abrasive material). The heading also covers abrasive elements for hones, whether or not they are mounted in the carriers required for their fixation in the body of the hone.

It should, however, be noted that certain abrasive tools are **excluded** and fall in **Chapter 82**. The latter Chapter, however, covers **only** those tools with cutting teeth, flutes, grooves, etc., which retain their identity and function even after application of the abrasive material (i.e., tools which, unlike those of this heading, could be put to use even if the abrasive had not been applied). Saws with cutting teeth covered with abrasive therefore remain in **heading 82.02**. Similarly crown drills as used for cutting discs from sheets of glass, quartz, etc., are classified in this heading if the working edge is smooth apart from the abrasive coating, but in **heading 82.07** if toothed (whether or not coated with abrasive).

- (4) **Polishing stones, whetstones, oilstones, hones and the like**, with or without handles, **used directly in the hand for sharpening, whetting, scouring or polishing** metals or other materials.

They may be of various shapes (e.g., rectangular, trapezoidal, sectors or segments of a circle, in the form of a knife blade, oblong with tapered ends), and may be square, triangular, round, half round, etc., in cross-section. They may also consist of prismatic plates, generally of agglomerated boron carbide, used in the hand, for whetting or sharpening grindstones of artificial abrasives, and, as a secondary use, for sharpening metal tools.

These stones are used, in particular, for sharpening tools and cutting instruments (e.g., cutlery, blades for harvesting machines, sickles, scythes, mowers, etc.), or for polishing metal, etc.

Tools with a fine cutting edge (e.g., razors or surgical instruments) are sharpened with oilstones or hones made of specially fine-grain stone or slate; these stones are usually moistened with water or oil before use. Certain stones (e.g., pumice) are also used for toilet, manicure and pedicure purposes, and also for the cleaning up, polishing, etc., of metals, etc.

Grinding stones, grinding wheels, etc., **must** be made essentially of natural stone, agglomerated or not, (e.g., sandstone, granite, lava, flint, molasse, dolomite, quartz, trachyte), of agglomerated natural or artificial abrasives (e.g., emery, pumice, tripoli, kieselguhr, crushed glass, corundum, silicon carbide, garnet, diamond, boron carbide) or of ceramics (of fired or refractory earths, or of porcelain).

Agglomerated grinding wheels, etc., are made by mixing ground abrasive or stone with binders such as ceramic materials (for example, powdered clay or kaolin, sometimes with added feldspar), sodium silicate, cement (especially magnesian cement) or less rigid cementing materials (such as rubber, shellac or plastics). Textile fibres such as cotton, nylon or flax are sometimes incorporated in the mixtures. The mixtures are moulded to shape, dried, and then heated (if necessary to the stage of vitrification in the case of ceramic binders) or cured (in the case of the rubber, plastics, etc., binders). The articles are then trimmed to size and shape.

In making certain polishing stones (oil stones), washed abrasive powders are used.

Grinding stones of this heading, and especially those for granary use or for pulping, sometimes have a ribbed surface. They may be in one piece or made up of assembled segments, be fitted with sockets, internal or external hoops, balancing weights or cavities; they may also be fitted with axles or spindles, but they must be **without** frameworks. Grinding stones with frameworks are classified in **heading 82.05** if hand or pedal operated or in **Chapter 84** or **85** if power operated.

In addition to the complete millstones, grindstones, etc., described above, the heading also covers identifiable blanks; segments and finished parts of such goods, if essentially of stone, agglomerated abrasives or ceramics are also included.

The heading **does not include** :

- (a) Perfumed pumice stone put up in blocks, tablets or similar prepared forms of **heading 33.04**.
 - (b) Natural or artificial abrasive powder or grain coated on to textile material, paper, paperboard or other materials (**heading 68.05**), whether or not the textile material, paper, etc., is subsequently glued on to supports such as discs or strips of wood (buff-sticks for use in the clock and watch industry, mechanical engineering, etc.).
 - (c) Dental burrs (**heading 90.18**).
- ◦ ◦

Subheading Explanatory Note.

Subheading 6804.10

The products of this subheading are designed for use in reducing the particle size of materials such as grain, pulp, pigments, etc., as opposed to trimming, polishing, sharpening, trueing or other discriminate removal of material.

Millstones and grindstones for milling or grinding

These products are generally put up in pairs and have a conical surface (one stone is concave and the other convex) which is channelled towards the centre to allow crushed grain to flow via the centre of the stone.

Millstones and grindstones for pulping

These products are of considerable size generally weighing several tonnes and manufactured either in a single piece or from several blocks assembled together by glueing. They exceed 1,200 mm in diameter and 500 mm in thickness.

68.05 - Natural or artificial abrasive powder or grain, on a base of textile material, of paper, of paperboard or of other materials, whether or not cut to shape or sewn or otherwise made up.

6805.10 - On a base of woven textile fabric only

6805.20 - On a base of paper or paperboard only

6805.30 - On a base of other materials

This heading covers textile material, paper, paperboard, vulcanised fibre, leather or other materials, in rolls or cut to shape (sheets, bands, strips, discs, segments, etc.), or in threads or cords, on to which crushed natural or artificial abrasives have been coated, usually by means of glue or plastics. The heading also covers similar products of nonwovens, in which abrasives are uniformly dispersed throughout the mass and fixed on to textile fibres by the bonding substance. The abrasives used include emery, corundum, silicon carbide, garnet, pumice, flint, quartz, sand and glass powder. The bands, discs, etc., may be sewn, stapled, glued or otherwise made up; the heading includes, for example, tools such as buff-sticks, made by permanently fixing abrasive paper or cloth onto blocks or strips of wood, etc. But the heading **excludes** grinding wheels composed of a rigid support (e.g., of paperboard, wood, metal) fitted with a compact agglomerated layer, rather than powder or grain, of abrasive, and similarly constituted hand tools (**heading 68.04**).

The goods of this heading are mainly used (by hand or mechanically) for smoothing or cleaning up metal, wood, cork, glass, leather, rubber (hardened or not) or plastics; also for smoothing or polishing varnished or lacquered surfaces, or for sharpening card clothing.

68.06 - Slag wool, rock wool and similar mineral wools; exfoliated vermiculite, expanded clays, foamed slag and similar expanded mineral materials; mixtures and articles of heat-insulating, sound-insulating or sound-absorbing mineral materials, other than those of heading 68.11 or 68.12 or of Chapter 69.

6806.10 - Slag wool, rock wool and similar mineral wools (including intermixtures thereof), in bulk, sheets or rolls

6806.20 - Exfoliated vermiculite, expanded clays, foamed slag and similar expanded mineral materials (including intermixtures thereof)

6806.90 - Other

Slag wool and rock wool (e.g., of granite, basalt, limestone or dolomite) are obtained by melting one or more of these constituents and converting a stream of the resulting liquid into fibres, usually by centrifugal action and stream or air blast.

This heading also includes a class of "alumino-silicates" known as "ceramic fibres". They are formed by fusing a blend of alumina and silica, in varying proportions, sometimes with the addition of small amounts of other oxides such as zirconia, chromia or boric oxide, and by blowing or extruding the melt into a mass of fibres.

The mineral wools of this heading, like the glass wool of heading 70.19, have a flocculent or fibrous appearance. They differ from the latter by their chemical composition (see Note 4 to Chapter 70), while their fibres are generally shorter and not as white in colour.

Expanded or exfoliated vermiculite is obtained from vermiculite (heading 25.30) by heat treatment which causes a very large expansion of the material, sometimes up to 35 times its original volume.

The heading also includes the expanded forms of perlite, chlorites, obsidian, etc., similarly obtained by heat treatment. These generally consist of very lightweight spheroidal grains. Perlite activated by heat treatment is in the form of shiny white microlamellar powder and is classified in **heading 38.02**.

Expanded clays are made either by calcining specially selected clays, or by calcining a mixture of clays with other materials (e.g., sulphite lye). **Foamed slag** is made by adding small amounts of water to molten slag, and should not be confused with granulated slag which has a much higher density; the latter is made by pouring molten slag into water and is classified in **heading 26.18**.

All the above materials are incombustible and excellent heat-insulating, sound-insulating, or sound-absorbing products. The heading includes them even when in bulk.

*
* * *

Subject to the tolerances concerning the asbestos content (referred to below), this heading also covers **heat-insulating**, **sound-insulating** or **sound-absorbing mixtures of mineral materials** in bulk, e.g., mixtures composed essentially of kieselguhr, siliceous fossil meals, magnesium carbonate, etc., often with added plaster, slag, powdered cork, sawdust or wood shavings, textile fibres, etc. The mineral wools described above may also form part of such mixtures which, in the mass, are used as packing materials, in the insulation of ceilings, roofs, walls, etc.

The heading includes articles, usually of low density, made from the above products or mixtures (e.g., blocks, sheets, bricks, tiles, tubes, cylinder shells, cords, pads). These articles may be artificially coloured in the mass, impregnated with fireproof substances, faced with paper, or reinforced with metal.

The mixtures and articles classified here may contain a small quantity of asbestos fibres, in particular to facilitate use. The proportion of asbestos added is generally not more than 5 % by weight. The heading **excludes** articles of asbestos-cement (**heading 68.11**) and mixtures with a basis of asbestos or of asbestos and magnesium carbonate (and articles thereof) (**heading 68.12**).

The heading also covers diatomite or other siliceous earths sawn into blocks or other shapes.

Articles of lightweight concrete (including concrete made with an aggregate of exfoliated vermiculite, expanded clay or the like) are **excluded** (**heading 68.10**).

Articles obtained by firing fall in **Chapter 69**.

68.07 - Articles of asphalt or of similar material (for example, petroleum bitumen or coal tar pitch).

6807.10 - In rolls

6807.90 - Other

This heading covers articles made from natural asphalt or bitumen, coal tar pitch, petroleum bitumen, bituminous mixtures, etc. (see heading 27.08, 27.13, 27.14 or 27.15). These articles usually contain fillers such as sand, slag, chalk, plaster, cement, talc, sulphur, asbestos fibre, wood fibre, sawdust, waste cork and natural resins.

Asphalt, bitumen, pitch, etc., in blocks of the kind remelted before use are **excluded** (**Chapter 27**) whether or not the materials have been refined or dehydrated, or mixed with other materials; the goods of this heading must, on the other hand, be identifiable as particular articles.

The heading includes :

- (1) Plates, bricks, tiles, flagstones, obtained by pressing or moulding and used for roofing, facing, tiling or paving.
- (2) Roofing boards consisting of a substrate (e.g., of paperboard, of web or fabric of glass fibre, of fabric of man-made fibre or jute, or of aluminium foil) completely enveloped in, or covered on both sides by, a layer of asphalt or similar material.
- (3) Building board made of one or more layers of textile fabric or paper completely enveloped in asphalt or similar material.
- (4) Cast or moulded tubes and containers.

Asphalt tubes and containers covered or reinforced with metal are classified as metal or asphalt articles according to which of the components gives the goods their essential character.

Metal tubes and containers (e.g., of cast iron or steel) coated with asphalt, bitumen, etc., remain classified as metal articles.

The heading further **excludes** :

- (a) Paper merely coated, impregnated or covered with tar or similar material, intended for use as, for example, wrapping paper (**heading 48.11**).
- (b) Textile fabrics coated, impregnated or covered, for example, with bitumen or asphalt (**Chapter 56** or **59**).
- (c) Articles made essentially of asbestos-cement with added asphalt (**heading 68.11**).
- (d) Fabrics or webs, etc., of glass fibre, simply coated or impregnated with bitumen or asphalt (**heading 70.19**).

68.08 - Panels, boards, tiles, blocks and similar articles of vegetable fibre, of straw or of shavings, chips, particles, sawdust or other waste, of wood, agglomerated with cement, plaster or other mineral binders.

This heading covers building or heat- or sound-insulating or sound-absorbing panels, boards, tiles, blocks, etc., made of vegetable materials (such as cellulose fibre, wood fibre, wood wool, wood chips, shavings or other wood waste, sawdust, straw, reeds, rushes or *crin végétal*), agglomerated or moulded with mineral binders such as cement (including magnesium oxychloride cement), plaster, lime or sodium silicate. They may also contain mineral fillers (such as siliceous fossil earths, magnesite, sand or asbestos), or be reinforced with metal.

The types of boards, panels, etc., of this heading are all relatively light but rigid, and the vegetable materials retain their own identity in the body of the binder.

As they must be agglomerated with mineral binders, they should not be confused with particle board of **heading 44.10** nor with fibreboard of **heading 44.11** since these must be agglomerated with organic binders. The heading also **excludes** agglomerated cork (**heading 45.04**) and articles of **heading 68.11**.

68.09 - Articles of plaster or of compositions based on plaster.

- Boards, sheets, panels, tiles and similar articles, not ornamented :

6809.11 -- Faced or reinforced with paper or paperboard only

6809.19 -- Other

6809.90 - Other articles

This heading covers articles of plaster or of plastering materials, coloured or not, such as stucco (plaster mixed with a solution of glue, and which, after moulding, often has the superficial appearance of marble), fibrous plaster (plaster reinforced with wisps of tow, etc., and generally mixed with a solution of gelatin or glue), alumed plaster (also called Keene's cement or English cement), and similar preparations which may contain textile fibres, wood fibre, sawdust, sand, lime, slag, phosphates, etc., but in which plaster is the essential element.

These articles may be dyed, varnished, waxed, lacquered, bronzed, gilded or silvered (by any process), or sometimes coated with asphalt; they may also be reinforced. The heading includes panels, boards, sheets or tiles, sometimes faced with paperboard, used in the building industry; and moulded articles such as casts, statues, statuettes, rosettes, columns, bowls, vases, ornamental goods, industrial moulds.

The heading **excludes** :

- (a) Plaster-coated fracture bandages put up for retail sale (**heading 30.05**), and plaster fracture splints (**heading 90.21**).
- (b) Panels, etc., agglomerated with plaster, of **heading 68.06** or **68.08**.
- (c) Anatomical models, models of crystals, geometric models, relief maps and other models, designed solely for demonstrational purposes, of **heading 90.23**.
- (d) Tailor's dummies, etc. (**heading 96.18**).
- (e) Original sculptures and statuary (**heading 97.03**).

68.10 - Articles of cement, of concrete or of artificial stone, whether or not reinforced (+).

- Tiles, flagstones, bricks and similar articles :

6810.11 -- Building blocks and bricks

6810.19 -- Other

- Other articles :

6810.91 -- Prefabricated structural components for building or civil engineering

6810.99 -- Other

This heading covers moulded, pressed or centrifuged articles (e.g., certain pipes) of cement (including slag cement), of concrete or of artificial stone, **other than** those of **heading 68.06** or **68.08** (in which cement is merely a binder), or **heading 68.11** (articles of asbestos-cement).

This heading also covers prefabricated structural components for building or civil engineering.

Artificial stone is an imitation of natural stone obtained by agglomerating pieces of natural stone or crushed or powdered natural stone (limestone, marble, granite, porphyry, serpentine, etc.) with lime or cement or other binders (e.g., plastics). Articles of artificial stone include those of "terrazzo", "granito", etc.

This heading also covers articles of slag cement.

The heading includes, *inter alia*, blocks, bricks, tiles; ceiling or wall mesh or lath (consisting of a wire framework combined with a **predominating** proportion of concrete); flagstones; beams; hollow flooring slabs and other constructional goods; pillars, posts, boundary stones; curbstones; piping; stair treads; railings; baths, sinks, water closet pans (bowls), troughs, vats, reservoirs; fountain basins; tombstones; standards, poles; railway sleepers; hovertrain guide-track sections; door or window frames; mantelpieces, window sills, door steps; friezes, cornices; vases, flower-pots, architectural or garden ornaments; statues, statuettes, animal figures; ornamental goods.

The heading also covers bricks, tiles, and other sandlime articles made from a pasty mixture of sand, lime and water; after pressure-moulding, these articles are steam-treated for several hours under high pressure in horizontal autoclaves, at a temperature of around 140 °C. These products, which may be white or artificially coloured, are used for much the same purposes as ordinary bricks, tiles, etc.

When lumps of quartz of various sizes are introduced into the mixture, artificial stone type products are obtained. Lightweight and porous sand-lime sheets for insulating purposes are also made by adding a metallic powder to the mixture, so that gases are given off; such sheets, however, are not pressure-moulded, but cast before insertion in the autoclave.

*
* * *

The articles of this heading may be bushed, ground, polished, varnished, bronzed, enamelled, made to imitate slate, moulded or otherwise ornamented, coloured in the mass, reinforced with metal, etc. (e.g., reinforced or pre-stressed concrete), or fitted with accessories of other materials (e.g., hinges, etc.).

The heading **does not include** :

- (a) Broken pieces of concrete (**heading 25.30**).
- (b) Articles made of agglomerated slate (**heading 68.03**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 6810.91

This subheading covers prefabricated structural components for building or for civil engineering, such as facing panels, interior walls, floor or ceiling sections, foundation components, pilings, tunnel sections, components for lock-gates or dams, gangways, cornices. These components, generally of concrete, usually have devices for facilitating their assembly.

68.11 - Articles of asbestos-cement, of cellulose fibre-cement or the like.

6811.40 - Containing asbestos

- Not containing asbestos :

6811.81 -- Corrugated sheets

6811.82 -- Other sheets, panels, tiles and similar articles

6811.89 -- Other articles

This heading covers hardened articles consisting essentially of an intimate mixture of fibres (for example, asbestos, cellulose or other vegetable fibres, synthetic polymer, glass or metallic fibres) and cement or other hydraulic binders, the fibres acting as strengthening agents. These articles may also contain asphalt, tar, etc.

These products are generally manufactured by pressing together thin layers of a mixture of fibres, cement and water or by moulding (possibly under pressure), by pressing or by extruding.

The heading includes sheets of all sizes and thicknesses, obtained as described above, and also articles made by cutting these sheets or by pressing, moulding or bending them before they have set, e.g., roofing, facing or partition sheets and tiles; sheets for making furniture; window sills; sign-plates, letters and numbers; barrier bars; corrugated sheets; reservoirs, troughs, basins, sinks; tubing joints; packing washers and joints; panels imitating carving; ridge tiles, gutters, window frames; flower-pots; ventilation or other tubing, cable conduits; chimney cowls, etc.

All these articles may be coloured in the mass, varnished, printed, enamelled, decorated, drilled, filed, planed, smoothed, polished or otherwise worked; they may also be reinforced with metal, etc.

68.12 - Fabricated asbestos fibres; mixtures with a basis of asbestos or with a basis of asbestos and magnesium carbonate; articles of such mixtures or of asbestos (for example, thread, woven fabric, clothing, headgear, footwear, gaskets), whether or not reinforced, other than goods of heading 68.11 or 68.13.

6812.80 - Of crocidolite

- Other :

6812.91 -- Clothing, clothing accessories, footwear and headgear

6812.92 -- Paper, millboard and felt

6812.93 -- Compressed asbestos fibre jointing, in sheets or rolls

6812.99 -- Other

This heading covers asbestos fibres **further worked** than beaten, cleaned, sorted or graded (e.g., carded fibres and dyed fibres). They may be for any purpose (e.g., for spinning, felting, etc., or for use as filtering, insulating, packing, etc., materials). Crude asbestos fibres or those simply graded according to length, beaten or cleaned are **excluded (heading 25.24)**.

The heading also includes mixtures of asbestos with magnesium carbonate, cellulose fibres, sawdust, pumice stone, talc, plaster, siliceous fossil earths, slag, aluminium oxide, glass fibres, cork, etc., used as packing for heat-insulation purposes, or as filtering material, or as a basis for moulding asbestos articles.

But in particular the heading covers a range of articles of asbestos, either alone or mixed as in the preceding paragraph and often also with natural resins, plastics, sodium silicate, asphalt or rubber, etc. These articles may be made by felting, spinning, twisting, plaiting, weaving, making up or moulding.

For a description of crocidolite asbestos, see the Explanatory Note to heading 25.24.

Asbestos paper, board and felt are usually obtained by crushing the fibres into pulp which is then formed and pressed into sheets as in the preparation of asbestos-cement sheets (heading 68.11). Boards are also obtained by bonding superimposed layers of asbestos sheets with plastics. These products differ from those of heading 68.11 in that the separate asbestos fibres can be readily distinguished. They may be in rolls, sheets or plates, or may be cut to shape in the form of strips, frames, discs, rings, etc.

In the manufacture of yarn, single or multiple, the asbestos fibres are beaten, carded and then spun. As asbestos fibres cannot be drawn, long fibres are used for spinning, while the shorter fibres are used for the manufacture of board, felt, paper, asbestos cement or asbestos powder.

Other asbestos articles of this heading include cords, plaits, pads; fabric in the piece or cut to shape; strips, sheaths, tubing, conduits, tube joints; containers; rods, slabs, tiles; packing joints (**other than** gaskets and similar joints of metal and asbestos and sets of gaskets and joints of **heading 84.84**); filter blocks; table-mats; protective clothing, headgear and footwear for firemen, industrial, chemical, civil defence workers, etc. (e.g., jackets, trousers, aprons, sleeves, gloves, mitts, gaiters, hoods and masks usually with mica eyepieces, helmets, boots with asbestos uppers or soles); mattresses; firemen's shields, fire-extinguishing sheets, theatre curtains, iron spheres and cones coated with asbestos for fighting fire in gas mains.

All these articles may be reinforced with metal (often with brass or zinc wire), or with some other material (e.g., textile or glass fibres); they may also be coated with grease, talc, graphite or rubber, or be varnished, bronzed, coloured in the mass, polished, drilled, milled or otherwise worked.

In addition to the articles excluded by the General Explanatory Note, the heading also **excludes** :

- (a) Asbestos powder or flakes (**heading 25.24**).
- (b) Materials and articles essentially of plastics even if containing asbestos as a filler (**Chapter 39**).
- (c) Articles of asbestos-cement (**heading 68.11**).
- (d) Friction material with a basis of asbestos (**heading 68.13**).

68.13 - Friction material and articles thereof (for example, sheets, rolls, strips, segments, discs, washers, pads), not mounted, for brakes, for clutches or the like, with a basis of asbestos, of other mineral substances or of cellulose, whether or not combined with textile or other materials.

6813.20 - Containing asbestos

- Not containing asbestos :

6813.81 -- Brake linings and pads

6813.89 -- Other

Asbestos friction material is usually made by high pressure moulding of a mixture of asbestos fibres, plastics etc.; it can also be made by compressing layers of woven or plaited asbestos which have been impregnated with plastics, pitch or rubber. It may be reinforced with brass, zinc or lead wire, or may sometimes be made up from metal wire or cotton yarn covered with asbestos. Owing to its high friction coefficient and its resistance to heat and wear, this material is used for lining brake shoes, clutch discs, etc., for vehicles of all kinds, cranes, dredgers or other machinery. The heading includes similar friction materials with a basis of other mineral materials (e.g., graphite, siliceous fossil earths) or of cellulose fibre.

According to the particular use for which it is intended, friction material of this heading may be in the form of sheets, rolls, strips, segments, discs, rings, washers, pads or cut to any other shape. The friction material may also be assembled by sewing, may be drilled or otherwise worked.

The heading **excludes** :

- (a) Friction materials not containing mineral materials or cellulose fibre (e.g., those of cork); these are generally classified according to the constituent material.
- (b) Mounted brake linings (including friction material fixed to a metal plate provided with circular cavities, perforated tongues or similar fittings, for disc brakes); these are classified as parts of the machines or vehicles for which they are designed (e.g., **heading 87.08**).

68.14 - Worked mica and articles of mica, including agglomerated or reconstituted mica, whether or not on a support of paper, paperboard or other materials.

6814.10 - Plates, sheets and strips of agglomerated or reconstituted mica, whether or not on a support

6814.90 - Other

This heading covers natural mica, further worked than merely rifted and trimmed (e.g., cut to shape), and also products consisting of agglomerated (bonded) mica or pulped (reconstituted) mica, and articles made from any of these materials.

Thin sheets and splittings obtained by merely rifting and trimming mica books as mined fall in **heading 25.25**.

The heading covers products obtained by cutting such sheets and splittings. Since they are obtained with a die-punch, their edges are clean cut.

Natural mica is often used as such in the form of sheets or splittings. However, since the small size of the crystals and their poor flexibility, high cost, etc., render natural mica unsuitable for many uses, it is frequently replaced by agglomerated (built-up) mica (e.g., micanite, micafolium), which is obtained by bonding mica splittings one above the other or side by side using shellac, natural resins, plastics, asphalt, etc. Agglomerated mica is made in sheet, plate or strip form, in all thicknesses, often with a fairly large surface area; the sheets, etc., are generally backed on one or (usually) both surfaces with textile fabric, glass fibre fabric, paper or asbestos.

Thin sheets of mica may also be obtained, without employing a binding agent, by submitting powdered and pulped mica waste to a thermal, chemical and mechanical process similar to that used for making paper (reconstituted mica).

These thin sheets are then mounted on to a paper or textile backing using a flexible bonding material; alternatively, they may be used for the manufacture of plates and strip of specified thicknesses by superimposing several thin sheets and bonding them with an organic binder.

The heading covers sheets, strips and rolls in the length; pieces cut to shape for special uses in the form of rectangles (including squares), discs, etc.; moulded articles such as tubes, conduits, etc. All these goods may be coloured in the mass, painted, drilled, milled or otherwise worked.

Owing to its high resistance to heat and its relative translucency, mica is used, *inter alia*, for the manufacture of windows for ovens, stoves, furnaces, etc., of unbreakable lamp "glasses", and of "glasses" for goggles, etc. But mica is mainly used in the electrical industry because of its excellent dielectric properties (in the manufacture of motors, generators, transformers, capacitors, resistors, etc.). It should, however, be noted that mica insulators and other mica insulating parts of electrical apparatus, even unmounted, fall in **headings 85.46 to 85.48**, and that mica dielectric condensers (capacitors) fall in **heading 85.32**.

68.15 - Articles of stone or of other mineral substances (including carbon fibres, articles of carbon fibres and articles of peat), not elsewhere specified or included.

6815.10 - Non-electrical articles of graphite or other carbon

6815.20 - Articles of peat

- Other articles :

6815.91 -- Containing magnesite, dolomite or chromite

6815.99 -- Other

This heading covers articles of stone or of other mineral substances, **not covered** by the earlier headings of this Chapter and **not included** elsewhere in the Nomenclature; it therefore **excludes**, for example, ceramic products of **Chapter 69**.

The heading covers, *inter alia* :

- (1) Non-electrical articles of natural or artificial graphite (including nuclear grade), or other carbons for example : filters; discs; bearings; tubes and sheaths; worked bricks and tiles; moulds for the manufacture of small articles of delicate design (e.g., coins, medals, lead soldiers for collections).
- (2) Carbon fibres and articles of carbon fibres. Carbon fibres are commonly produced by carbonising organic polymers in filamentary forms. The products are used, for example, for reinforcement.
- (3) Articles made of peat (for example, sheets, cylinder shells, pots for raising plants). Textile articles of peat fibre are, however, **excluded** (**Section XI**).
- (4) **Unfired** bricks made of dolomite agglomerated with tar.
- (5) Bricks and other shapes (in particular magnesite or chrome-magnesite products), chemically bonded **but not yet fired**. These articles are fired during the first heating of the furnace in which they are installed. Similar products presented after firing are **excluded** (**heading 69.02 or 69.03**).
- (6) **Unfired** silica or alumina vats (e.g., as used for melting glass).
- (7) Touchstones for testing precious metal; these may be of natural stone (e.g., lydite, a hard, fine-grained dark stone resistant to acids).
- (8) Paving blocks and slabs obtained by moulding fused slag without a binder, but **excluding** those having the character of heat-insulating goods of **heading 68.06**.
- (9) Filter tubes of finely crushed and agglomerated quartz or flint.
- (10) Blocks, slabs, sheets and other articles of fused basalt; these are used, because of their great resistance to wear, as linings for pipes, belt-conveyors, chutes for coke, coal, ores, gravel, stone, etc.

The heading also **excludes** :

- (a) Blocks, plates and similar semi-manufactures of artificial graphite or of "other carbon", mainly used for cutting into electrical brushes (**heading 38.01**) (see corresponding Explanatory Note).
 - (b) Refractory goods, fired as ceramics, with a basis of carbonaceous substances (graphite, coke, etc.) and coal tar pitch or clay (**heading 69.02** or **69.03**, as the case may be).
 - (c) Carbons, brushes, electrodes and other parts or articles for electrical uses (**heading 85.45**).
-

Chapter 69

Ceramic products

Notes.

- 1.- This Chapter applies only to ceramic products which have been fired after shaping. Headings 69.04 to 69.14 apply only to such products other than those classifiable in headings 69.01 to 69.03.
- 2.- This Chapter does not cover :
 - (a) Products of heading 28.44;
 - (b) Articles of heading 68.04;
 - (c) Articles of Chapter 71 (for example, imitation jewellery);
 - (d) Cermets of heading 81.13;
 - (e) Articles of Chapter 82;
 - (f) Electrical insulators (heading 85.46) or fittings of insulating material of heading 85.47;
 - (g) Artificial teeth (heading 90.21);
 - (h) Articles of Chapter 91 (for example, clocks and clock cases);
 - (ij) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings, prefabricated buildings);
 - (k) Articles of Chapter 95 (for example, toys, games and sports requisites);
 - (l) Articles of heading 96.06 (for example, buttons) or of heading 96.14 (for example, smoking pipes); or
 - (m) Articles of Chapter 97 (for example, works of art).

GENERAL

The term "ceramic products" applies to products obtained :

- (A) By firing inorganic, non-metallic materials which have been prepared and shaped previously at, in general, room temperature. Raw materials comprise, inter alia, clays, siliceous materials, materials with a high melting point, such as oxides, carbides, nitrides, graphite or other carbon, and in some cases binders such as refractory clays or phosphates.
- (B) From rock (e.g., steatite), fired after shaping.

The manufacturing process of the ceramic products referred to in paragraph (A) above (whatever their constituent material) comprises the following main stages :

(i) **Preparation of the paste (or body).**

In some cases (e.g., manufacture of sintered alumina articles) the constituent material is used directly in powder form with the addition of a small amount of lubricant. In most cases, however, it is first made into a paste. This involves measuring and mixing the various constituents and, where necessary, milling, sieving, filter-pressing, kneading, maturing and de-airing. Some refractory products are also made from a blend of graded aggregate and fines, along with a small amount of liquid binder, which may be aqueous (e.g., tar, resin materials, phosphoric acid, lignin liquor).

(ii) **Shaping.**

The prepared powder or paste is then shaped as nearly as possible to the desired form.

This is done by extrusion (through an extrusion die), pressing, moulding, casting or hand-shaping, followed in some cases by some degree of machining.

(iii) **Drying** the resulting articles.

(iv) **Firing.**

In this operation, the “green ware” is heated to a temperature of 800 °C or higher according to the nature of the product. After firing, the grains are closely bound together as a result of diffusion, chemical transformation or partial fusion.

Articles heated to temperatures less than 800 °C for purposes such as curing of resins, accelerating hydration reactions, or for the removal of water or other volatile components, are **not considered to be fired** for the purposes of Chapter Note 1. Such articles are **excluded** from Chapter 69.

(v) **Finishing.**

The finishing processes depend on the intended use of the ceramic product. Sometimes machine finishing to a high degree of precision is necessary. Finishing may also include marking, metallising or impregnation.

Ceramic products are also very often coloured (either in the body or superficially), decorated or glazed by using, as appropriate, specially prepared colours or opacifiers, vitrifiable enamels or glazes, slips, lustres, etc.

Firing, after shaping, is the essential distinction between the goods of this Chapter and the mineral or stone articles classified in Chapter 68 which are generally not fired, and the glass articles of Chapter 70 in which the vitrifiable compound has undergone complete fusion.

According to the composition and the firing process adopted, the following products are obtained :

- I. Goods of siliceous fossil meals or of similar siliceous earths and refractory goods of sub-Chapter I (headings 69.01 to 69.03).
- II. Other ceramic products, consisting essentially of common pottery, stoneware, earthenware, porcelain or china, etc. constituting sub-Chapter II (headings 69.04 to 69.14).

This Chapter **excludes** :

- (a) Broken pottery and broken pieces of brick (**heading 25.30**).
 - (b) Products of **heading 28.44**.
 - (c) Blocks, plates, bars and similar semi-manufactures of graphite or of other carbon, or metallo-graphitic or other grades, used, e.g., for cutting into electrical brushes (**heading 38.01**) (see corresponding Explanatory Note).
 - (d) Unmounted cut elements of piezo-electric ceramic materials, e.g., of barium titanate or of lead zirconate titanate (**heading 38.24**).
 - (e) Articles of **heading 68.04**.
 - (f) Glass-ceramic products (**Chapter 70**).
 - (g) Sintered mixtures of base metal powders and heterogeneous intimate base metal mixtures obtained by melting (**Section XV**).
 - (h) Cermets of **heading 81.13**.
 - (ij) Plates, sticks, tips and the like for tools, unmounted, of cermets (**heading 82.09**) and other articles of **Chapter 82**.
-

Sub-chapter I

GOODS OF SILICEOUS FOSSIL MEALS OR OF SIMILAR SILICEOUS EARTHS, AND REFRACTORY GOODS

GENERAL

This sub-Chapter covers, whether or not they contain clay :

- (A) **In heading 69.01 ceramic goods** obtained by the firing after shaping of siliceous fossil meals or similar siliceous earths such as kieselguhr, tripolite or diatomite (mostly falling in heading 25.12), or of silica obtained by the incineration of certain vegetable products (e.g., rice boll ash). These materials are usually mixed with binders (such as clay or magnesia) and sometimes with other substances (e.g., asbestos, hair, sawdust, coal dust).

These articles are usually very light weight, and their porous structure makes them excellent heat-insulators for use in building, for the lagging of gas and steam piping. Some of these goods are also used as refractory products in the construction of ovens, industrial furnaces, steam generating boilers or other industrial plant and for other applications where lightness of the material, low thermal conductivity, as well as heat resistance, are desired. Others are used as heat-insulators for working temperatures of less than 1,000 °C.

- (B) **In headings 69.02 and 69.03 refractory goods**, i.e., fired articles having the special property of resisting high temperatures as met in metallurgy, the glass industry, etc. (e.g., of the order of 1,500 °C and higher). According to the particular uses for which they are intended, refractory articles may also need to withstand rapid changes of temperature, be either good thermal insulators or conductors, have a low coefficient of thermal expansion, be porous or dense, resist the corrosive effects of products with which they come into contact, have a good mechanical strength and resistance to wear, etc.

However, to fall in heading 69.02 or 69.03 as refractory goods, articles must not only be **capable** of resisting high temperatures, they must also be **designed** for high temperature work. Heading 69.03 would therefore include crucibles of sintered alumina, but textile machine thread guides of the same material would fall in heading 69.09 since they are designed for clearly non-refractory uses.

The main types of refractory goods are :

- (1) High alumina refractories based either upon bauxite, mullite or corundum (sometimes mixed with clays) or on kyanite, sillimanite or andalusite (aluminium silicates) mixed with clays, or on sintered alumina.
- (2) Alumino-silicate refractories (e.g., based upon fire-clay with some chamotte or grog).
- (3) Silica and semi-silica refractories (based upon sand, crushed quartz, flint, etc., and bonded with clay or lime).

- (4) Magnesite refractories based upon magnesite (giobertite), sea-water magnesia or dolomite; refractories based upon chromite or chromium oxide; chrome-magnesite refractories.
- (5) Refractories based upon silicon carbide.
- (6) Zirconium oxide or zirconium silicate refractories, usually agglomerated with clay; refractories based upon beryllium oxide, thorium oxide, cerium oxide, etc.
- (7) Refractories based upon graphite or other carbon, usually agglomerated with pitch, tar or clay. (Articles of graphite or other carbon of a kind used for electrical purposes fall in **heading 85.45**.)
- (8) Refractories based upon other materials, e.g., silicon nitride, boron nitride, aluminium titanate and related compounds.

Refractory materials are used mainly to line blast furnaces, coke ovens, petroleum cracking plants, glass, ceramic and other industrial furnaces, and in the manufacture of pots, crucibles and other plant for the chemical, glass, cement and aluminium and other metallurgical industries.

But headings 69.02 and 69.03 **do not cover** articles which, though sometimes described as refractory or semi-refractory, are incapable of withstanding industrial temperatures of the type described above. Such articles fall in the appropriate heading of sub-Chapter II.

69.01 - Bricks, blocks, tiles and other ceramic goods of siliceous fossil meals (for example, kieselguhr, tripolite or diatomite) or of similar siliceous earths.

This heading covers all articles made of the materials listed in the heading text, whatever their shape (e.g., bricks, blocks, slabs, panels, tiles, hollow bricks, cylinder shells, pipes), whether or not refractory.

The heading **excludes** :

- (a) Light non-refractory bricks not containing siliceous fossil meals or similar siliceous earths (e.g., those made from bodies containing chopped straw, sawdust, peat fibre, etc., the organic matter having been burnt away during the firing process to leave a porous structure) (**heading 69.04**).
- (b) Filter plates made from a body containing kieselguhr and quartz (**heading 69.09**).

69.02 - Refractory bricks, blocks, tiles and similar refractory ceramic constructional goods, other than those of siliceous fossil meals or similar siliceous earths (+).

6902.10 - Containing by weight, singly or together, more than 50 % of the elements Mg, Ca or Cr, or expressed as MgO, CaO or Cr₂O₃

6902.20 - Containing by weight more than 50 % of alumina (Al₂O₃), of silica (SiO₂) or of a mixture or compound of these products

6902.90 - Other

This heading covers a group of refractory products (**other than** those of **heading 69.01**) normally used in the construction of ovens, kilns, furnaces or other plant for the metallurgical, chemical, ceramic, glass and other industries.

It includes, *inter alia* :

- (1) Bricks of all shapes (parallelepiped, wedge shaped, cylindrical, semi-cylindrical, etc.), including keystones and other specially shaped bricks (e.g., runner bricks, concave on one face and rectilinear on the others) even if they are clearly recognisable as being of the kind specially designed for the construction of plant or machinery of Section XVI.
- (2) Refractory blocks and tiles for flooring, walls, hearths, etc.

The heading **excludes** tubing, piping (including runways in the form of half-cylinders) and angles, bends and similar tube or pipe fittings of refractory materials (**heading 69.03**).

○
○ ○

Subheading Explanatory Note.

Subheading 6902.10

What has to be determined for the purposes of this subheading is the content of MgO, CaO or Cr₂O₃. This is normally done by determining the contents of the elements present (i.e., Mg, Ca or Cr) and from these amounts the equivalent concentrations in terms of their oxides can be calculated. For example, 40 % Ca is equivalent to 56 % CaO and 24 % Mg is equivalent to 40 % MgO. Thus, a product based on calcium silicate containing 40 % Ca (equivalent to 56 % CaO) would be classified in this subheading.

69.03 - Other refractory ceramic goods (for example, retorts, crucibles, muffles, nozzles, plugs, supports, cupels, tubes, pipes, sheaths and rods), other than those of siliceous fossil meals or of similar siliceous earths.

6903.10 - Containing by weight more than 50 % of graphite or other carbon or of a mixture of these products

6903.20 - Containing by weight more than 50 % of alumina (Al_2O_3) or of a mixture or compound of alumina and of silica (SiO_2)

6903.90 - Other

This heading covers all refractory goods **not** specified or included in the preceding headings.

These articles include :

- (1) Articles which, unlike the refractory products of **heading 69.02**, are in many cases not permanent fixtures, such as retorts, reaction vessels, crucibles, cupels and similar articles for industrial or laboratory use, muffles, nozzles, plugs, burner jets and similar parts of furnaces; saggars, stands and other kiln furniture to support or separate pottery during firing; sheaths and rods; stands for crucibles; ingot moulds; etc.
- (2) Tubing, piping (including runways in the form of half-cylinders) and angles, bends and similar tube or pipe fittings, even if intended for use as permanent fixtures in construction work.

The heading **does not**, however, **include** Seger cones (ceramic firing testers) (see Explanatory Note to **heading 38.24**); these are **not fired after shaping**

Sub-chapter II

OTHER CERAMIC PRODUCTS

GENERAL

This sub-Chapter covers ceramic articles **other than** those of siliceous fossil meals or of similar siliceous earths and refractory goods of sub-Chapter I.

For the purpose of the Nomenclature, these articles are classified according to kind (bricks, tiles, sanitary ware, etc.), and classification is not affected by the nature of the ceramics used in their manufacture or by the presence of glazing, **except** in the case of :

- (i) Ceramic tiles, flags and mosaic cubes and the like, classified in heading 69.07 when unglazed and in heading 69.08 when glazed.
- (ii) Tableware, kitchenware, other household articles and toilet articles, classified in heading 69.11 when of porcelain or china and in heading 69.12 if of other kinds of ceramics.

(I) PORCELAIN OR CHINA

Porcelain or china means hard porcelain, soft porcelain, biscuit porcelain (including parian) and bone china. All these ceramics are almost completely vitrified, hard, and are essentially impermeable (even if they are not glazed). They are white or artificially coloured, translucent (except when of considerable thickness), and resonant.

Hard porcelain is made from a body composed of kaolin (or kaolinic clays), quartz, feldspar (or feldspathoids), and sometimes calcium carbonate. It is covered with a colourless transparent glaze fired at the same time as the body and thus fused together.

Soft porcelain contains less alumina but more silica and fluxes (e.g., feldspar). Bone china, which contains less alumina, contains calcium phosphate (e.g., in the form of bone ash); a translucent body is thus obtained at a lower firing temperature than with hard porcelain. The glaze is normally applied by further firing at a lower temperature, thus permitting a greater range of underglaze decoration.

Biscuit porcelain is unglazed porcelain, of which parian-ware (sometimes called Carrara porcelain) is a special, fine-grained, yellowish type containing more feldspar, and often resembling Paros marble in appearance, hence its name.

(II) OTHER CERAMIC PRODUCTS

Ceramic products other than of porcelain or china include :

- (A) Ceramics with a porous body which, unlike porcelain, are opaque, permeable to liquids, easily scratched with iron and whose fracture sticks to the tongue. Such ceramics include :
- (1) Pottery made from common ferruginous and calcareous clay (brick earth). It has a dull earthy texture and its colour is generally brown, red or yellow.

- (2) A wide range of white or coloured ceramics (earthenware, majolica, delft-ware, etc.). The body is porous and must be glazed to make the articles impermeable (e.g., with transparent or opaque glazes such as white or coloured metallic oxides). Earthenware, etc., is made from finely sieved clays mixed with water. It has a fine-grained body obtained by firing to a higher temperature than in the case of pottery made from common clay; it differs from porcelain or china because it is not completely vitrified.
- (B) Stoneware which, though dense and hard enough to resist scratching by a steel point, differs from porcelain because it is opaque and normally only partially vitrified. Stoneware may be a vitreous (impermeable) or semi-vitreous ware. It is usually grey or brownish because of impurities contained in the clay used for its manufacture, and is normally glazed.
- (C) Certain so-called "semi-porcelains" or "imitation porcelains", sometimes prepared, decorated and glazed to give the commercial appearance of porcelain. Without being really opaque like earthenware, or truly translucent like porcelain, these products may be slightly translucent in the thinner parts such as the bottoms of cups. These materials can, however, be distinguished from real porcelain because their fracture is rough-grained, dull and non-vitrified. They are therefore porous beneath the glaze and the fracture clings to the tongue. Further, they are easily scratched with a steel knife, though it should be noted that certain soft chinas may also be scratched by steel. Products of these imitation "porcelains" **are not** considered as porcelain or china.

The sub-Chapter also includes certain goods made by shaping and firing powdered steatite, etc., generally mixed with clay (e.g., kaolins), feldspar, etc., but it should be noted that many articles of these materials are designed for electrical purposes and are therefore classified in **Chapter 85**. This sub-Chapter also covers articles made by firing steatite shaped by sawing.

Certain ceramic articles made of refractory materials (e.g., sintered alumina) may also fall in sub-Chapter II if **not** of a type designed for use as refractory goods (see Explanatory Note to heading 69.09).

69.04 - Ceramic building bricks, flooring blocks, support or filler tiles and the like.

6904.10 - Building bricks

6904.90 - Other

This heading covers non-refractory ceramic bricks (i.e., bricks unable to withstand temperatures of 1,500 °C or higher) of the kinds commonly used for building walls, houses, industrial chimney-stacks, etc. Such bricks remain in the heading even if they can also be used for other purposes (e.g., vitrified bricks which can be used for paving or bridge piling, as well as for the construction of buildings).

Bricks are usually relatively porous (common pottery), but some are more or less vitrified (stoneware or engineering bricks) and are then used in constructional work calling for great mechanical strength or resistance to acids (e.g., in chemical plant).

The heading includes :

- (1) Ordinary solid bricks of rectangular shape, with flat or indented surfaces.
- (2) Curved bricks, sometimes perforated, for industrial chimney-stacks.
- (3) Hollow bricks, perforated bricks; long hollow flooring blocks and constructional slabs used particularly for flooring, ceilings, etc., in combination with structural steelwork, and support or filler tiles (i.e., ceramic fittings designed to support the blocks while encasing the girders).
- (4) Facing bricks (e.g., for facing houses or walls, the surrounds of doors or windows, including special bricks for column capitals, borders, friezes or other architectural decoration).

So-called "double" bricks specially perforated lengthwise, ready for splitting before use, remain in this heading **provided** that they retain the character of building bricks after separation.

All these bricks, especially those intended for facing, may be polished, sand-faced (by fusing sand on to the surface during firing), covered with a thin layer of white or coloured slip which hides the colour of the body, smoked or flamed, coloured in the body or on the surface (by adding metallic oxides, by using ferruginous clay, or by heating in a reducing atmosphere with hydrocarbons or carbon), impregnated with tar, or glazed, etc. They may also have moulded, embossed or indented designs on one or two faces.

The heading also includes light bricks made from mixtures containing sawdust, peat fibres, chopped straw, etc., which are burned away during firing, leaving a very porous structure.

The heading **does not cover** :

- (a) Bricks of kieselguhr, etc. (**heading 69.01**) and refractory bricks (**heading 69.02**).
- (b) Flags and paving, hearth or wall tiles (see Explanatory Notes to **headings 69.07** and **69.08**).

69.05 - Roofing tiles, chimney-pots, cowls, chimney liners, architectural ornaments and other ceramic constructional goods.

6905.10 - Roofing tiles

6905.90 - Other

This heading covers a range of non-refractory goods, usually of common pottery but sometimes more or less vitrified, which, like bricks, are used in constructional or building work.

It includes :

- (1) Roofing tiles (for roofs, for topping walls, etc.). These are usually provided with nibs, holed for nailing, or may be moulded to interlock, and in this respect differ from the tiles of **headings 69.07 and 69.08**. They may be flat, half cylinders or of special shapes for eaves, ridges, hips or valleys, etc.
- (2) Chimney-pots, cowls, chimney liners, flue-blocks, etc.
- (3) Architectural ornaments for use on buildings, walls, gates, etc. (e.g., cornices and friezes); gargoyles; pediments, rosettes, balustrades, corbels, capitals; gable-end, eave, ridging and roof ornaments, etc.
- (4) Other ceramic constructional goods, e.g., ventilator grills; clay-lath used as support for plaster-work and formed of wire mesh with fired clay crosses or plates at the intersections, the fired clay forming the major constituent.

These articles fall in this heading whether plain, sand-faced, covered with slip, coloured in the mass, impregnated with other substances, glazed, ribbed, channelled, fluted or otherwise decorated by moulding.

The heading **excludes**, *inter alia*, pipes and guttering and the like, such as rain-water drain-pipes (**heading 69.06**), even if used for constructional purposes.

69.06 - Ceramic pipes, conduits, guttering and pipe fittings.

This heading applies to non-refractory piping, etc., designed, as a general rule, to interlock and to be used for draining or for the distribution of fluids. They may be of any shape or section (straight, curved, branched, of constant or varying diameter, etc.), and may be glazed.

The heading includes :

- (1) Agricultural or horticultural drainage pipes, of porous common pottery, fired at only a low temperature and roughly finished.
- (2) Other pipes, conduits and guttering (e.g., rain-water drain-pipes, sewer pipes, conduit tubing to protect electric cables but **not** designed to act as insulators, half tubes in the form of gutters or runways, wall drainage tubes).

These pipes, etc., may be of unglazed common pottery, but are often rendered impermeable by glazing or by vitrification (e.g., chemical piping).

- (3) Pipe fittings for connecting or branching (collars, flanges, elbows, T-pieces, clean out traps, etc.).

The heading **does not cover** :

- (a) Tubular chimney-parts (e.g., chimney-pots, cowls, chimney liners and flue-blocks) (**heading 69.05**).
- (b) Small tubes and tubing (e.g., combustion tubes), usually of porcelain or china, specially designed for laboratories (**heading 69.09**).
- (c) Insulating electric conduit tubing and joints, and all tubular fittings designed for electrical uses (**headings 85.46 and 85.47** in particular).

69.07 - Ceramic flags and paving, hearth or wall tiles; ceramic mosaic cubes and the like, whether or not on a backing; finishing ceramics (+).

- Flags and paving, hearth or wall tiles, other than those of subheadings 6907.30 and 6907.40 :

6907.21 -- Of a water absorption coefficient by weight not exceeding 0.5 %

6907.22 -- Of a water absorption coefficient by weight exceeding 0.5 % but not exceeding 10 %

6907.23 -- Of a water absorption coefficient by weight exceeding 10 %

6907.30 - Mosaic cubes and the like, other than those of subheading 6907.40

6907.40 - Finishing ceramics

This heading covers ceramic flags and tiles, including quarry tiles, commonly used for paving or for facing walls, hearths, etc.

Flags and paving, hearth or wall tiles are thinner in relation to their surface dimensions than are building bricks. Whereas bricks play an essential part in constructional work, forming the very framework of the building, flags and tiles are more especially intended for fixing by cement, adhesive or by other means to the surface of existing walls, etc. They also differ from roofing tiles in that they are usually flat and do not need to be pierced or provided with nibs or otherwise shaped for interlocking and that they are designed to be placed side by side without overlapping. Flags are larger than tiles and are usually rectangular; tiles may be of other geometric shapes (hexagonal, octagonal, etc.). Tiles are mainly used for facing walls, mantelpieces, hearths, floors and paths; flags are more especially used for paving or flooring, or as hearth slabs. Both categories may be made from clays or other inorganic raw materials, usually shaped by extruding or pressing at room temperature, but can be formed by other processes, then dried and subsequently fired at temperatures sufficient to develop the required properties. However types which have to withstand heavy wear are often vitrified, for example, tiles of stoneware, or porcelain (china) or of fired steatite (e.g., tiles for lining grinding mills, etc.).

The wear resistance and the vitrification rate vary depending on the structure of tile. These structural features are characterized by the absorption capacity of water. A high water absorption level corresponds to a porous structure. A low water absorption level corresponds to a compact (vitrified) structure.

The porosity factor or water absorption coefficient (symbol E) is defined as the percentage of water by mass after saturating the dry sample product (tile) in water.

The determination of the level of water absorption is based on the vacuum method set out in ISO standard 10545-3.

The formula for calculating the water absorption is given by the following equation :

$$E = \{(M_f - M_i) / M_i\} \times 100 \text{ where :}$$

E = Water absorption expressed as a percentage

M_i = The dry mass of the specimen

M_f = The saturated mass of the specimen

Certain ceramic tiles are used solely for paving; unlike bricks, they are usually cubic or in the form of truncated pyramids. In practice, they are normally of stoneware or, exceptionally, of porcelain or china (e.g., flags for pedestrian crossings).

The classification of goods in this heading is therefore determined by their shape and size, rather than by their composition; thus bricks suitable for use both in building and for paving are **excluded (heading 69.04)**.

Goods of this heading may be coloured in the mass, marbled, ribbed, channelled, fluted, glazed, etc.

Subject to the above conditions, the heading also includes :

- (1) Finishing ceramics such as bordering, capping, skirting, frieze, angle, corner or other fitting tile pieces employed as complementary elements for finishing off the facing, paving, etc., work, with or without rounded edges, non flat or 3-dimensional, which give them the character of finishing pieces; that would be the case, in particular, for bordering, skirting, frieze, corner pieces, decorative inserts and other ceramic accessories. In these cases, these pieces need to match with the other basic tiles, so their proper surface usually has the same shade or finish of the normal tiles. They are generally sold by piece or by linear metre.
- (2) Double tiles intended for splitting before use.
- (3) Terracotta cladding elements used in the building industry for exterior or interior cladding purposes, of various dimensions, with a modular structure, which are attached by, e.g., metal clips to vertical or horizontal metal profiles secured to the walls of the main structure.
- (4) Mosaic cubes and the like, whether or not on a paper or other backing, characterized by their small sizes.

On the other hand, in addition to glazed articles the heading **excludes** :

- (a) Tiles specially adapted as table mats, etc. (**heading 69.11 or 69.12**).
- (b) Ornaments and the like of **heading 69.13**.
- (c) Ceramic tiles specially adapted for stoves (**heading 69.14**).

Subheading Explanatory Note.

Subheading 6907.40

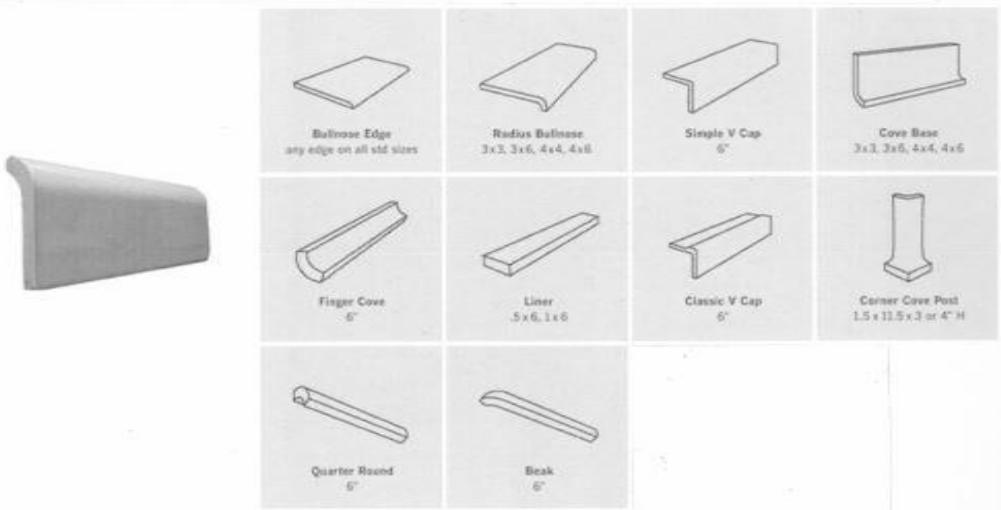

Pictures of some of the types of finishing ceramics which are covered by this subheading are reproduced below.

Finishing ceramics

Exploded view - three rows of trim tiles

Finishing ceramics

[69.08]

69.09 - Ceramic wares for laboratory, chemical or other technical uses; ceramic troughs, tubs and similar receptacles of a kind used in agriculture; ceramic pots, jars and similar articles of a kind used for the conveyance or packing of goods (+).

- Ceramic wares for laboratory, chemical or other technical uses :

6909.11 -- Of porcelain or china

6909.12 -- Articles having a hardness equivalent to 9 or more on the Mohs scale

6909.19 -- Other

6909.90 - Other

This heading covers a range of very varied articles usually made from vitrified ceramics (stoneware, porcelain or china, steatite ceramics, etc.), glazed or unglazed. It **does not**, however, **cover** refractory goods of a kind designed for resisting high temperatures as described in the General Explanatory Note to sub-Chapter I. But articles of a type **not designed for high temperature work remain in this heading** even if made of refractory materials (e.g., thread guides, grinding apparatus, etc., of sintered alumina).

The heading covers in particular :

- (1) Laboratory wares (e.g., for research or industrial use) such as crucibles and crucible lids, evaporating dishes, combustion boats, cupels; mortars and pestles; spoons for acids, spatulas; supports for filters and catalysts; filter plates, tubes, candles, cones, funnels, etc.; water-baths; beakers, graduated vessels (**other than** graduated kitchen measures); laboratory dishes, mercury troughs; small tubes (e.g., combustion tubes, including analysis tubes for estimation of carbon, sulphur, etc.).
- (2) Ceramic wares for other technical uses, such as pumps, valves; retorts, vats, chemical baths and other static containers with single or double walls (e.g., for electroplating, acid storage); taps for acids; coils, fractionating or distillation coils and columns, Raschig rings for petroleum fractionating apparatus; grinding apparatus and balls, etc., for grinding mills; thread guides for textile machinery and dies for extruding man-made textiles; plates, sticks, tips and the like, for tools.
- (3) Containers of the kinds used for the commercial transport or packing of goods, e.g., large containers, carboys, etc., for the transport of acids and other chemical products; flagons, jars and pots, for foodstuffs (jam, condiments, meat pastes, liqueurs, etc.), for pharmaceutical products or cosmetics (pomades, ointments, creams, etc.), for inks, etc.
- (4) Troughs, tubs and similar containers of the type used in agriculture.

The heading **excludes** :

- (a) Articles of **heading 68.04**.
- (b) Retorts, crucibles, muffles, cupels and other similar articles of refractory materials (**heading 69.03**).
- (c) Kitchen or domestic containers (e.g., tea caddies, bread bins, biscuit barrels) (**heading 69.11** or **69.12**).
- (d) General purpose jars and containers for laboratories and display jars for pharmacies, confectioners, etc. (**heading 69.14**).
- (e) Articles of cermets (**heading 81.13**).
- (f) Electrical apparatus (switches, junction boxes, fuses, etc.) of **headings 85.33 to 85.38**, and electrical insulators, insulating fittings, etc., of **heading 85.46** or **85.47**.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 6909.12

This subheading covers high-performance ceramic articles. These articles are composed of a crystalline ceramic matrix (e.g., of alumina, silicon carbide, zirconia, or nitrides of silicon, boron or aluminium, or of combinations thereof); whiskers or fibres of reinforcing material (e.g., of metal or graphite) may also be dispersed in the matrix to form a composite ceramic material.

These articles are characterized by a matrix which has a very low porosity and in which the grain size is very small; by high resistance to wear, corrosion, fatigue and thermal shock; by high-temperature strength; and by strength-to-weight ratios comparable to or better than those of steel.

They are often used in place of steel or other metal parts in mechanical applications requiring close dimensional tolerances (e.g., engine turbocharger rotors, rolling contact bearings and machine tools).

The Mohs scale mentioned in this subheading rates a material by its ability to scratch the surface of the material below it on the scale. Materials are rated from 1 (for talc) to 10 (for diamond). Most of the high-performance ceramic materials fall near the top of the scale. Silicon carbide and aluminium oxide, both of which are used in high-performance ceramics, fall at 9 or above on the Mohs scale. To distinguish among harder materials, the Mohs scale is sometimes expanded, with talc as 1 and diamond as 15. On the expanded Mohs scale, fused alumina has a hardness equivalent to 12, and silicon carbide has a hardness equivalent to 13.

69.10 - Ceramic sinks, wash basins, wash basin pedestals, baths, bidets, water closet pans, flushing cisterns, urinals and similar sanitary fixtures.

6910.10 - Of porcelain or china

6910.90 - Other

This heading covers fittings designed to be **permanently fixed in place**, in houses, etc., normally by connection to the water or sewage systems. They must therefore be made impervious to water by glazing or by prolonged firing (e.g., stoneware, earthenware, fire-clay sanitary ware, imitation porcelain, or vitreous china). In addition to the fittings specified, the heading includes such items as lavatory cisterns.

Ceramic flushing cisterns remain classified in this heading, **whether or not** equipped with their mechanisms.

The heading **does not**, however, **include** small accessory bathroom or sanitary fittings, such as soap dishes, sponge baskets, tooth-brush holders, towel hooks and toilet paper holders, even if of a kind designed for fixing to the wall, nor portable sanitary articles such as bed pans, urinals and chamber-pots; these goods fall in **heading 69.11 or 69.12**.

69.11 - Tableware, kitchenware, other household articles and toilet articles, of porcelain or china.

6911.10 - Tableware and kitchenware

6911.90 - Other

See the Explanatory Note to heading 69.12.

69.12 - Ceramic tableware, kitchenware, other household articles and toilet articles, other than of porcelain or china.

Tableware, kitchenware, other household articles and toilet articles are classified in **heading 69.11 if of porcelain or china, and in heading 69.12 if of other ceramics** such as stoneware, earthenware, imitation porcelain (see General Explanatory Note to sub-Chapter II).

The headings therefore include :

- (A) Tableware such as tea or coffee services, plates, soup tureens, salad bowls, dishes and trays of all kinds, coffee-pots, teapots, sugar bowls, beer mugs, cups, sauce-boats, fruit bowls, cruets, salt cellars, mustard pots, egg-cups, teapot stands, table mats, knife rests, spoons and serviette rings.
- (B) Kitchenware such as stew-pans, casseroles of all shapes and sizes, baking or roasting dishes, basins, pastry or jelly moulds, kitchen jugs, preserving jars, storage jars and bins (tea caddies, bread bins, etc.), funnels, ladles, graduated kitchen capacity measures and rolling-pins.
- (C) Other household articles such as ash trays, hot water bottles and matchbox holders.
- (D) Toilet articles (whether for domestic or non-domestic use) such as toilet sets (ewers, bowls, etc.), sanitary pails, bed pans, urinals, chamber-pots, spittoons, douche cans, eye baths; soap dishes, towel rails, tooth-brush holders, toilet paper holders, towel hooks and similar articles for bathrooms, toilets or kitchens, whether or not designed for fixing to or setting in the wall.

The headings exclude :

- (a) Carboys, jars, bottles, pots and similar articles of a kind used for the packing or transport of goods (**heading 69.09**).
- (b) Baths, bidets, sinks and similar sanitary fittings (**heading 69.10**).
- (c) Statuettes and other ornamental articles of **heading 69.13**.
- (d) Ceramic ware having more than minor trimmings of precious metal or metal clad with precious metal (**Chapter 71**).
- (e) Coffee or spice mills with containers of ceramics and working parts of metal (**heading 82.10**).
- (f) Electro-thermic apparatus (for cooking, heating, etc.), including electric heating elements (cooking plates, heating resistors, etc.), of **heading 85.16**.
- (g) Articles of **Chapter 91**, including clock cases.
- (h) Lighters of **heading 96.13** and scent sprays, etc. (**heading 96.16**).

69.13 - Statuettes and other ornamental ceramic articles.

6913.10 - Of porcelain or china

6913.90 - Other

This heading covers a wide range of ceramic articles of the type designed essentially for the interior decoration of homes, offices, assembly rooms, churches, etc., and outdoor ornaments (e.g., garden ornaments).

The heading **does not include** articles falling in more specific headings of the Nomenclature even if they are suited by reason of their nature or finish for decorative use, e.g. :

- (a) Cornices, friezes and similar architectural ornaments (**heading 69.05**).
- (b) Goods having more than mere minor fittings of precious metal or metal clad with precious metal (**Chapter 71**).
- (c) Imitation jewellery (**heading 71.17**).
- (d) Barometers, thermometers and other apparatus of **Chapter 90**.
- (e) Clocks and cases therefor, even if the latter are decorated or consist, for example, of statuettes or similar objects clearly designed to act as clock cases (**Chapter 91**).
- (f) Lamps and lighting fittings and parts thereof, of **heading 94.05**.
- (g) Toys, games and sports requisites (**Chapter 95**).
- (h) Buttons, smoking pipes, table lighters, scent sprays and other articles of **Chapter 96**.
- (ij) Paintings, drawings and pastels executed entirely by hand, and original statuary, collectors' pieces and antiques of an age exceeding 100 years (**Chapter 97**).

The heading covers :

(A) **Articles which have no utility value but are wholly ornamental, and articles whose only usefulness is to support or contain other decorative articles or to add to their decorative effect**, e.g. :

- (1) Statues, statuettes, busts, haut or bas reliefs, and other figures for interior or exterior decoration; ornaments (including those forming parts of clock sets) for mantelpieces, shelves, etc., (animals, symbolic or allegorical figures, etc.); sporting or art trophies; wall ornaments incorporating fittings for hanging (plaques, trays, plates); medallions; firescreens; artificial flowers, fruit, leaves, etc.; wreaths and similar ornaments for tombs; knick-knacks for shelves or domestic display-cabinets.
- (2) Crucifixes and other church or religious ornaments.
- (3) Purely ornamental table-bowls, vases, pots, jardinières.

- (B) **Tableware and other domestic articles only if the usefulness of the articles is clearly subordinate to their ornamental character**, for example, trays moulded in relief so that their usefulness is virtually nullified, ornaments incorporating a purely incidental tray or container usable as a trinket dish or ashtray, miniatures having no genuine utility value, etc. In general, however, tableware and domestic utensils are designed essentially to serve useful purposes, and any decoration is usually secondary so as not to impair the usefulness. If, therefore, such decorated articles serve a useful purpose no less efficiently than their plainer counterparts, they are classified in **heading 69.11 or 69.12** rather than in this heading.
- (C) **Articles, other than tableware and domestic articles, of the kind used for ornamenting or decorating** the household, office, etc. For example, smokers' sets, jewel cases, cachou boxes, cigarette boxes, perfume burners, ink-stands, book-ends, paperweights and similar desk furnishings and picture frames.

69.14 - Other ceramic articles.

6914.10 - Of porcelain or china

6914.90 - Other

This heading covers all ceramic articles **not covered** by other headings of this Chapter or in other Chapters of the Nomenclature.

It includes, *inter alia* :

- (1) Stoves and other heating apparatus, made essentially of ceramics (generally of earthenware, sometimes of common pottery, etc.); non-refractory firebrick cheeks; ceramic parts of stoves or fireplaces, ceramic linings for wood burning stoves, including tiles of a kind specially adapted for stoves. Electric heating apparatus is, however, classified in **heading 85.16**.
- (2) Non-decorative flower-pots (e.g., for horticulture).
- (3) Fittings for doors, windows, etc., such as handles and knobs, finger plates, etc.; knobs, etc., for lavatory chains.
- (4) Letters, numbers, sign-plates and similar motifs for shop signs and shop windows, whether or not bearing a printed picture or text, except when illuminated (**heading 94.05**).
- (5) Spring lever stoppers, etc., predominantly of ceramics (e.g., for lemonade bottles).
- (6) General purpose jars and containers for laboratories and display jars for pharmacies, confectioners, etc.
- (7) Various other articles such as knife handles, school inkwells, humidifiers for radiators and bird-cage accessories.

The heading **excludes** :

- (a) Artificial teeth of ceramics (**heading 90.21**).
 - (b) Toys, games and sports requisites (**Chapter 95**).
 - (c) Buttons, smoking pipes and other articles of **Chapter 96**.
-

Chapter 70

Glass and glassware

Notes.

1.- This Chapter does not cover :

- (a) Goods of heading 32.07 (for example, vitrifiable enamels and glazes, glass frit, other glass in the form of powder, granules or flakes);
- (b) Articles of Chapter 71 (for example, imitation jewellery);
- (c) Optical fibre cables of heading 85.44, electrical insulators (heading 85.46) or fittings of insulating material of heading 85.47;
- (d) Optical fibres, optically worked optical elements, hypodermic syringes, artificial eyes, thermometers, barometers, hydrometers or other articles of Chapter 90;
- (e) Lamps or lighting fittings, illuminated signs, illuminated name-plates or the like, having a permanently fixed light source, or parts thereof of heading 94.05;
- (f) Toys, games, sports requisites, Christmas tree ornaments or other articles of Chapter 95 (excluding glass eyes without mechanisms for dolls or for other articles of Chapter 95); or
- (g) Buttons, fitted vacuum flasks, scent or similar sprays or other articles of Chapter 96.

2.- For the purposes of headings 70.03, 70.04 and 70.05 :

- (a) glass is not regarded as " worked " by reason of any process it has undergone before annealing;
- (b) cutting to shape does not affect the classification of glass in sheets;
- (c) the expression " absorbent, reflecting or non-reflecting layer " means a microscopically thin coating of metal or of a chemical compound (for example, metal oxide) which absorbs, for example, infra-red light or improves the reflecting qualities of the glass while still allowing it to retain a degree of transparency or translucency; or which prevents light from being reflected on the surface of the glass.

3.- The products referred to in heading 70.06 remain classified in that heading whether or not they have the character of articles.

4.- For the purposes of heading 70.19, the expression " glass wool " means :

- (a) Mineral wools with a silica (SiO_2) content not less than 60 % by weight;
- (b) Mineral wools with a silica (SiO_2) content less than 60 % but with an alkaline oxide (K_2O or Na_2O) content exceeding 5 % by weight or a boric oxide (B_2O_3) content exceeding 2 % by weight.

Mineral wools which do not comply with the above specifications fall in heading 68.06.

5.- Throughout the Nomenclature, the expression " glass " includes fused quartz and other fused silica.

Subheading Note.

1.- For the purposes of subheadings 7013.22, 7013.33, 7013.41 and 7013.91, the expression "lead crystal" means only glass having a minimum lead monoxide (PbO) content by weight of 24 %.

GENERAL

This Chapter covers glass in all forms and articles of glass (**other than** goods excluded by Note 1 to this Chapter or covered more specifically by other headings of the Nomenclature).

Glass (except fused quartz and other fused silica referred to below) is a fused homogeneous mixture, in varying proportions, of an alkali silicate (of sodium or potassium) with one or more silicates of calcium and lead, and accessorially of barium, aluminium, manganese, magnesium, etc.

There are many varieties of glass according to their composition (e.g., Bohemian glass, crown glass, lead crystal glass, flint glass, strass paste). These various types are non-crystalline (amorphous) and wholly transparent.

The various headings of this Chapter cover the corresponding articles irrespective of the variety of glass of which they consist.

Manufacturing processes vary considerably and include :

- (A) **Casting** (e.g., for plate glass).
- (B) **Rolling** (e.g., for plate glass or wired glass).
- (C) **Floating** (for float glass).
- (D) **Moulding**, whether or not combined with pressing, blowing or drawing (e.g., for the manufacture of bottles, tumblers, certain types of optical glass, ashtrays).
- (E) **Blowing**, mechanical or non-mechanical, with or without moulds (e.g., for the manufacture of bottles, ampoules, ornaments and sometimes for the manufacture of sheet glass).
- (F) **Drawing or extruding** (particularly for sheet glass, rods, tubes and piping, and fibre glass).
- (G) **Pressing**, generally with moulds, frequently used as the manufacturing process for e.g., ashtrays, and also in combination with rolling (e.g., for figured rolled glass) or blowing (e.g., for bottles).
- (H) **Lampworking**, with the aid of a blow lamp (for the manufacture of ampoules, fancy articles, etc., from glass rod or tubing).
- (IJ) **Cutting out** the required articles from blanks, spheres, etc., obtained by any process (articles of fused quartz or other fused silica, in particular, are often obtained from blanks of solid or hollow section).

For **multicellular glass**, see the Explanatory Note to heading 70.16.

In certain cases the method of manufacturing the articles determines their classification in this Chapter. For example, heading 70.03 applies only to cast or rolled glass, and heading 70.04 only to drawn or blown glass.

*
* *

Note 5 to this Chapter provides that the expression "glass" includes fused quartz and other fused silica.

This Chapter also covers :

- (1) **Milk or opal glasses** which are translucent and are obtained by adding materials such as fluorspar or bone ash (in the proportion of about 5 %) to the mass of the glass; the added material gives rise to partial crystallisation in the melt on cooling or reheating.
- (2) **Special materials known as glass-ceramics**, in which the glass is converted into an almost wholly crystalline material by a process of controlled crystallisation. They are made by adding to the glass batch nucleating agents which are often metal oxides (such as titanium dioxide and zirconium oxide) or metals (such as copper powder). After the article has been shaped by ordinary glass-making techniques, it is maintained at a temperature such as to ensure crystallisation of the glassy body around the nucleating crystals (devitrification). Glass-ceramics may be opaque or sometimes transparent. They have much better mechanical, electrical and heat-resistant properties than ordinary glass.
- (3) **Glass having a low coefficient of expansion**, e.g., borosilicate glass.

70.01 - Cullet and other waste and scrap of glass; glass in the mass.

This heading covers :

- (A) **Waste and scrap of glass of all kinds** arising from the manufacture of glass (including glass waste splashed outside the melting pots and subsequently recovered); also broken articles. Waste glass is generally characterised by its sharp edges.
- (B) **Glass** (including “enamel” glass), **in the mass** (i.e., in more or less regular blocks), with no particular intended use.

“Enamel” glass is of greater fusibility and higher density than most ordinary varieties of glass. It is usually opaque though occasionally transparent; it may be colourless or of various colours. It falls in this heading when in the mass (in lumps or slabs). It is used for colouring or opacifying other glass, for lampworking into ornaments, etc., and for enamelling pottery, etc.

The heading also includes vitrite in the mass, a type of glass with a low melting point, used for insulating the contact terminals at the base of electric light bulbs. It has a high manganese dioxide content which gives it a blackish colour so that the inner fittings of the base are concealed.

Glass (including vitrite and “enamel” glass) in the form of powder, granules or flakes is **excluded (heading 32.07)**.

70.02 - Glass in balls (other than microspheres of heading 70.18), rods or tubes, unworked.

7002.10 - Balls

7002.20 - Rods

- Tubes :

7002.31 -- Of fused quartz or other fused silica

7002.32 -- Of other glass having a linear coefficient of expansion not exceeding 5×10^{-6} per Kelvin within a temperature range of 0 °C to 300 °C

7002.39 -- Other

This heading covers :

- (1) Solid glass balls, which are generally manufactured by moulding or pressing or on double-screw machines, and which may be used, *inter alia*, as raw material for the production of fibre, or for the preparation of lithographic plates.
- (2) Glass rods and tubing of various diameters, which are generally obtained by drawing (combined with blowing in the case of tubing); they may be used for many purposes (e.g., for chemical or industrial apparatus; in the textile industry; for further manufacture into thermometers, ampoules, electric or electronic bulbs and valves, or ornaments). Certain tubes for fluorescent lighting (used mainly for advertising purposes) are drawn with partitions running through the length.

This group includes "enamel" glass, in bars, rods or tubes ("enamel" glass is defined in the Explanatory Note to heading 70.01).

Balls of this heading must be unworked; similarly rod and tubing must be unworked (i.e., as obtained direct from the drawing process or merely cut into lengths the ends of which may have been simply smoothed).

The heading **excludes** balls, rod and tubing made into finished articles or parts of finished articles recognisable as such; these are classified under the appropriate heading (e.g., **heading 70.11**, **70.17** or **70.18**, or **Chapter 90**). If worked, but not recognisable as being intended for a particular purpose, they fall in **heading 70.20**.

This heading includes tubes (whether or not cut to length) of glass which has had fluorescent material added to it in the mass. On the other hand, tubes coated inside with fluorescent material, whether or not otherwise worked, are **excluded** (**heading 70.11**).

Glass balls having the character of toys (veined glass marbles put up in any form, and glass balls of any kind put up in packets for the amusement of children) are classified in **heading 95.03**. Glass balls, which have been ground after shaping, used for stoppering certain bottles fall in **heading 70.10**.

The heading also **excludes** the spherical glass grains (microspheres, not exceeding 1 mm in diameter) used, for example, for the manufacture of panels for road signs, reflecting signs or cinema screens, or in the cleaning of aeroplane jet engines or metallic surfaces (**heading 70.18**).

70.03 - Cast glass and rolled glass, in sheets or profiles, whether or not having an absorbent, reflecting or non-reflecting layer, but not otherwise worked.

- Non-wired sheets :

7003.12 -- Coloured throughout the mass (body tinted), opacified, flashed or having an absorbent, reflecting or non-reflecting layer

7003.19 -- Other

7003.20 - Wired sheets

7003.30 - Profiles

This heading covers all types of cast glass and rolled glass **provided** it is in sheets (whatever the thickness and whether or not cut to shape), or profiles, whether or not having an absorbent, reflecting or non-reflecting layer, but not otherwise worked.

It includes :

- (A) Unworked plate glass. This is generally non-transparent on account of its grained or rough surfaces. It may also be artificially coloured in the mass by means of metallic oxides or other salts. Surface ground or polished plate glass is **excluded (heading 70.05)**.
- (B) A category of non-transparent glass which is more or less opacified in the mass and sometimes completely opaque. It is often made to resemble marble, porcelain (china) or alabaster in appearance. This type of glass is made in white, black and other colours, plain or veined, and is used for facing walls, for the manufacture of tops for washstands, counters, desks, tables, operating tables, etc., of tablets for gravestones, of advertising boards, signs, etc.

This type of glass may be intended for subsequent mechanical polishing on one or both faces, but when so treated it is **excluded (heading 70.05)**. In the unworked state this glass shows marks resulting from contact with the roller or may bear traces of sand resulting from the casting. Certain opal glass has also one ribbed or rough surface in order to facilitate fixing.

- (C) A range of non-transparent glass, with an irregular surface obtained during manufacture. This group includes rough cast glass, cathedral glass, hammered cathedral glass, etc.; figured-rolled glass having one surface impressed with patterns (stripes, diamond patterns, ridges, etc.); corrugated glass and cast so-called antique glass (i.e., glass containing air bubbles, or crackled on the surface, or with other deliberate "defects"). Glass of these types, which may also be coloured in the mass, is used for the windows of factories, warehouses, offices, bathrooms and, in general, all premises where light is required but with varying degrees of obscuration.

Owing to the nature of the processes by which they are made, the types of glass in this category are not rendered plane by further processing.

As already stated, this heading covers **only** cast glass and rolled glass.

In the casting process (which is being replaced, except in the case of large surfaces, by the rolling method), the molten glass is poured on to a fixed table. There are two metal flanges along the sides of the table to determine its thickness. The crucible is emptied in front of a heavy metal roller which runs on the flanges and squeezes the viscous mass of glass to the thickness of the flanges. As soon as the glass reaches the required consistency, it is passed slowly through an annealing tunnel or lehr, where the temperature gradually decreases towards the outlet, which is quite cool. During the casting process, profiles (e.g., U-shaped) can also be obtained by bending a glass ribbon lengthwise while still in a semi-molten state.

In the rolling process, the molten glass is passed between rollers from which it emerges either as a continuous ribbon or in sheets or profiles. It is then carried mechanically into a lehr.

It is during the casting or rolling processes that the surfaces of figured, hammered, etc., glass are impressed. In the casting method, either engraved casting tables or an engraved roller form the patterns in the semi-molten glass. In the rolling method, the desired effects are obtained by means of the final roller, which is engraved.

The types of glass described above may have holes obtained during manufacture, or may be wired. Plate, figured, cathedral and similar types of glass are sometimes wired where protection against the danger of splinters on disintegration or breakage is required, thus making it suitable for building purposes. Wired glass is almost always obtained by embedding a network of steel wire in the soft glass while it is being rolled.

Glass classified in this heading may have been flashed, generally with glass of another colour, during the manufacturing process or may have been coated with an absorbent, reflecting or non-reflecting layer, but **not further worked**.

The heading **excludes** not only cast glass and rolled glass which, by reason of subsequent processing, fall in other headings (e.g., **heading 70.05, 70.06, 70.08 or 70.09**), but also safety glass (**heading 70.07**) which may have been subject to rolling during manufacture.

70.04 - Drawn glass and blown glass, in sheets, whether or not having an absorbent, reflecting or non-reflecting layer, but not otherwise worked.

7004.20 - Glass, coloured throughout the mass (body tinted), opacified, flashed or having an absorbent, reflecting or non-reflecting layer

7004.90 - Other glass

This heading is **restricted** to drawn glass and blown glass which **must** be unworked and in sheets (whether or not cut to shape).

The non-mechanical blowing process, now more or less completely discarded (except for certain special types of glass), has been replaced by various mechanical processes consisting essentially of drawing (e.g., the Fourcault, Libbey-Owens or Pittsburgh processes) or of drawing combined with blowing.

The glass of this heading may be of various thicknesses but, in general, is less thick than cast glass of **heading 70.03**. It may be coloured or opacified in the mass, or flashed with glass of another colour during manufacture or may be coated with an absorbent, reflecting or non-reflecting layer.

Drawn glass and blown glass are frequently used in the form in which they are originally produced, without any further working. In addition to their main use as glass for windows, doors, display cases, greenhouses, clocks, pictures, etc., these types of glass are also used as parts of articles of furniture, for photographic plates, plain spectacle glass, etc.

The heading **excludes** drawn glass and blown glass which have been surface ground, polished or otherwise worked (see the Explanatory Notes to **headings 70.05, 70.06, 70.09**, etc.).

70.05 - Float glass and surface ground or polished glass, in sheets, whether or not having an absorbent, reflecting or non-reflecting layer, but not otherwise worked.

7005.10 - Non-wired glass, having an absorbent, reflecting or non-reflecting layer

- Other non-wired glass :

7005.21 -- Coloured throughout the mass (body tinted), opacified, flashed or merely surface ground

7005.29 -- Other

7005.30 - Wired glass

This heading covers float glass in sheets. Its raw materials are melted in a furnace. The molten glass leaves the furnace and is fed on to a float bath of molten metal. On the float bath, the glass acquires the flatness of a liquid pool and later retains the smooth finish of liquid surfaces. Before it reaches the end of the bath, it is cooled to a temperature at which it is hard enough to be passed over rollers without being marked or distorted. From the float bath the glass moves through an annealing lehr, at the end of which it is cooled and can be cut. This glass is not surface ground or polished : it is perfectly flat as a result of the manufacturing process.

The heading also covers the types of glass of headings 70.03 and 70.04, **which have been surface ground or polished** (usually the two processes are combined).

In the surface grinding process the glass is subjected to the action of rotating iron-shod discs which, in conjunction with a flow of water containing abrasives, wears the glass surface down to smoothness. Transparency is achieved by polishing in a machine with felt-covered discs impregnated with rouge (iron oxide). Surface grinding can be continuous and twin-grinding machines are capable of working both surfaces of the glass simultaneously. A final polishing is sometimes done.

The glass of this heading may be coloured or opacified in the mass, or flashed with glass of another colour during manufacture or may be coated with an absorbent, reflecting or non-reflecting layer.

Glass of this heading is frequently used in windows and doors, motor cars, ships, aircraft, etc., for the manufacture of mirrors, table and desk tops, shelves, display cases, etc., and in the manufacture of safety glass of heading 70.07.

Glass in sheets which has undergone working not provided for in the heading text or in Note 2 (b) to this Chapter, including bent or curved glass, is **excluded (headings 70.06, 70.07, 70.09, etc.).**

70.06 - Glass of heading 70.03, 70.04 or 70.05, bent, edge-worked, engraved, drilled, enamelled or otherwise worked, but not framed or fitted with other materials.

This heading covers glass of the types referred to in headings 70.03 to 70.05 which has been subjected to one or more of the processes mentioned below. The heading **does not**, however, **include** safety glass (**heading 70.07**), multiple-walled insulating units of glass (**heading 70.08**) or glass in the form of mirrors (**heading 70.09**).

The heading includes :

- (A) **Bent or curved glass** such as the special glass (e.g., for display windows) which is obtained by hot-bending or hot-curving (in a suitable furnace and over moulds) flat glass sheets, **with the exception**, however, of the bent or curved glass of **heading 70.15**.
- (B) **Glass with worked edges** (ground, polished, rounded, notched, chamfered, bevelled, profiled, etc.), thus acquiring the character of articles such as slabs for table-tops, for balances or other weighing machinery, for observation slits and the like, for signs of various kinds, fingerplates, glasses for photograph frames, etc., window panes, glass fronts for furniture, etc.
- (C) **Glass perforated or fluted** as a subsequent operation, etc.
- (D) **Glass which has been surface worked after manufacture**, for example, glass subjected to obscuring processes (sand-blasted glass, or glass rendered dull by treatment with emery or acid); frosted glass; glass engraved or etched by any process; enamelled glass (i.e., glass decorated with enamel or vitrifiable colours); glass bearing designs, decorations, various motifs, etc., produced by any process (hand painting, printing, window transparencies, etc.) and all other glass decorated in any other way, **except** glass hand painted so as to constitute a painting of **heading 97.01**.

This heading covers not only flat glass in the form of semi-finished products (e.g., sheets without any particular purpose), but also articles of flat glass designed for a specific purpose, **subject to** their being neither framed, backed, nor fitted with material other than glass. The heading thus includes, *inter alia*, fingerplates (for doors or switches) made entirely of bevelled or perforated glass and sign-plates, even when bevelled, coloured or bearing designs or other decorations.

On the other hand, glass sheets set in wood or in base metal, designed for framing photographs, pictures, etc., fall in **heading 44.14** or **83.06** respectively; decorative glass mirrors, whether or not framed, with printed illustrations on one surface, fall in **heading 70.09** or **70.13**; serving trays consisting of a glass plate, whether or not coloured, with a frame and handles, etc., fall in **heading 70.13**; advertising panels, sign-plates, address plates, panels, letters, figures and similar motifs backed with paper, paperboard, felt, metal, etc., or framed fall in **heading 70.20** (or in **heading 94.05**, if illuminated). Similarly, glass plates framed or mounted in other materials, and thereby assuming the character of parts of machines or appliances or parts of articles of furniture, are **classified with those machines, appliances or articles of furniture**.

Glass plates for articles of furniture, not framed or mounted in other materials, remain classified in this heading if presented separately, but are classified with the articles of furniture if they are presented at the same time (whether or not assembled) and clearly intended for incorporation therein.

Photographic glass plates (sensitised, exposed or developed) fall in **Chapter 37**. Glass plates bearing electrical circuits consisting of impressed conductive metallic pastes, and heating glass plates bearing metallised strips or designs acting as electrical resistances fall in **Chapter 85**.

70.07 - Safety glass, consisting of toughened (tempered) or laminated glass.

- Toughened (tempered) safety glass :

7007.11 -- Of size and shape suitable for incorporation in vehicles, aircraft, spacecraft or vessels

7007.19 -- Other

- Laminated safety glass :

7007.21 -- Of size and shape suitable for incorporation in vehicles, aircraft, spacecraft or vessels

7007.29 -- Other

The term "safety glass" covers **only** the types of glass described below and does **not** refer to protective glass such as ordinary wired glass and selective absorption glasses (e.g., anti-glare glass, X-ray protective glass).

(A) Toughened (tempered) glass.

This is :

- (1) Glass obtained by reheating pieces of glass until they are soft but not soft enough to lose their shape. The glass is then cooled rapidly by appropriate processes (thermal-toughened glass).
- (2) Glass whose strength, durability and flexibility have been substantially increased by a complex physical-chemical treatment (e.g., ion-exchange) which may include a modification of the surface structure (commonly known as "chemically toughened glass").

This glass cannot be worked after manufacture because of the internal stresses set up by the processing and is therefore always produced in the shapes and sizes required before tempering.

(B) Laminated glass.

Safety glass of this type, commonly known as laminated glass, sandwich glass, etc., is made in sandwich form, with one or more interlayers of plastics between two or more sheets of glass. The plastics core usually consists of sheets of cellulose acetate, vinyl or acrylic products. Complete adhesion is obtained by applying considerable heat and pressure, sometimes after spraying the inside surfaces of the glass sheets with a special type of adhesive. Another method is to produce a plastics film directly on the glass sheets; the glass sheets are then sealed together by applying heat and pressure.

A characteristic of toughened safety glass is that under the effect of shock it breaks into small pieces without sharp edges or even disintegrates, thus reducing the danger of injury from flying fragments. Laminated safety glass normally cracks without shattering, but, should the impact be great enough to fracture it, any flying pieces would not usually be sufficiently large to cause severe cuts. For special purposes, wire mesh may be incorporated in the laminated glass, or the plastics interlayers may be coloured.

Because of these qualities these types of glass are used in motor car windscreens and windows, in doors, in ships' portholes, in protective goggles for industrial workers or drivers, and for eyepieces for gas masks or divers' helmets. Bullet proof glass is a special type of laminated glass.

This heading makes no distinction between unshaped and shaped (e.g., bent or curved) glass.

However, curved safety glass having the character of clock or watch glasses or of a kind used for sun-glasses is classified in **heading 70.15**. Safety glass incorporated in other articles and thus in the form of parts of machines, appliances or vehicles is classified with those machines, appliances or vehicles; similarly goggles containing lenses of safety glass fall in **heading 90.04**.

Multiple-walled insulating glass, for example, that composed of a sandwich of two sheets of glass with an interlayer of glass fibre, falls in **heading 70.08**.

Articles of toughened (tempered) glass and glass-ceramics, other than those of a kind used for the purposes mentioned above, are classified according to their individual character (e.g., toughened tumblers, borosilicate baking dishes and glass-ceramic plates in **heading 70.13**).

Plastics used as a substitute for safety glass are classified according to the constituent material (**Chapter 39**).

70.08 - Multiple-walled insulating units of glass.

This heading covers multiple-walled insulating units of glass, the most common type of which consists of two or more panels of glass (sheet, plate, float or even such types as hammered or cathedral) separated by a layer of dry air or inert gas, sometimes divided internally into compartments. These sheets are sealed around the edges by a metal, plastic or other joint which makes a completely airtight unit.

Another type of multiple-walled insulating glass consists of a sandwich of two sheets of glass with an interlayer of glass fibre.

These types of glass, which are used for glazing windows, roofs, etc., provide a degree of heat and sound insulation and reduce condensation.

70.09 - Glass mirrors, whether or not framed, including rear-view mirrors.

7009.10 - Rear-view mirrors for vehicles

- Other :

7009.91 -- Unframed

7009.92 -- Framed

The term "glass mirrors" applies to glass, one surface of which has been coated with metal (usually silver, sometimes platinum or aluminium) to give a clear and brilliant reflection.

In the silvering method a dilute ammoniacal solution of silver nitrate (mixed with a reducing solution based on potassium sodium tartrate or invert sugar) is used. These products are poured on to the surface of the glass after it has been scrupulously cleaned. The reduction of the silver salts forms a lasting and brilliant deposit of metallic silver.

In the platinum deposition process, a compound of platinum chloride is brushed on to the glass, which is then heated almost to softening point. This gives a very adherent coating of metal.

The metal coating (particularly if it is of silver) is given protective coatings, sometimes consisting of one or more coatings of varnish or an electrolytic deposit of copper, itself protected by a coating of varnish.

This heading covers mirrors in sheets, whether or not further worked. It also includes shaped mirrors of any size, for example, mirrors for furniture, for interior decoration, for railway carriages, etc.; toilet mirrors (including hand or hanging mirrors); pocket mirrors (whether or not in a protective case). The heading further includes magnifying or reducing mirrors and rear-view mirrors (e.g., for vehicles). All these mirrors may be backed (with paperboard, fabric, etc.), or framed (with metal, wood, plastics, etc.), and the frame itself may be trimmed with other materials (fabric, shells, mother of pearl, tortoise-shell, etc.). Mirrors designed for placing on the floor or ground (for example, cheval-glasses or swing-mirrors of the type used in tailors' fitting rooms or in footwear shops) also remain in this heading in accordance with Note 1 (b) to Chapter 94.

This heading also covers mirrors, whether or not framed, bearing printed illustrations on one surface, provided they retain the essential character of mirrors. However, once the printing is such as to preclude use as a mirror, these goods are classifiable in **heading 70.13** as decorative articles of glass.

It should be noted, however, that mirrors converted into parts of articles of furniture of **Chapter 94** (e.g., wardrobe doors) are classified with those articles of furniture.

The heading further **excludes** :

- (a) Mirrors which have been converted into other articles by the addition of some extra part, e.g., certain serving trays with handles (**heading 70.13**); on the other hand table-centres consisting of a simple mirror remain classified in this heading.
- (b) Mirrors the mounts or frames of which contain precious metal or metal clad with precious metal, whether or not with natural or cultured pearls or with diamonds or other precious or semi-precious stones (natural, synthetic or reconstructed) (**other than** as minor trimmings) (**heading 71.14**), or whose mounts or frames otherwise contain natural or cultured pearls or precious or semi-precious stones (natural, synthetic or reconstructed) (**heading 71.16**).
- (c) Optically worked glass mirrors (**Chapter 90**) (see corresponding Explanatory Notes).

- (d) Mirrors combined with other elements and constituting toys, games or hunting or shooting requisites (e.g., lark mirrors) (**Chapter 95**).
- (e) Mirrors of an age exceeding 100 years (**heading 97.06**).

70.10 - Carboys, bottles, flasks, jars, pots, phials, ampoules and other containers, of glass, of a kind used for the conveyance or packing of goods; preserving jars of glass; stoppers, lids and other closures, of glass.

7010.10 - Ampoules

7010.20 - Stoppers, lids and other closures

7010.90 - Other

This heading covers all glass containers of the kinds commonly used commercially for the conveyance or packing of liquids or of solid products (powders, granules, etc.). They include :

- (A) Carboys, demijohns, bottles (including syphon vases), phials and similar containers, of all shapes and sizes, used as containers for chemical products (acids, etc.), beverages, oils, meat extracts, perfumery preparations, pharmaceutical products, inks, glues, etc.

These articles, formerly produced by blowing, are now almost invariably manufactured by machines which automatically feed molten glass into moulds where the finished articles are formed by the action of compressed air. They are usually made of ordinary glass (colourless or coloured) although some bottles (e.g., for perfumes) may be made of lead crystal, and certain large carboys are made of fused quartz or other fused silica.

The above-mentioned containers are generally designed for some type of closure; these may take the form of ordinary stoppers (of cork, glass, etc.), glass balls, metal caps, screw caps (of metal or plastics), or special devices (e.g., for beer bottles, bottles for aerated waters, soda water syphons, etc.).

These containers remain in this heading even if they are ground, cut, sand-blasted, etched or engraved, or decorated (this applies, in particular, to certain perfume or liqueur bottles), banded, wickered or otherwise trimmed with various materials (wicker, straw, raffia, metal, etc.); they may also have tumbler-caps fitted to the neck. They may be fitted with drop measuring devices or may be graduated, **provided** that they are not of a kind used as laboratory glassware.

- (B) Jars, pots and similar containers for the conveyance or packing of certain foodstuffs (condiments, sauces, fruit, preserves, honey, etc.), cosmetic or toilet preparations (face creams, hair lotions, etc.), pharmaceutical products (ointments, etc.), polishes, cleaning preparations, etc.

These articles are usually made of ordinary glass (colourless or tinted) by pressure in a mould usually followed by blowing with compressed air. They generally have a large opening, a short neck (if any) and as a rule, a lip or flange to hold the lid or cap. Some of these containers, however, may be closed by corks or screw stoppers.

Like bottles, these articles may be sand-blasted, cut, etched or engraved, decorated, banded, etc.

- (C) Ampoules, usually obtained from a drawn glass tube, and intended to serve, after sealing, as containers for serums or other pharmaceutical products, or for liquid fuels (e.g., ampoules of petrol for cigarette lighters), chemical products, etc.

(D) Tubular containers and similar containers generally obtained from lamp-worked glass tubes or by blowing, for the conveyance or packing of pharmaceutical products or similar uses.

The heading also includes preserving jars of glass.

Closures of any material, **presented with the containers** for which they are intended, remain classified in this heading.

The heading also covers stoppers and other closures, of glass, whether made of ordinary glass or of lead crystal, and whether or not ground, cut, sand-blasted, etched or engraved, or decorated. It further includes certain glass balls for stoppering bottles; these balls are cut from glass slabs and mechanically worked after being shaped into balls.

The heading **does not include** :

- (a) Bottles and flasks, wholly or mainly covered with leather or composition leather (**heading 42.05**).
- (b) Glass inners for vacuum flasks or for other vacuum vessels (**heading 70.20**).
- (c) Decanters, drinking glasses and other glass containers being domestic glassware (**heading 70.13**), but not containers used primarily for the commercial conveyance or packing of goods.
- (d) Infants' feeding bottles (**heading 70.13**).
- (e) Laboratory, hygienic or pharmaceutical glassware (**heading 70.17**).
- (f) Special display bottles and display jars of a kind used in shops (**heading 70.20**).
- (g) Bottles, flasks, etc. for scent sprays (**heading 70.13**), scent sprays (**heading 96.16**), and vacuum flasks and other vacuum vessels (**heading 96.17**).

70.11 - Glass envelopes (including bulbs and tubes), open, and glass parts thereof, without fittings, for electric lamps, cathode-ray tubes or the like.

7011.10 - For electric lighting

7011.20 - For cathode-ray tubes

7011.90 - Other

This heading covers :

(A) All open glass envelopes (including bulbs and tubes) of any shape or size, **without fittings**, for the manufacture of electric lamps, valves and tubes, whether these are for illuminating or other purposes (incandescent or vapour discharge lamps, X-ray tubes, radio valves, cathode-ray tubes, rectifier valves or other electronic tubes or valves, infra-red lamps, etc.). Most of these envelopes are mass-produced by automatic machines; they may be frosted, coloured, opal, metallised, coated with fluorescent material, etc.

Glass parts of envelopes (such as face-plates or cones of cathode-ray tubes for television receivers, spotlight bulb reflectors) remain in this heading.

- (B) Tubes with narrowed ends clearly intended for electric lamps, or bent into shape for advertising signs.
- (C) Tubes lined with a fluorescent substance (e.g., zinc silicate, cadmium borate, calcium tungstate).

By means of a series of operations (including, insertion of filaments or electrodes, exhaustion of the envelope, introduction of one or more rare gases, of mercury, etc., fitting of caps or connectors), these envelopes are made into electric lamps, cathode-ray tubes or the like of Chapter 85.

All the above-mentioned articles may be of ordinary glass, crystal glass or fused quartz.

The heading **does not include** :

- (a) Glass tubes merely cut to length, whether or not the ends have been fire polished or otherwise smoothed, or tubes which have had fluorescent materials (e.g., sodium uranate) added to the glass in the mass (**heading 70.02**).
- (b) Glass bulbs, tubes and envelopes, closed or with fittings, and finished bulbs, tubes and valves (see **headings 85.39, 85.40, 90.22**, etc.).

[70.12]

70.13 - Glassware of a kind used for table, kitchen, toilet, office, indoor decoration or similar purposes (other than that of heading 70.10 or 70.18).

7013.10 - Of glass-ceramics

- Stemware drinking glasses, other than of glass-ceramics :

7013.22 -- Of lead crystal

7013.28 -- Other

- Other drinking glasses, other than of glass ceramics :

7013.33 -- Of lead crystal

7013.37 -- Other

- Glassware of a kind used for table (other than drinking glasses) or kitchen purposes, other than of glass-ceramics :

7013.41 -- Of lead crystal

7013.42 -- Of glass having a linear coefficient of expansion not exceeding 5×10^{-6} per Kelvin within a temperature range of 0 °C to 300 °C

7013.49 -- Other

- Other glassware :

7013.91 -- Of lead crystal

7013.99 -- Other

This heading covers the following types of articles, most of which are obtained by pressing or blowing in moulds :

- (1) **Table or kitchen glassware**, e.g. drinking glasses, goblets, tankards, decanters, infants' feeding bottles, pitchers, jugs, plates, salad bowls, sugar-bowls, sauce-boats, fruit-stands, cake-stands, hors-d'oeuvres dishes, bowls, basins, egg-cups, butter dishes, oil or vinegar cruets, dishes (for serving, cooking, etc.), stew-pans, casseroles, trays, salt cellars, sugar sifters, knife-rests, mixers, table hand bells, coffee-pots and coffee-filters, sweetmeat boxes, graduated kitchenware, plate warmers, table mats, certain parts of domestic churns, cups for coffee-mills, cheese dishes, lemon squeezers, ice-buckets.
- (2) **Toilet articles**, such as soap-dishes, sponge-baskets, liquid soap distributors, hooks and rails (for towels, etc.), powder bowls, perfume bottles, parts of toilet sprays (**other than heads**) and tooth-brush holders.
- (3) **Office glassware**, such as paperweights, inkstands and inkwells, book ends, containers for pins, pen-trays and ashtrays.
- (4) **Glassware for indoor decoration** and other glassware (including that for churches and the like), such as vases, ornamental fruit bowls, statuettes, fancy articles (animals, flowers, foliage, fruit, etc.), table-centres (**other than** those of **heading 70.09**), aquaria, incense burners, etc., and souvenirs bearing views.

These articles may be e.g., of ordinary glass, lead crystal, glass having a low coefficient of expansion (e.g., borosilicate glass) or of glass ceramics (the latter two in particular, for kitchen glassware). They may also be colourless, coloured or of flashed glass, and may be cut, frosted, etched or engraved, or otherwise decorated, or of plated glass (for example, certain trays fitted with handles). Table-centres consisting of a simple mirror are, however, **excluded** (see Explanatory Note to **heading 70.09**).

On the other hand, this heading covers decorative articles which are in the form of mirrors, but cannot be used as mirrors due to the presence of printed illustrations; otherwise they are classified in **heading 70.09**.

Articles of glass combined with other materials (base metal, wood, etc.), are classified in this heading **only** if the glass gives the whole the character of glass articles. Precious metal or metal clad with precious metal may be present, **as minor trimmings only**; articles in which such metals constitute more than mere trimmings are excluded (**heading 71.14**).

The heading also **excludes** :

- (a) Glass mirrors, whether or not framed (**heading 70.09**).
- (b) Bottles, flasks, jars and pots of a kind commonly used for the commercial conveyance or packing of goods, and preserving jars (**heading 70.10**).
- (c) Leaded lights and the like (**heading 70.16**).
- (d) Articles of **heading 70.18** of a kind suitable for interior decoration (e.g., imitation flowers and foliage of glass beads and ornaments of lamp-worked glass).
- (e) Clock cases (**heading 91.12**).
- (f) Lamps and lighting fittings and parts thereof of **heading 94.05**.
- (g) Scent sprays and similar toilet sprays (**heading 96.16**).
- (h) Vacuum flasks and other vacuum vessels of **heading 96.17**.

70.14 - Signalling glassware and optical elements of glass (other than those of heading 70.15), not optically worked.

This heading covers the following articles **provided** they have not been optically worked :

- (A) **Signalling glassware** (colourless or coloured) intended for incorporation in reflecting road signs (e.g., in panels, plates, posts, etc.), or in display signs, or as simple reflectors for cycles, automobiles, etc. These articles, which are usually convex, hemispherical or flat with grooves normally running parallel, have the property of reflecting light projected on them (by automobile headlamps, for example) and are thus visible from a distance in the dark.
- (B) **Optical elements of glass** (colourless or coloured). The heading includes elements which are manufactured in such a way that they produce some required optical effect without being optically worked. These articles include mainly lenses and similar articles for automobile headlamps, parking lights, direction indicating lights, cycle rear lights, road traffic lights, certain buoys, spotlight bulbs, pocket lamps, electric torches, switchboards or panel lights, and also certain common magnifying glasses.

The heading also includes blanks of optical elements and optical elements which require optical working.

Optical working consists of grinding the surfaces first with coarse and then with gradually finer abrasives. The successive operations are thus roughing, trueing, smoothing and polishing.

Articles which have undergone one or more of the processes **preceding** polishing remain in this heading. But elements which have the whole or part of one or more of their surfaces polished to produce the required optical properties are **excluded** (**heading 90.01** or **90.02** according to whether they are unmounted or mounted - see corresponding Explanatory Notes).

Simple grinding of the edges of discs or lenses, without further working, is not regarded as optical working.

Articles of the heading are generally obtained by simple moulding or pressing or by cutting from sheets, strips, lumps or slabs.

The articles remain here even if framed, set in a mounting or backed with a reflecting surface, but the recognisable finished articles are **excluded** (e.g., **heading 83.10**, in the case of sign-plates, numbers, letters and other signs, of base metal, **heading 85.12** in the case of headlamps, headlights or parking lights for cycles or motor vehicles).

The heading also **excludes** :

- (a) Glasses for non-corrective or corrective spectacles (**not optically worked**) (see Explanatory Note to **heading 70.15**).
- (b) Spherical glass "microspheres" presented as such (see Explanatory Note to **heading 70.18**). On the other hand, the heading **includes** plates coated with these microspheres and intended for fixing to a road sign or panel.
- (c) **Optically worked** optical elements of glass, and optical elements of materials other than glass (**Chapter 90**).
- (d) Lamps and lighting fittings and parts thereof of **heading 94.05**.

70.15 - Clock or watch glasses and similar glasses, glasses for non-corrective or corrective spectacles, curved, bent, hollowed or the like, not optically worked; hollow glass spheres and their segments, for the manufacture of such glasses.

7015.10 - Glasses for corrective spectacles

7015.90 - Other

This heading covers :

(A) Glass, curved, bent, hollowed or the like, of any shape or size, with or without parallel faces, used as clock or watch glasses; it also includes all similar glasses for photograph frames and the like, medallions, hygrometers, barometers and similar appliances. In other words the heading covers a range of glasses of types normally designed to protect the dials or faces of the articles in question, even if in particular cases the glasses are intended for use as laboratory watch glasses or for the manufacture of mirrors.

When the above glasses do not have parallel faces, they may have certain optical properties, but whereas the primary function of the glass elements of **heading 70.14** is to produce a required optical effect, the main function of the goods of this paragraph is protection.

(B) Glass, curved or the like, for non-corrective spectacles (e.g., sun-glasses and other protective spectacles), i.e., glass generally of poorer quality than used for corrective spectacles.

These glasses usually have parallel faces, and are not intended, in practice, for optical working. Nevertheless, should they be optically worked they would be **excluded (heading 90.01)**.

The glasses described in Parts (A) and (B) are mainly manufactured by the following processes :

- (1) Glass is blown into a hollow sphere of a diameter not usually exceeding 80 cm. This sphere is divided into three or four parts which are in turn cut into small segments by means of a kind of diamond-tipped compass. The edges of each segment are then turned-in by hot-pressure in a mould.
- (2) Small squares or discs are cut from flat glass; they are then curved either by softening in a concave mould or revolving ring under the action of heat, or by hot-pressure in a mould.
- (3) The molten glass is poured directly into the mould of a mechanical press.
- (4) A cavity is ground in one surface of a piece of round or rectangular (including square) flat glass to provide space for the clock or watch hands.

In addition to glasses shaped for use (round, oval or rectangular including square), this heading also covers hollow spheres and segments obtained by the process described in (1) above.

- (C) Glass (including blanks, i.e. pieces simply pressed or moulded but not optically worked) for corrective spectacles. In most cases, the corrective spectacle industry uses glass obtained by pressing molten glass into blanks which are generally in the shape of the finished spectacle lenses. In some cases, spectacle lens blanks are obtained by cutting pieces of sheet glass produced by rolling or drawing processes and then softening these cut pieces in a furnace before pressing them into blanks. Blanks from either source require additional surfacing, mainly polishing, before they can be used as corrective spectacle lenses.

This heading covers blanks for corrective spectacle lenses, i.e., pieces simply moulded and not optically worked. Prior to moulding, this type of glass falls in **heading 70.03, 70.04, 70.05 or 70.06**, as appropriate.

The heading **does not cover** :

- (a) Flat glass for the same uses (**headings 70.05, 70.06 and 70.07** in particular).
- (b) Optical elements of **heading 70.14**.
- (c) Clock or watch glasses specially prepared for laboratory use (pierced in the centre, ground on the edges to ensure airtight sealing, etc.) (**heading 70.17**).
- (d) Glass for corrective spectacles or contact lenses, optically worked (**Chapter 90**).

70.16 - Paving blocks, slabs, bricks, squares, tiles and other articles of pressed or moulded glass, whether or not wired, of a kind used for building or construction purposes; glass cubes and other glass smallwares, whether or not on a backing, for mosaics or similar decorative purposes; leaded lights and the like; multicellular or foam glass in blocks, panels, plates, shells or similar forms.

7016.10 - Glass cubes and other glass smallwares, whether or not on a backing, for mosaics or similar decorative purposes

7016.90 - Other

This heading covers a range of glass articles obtained by pressing or moulding (whether or not combined with blowing); they are chiefly used for covering roofs, cupolas or archways, but are also used, usually in conjunction with concrete, for slabbing the lining walls of cellars, basements, underground corridors, etc.

The heading thus includes solid or hollow bricks, squares, tiles, slabs and various mouldings (double-headed, etc.). The heading also includes architectural ornaments (rosettes, king-posts, etc.), steps and risers, banister knobs, etc.

These articles, which are of different degrees of translucency, may have their edges worked or grooved, and may be patterned, wired or combined with metal, concrete or other materials.

The heading further includes :

- (1) **Mosaic cubes**, generally coloured or with one surface gilded, and **small glass rectangles** and other flat shapes, whether or not silvered, used as a facing material for walls, furniture, etc. These articles remain classified here, whether or not on a paper, paperboard, textile fabric or other backing. The heading also includes small coloured **glass fragments or chippings**, usually of opal glass, which are inlaid in cement to produce ornamental designs on the façades of buildings.
- (2) Leaded lights for private houses, stained glass windows for churches, etc. These consist of panels, rosettes, etc., formed of glass (usually coloured in the mass, surface-coloured or made of antique glass) of all shapes, embedded in lead cames, and sometimes reinforced with metal rods.

Similar assemblies are made with the cames of other metals, particularly copperlight glazing, to make them more fire resistant.

- (3) Multicellular or foam glass in blocks, panels, plates, shells or similar forms, usually obtained from molten glass into which compressed air is blown or gassing agents are introduced. This gives colourless or coloured glass with a structure akin to that of pumice-stone; it has a specific gravity not exceeding 0.5 (hence its use as a substitute for cork), and is easily drilled, sawn, filed, etc. It is a heat- and sound-insulating and sound-absorbing material, used, in the forms mentioned above, in building, etc.

This glass is also used for the manufacture of life-belts, life-buoys, ornaments, etc. In such forms, it is **excluded** from this heading and classified in the headings applicable to similar articles of other kinds of glass (more particularly, **heading 70.13, 70.17 or 70.20**).

The heading also **excludes** :

- (a) Glass of **headings 70.04 to 70.06**.
- (b) Multiple-walled insulating glass (**heading 70.08**).
- (c) Finished panels and other decorative motifs made from mosaic cubes (**heading 70.20**).
- (d) Leaded lights of an age exceeding 100 years (**heading 97.06**).

70.17 - Laboratory, hygienic or pharmaceutical glassware, whether or not graduated or calibrated.

7017.10 - Of fused quartz or other fused silica

7017.20 - Of other glass having a linear coefficient of expansion not exceeding 5×10^{-6} per Kelvin within a temperature range of 0 °C to 300 °C

7017.90 - Other

This heading covers **glass articles of a kind in general use in laboratories** (research, pharmaceutical, industrial, etc.), including special bottles (gas washing, reagent, Woulf's, etc.), special tubes (gas washing, drying, condensation, filter, gas burettes, test-tubes, etc.), stirrers, distilling flasks, graduated jars, culture flasks (Kolle, Roux, etc.), burettes of all kinds, evaporating dishes, volumetric flasks, special bell-jars and receivers (vacuum, necked, etc.), special dropping bottles (calibrated, etc.), retorts, crystallising dishes, drying cylinders, filter plates and discs, spoons, desiccators, dialysers, adapters, condensers, receivers for distillation apparatus, special funnels (with stop-cock, bulb-shaped funnels, etc.), cylinders, crucibles, filter crucibles, special flasks (conical, multi-necked, etc.), special spirit burners, mortars, weighing boats, pipettes, vacuum vessels of various specialized types (**not falling in heading 96.17**), wash-bottles, stop-cocks, spatulas, jars (filtering, precipitating, multinecked, etc.), muffles, crucible support plates, microscope slides and cover glasses, etc.

Reference should be made to Explanatory Note to heading 90.27 for the rules governing the classification of instruments and apparatus for physical or chemical analysis which, though potentially covered by **heading 90.27**, may at the same time be taken to be laboratory glassware within the meaning of this heading. Such reference will show that this heading covers for example, acidimeters (**other than** those of **heading 90.25**), galactometers, butyrometers, lactobutyrometers, and similar instruments for testing dairy products; albumenometers and ureometers; eudiometers; volumenometers, nitrometers, Kipps and Kjeldahl apparatus and the like; calcimeters; cryoscopes and ebullioscopes for determining molecular weights, etc.

The expression "hygienic or pharmaceutical glassware" refers to articles of general use **not** requiring the services of a practitioner. The heading therefore covers, *inter alia*, irrigators, nozzles (for syringes, enemas, etc.), urinals, bed pans, chamber pots, spittoons, cupping-glasses, breast-relievers (with or without rubber bulb), eye-baths, inhalers and tongue depressors. Spools and reels for winding surgical catgut are also included.

Articles of this heading may be graduated or calibrated. They may be made of ordinary glass (particularly for pharmaceutical or hygienic purposes), but laboratory glassware is frequently of borosilicate glass, fused quartz or other fused silica because of the greater chemical stability and low coefficient of expansion of such glass.

The heading **excludes** :

- (a) Containers for the conveyance or packing of goods (**heading 70.10**); ordinary curved watch glasses sometimes used in the laboratory (**heading 70.15**, see the Explanatory Note to that heading); chemists' special display bottles and glassware of a kind used for industrial purposes (**heading 70.20**).
- (b) Glass instruments and appliances of **Chapter 90**, for example, hypodermic syringes, special cannulae and other articles being medical, surgical, dental or veterinary instruments or appliances (**heading 90.18**); hydrometers and similar floating instruments, thermometers, pyrometers and barometers of **heading 90.25**, instruments and apparatus of **heading 90.26** (for measuring or checking fluid flow, etc.) and instruments and apparatus for physical or chemical analysis, etc., of **heading 90.27**.

70.18 - Glass beads, imitation pearls, imitation precious or semi-precious stones and similar glass smallwares, and articles thereof other than imitation jewellery; glass eyes other than prosthetic articles; statuettes and other ornaments of lamp-worked glass, other than imitation jewellery; glass microspheres not exceeding 1 mm in diameter.

7018.10 - Glass beads, imitation pearls, imitation precious or semi-precious stones and similar glass smallwares

7018.20 - Glass microspheres not exceeding 1 mm in diameter

7018.90 - Other

This heading covers a range of widely diversified glass articles, most of which are used, directly or after further processing, for ornamental and decorative purposes.

These include :

(A) **Glass beads** (e.g., as used for necklaces, rosaries, imitation flowers, ornaments for graves, etc.; for decorating textile articles (trimmings, embroidery, etc.), handbags or the like; or for use as electrical insulators). These beads, whether or not coloured, are in the form of small pierced balls, more or less round in shape; they are obtained from tubes which are cut into sections of approximately equal length and diameter. The resulting small cylinders are then introduced, together with a mixture of powdery materials (charcoal, graphite, plaster, etc.), into a metal drum revolving over a furnace. Heat softens the glass cylinders and friction gives them a more or less spherical shape, while the powdery material prevents them from adhering to one another.

(B) **Imitation pearls**, hollow or solid, of all colours, shapes and sizes, simulating real pearls. Hollow pearls of the most usual type are obtained by blowing thin glass spheres along a glass tube of very small diameter and then separating them from each other. Due to the manufacturing process, these pearls present two directly opposite openings through which a string can be run. Hollow pearls may also be blown along a glass rod. A material containing pearl essence (a pasty substance consisting of certain fish scales dissolved in ammonia) is then blown into the glass spheres, and sometimes they are filled with white wax to increase their solidity. Such beads can be easily distinguished from real pearls through their lightness and the fact that they can be crushed under very light pressure.

Solid imitation pearls are obtained by turning a drop of glass on a copper wire in a flame, or by casting glass in small moulds traversed by a thin copper tube. After cooling, the metal is dissolved in nitric acid; the glass is not attacked and the pearls show a diametral opening. These pearls are then coated with pearl essence and, finally, with a protective layer of transparent varnish.

(C) **Imitation precious stones** (including imitation semi-precious stones) should not be confused with the synthetic or reconstructed precious stones of **heading 71.04** (see corresponding Explanatory Note). These imitation stones are made of special glass (e.g., strass) with a high refractive index which may be colourless or coloured directly with metallic oxides.

Imitation stones are generally obtained by cutting fragments of the required size from a glass block; these fragments are then arranged on a piece of sheet metal covered with tripoli and placed in a small oven in which their edges are rounded off. The stones can then be cut (in the shape of diamonds, rose-cut diamonds, etc.) or engraved (imitation cameos or intaglios). These stones can also be obtained by direct moulding (e.g., in the case of stones of a definite shape for trinkets). The underside of such stones is often covered with reflecting metallic paint (gem-finish).

- (D) **Other glass smallwares** such as imitation coral.
- (E) **Various glass articles (other than imitation jewellery)**, obtained by assembling certain of the individual articles mentioned above, such as flowers, foliage and pearl ornaments for wreaths; fringes made of beads or bugles and intended for lampshades, shelves, etc.; blinds and portières made of glass beads or bugles, and table mats made similarly; rosaries made of glass beads or imitation precious or semi-precious stones.
- (F) **Glass eyes (other than those for wear by humans (heading 90.21))**, e.g., those for dolls, robots, stuffed animals. Dolls' eyes fitted to an eye closing mechanism are, however, excluded (heading 95.03).
- (G) **Statuettes and other ornaments (other than imitation jewellery)** obtained by working glass in the pasty state with a blow-pipe. These articles are designed for placing on shelves (animals, plants, statuettes, etc.). They are generally made of clear glass (lead crystal, strass, etc.) or "enamel" glass.
- (H) **Glass microspheres** not exceeding 1 mm in diameter, used for the manufacture of panels for road signs, reflecting signs or cinema screens, or in the cleaning of aeroplane jet engines or metallic surfaces. They are perfect spheres of solid cross-section.

Flowers, foliage and fruit of cast or moulded glass, for interior decoration and the like, are excluded (heading 70.13). Fancy articles of lamp-worked glass incorporating precious metal or metal clad with precious metal other than as a minor trimming, or constituting imitation jewellery as defined for the purposes of Chapter 71, fall in that Chapter.

The heading also excludes :

- (a) Glass powder, very often silvered or coloured, for decorating postcards, Christmas tree decorations, etc. (heading 32.07).
- (b) Handbags and similar articles of leather or fabric, decorated with glass beads, imitation pearls or imitation precious or semi-precious stones (heading 42.02).
- (c) Picture postcards, Christmas cards and the like, with glass trimmings (heading 49.09).
- (d) Textile articles incorporating appliqué work of glass beads (Section XI and particularly heading 58.10).
- (e) Fabrics coated with microspheres for cinematographic screens, etc. (heading 59.07).
- (f) Footwear, headgear and walking sticks and umbrellas decorated with glass beads, imitation pearls or imitation precious or semi-precious stones (Chapters 64, 65 and 66).
- (g) Imitation pearls or imitation precious or semi-precious stones mounted or set in precious metal or metal clad with precious metal (heading 71.13 or 71.14) or imitation jewellery within the meaning of heading 71.17 (see corresponding Explanatory Note).
- (h) Cuff-links (heading 71.13 or 71.17 as appropriate).

- (ij) Toys, games, Christmas tree decorations (including balls of thin blown glass) (**Chapter 95**).
- (k) Buttons and studs (**heading 96.06** or **Chapter 71** as appropriate).

70.19 - Glass fibres (including glass wool) and articles thereof (for example, yarn, woven fabrics) (+).

- Slivers, rovings, yarn and chopped strands :

7019.11 -- Chopped strands, of a length of not more than 50 mm

7019.12 -- Rovings

7019.19 -- Other

- Thin sheets (voiles), webs, mats, mattresses, boards and similar nonwoven products :

7019.31 -- Mats

7019.32 -- Thin sheets (voiles)

7019.39 -- Other

7019.40 - Woven fabrics of rovings

- Other woven fabrics :

7019.51 -- Of a width not exceeding 30 cm

7019.52 -- Of a width exceeding 30 cm, plain weave, weighing less than 250 g/m², of filaments measuring per single yarn not more than 136 tex

7019.59 -- Other

7019.90 - Other

This heading includes glass fibres themselves and glass fibres (including glass wool as defined in Note 4 to this Chapter) made up in various forms, including those glass fibre articles excluded from other headings by reason of their nature.

Glass fibres have the following properties : they are less flexible than vegetable or animal textile fibres (glass yarns cannot be knotted easily); they do not stretch; they are strong (stronger than any of the textile fibres of Section XI); they do not burn; they do not rot and are resistant to water and most acids; they are a poor conductor of electricity and, in some cases, of heat or sound; they are non-hygroscopic.

Glass fibres can be obtained by various processes which, apart from a few exceptions, can be grouped in three broad categories :

(I) Mechanical drawing.

In this process glass is melted in a furnace. It flows into a forehearth, the underside of which is fitted with bushings made of alloys of precious metal (normally of rhodium or of platinum) to withstand the high temperatures. The bushings are pierced by a large number of small holes through which molten glass threads flow. After a sizing treatment (for example, with silicone), these threads are carried on to a high speed mandril which draws them out into very fine parallel filaments. Thus a continuous strand similar to a man-made textile filament yarn is obtained.

Thicker fibres may be obtained by a more or less identical process; these are wound in the form of a web which is used directly as such (heat- or sound-insulation mats).

(II) **Centrifugal drawing.**

In this system, glass melted in pots falls on a refractory clay disc revolving at great speed and fitted along the **periphery** with a very large number of teeth. The glass adheres to this disc, which is heated by the flame from a furnace, but, at the same time it is drawn into filaments by means of centrifugal force. These filaments are blown on to a stationary table and coiled on to a cooling drum.

This process thus yields short fibres known as glass wool, which is used in bulk without spinning.

(III) **Drawing by means of fluids.**

In this process, drawing is achieved by means of jets of high-pressure steam or compressed air blown from either side on to the filaments of molten glass coming from the furnace through a drawing-plate. Under the action of these jets, the filaments are broken into short lengths which are coated with lubricants in the course of manufacture.

The fibres thus obtained are coiled on a drum to form either webs which are used as such (insulation blankets), or continuous slivers or rovings of fibres (similar to slivers or rovings of waste silk) which can subsequently be spun into yarn.

*
* * *

Glass fibres and articles of glass fibres of this heading may be, in particular, in the following forms :

- (A) Glass wool in bulk.
- (B) Slivers, rovings, yarn and chopped strands.
- (C) Thin sheets (voiles), webs, mats, mattresses, boards and similar nonwoven products.
- (D) Woven fabrics, including narrow fabrics.

This heading also covers curtains, draperies and other articles of woven glass fabrics.

It is pointed out that although "chemical embroideries" or embroideries without visible ground, in which the embroidering thread consists of glass fibres, are classified here, embroidery in any of the textiles classified in Section XI, in which some of the effects are obtained by embroidering threads made of glass fibres, is excluded (**heading 58.10**).

*
* * *

The uses of glass fibres are increasing steadily, for example :

- (1) In furnishing and interior decoration (e.g., for upholstery, wall hangings, curtains, mosquito-nets), in the form of fabrics, which can be dyed or printed.

- (2) For heat-insulation purposes (e.g., for insulating roofs, chimneys, boilers, furnaces, steam piping, steam turbine bodies, tubes or pipes, ice-cupboards, and heat-insulated vans or wagons) in the form of fibres in bulk, nodules, felts, pads, casings (for pipes) or braids, (whether or not impregnated with glue, pitch or other substances, or with paper, textile or wire mesh supports).
- (3) For sound-insulation (e.g., for flats, offices, ships' cabins, theatres) in the form of fibres in bulk, felts, mattresses or rigid boards.
- (4) For electrical insulation (e.g., for electric wires, cables or other current carrying apparatus) in the form of filaments, yarn, tape, braid, fabric (whether or not impregnated with natural resins, plastics, asphalt, etc.).
- (5) For the reinforcement of thermoplastic and thermoset resins for making façade coverings and panellings, domes and flat or corrugated plates for the building industry, tanks, vats and pipes for storing and transporting liquids, machine hoods and other moulded parts for industrial or agricultural use, bumpers for motor vehicles, equipment for track vehicles, railway coaches or aircraft, boat hulls, skis, tennis rackets and other articles for sport, etc.
- (6) For the manufacture of miscellaneous other products such as : filtration products for air-conditioning or for the chemical industry, brushes, wicks for lamps and lighters, cinema screens.

The heading **excludes** :

- (a) Semi-finished products and articles obtained by compressing glass fibres, or superimposed layers of glass fibres, impregnated with plastics, if having a hard, rigid character and hence having lost the character of articles of glass fibres (**Chapter 39**).
- (b) Mineral wools (see Note 4 to Chapter 70) and articles thereof of **heading 68.06**.
- (c) Roofing boards with a substrate consisting of glass-fibre web or fabric completely enveloped in, or covered on both sides by, a layer of asphalt or similar material (**heading 68.07**).
- (d) Multiple-walled insulating glass with an interlayer of glass fibres (**heading 70.08**).
- (e) Optical fibre cables of **heading 85.44**, electrical insulators (**heading 85.46**) and fittings of insulating material (**heading 85.47**).
- (f) Optical fibres, bundles and cables of **heading 90.01**.
- (g) Dolls' wigs of glass fibres (**heading 95.03**) and fishing rods made of glass fibres agglomerated with synthetic resin (**heading 95.07**).
- (h) Brushes of glass fibres (**heading 96.03**).

○
○ ○

Subheading Explanatory Notes.

Subheading 7019.11

Chopped strand is produced by cutting strands containing many parallel filaments. Generally, chopped strands are used to provide strength, for example, to plastics or mortar.

Subheading 7019.12

A **glass roving** consists of a loose assemblage of one or more strands of long (continuous) filaments with little or no twist (less than 5 turns per metre). Roving is generally used in the production of continuous filament glass yarns, but can also be used directly in the weaving of certain glass fabrics, e.g., for draperies.

Subheading 7019.19

This subheading includes **sliver**. A sliver consists of staple fibres of short lengths, usually less than 380 mm in length. The staple fibres are loosely arranged in parallel fashion into a rope-like strand with little or no twist (less than 5 turns per metre). Sliver is generally used to produce staple fibre yarn, but may also go into the manufacture of wire and cable.

Yarn of this subheading is twisted, and of either continuous filament or staple fibre.

Subheading 7019.31

Mats are flat reinforcing products of glass strands consisting of several hundred parallel filaments distributed in random order.

These threads can be cut (mats of discontinuous strands) or not (mats of continuous thread) and are held together by means of a binder, or the needleloom process.

They retain their shape in the form of parallel filaments, which can be individually separated from the mat by hand without damaging it.

Subheading 7019.32

Thin sheets (voiles) are nonwovens made from individual glass fibres (filaments) distributed in random order. The fibres are held together by means of a binder and pressed and may or may not incorporate reinforcement threads which are most often stretched lengthwise throughout the sheets.

Unlike the glass mats, the individual filaments of these products cannot be removed by hand without damaging the sheet.

Thin sheets can be distinguished from webs, mattresses and other insulation products by their regular thickness which does not exceed 5 mm.

70.20 - Other articles of glass.

This heading covers glass articles (including glass parts of articles) **not covered** by other headings of this Chapter or of other Chapters of the Nomenclature.

These articles remain here even if combined with materials other than glass, **provided** they retain the essential character of glass articles. The heading includes :

- (1) Industrial articles such as pots, bowls, cylinders or discs for glazing hides or skins; protectors for safety or other apparatus; greasing cups; thread guides; sight-holes and gauge-glasses; S-shaped tubes; coils; guttering and drains for corrosive products (often of fused quartz or other fused silica); absorption drums for hydrochloric acid and trickling columns.
- (2) Articles for husbandry (tanks, troughs, etc.) and horticultural appliances (cloches, etc.).
- (3) Letters, numbers, sign-plates and similar motifs for shop signs and shop windows, whether or not bearing a printed picture or text (**other than** those of **heading 70.06, 70.09 or 70.14**, or of **heading 94.05**, if illuminated).
- (4) Glass inners for vacuum flasks or for any other type of vacuum vessels, other than those transformed by a casing or any other kind of protective envelope (complete or partial) into vacuum flasks or other vacuum vessels of **heading 96.17**. The inners of this heading are normally made of ordinary glass, or of glass with a low coefficient of expansion. They are generally more or less cylindrical and have double walls whose interior is silvered or gilded. The space between the walls is exhausted and the walls are then sealed. This heading covers **only** the glass inners. These may be finished or unfinished, and may be with or without stoppers or other closures (whether or not fitted).
- (5) Miscellaneous articles such as floats for fishing nets; knobs and handles for doors, cistern chains, etc.; pots for water colours; accessories for bird-cages (feeding or drinking troughs, etc.); display bottles for shops; dropping-tubes, spirit burners **other than** those of **heading 70.17**, base cups for piano or furniture feet; finished panels and other decorative motifs made from glass mosaic cubes, whether or not framed; life-buoys and life-belts.

The heading also **excludes** :

- (a) Glass knobs, handles and the like, for umbrellas and walking-sticks (**heading 66.03**).
 - (b) Insulators and fittings of insulating material of **heading 85.46 or 85.47**.
 - (c) Instruments, appliances and other articles of **Chapter 90**.
 - (d) Articles of **Chapter 91** (e.g., glass clock cases, other than merely protective covers).
 - (e) Musical instruments, and parts and accessories therefor, of **Chapter 92** (e.g., tuning forks of fused silica).
 - (f) Glass furniture, and parts thereof clearly recognisable as such (**Chapter 94**).
 - (g) Toys, games, Christmas tree decorations, fishing or hunting requisites and other glass articles of **Chapter 95**.
 - (h) Glass articles of **Chapter 96** (e.g., buttons; pen-holders; pencil-holders; pen nibs; lighters; scent sprays; vacuum flasks and other vacuum vessels, complete).
 - (ij) Antiques, being articles of an age exceeding 100 years (**heading 97.06**).
-

Section XIV

NATURAL OR CULTURED PEARLS, PRECIOUS OR SEMI-PRECIOUS STONES, PRECIOUS METALS, METALS CLAD WITH PRECIOUS METAL, AND ARTICLES THEREOF; IMITATION JEWELLERY; COIN

Chapter 71

Natural or cultured pearls, precious or semi-precious stones, precious metals, metals clad with precious metal, and articles thereof; imitation jewellery; coin

Notes.

- 1.- Subject to Note 1 (a) to Section VI and except as provided below, all articles consisting wholly or partly :
 - (a) Of natural or cultured pearls or of precious or semi-precious stones (natural, synthetic or reconstructed), or
 - (b) Of precious metal or of metal clad with precious metal, are to be classified in this Chapter.
- 2.- (A) Headings 71.13, 71.14 and 71.15 do not cover articles in which precious metal or metal clad with precious metal is present as minor constituents only, such as minor fittings or minor ornamentation (for example, monograms, ferrules and rims), and paragraph (b) of the foregoing Note does not apply to such articles (*).
- (B) Heading 71.16 does not cover articles containing precious metal or metal clad with precious metal (other than as minor constituents).
- 3.- This Chapter does not cover :
 - (a) Amalgams of precious metal, or colloidal precious metal (heading 28.43);
 - (b) Sterile surgical suture materials, dental fillings or other goods of Chapter 30;
 - (c) Goods of Chapter 32 (for example, lustres);
 - (d) Supported catalysts (heading 38.15);
 - (e) Articles of heading 42.02 or 42.03 referred to in Note 3 (B) to Chapter 42;
 - (f) Articles of heading 43.03 or 43.04;
 - (g) Goods of Section XI (textiles and textile articles);
 - (h) Footwear, headgear or other articles of Chapter 64 or 65;
 - (ij) Umbrellas, walking-sticks or other articles of Chapter 66;
 - (k) Abrasive goods of heading 68.04 or 68.05 or Chapter 82, containing dust or powder of precious or semi-precious stones (natural or synthetic); articles of Chapter 82 with a working part of precious or semi-precious stones (natural, synthetic or reconstructed); machinery, mechanical appliances or electrical goods, or parts thereof, of Section XVI. However, articles and parts thereof, wholly of precious or semi-precious stones (natural, synthetic or reconstructed) remain classified in this Chapter, except unmounted worked sapphires and diamonds for styli (heading 85.22);

(*) The underlined portion of this Note constitutes an optional text.

- (l) Articles of Chapter 90, 91 or 92 (scientific instruments, clocks and watches, musical instruments);
- (m) Arms or parts thereof (Chapter 93);
- (n) Articles covered by Note 2 to Chapter 95;
- (o) Articles classified in Chapter 96 by virtue of Note 4 to that Chapter; or
- (p) Original sculptures or statuary (heading 97.03), collectors' pieces (heading 97.05) or antiques of an age exceeding one hundred years (heading 97.06), other than natural or cultured pearls or precious or semi-precious stones.

- 4.- (A) The expression " precious metal " means silver, gold and platinum.
- (B) The expression " platinum " means platinum, iridium, osmium, palladium, rhodium and ruthenium.
- (C) The expression " precious or semi-precious stones " does not include any of the substances specified in Note 2 (b) to Chapter 96.
- 5.- For the purposes of this Chapter, any alloy (including a sintered mixture and an inter-metallic compound) containing precious metal is to be treated as an alloy of precious metal if any one precious metal constitutes as much as 2 %, by weight, of the alloy. Alloys of precious metal are to be classified according to the following rules :
- (a) An alloy containing 2 % or more, by weight, of platinum is to be treated as an alloy of platinum;
 - (b) An alloy containing 2 % or more, by weight, of gold but no platinum, or less than 2 %, by weight, of platinum, is to be treated as an alloy of gold;
 - (c) Other alloys containing 2 % or more, by weight, of silver are to be treated as alloys of silver.
- 6.- Except where the context otherwise requires, any reference in the Nomenclature to precious metal or to any particular precious metal includes a reference to alloys treated as alloys of precious metal or of the particular metal in accordance with the rules in Note 5 above, but not to metal clad with precious metal or to base metal or non-metals plated with precious metal.
- 7.- Throughout the Nomenclature the expression " metal clad with precious metal " means material made with a base of metal upon one or more surfaces of which there is affixed by soldering, brazing, welding, hot-rolling or similar mechanical means a covering of precious metal. Except where the context otherwise requires, the expression also covers base metal inlaid with precious metal.
- 8.- Subject to Note 1 (a) to Section VI, goods answering to a description in heading 71.12 are to be classified in that heading and in no other heading of the Nomenclature.

- 9.- For the purposes of heading 71.13, the expression " articles of jewellery " means :
- (a) Any small objects of personal adornment (for example, rings, bracelets, necklaces, brooches, ear-rings, watch-chains, fobs, pendants, tie-pins, cuff-links, dress-studs, religious or other medals and insignia); and
 - (b) Articles of personal use of a kind normally carried in the pocket, in the handbag or on the person (for example, cigar or cigarette cases, snuff boxes, cachou or pill boxes, powder boxes, chain purses or prayer beads).

These articles may be combined or set, for example, with natural or cultured pearls, precious or semi-precious stones, synthetic or reconstructed precious or semi-precious stones, tortoise shell, mother-of-pearl, ivory, natural or reconstituted amber, jet or coral.

- 10.- For the purposes of heading 71.14, the expression " articles of goldsmiths' or silversmiths' wares " includes such articles as ornaments, tableware, toilet-ware, smokers' requisites and other articles of household, office or religious use.

11.- For the purposes of heading 71.17, the expression "imitation jewellery" means articles of jewellery within the meaning of paragraph (a) of Note 9 above (but not including buttons or other articles of heading 96.06, or dress-combs, hair-slides or the like, or hairpins, of heading 96.15), not incorporating natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed) nor (except as plating or as minor constituents) precious metal or metal clad with precious metal.

○
○ ○

Subheading Notes.

- 1.- For the purposes of subheadings 7106.10, 7108.11, 7110.11, 7110.21, 7110.31 and 7110.41, the expressions "powder" and "in powder form" mean products of which 90 % or more by weight passes through a sieve having a mesh aperture of 0.5 mm.
- 2.- Notwithstanding the provisions of Chapter Note 4 (B), for the purposes of subheadings 7110.11 and 7110.19, the expression "platinum" does not include iridium, osmium, palladium, rhodium or ruthenium.
- 3.- For the classification of alloys in the subheadings of heading 71.10, each alloy is to be classified with that metal, platinum, palladium, rhodium, iridium, osmium or ruthenium which predominates by weight over each other of these metals.

GENERAL

This Chapter includes :

- (1) In headings 71.01 to 71.04, natural or cultured pearls, diamonds, other precious or semi-precious stones (natural, synthetic or reconstructed), unworked or worked, but not mounted, set or strung; also, in heading 71.05, certain waste resulting from the working of these stones.
- (2) In headings 71.06 to 71.11, precious metals and metals clad with precious metal, unwrought, semi-manufactured, or in powder form, but not having reached the stage of articles classified in sub-Chapter III, and in heading 71.12, waste and scrap of precious metal or metal clad with precious metal, and waste and scrap containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal.

Under Note 4 to this Chapter, the expression "precious metal" means silver, gold and platinum. It should be noted that the term "platinum" also covers iridium, osmium, palladium, rhodium and ruthenium.

Under Note 5 to this Chapter, alloys (**other than** amalgams - **heading 28.43**) containing precious metals are classified as follows :

- (A) **As platinum** - if containing 2 % or more, by weight, of platinum.
- (B) **As gold** - if containing 2 % or more, by weight, of gold, but no platinum or less than 2 % of platinum.
- (C) **As silver** - other alloys containing 2 % or more, by weight, of silver.
- (D) **As base metals (Section XV)** - all alloys containing less than 2 % of platinum and less than 2 % of gold and less than 2 % of silver.

Under Note 6 to this Chapter, unless the context otherwise requires, any reference to precious metal also includes a reference to its alloys as described at (A), (B) and (C) above, but **not** to metal clad with precious metal, **nor** to base metals or non-metals plated with silver, gold or platinum.

Under Note 7 to this Chapter, the expression " metal clad with precious metal " means material made with a base of metal, one or more surfaces of which have been covered to any thickness with precious metal by soldering, brazing, welding, hot-rolling or similar mechanical means.

Plates and sheets, bars, etc., of metal clad with precious metal are most frequently made by covering one or both surfaces of the foundation metal with the precious metal, " sweating " the two metals together and then rolling them.

Wire clad with precious metal is obtained by inserting a core of base metal into a tube of precious metal, " sweating " the two metals together and then drawing them through a die.

Except where the context otherwise requires base metal articles inlaid with precious metal are also classified as articles of metal clad with precious metal (e.g., copper plates inlaid with silver strips for use in the electrical industry, and the so-called damaskeen work of steel inlaid with strips or threads of hammered gold).

Metal clad with precious metal, as defined in this Chapter, should not be confused with base metals plated with precious metals by electrolysis, vapour deposition, spraying or immersion in a solution of salts of precious metals, etc. These plated base metals remain classified in the Chapters for the respective foundation metals irrespective of the thickness of the plating.

The Chapter also **excludes** :

- (a) Colloidal precious metals and amalgams of precious metals (**heading 28.43**).
 - (b) Radioactive isotopes (e.g., iridium 192) including precious metals in the form of needles, thread or sheets containing radioactive isotopes (**heading 28.44**).
 - (c) Alloys specially prepared for dental fillings (**heading 30.06**).
- (3) In general, articles made wholly or partly of natural or cultured pearls, diamonds or other precious or semi-precious stones (natural, synthetic or reconstructed), precious metals or metal clad with precious metal (headings 71.13 to 71.16). In particular, this group includes jewellery and goldsmiths' or silversmiths' wares (see Explanatory Notes to headings 71.13 and 71.14), but it **does not include** :
- (a) The articles specified in Note 3 to this Chapter.
 - (b) Other articles in which the parts of precious metals or metal clad with precious metal are merely minor constituents, such as minor fittings (for example, monograms, ferrules, rims), **provided** the goods do not contain natural or cultured pearls, diamonds or other precious stones or semi-precious stones (natural, synthetic or reconstructed).

Knives, pen-knives, carving sets, razors and other articles of cutlery with base metal or non-metallic handles are therefore classified in **Chapter 82**, even if they have initials, monograms, ferrules, etc., of precious metals or of metal clad with precious metal; (similar cutlery with handles of precious metal or of metal clad with precious metal are classified in this Chapter).

In the same way, bowls, vases and other porcelain, china or glass tableware are classified in **Chapter 69** or **70** even if they have minor fittings or ornamentation (e.g., rims) of precious metal or metal clad with precious metal.

This group also **excludes** articles of base metals or non-metals plated with precious metals (other than articles of metal clad with precious metal).

- (4) Imitation jewellery (heading 71.17) as defined in Note 11 to this Chapter (see corresponding Explanatory Note), **other than** the articles specified in Note 3 to this Chapter.
 - (5) Coin (heading 71.18), **other than** collectors' pieces (**heading 97.05**).
-

Sub-Chapter I

NATURAL OR CULTURED PEARLS AND PRECIOUS OR SEMI-PRECIOUS STONES

71.01 - Pearls, natural or cultured, whether or not worked or graded but not strung, mounted or set; pearls, natural or cultured, temporarily strung for convenience of transport.

7101.10 - Natural pearls

- Cultured pearls :

7101.21 -- Unworked

7101.22 -- Worked

The pearls classified in this heading are, like mother of pearl, the result of the natural secretion of various sea or fresh water molluscs (especially of the pearl oyster and the pearl mussel).

Pearls have a shiny surface and consist essentially of layers of calcium carbonate coated with a horny material (conchiolin). The layers of carbonate cause optical interference and diffraction which produce the characteristic nacreous lustre of pearls ("orient"); the conchiolin gives the pearls their translucency or "water".

Pearls are usually white but may be shaded or coloured (e.g., grey, black, purple, red, yellow, green or blue).

They are usually round, but sometimes half round (button pearls) or irregular (baroque or blister pearls), and their size varies considerably. Mother of pearl (**headings 05.08 or 96.01**) has much the same composition, but usually takes the form of thin sheets.

This heading also includes cultured pearls (i.e., those produced by human intervention). This is done by fixing a bead of mother of pearl in a sac cut from the mantle of one oyster and then inserting this sac in the tissues of another healthy oyster. Over a period of years, the bead is slowly covered with concentric layers of nacre. Cultured pearls are therefore very similar in appearance to real pearls but can be distinguished from the latter by special apparatus (endoscope) or by X-ray examination.

This heading covers natural or cultured pearls whether unworked, i.e., as gathered and merely cleansed (for example, by means of salt and water), or worked, i.e. ground to remove defective parts, drilled or sawn (e.g., half or three-quarter pearls). The pearls of this heading may be temporarily strung for convenience of transport. Pearls which have been set, mounted or which have been permanently strung after grading are **excluded** (e.g., **heading 71.13, 71.14 or 71.16**, as appropriate).

It should be noted that natural or cultured pearls are excluded from Chapter 97 (collectors' pieces, antiques, etc.), and therefore **remain** in this Chapter.

This heading **excludes** :

- (a) Imitation pearls (plastics - **heading 39.26**; glass - **heading 70.18**; wax - **heading 96.02**).
- (b) Mother of pearl, unworked or simply prepared (**heading 05.08**) or worked (**heading 96.01**).

71.02 - Diamonds, whether or not worked, but not mounted or set (+).

7102.10 - Unsorted

- Industrial :

7102.21 -- Unworked or simply sawn, cleaved or bruted

7102.29 -- Other

- Non-industrial :

7102.31 -- Unworked or simply sawn, cleaved or bruted

7102.39 -- Other

Diamond is a crystalline and allotropic form of carbon with, in the pure state, a very high refractive index and dispersive power. It is the hardest known mineral. Because of these qualities diamond is used for making articles of adornment or ornamentation and also for industrial purposes (in particular, for wire drawing).

The heading covers unworked stones, and stones worked, e.g., by cleaving, sawing, bruting, tumbling, faceting, grinding, polishing, drilling, engraving (including cameos and intaglios), preparing as doublets, **provided** they are neither set nor mounted.

The heading **does not cover** :

- (a) Dust and powder of diamonds (**heading 71.05**).
- (b) Unmounted worked diamonds for styli (**heading 85.22**).
- (c) Diamonds worked so as to be recognisable as parts of meters, of measuring instruments or of other goods of Chapter 90 (**Chapter 90**).

Subheading Explanatory Notes.

Subheading 7102.10

Before "unworked" or rough diamonds are marketed as "industrial" or "non-industrial" they are graded and sorted in terms of technical criteria by diamond experts. The technical criteria include weight (mass) and crystallographic suitability for cutting. Account is also taken of shape, transparency, colour and clarity or quality of crystals.

This subheading covers those lots (i.e., parcels) of diamonds or single diamonds which have not been submitted to such expert examination.

This subheading also includes parcels of rough diamonds that have only been sieved and that are packaged according to size without having been submitted to further expert examination.

Subheadings 7102.21 and 7102.29

These subheadings cover the following natural diamonds :

- (1) Diamonds proper, that is to say, transparent or translucent diamonds which because of their characteristic features cannot, normally be used for jewellery or for goldsmiths' or silversmiths' wares.

- (2) Black diamonds, and other polycrystalline diamond-aggregates, including carbonados, which are harder than transparent diamonds.
- (3) Bort proper, that is to say, opaque diamonds and other diamonds (including waste from working diamonds), normally unsuitable for cutting.
- (4) Diamonds which because of their characteristic features (colour, clarity or quality, transparency, etc.) are destined for precise, particular uses in industrial applications (such as dressers, wire-drawing dies, or diamond anvils), but which are also suitable for use in jewellery.

These diamonds are generally intended for setting in tools (diamond cutting tools, boring tools, etc.) or fitting to machine accessories or machinery.

Subheading 7102.21 covers :

- (1) Diamonds in their natural state, i.e., as they occur in deposits or extracts from the parent rock, sorted into lots or parcels.
- (2) Diamonds simply sawn (e.g., into thin strips), cleaved (by splitting along the natural plane of the layers), bruted, tumbled or which have only a small number of polished facets (e.g., so-called windows, which are mostly made to allow expert examination of the internal characteristics of the rough diamond), i.e., stones which have only a provisional shape and clearly have to be further worked. The strips may also be cut into discs, rectangles, hexagons or octagons, provided that all the surfaces and ridges are rough, matt and unpolished.
- (3) Tumbled diamonds of which the surface has been rendered glossy and shiny by chemical treatment, also known as chemical polishing. Chemical polishing is different from traditional abrasive polishing in that the diamonds are not mounted individually and polished on a polishing wheel, but are loaded – in bulk – into a chemical reactor.
- (4) Broken or crushed diamonds.

Subheading 7102.29 covers polished or drilled diamonds, and engraved diamonds (other than diamonds engraved for identification purposes only).

Subheadings 7102.31 and 7102.39

These subheadings cover natural diamonds which, because of their characteristic features (colour, clarity or purity, transparency, etc.) are suitable for use by jewellers, goldsmiths or silversmiths.

Subheading 7102.31 covers :

- (1) Diamonds in their natural state, i.e., as they occur in deposits or extracts from the parent rock, sorted into lots or parcels.
- (2) Diamonds simply sawn, cleaved (by splitting along the natural plane of the layers), bruted or which have only a small number of polished facets (e.g., so-called windows, which are mostly made to allow expert examination of the internal characteristics of the rough diamond), i.e., stones which have only a provisional shape and clearly have to be further worked.
- (3) Tumbled diamonds of which the surface has been rendered glossy and shiny by chemical treatment, also known as chemical polishing. Chemical polishing is different from traditional abrasive polishing in that the diamonds are not mounted individually and polished on a polishing wheel, but are loaded – in bulk – into a chemical reactor.

Subheading 7102.39 covers :

- (1) Polished diamonds having multiple flat polished surfaces or facets, which do not require to be further worked before being used in jewellery.

- (2) Drilled diamonds, engraved diamonds (including cameos and intaglios) and diamonds prepared as doublets or triplets.
- (3) Diamonds which were subjected to polishing and drilling or engraving and were broken during these operations, as well as polished diamonds broken during their transportation or storage.

Subheading 7102.39 **does not cover** :

- (a) Diamonds which have only a small number of polished facets (e.g., windows which are made to allow expert examination of the internal characteristics of the rough diamond) and which clearly have to be further worked;
- (b) Diamonds which have only been engraved for identification purposes.

71.03 - Precious stones (other than diamonds) and semi-precious stones, whether or nor worked or graded but not strung, mounted or set; ungraded precious stones (other than diamonds) and semi-precious stones, temporarily strung for convenience of transport (+).

7103.10 - Unworked or simply sawn or roughly shaped

- Otherwise worked :

7103.91 -- Rubies, sapphires and emeralds

7103.99 -- Other

Because of their colour, brilliance, resistance to deterioration, and often also because of their rarity, these stones, which are usually crystalline, are used by jewellers, goldsmiths and silversmiths for making articles of adornment or ornamentation. Some are also used in clocks and watches or in tools or, because of their hardness or other special properties, for other industrial purposes (e.g., ruby, sapphire, agate, piezo-electric quartz).

The provisions of the second paragraph of the Explanatory Note to heading 71.02 apply, *mutatis mutandis*, to this heading.

But the heading **excludes** stones of the following kinds, **even if unmounted and unset** :

- (a) Unmounted worked sapphires for styls (**heading 85.22**).
- (b) Stones worked so as to be recognisable as parts of meters, of measuring instruments, of clocks or watches or of other goods of **Chapter 90** or **91**; also optical elements of quartz (**heading 90.01** or **90.02**).

The stones of this heading are therefore mainly stones intended for mounting or setting in jewellery or goldsmiths' or silversmiths' wares; but, **provided they are unmounted**, the heading also covers stones for setting in tools of headings 82.01 to 82.06 or in machinery, etc., of Section XVI (e.g., piezo-electric quartz for high frequency apparatus, etc.).

The heading **excludes** stones converted into articles, for example, cut agate mortars and pestles, agate crosses and rings, garnet goblets and cups, statuettes and ornamental goods of jade, ashtrays and paperweights of agate or onyx, rings for fishing rods, etc.; such articles are classified generally in **heading 71.16**.

The stones of this heading may be strung for convenience of transport, **provided** this method of assembly is temporary and that the stones have not been graded and are not directly suitable for use as jewellery. Precious or semi-precious stones which have been set or mounted fall in **heading 71.13, 71.14 or 71.16** (see the related Explanatory Notes) **unless** they are included in other headings, under the provisions of Note 1 to this Chapter.

The heading includes the precious or semi-precious stones listed in the Annex to this Chapter, the name of the mineralogical species being given with the commercial names; the heading is, of course, **restricted** to those stones and varieties of a quality suitable for use in jewellery, etc.

This heading also **excludes** :

- (a) Certain stones which, although belonging to the mineral species cited above, are of non-precious varieties, or of a quality not suitable for use in jewellery, goldsmiths' or silversmiths' wares; such stones are classified in **Chapter 25, 26 or 68**.
- (b) Steatite (unworked, **heading 25.26**; worked, **heading 68.02**).
- (c) Jet (unworked, **heading 25.30**; worked, **heading 96.02**).
- (d) Imitation precious or semi-precious stones made of glass (**heading 70.18**).

○
○ ○

Subheading Explanatory Notes.

Subheading 7103.10

This subheading includes stones roughly worked by sawing (e.g., into thin strips), cleaving (splitting along the natural plane of the layers) or bruting, i.e., stones which have only a provisional shape and clearly have to be further worked. The strips may also be cut into discs, rectangles, hexagons or octagons, provided all the surfaces and ridges are rough, matt and unpolished.

Subheadings 7103.91 and 7103.99

Subheadings 7103.91 and 7103.99 cover polished or drilled stones, engraved stones (including cameos and intaglios) and stones prepared as doublets or triplets.

71.04 - Synthetic or reconstructed precious or semi-precious stones, whether or not worked or graded but not strung, mounted or set; ungraded synthetic or reconstructed precious or semi-precious stones, temporarily strung for convenience of transport (+).

7104.10 - Piezo-electric quartz

7104.20 - Other, unworked or simply sawn or roughly shaped

7104.90 - Other

These stones are used for the same purposes as the natural precious or semi-precious stones of the two preceding headings.

(A) **Synthetic precious and semi-precious stones.** This expression covers a range of chemically produced stones which either :

- have essentially the same chemical composition and crystal structure as a particular natural stone (e.g., ruby, sapphire, emerald, industrial diamond, piezo-electric quartz); or
- because of their colour, brilliance, resistance to deterioration, and hardness are used by jewellers, goldsmiths and silversmiths in place of natural precious or semi-precious stones, even if they do not have the same chemical composition and crystal structure as the stones which they resemble, e.g., yttrium aluminium garnet and synthetic cubic zirconia, both of which are used to imitate diamond.

When unworked, synthetic stones generally have the appearance of small cylinders or pear-shaped drops and are known as "boules"; these are usually split along their length or sawn into discs.

(B) **Reconstructed precious and semi-precious stones** are obtained artificially by various means, e.g., agglomerating, pressing or fusing together (usually with the aid of a blow pipe) fragments of natural precious or semi-precious stones which have generally been reduced to a powder.

Synthetic and reconstructed stones can normally be distinguished from natural stones by microscopic examination (preferably in a medium other than air) which reveals small bubbles and streaks.

The provisions of the Explanatory Notes to headings 71.02 and 71.03, especially as regards the working to which the stones may be submitted, are also applicable here.

Synthetic or reconstructed stones should not be confused with glass imitation precious or semi-precious stones of **heading 70.18** (see corresponding Explanatory Note).

Subheading Explanatory Notes.

Subheading 7104.10

Piezo-electric quartz has the property, when subjected to mechanical pressure, of producing an electric charge, the strength of which varies in relation to the pressure and, conversely, of converting into mechanical pressure the differences in electric potential to which it is subjected.

By reason of this property, piezo-electric quartz is used in the electrical equipment industry for various purposes : the manufacture of microphones, loudspeakers, instruments for transmitting or receiving ultrasonic waves, instruments for fixed frequency oscillations, etc.

The piezo-electric quartz falling in this subheading is generally in the form of thin sheets, plates, rods, etc., obtained by sawing synthetic quartz with a precision-cut along the line of electrical axis.

Subheading 7104.20

The Explanatory Note to subheading 7103.10 applies, *mutatis mutandis*, to this subheading.

Subheading 7104.90

The Explanatory Note to subheadings 7103.91 and 7103.99 applies, *mutatis mutandis*, to this subheading.

71.05 - Dust and powder of natural or synthetic precious or semi-precious stones.

7105.10 - Of diamonds

7105.90 - Other

This heading covers dust and powder obtained, for example, from the polishing or grinding of the stones covered by the three preceding headings. The most important of these powders are derived from diamonds and garnets.

Natural diamond dust and powder are obtained mainly by crushing "bort" (industrial grade diamond grains). Synthetic diamond dust and powder are produced by direct conversion, generally of graphite, at high temperatures and pressures.

These dusts and powders differ from the diamonds of headings 71.02 and 71.04 in that, for practical purposes, they are too small to be mounted individually. They are normally used for abrasive purposes. Their particle size generally does not exceed 1,000 micrometers (microns) but sizing is effected by sieving rather than by measuring individual particles. There can be a considerable degree of overlap between the size of dust and powder particles and that of stones, but whereas stones are counted individually to determine quantity, dust and powder are weighed.

Diamond dust and powder are used for the manufacture of grinding, polishing or honing wheels, cutters, polishing pastes, etc.

Garnet powder is used mainly for the grinding of optical lenses or as an abrasive on a base of paper or other material.

The heading **does not cover** artificial corundum powder (**heading 28.18**).

Sub-Chapter II

PRECIOUS METALS AND METALS CLAD WITH PRECIOUS METAL

71.06 - Silver (including silver plated with gold or platinum), unwrought or in semi-manufactured forms, or in powder form.

7106.10 - Powder

- Other :

7106.91 -- Unwrought

7106.92 -- Semi-manufactured

This heading covers the various unwrought, semi-manufactured or powder forms of silver or of silver alloys (as defined in the General Explanatory Note), of gold-plated silver (silver gilt) or of silver plated with platinum. The heading **does not**, however, **cover** silver clad with precious metal.

*
* *

Silver is a white metal, not corroded by the atmosphere but tending to tarnish; it is the best conductor of heat and electricity, and is the most malleable and ductile metal after gold. It is very soft in its pure state, and consequently is frequently alloyed with other metals. Unalloyed silver is, however, widely used in electrical applications (contacts, fuses, etc.), in certain apparatus used in the chemical or food industries or in surgery, and as a plating metal.

Under the provisions of Note 5 to this Chapter (see General Explanatory Note above), the **silver alloys** which may fall in this heading include :

- (1) **Silver-copper alloys.** The most important of these are used in the manufacture of coins or of goldsmiths' or silversmiths' wares; some are also used in the manufacture of electrical contacts.
- (2) **Silver-copper-cadmium, silver-copper-titanium and silver-indium alloys,** used in the manufacture of goldsmiths' or silversmiths' wares.
- (3) **Silver-copper-zinc alloys,** sometimes also containing cadmium, tin or phosphorus, used as solders.
- (4) **Silver-antimony-tin-lead, silver-copper-lead, silver-cadmium and silver-thallium anti-friction alloys.**
- (5) **Sintered silver-tungsten, silver-molybdenum, silver-nickel and silver-iron alloys,** used to make electrical contacts.

The heading covers silver and its alloys in the following forms :

- (I) **Powder,** usually in the form of finely divided powder, obtained by various mechanical or chemical processes. It is used in metallurgy and in the manufacture of metallising preparations for electronic applications and of conducting cements.

The heading **excludes** powders or flakes prepared as colours, paints or the like (e.g., made up with other colouring matter or put up as a liquid or pasty dispersion in a binder or solvent); these fall in **heading 32.06, 32.07** (liquid lustres and similar compounds for the ceramic or glass industries), **32.08 to 32.10, 32.12 or 32.13**.

(II) **Unwrought silver in lumps, grains, ingots, cast bars, pellets, etc.**; also native silver in lumps, nuggets, crystals, etc., separated from their gangues.

(III) **Bars, rods, sections, wire, plates, sheets and strip.** These are usually obtained by rolling or drawing; strip and discs, etc., may also be obtained by cutting sheet silver. The heading includes silver thread for use in the textile industry **provided** it has not been spun or otherwise combined with textile yarn (**Section XI**). Very fine sterile silver wire used for surgical sutures is, however, classified in **heading 30.06**.

The heading also covers metallo-graphitic blocks, plates, bars, rods, etc., with a basis of "carbon", containing silver (see Explanatory Note to heading 38.01).

(IV) **Tubes and pipes (including coiled tubing) provided** that they are note made up into specific identifiable articles (e.g., parts of chemical apparatus).

(V) **Foil** (for silvering) is usually obtained by hammering or beating thin sheets of silver separated by sheets of gold-beaters' skin. This foil is generally put up in booklets and may be fixed to a backing of paper, plastics, etc.

However the heading **excludes** stamping foils (also known as blocking foils) composed of silver powder agglomerated with gelatin, glue or other binder, or of silver deposited on paper, plastics or other support (**heading 32.12**).

(VI) **Purls, spangles and cuttings.** Purls are small twists of silver wire used in embroidery or trimmings. Spangles and cuttings, used for the same purposes, are small pieces cut to geometric form (round, star-shaped, etc.) and usually pierced in the middle.

The heading **does not cover** castings, sinterings, stampings, pressings, etc., in the form of blanks for articles of jewellery, etc., falling in **sub-Chapter III** (e.g., settings, ring blanks, badges, flowers and figures).

71.07 - Base metals clad with silver, not further worked than semi-manufactured.

Metal clad with precious metal (including base metal inlaid with precious metal) is defined in Note 7 to this Chapter and the General Explanatory Note to this Chapter.

The alloys of tin, nickel, zinc and particularly of copper are sometimes clad with silver. Unalloyed copper and steel may also be clad in this way. Such metals are used in silversmiths' wares (tableware, articles of interior decoration, etc.), and in tubing, vessels and apparatus for the chemical or food industries.

Base metal clad with silver falling in this heading is usually in the form of bars, rods, sections, wire, plates, sheets, strip, tubes or pipes.

In general, the provisions of Explanatory Note to heading 71.06 also apply, *mutatis mutandis*, to base metal clad with silver.

71.08 - Gold (including gold plated with platinum) unwrought or in semi-manufactured forms, or in powder form (+).

- Non-monetary :

7108.11 -- Powder

7108.12 -- Other unwrought forms

7108.13 -- Other semi-manufactured forms

7108.20 - Monetary

This heading covers the various unwrought, semi-manufactured or powder forms of gold or gold alloys (as defined in the General Explanatory Note), or of gold plated with platinum. The heading **does not**, however, **cover** gold clad with precious metal.

*
* * *

Gold has a characteristic yellow colour; it is not oxidised even at high temperature, and has remarkable chemical resistance to most reagents, including acids (aqua regia, however, attacks it). It is, after silver and copper, the best conductor of heat and electricity. It is the most malleable and most ductile of all metals, but is very soft, and is therefore rarely used unalloyed except for electro-plating, or as an electrodeposit.

Under the terms of Note 5 to this Chapter (see General Explanatory Note), the **gold alloys** which may fall in this heading, include :

- (1) **Gold-silver alloys**, varying in colour from yellow through green to white, according to the proportions of the constituent metals. They are used in jewellery and also in electrical contacts and in special high melting point solders.
- (2) **Gold-copper alloys**, used in the manufacture of coins, jewellery or goldsmiths' wares or in electrical contacts.
- (3) **Gold-silver-copper alloys**, primarily used in jewellery, goldsmiths' wares, in dental alloys or as solders. These alloys may contain zinc and cadmium and are then also used as solders. The alloy called "doré" or "bullion doré" consisting mainly of silver and copper falls in this heading when it contains 2 % or more, by weight, of gold. It is obtained from certain cupriferous pyrites or from residues derived from the processing of blister copper and is subsequently refined to separate its constituent metals.
- (4) **Gold-copper-nickel alloys**, sometimes containing added zinc and magnesium, giving a range of alloys (known as "white" golds or, in some countries, as "grey" golds) often used as a substitute for platinum. Other "white" golds contain 2 % or more of palladium and are therefore **excluded** (**heading 71.10**).
- (5) **Gold-nickel alloys**, used in the manufacture of electrical contacts.

The heading includes gold and gold alloys in the same forms as those described for silver. The provisions of Explanatory Note to heading 71.06 therefore apply, *mutatis mutandis*.

○
○ ○

Subheading Explanatory Note.

Subheading 7108.20

This subheading covers gold exchanged between national or international monetary authorities or authorised banks.

71.09 - Base metals or silver, clad with gold, not further worked than semi-manufactured.

Metal clad with precious metal (including base metal inlaid with precious metal) is defined in Note 7 and the General Explanatory Note to this Chapter. Base metal or silver clad with gold are usually in forms similar to those described for base metal clad with silver (see the Explanatory Note to heading 71.07).

Base metal (e.g., copper and its alloys) or silver is clad with gold for the manufacture of jewellery (bracelets, watch-chains, ear-rings, etc.), watch-cases, cigar or cigarette-holders, lighters, goldsmiths' wares, electrical contacts, chemical apparatus, etc.

71.10 - Platinum, unwrought or in semi-manufactured forms, or in powder form.

- Platinum :

7110.11 -- Unwrought or in powder form

7110.19 -- Other

- Palladium :

7110.21 -- Unwrought or in powder form

7110.29 -- Other

- Rhodium :

7110.31 -- Unwrought or in powder form

7110.39 -- Other

- Iridium, osmium and ruthenium :

7110.41 -- Unwrought or in powder form

7110.49 -- Other

Like headings 71.06 for silver and 71.08 for gold, this heading covers platinum and its alloys as defined in the General Explanatory Note.

*
* *

The term "platinum" covers (see Note 4 (B) to Chapter 71) :

(A) **Platinum** which is a greyish-white, soft and ductile metal, not tarnished at room temperature and resistant to acids except aqua regia. It can be fabricated into bars, sheets, strip, tubes, wire and other semi-manufactured forms by forging, rolling or drawing.

In view of their outstanding resistance to corrosion, high melting point and high catalytic activity, platinum and its alloys have many important applications in industry surpassing their use in jewellery or in dentistry, for example, in the electrical industry for the manufacture of thermocouples and resistance thermometers, and as electrical contacts and electrodes for various applications; in the textile industry for spinnerets for man-made fibres; in the glass industry for molten glass equipment such as bushings for glass fibre production, crucibles, stirrers, etc.; in the chemical and petroleum industries as catalysts (e.g., in the ammonia-oxidation process for the manufacture of nitric acid or as a platforming catalyst); as chemical apparatus (e.g., crucibles); in the aircraft industry for electrodes of sparking plugs for spark-ignition internal combustion aero-engines and for ignition devices in gas-turbine aero-engines.

Platinum and its alloys also find a use in the manufacture of surgical instruments (particularly hypodermic needles), in certain gas lighters and for many other applications such as measuring standards, hair lines for optical instruments, etc.

- (B) **Palladium** which is a silvery-white metal, soft, very ductile and highly resistant to tarnishing and corrosion. It dissolves in aqua regia and nitric acid and is attacked by hot sulphuric acid. Palladium can be made into bars, sheets, strip, tubes, wire or other semi-manufactured forms by forging, rolling or drawing.

It is mainly used for electrical contacts, in brazing alloys, in hydrogen purification equipment, as a hydrogenation catalyst, in the manufacture of jewellery and as an intermediate contact layer to facilitate the coating of plastics with precious metals.

- (C) **Rhodium** which is a silvery-white, hard but ductile metal. It is characterised by its high reflectivity and has the highest electrical and thermal conductivities of all the platinum group metals. It is resistant to corrosion by nearly all aqueous solutions, including mineral acids even at high temperatures.

Rhodium may be made into bars, sheets, strip, wire and other semi-manufactured forms by forging, rolling or drawing.

Its major use is as an alloying addition to platinum and in this form it has several applications in the electrical and glass-making industries. Its low electrical resistance and high resistance to tarnishing make it suitable, in the electrodeposited form, for electrical contacts and for contact surfaces where wear resistance is of importance (e.g., in slip rings). It is also used as a catalyst and for plating silver or silver-plated cutlery and hollow-ware to give a tarnish resistant finish.

- (D) **Iridium** which is a greyish-white, hard metal, resistant to the action of acids, including aqua regia, at normal and high temperatures.

It can be made into thin strip or wire by rolling and drawing.

Iridium is used as a constituent of alloys used for thermocouples, crucibles, or electrodes for aircraft-engine sparking plugs.

- (E) **Osmium** which is the most refractory of the metals included in this heading. In the compact state it has a bluish-white colour similar to zinc and is resistant to acids. When finely divided, it is an amorphous black powder, and is attacked by nitric acid and aqua regia and is slowly oxidised in the atmosphere.

The metal is mainly used in various, hard, corrosion-resistant alloys used for tipping pen-nibs or instrument pivots. It is also used as a catalyst.

- (F) **Ruthenium** which is a brittle, hard, grey metal. It has a high resistance to corrosion. It is unattacked by aqua regia, but is slowly attacked by solutions of sodium hypochlorite. It can be obtained on a small scale in the form of sheets, strip and wire.

It is used as an alloying addition to platinum, palladium, molybdenum, tungsten, etc. (e.g., for the manufacture of pen-nib points and compass pivots). It is also used as a catalyst and, in the electrodeposited form, for electrical contacts and for contact surfaces where wear resistance is of importance.

Under the terms of Note 5 to this Chapter (see General Explanatory Note), the **alloys of platinum** with other metals (gold, silver or base metals) which may fall in this heading, include :

- (1) **Platinum-rhodium alloys**, - thermocouple wire; furnace windings; components in the glass industry; catalyst gauzes; spinnerets.
- (2) **Platinum-iridium alloys**, - electrical contacts; jewellery; hypodermic needles.
- (3) **Platinum-ruthenium alloys**, - electrical contacts.
- (4) **Platinum-copper alloys**, (max. 5 % copper), - jewellery.
- (5) **Platinum-tungsten alloys**, - valve electrode wires; spark-ignition wires.
- (6) **Platinum-cobalt alloys**, - permanent magnets.
- (7) **Palladium-ruthenium alloys**, - jewellery.
- (8) **Palladium-silver alloys**, - brazing alloys; hydrogen diffusion membranes; electrical contacts.
- (9) **Palladium-copper alloys**, - electrical contacts; brazing.
- (10) **Palladium-aluminium alloys**, - fuse wire.
- (11) **Rhodium-iridium alloys**, - thermocouples.
- (12) **Iridium-osmium alloys**, - pen tips.
- (13) **Iridium-tungsten alloys**, - high temperature springs.
- (14) **Gold-platinum alloys**, - spinnerets.
- (15) **Gold-silver-palladium-copper alloys**, - jewellery; electrical contact springs.
- (16) **Silver-copper-palladium alloys**, - brazing alloys.
- (17) **Osmiridium (iridosmine)**, a natural alloy containing osmium, iridium, ruthenium and platinum; it is the main source of osmium.

71.11 - Base metals, silver or gold, clad with platinum, not further worked than semi-manufactured.

Metals clad with precious metal (including those inlaid on base metal with precious metal) are defined in Note 7 to this Chapter and in the General Explanatory Note. They are usually presented in forms similar to those described for silver in the Explanatory Note to heading 71.07.

Base metals (e.g., copper, tungsten), silver or gold, clad with platinum are used mainly in jewellery and in electrical apparatus.

71.12 - Waste and scrap of precious metal or of metal clad with precious metal; other waste and scrap containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal.

7112.30 - Ash containing precious metal or precious metal compounds

- Other :

7112.91 -- Of gold, including metal clad with gold but excluding sweepings containing other precious metals

7112.92 -- Of platinum, including metal clad with platinum but excluding sweepings containing other precious metals

7112.99 -- Other

This heading covers waste and scrap in metallic form **fit only** for the recovery of the precious metal, or for use as a basis for the manufacture of chemicals.

The heading also covers waste and scrap of any material containing precious metal or precious metal compounds, of a kind used principally for the recovery of precious metal.

It includes, in particular :

- (A) Ash containing precious metal or precious metal compounds, arising from the incineration of photographic films, printed circuit boards, etc.
- (B) Waste and residues derived from the mechanical working of precious metal or of metal clad with precious metal, in mints, goldsmiths', silversmiths', jewellers' workshops, etc., for example, sweepings, dust, lemens, shavings, etc., resulting from shaping, drilling, working, etc.
- (C) Scrap of worn-out or broken articles (tableware, goldsmiths' or silversmiths' wares, catalysts in the form of woven gauze, etc.) no longer fit for their original use. It **does not extend** to those which, with or without repair or renovation, can be reused for their former purposes, or which can be converted for other uses without being subjected to processes for the recovery of precious metals.
- (D) Waste and scrap of photographic plates, film, paper, paperboard or textiles, containing precious metal in metallic form or in the form of compounds (e.g., silver halides).
- (E) Waste and scrap of electronic circuit boards and similar carriers containing precious metal (e.g., gold or silver).
- (F) Residues of metallurgical, electrolytic or chemical processes, containing precious metal (e.g., slags, sludges from electrolytic refining and plating, silver residues from photographic fixing baths).

Sub-Chapter III

JEWELLERY, GOLDSMITHS' AND SILVERSMITHS' WARES AND OTHER ARTICLES

71.13 - Articles of jewellery and parts thereof, of precious metal or of metal clad with precious metal.

- Of precious metal whether or not plated or clad with precious metal :

7113.11 -- Of silver, whether or not plated or clad with other precious metal

7113.19 -- Of other precious metal, whether or not plated or clad with precious metal

7113.20 - Of base metal clad with precious metal

This heading covers articles of jewellery as defined in Note 9 to this Chapter, wholly or partly or precious metal or metal clad with precious metal, that is :

(A) **Small objects of personal adornment** (gem-set or not) such as rings, bracelets, necklaces, brooches, ear-rings, neck chains, watch-chains and other ornamental chains; fobs, pendants, tie-pins and clips, cuff-links, dress-studs, buttons, etc.; religious or other crosses; medals and insignia; hat ornaments (pins, buckles, rings, etc.); ornaments for handbags; buckles and slides for belts, shoes, etc.; hair-slides, tiaras, dress combs and similar hair ornaments.

(B) **Articles of personal use normally carried in the pocket, in the handbag or on the person** such as cigar or cigarette cases, snuff boxes, spectacle cases, powder boxes, lipstick holders, pocket combs, cachou boxes, chain purses, rosaries, key rings.

To fall in this heading these articles **must** contain precious metal or metal clad with precious metal (including base metal inlaid with precious metal) to an extent **exceeding minor constituents**; (thus a cigarette case of base metal with a simple monogram of gold or silver remains classified as an article of base metal). **Subject** to this condition the goods may also contain pearls (natural, cultured or imitation), precious or semi-precious stones (natural, synthetic or reconstructed), imitation stones, or parts of tortoise-shell, mother of pearl, ivory, amber (natural or agglomerated), jet or coral.

The heading also covers unfinished or incomplete articles of jewellery and identifiable parts of jewellery, **provided** they contain precious metal or metal clad with precious metal to an extent **exceeding minor constituents**, for example, motifs for incorporation in rings, brooches, etc.

The heading **excludes** :

- (a) Articles of **heading 42.02 or 42.03** referred to in Note 3 (B) to Chapter 42.
- (b) Goods of **heading 43.03 or 43.04** (articles of furskin or of artificial fur).
- (c) Footwear, headgear and other articles of **Chapter 64 or 65** with parts of the materials of this Chapter.
- (d) Imitation jewellery of **heading 71.17**.
- (e) Coins, **except** those mounted as jewellery (**heading 71.18 or Chapter 97**).
- (f) Articles of **Chapter 90** (e.g., spectacles, lorgnettes, etc., and mountings therefor).
- (g) Watches and wrist-watch bracelets (**Chapter 91**).
- (h) Articles of **Chapter 96, other than** those of **headings 96.01 to 96.06 or 96.15**, for example, fountain pens, stylograph pens, pen-holders, pencil-holders and propelling pencils (also parts and fittings thereof); lighters, smoking pipes, cigar or cigarette holders, and parts thereof; scent or similar sprays of a kind used for toilet purposes, and heads therefor.
- (ij) Articles of jewellery of an age exceeding 100 years (**heading 97.06**).

71.14 - Articles of goldsmiths' or silversmiths' wares and parts thereof, of precious metal or of metal clad with precious metal.

- Of precious metal whether or not plated or clad with precious metal :

7114.11 -- Of silver, whether or not plated or clad with other precious metal

7114.19 -- Of other precious metal, whether or not plated or clad with precious metal

7114.20 - Of base metal clad with precious metal

This heading covers articles of goldsmiths' or silversmiths' wares as defined in Note 10 to this Chapter wholly or partly of precious metal or metal clad with precious metal. In general these goods are larger than articles of jewellery of heading 71.13; they include :

- (A) **Articles of tableware** such as table knives, carving sets, spoons, forks; ladles; poultry or meat grips; trays, plates, soup or vegetable dishes and bowls; sauce-boats; fruit dishes; sugar-bowls, coffee-pots, teapots, tea or coffee cups; goblets; egg-cups, decanters, liqueur services; stands and baskets for bread, cake, fruit, etc.; fish-servers; cake servers; wine cooling buckets; cruets; sugar-tongs; knife-rests, serviette rings; table bells; ornamental stoppers, etc.
- (B) **Toilet articles** such as hand mirrors; bottles and powder boxes (**other than** those of **heading 71.13**); brush boxes, clothes brushes, nail brushes, hair brushes, combs (**other than** dress combs and pocket combs - **heading 71.13**); jugs, etc. Scent sprays are **excluded** (**heading 96.16**).
- (C) **Office or desk equipment** such as ink-pots, ink-stands, book-ends, paperweights, paper-knives.
- (D) **Smokers' requisites** such as cigar or cigarette boxes, tobacco jars, ashtrays, matchbox holders, etc.; but **not including** articles of **heading 96.13** or **96.14** (cigarette and other lighters, smoking pipes, cigarette holders, etc.)
- (E) **Other articles for domestic or similar use**, for example, busts, statuettes and other figures for interior decoration; jewel cases; table centre-pieces, vases, jardinières; picture frames; lamps, candelabra, candlesticks, chandeliers; mantelpiece ornaments, decorative dishes and plates, medals and medallions (**other than** those for personal adornment); sporting trophies; perfume burners, etc.
- (F) **Articles for religious use** such as reliquaries, chalices, ciboriums, monstrances, crucifixes, candlesticks, lamps.

The heading also covers **unfinished** or **incomplete articles** of goldsmiths' or silversmiths' wares and identifiable **parts** of goldsmiths' or silversmiths' wares, for example, silver handles for tableware, silver backs for toilet brushes, etc.

Like jewellery and **subject to the same reservation as regards minor constituents**, the goods of this heading **must** contain precious metal or metal clad with precious metal; they may also contain pearls (natural, cultured or imitation) precious or semi-precious stones (natural, synthetic or reconstructed), imitation stones, tortoise-shell, mother of pearl, ivory, amber (natural or agglomerated), jet or coral.

The heading **excludes** :

- (a) Umbrellas, walking-sticks and other articles of **heading 66.01** or **66.02** having fittings in materials of this Chapter, as well as parts, fittings and accessories of these articles, wholly or partly of these materials (**heading 66.03**).
- (b) Articles of **Chapter 90** (e.g., binoculars and telescopes).
- (c) Clocks and watches and their cases (**Chapter 91**).
- (d) Musical instruments (**Chapter 92**).
- (e) Arms and parts thereof of **Chapter 93** (side-arms, pistols, revolvers, etc.).
- (f) Scent and similar sprays of a kind used for toilet purposes, and heads therefor (**heading 96.16**).
- (g) Original statuary or sculptures (**heading 97.03**) collectors' pieces of **heading 97.05** and antiques of **heading 97.06**.

71.15 - Other articles of precious metal or of metal clad with precious metal.

7115.10 - Catalysts in the form of wire cloth or grill, of platinum

7115.90 - Other

This heading covers all articles wholly or partly of precious metal or metal clad with precious metal **not constituting** jewellery, unfinished or incomplete articles of jewellery or parts of jewellery (**heading 71.13**) or goldsmiths' or silversmiths' wares, unfinished or incomplete articles of goldsmiths' or silversmiths' wares or parts thereof (**heading 71.14**), and **not excluded** under the provisions of Note 2 (A) or 3 to this Chapter.

The heading **does not cover**, for example :

- (a) Articles in which precious metal or metal clad with precious metal is present as minor constituents only.
- (b) Sterile surgical suture materials, dental fillings and other goods of **Chapter 30**.
- (c) Woven fabrics of **heading 58.09** and other goods of **Section XI**.
- (d) Machinery, mechanical appliances and electrical goods and identifiable parts thereof, of **Section XVI** (for example, platinum extrusion spinnerets, anti-friction bearings, parts of chemical or industrial machinery, electrical contacts).
- (e) Articles of **Chapter 90** (for example, artificial limbs, teeth and other artificial parts of the body; fracture plates, medical or surgical instruments, pyrometers with thermocouples of precious metals; laboratory instruments and apparatus and parts thereof of gold, silver or platinum); articles of **Chapter 91** (clocks and watches), or of **Chapter 96** (e.g., platinum-sponge gas lighters).

This heading is therefore largely confined to articles for technical or laboratory use such as crucibles, cupels and certain spatulas (e.g., of platinum or metals of the platinum group); platinum or platinum alloy in the form of cloth or grill for use as catalysts, etc.; vessels (whether or not lined or heat-insulated), not fitted nor designed to be fitted with mechanical or thermal equipment; electroplating anodes. Gold anodes may be in the form of sheets of pure gold cut to the required size and drilled at two corners for attachment of hooks for suspending them in the electro-plating tank. Silver anodes may also be in this form or in the form of extruded sections having a "dog-bone" cross-section and drilled at each end. Platinum anodes usually consist either of small corrugated platinum sheets or strips to which a narrow strip of platinum has been welded for suspending them in the electrolytic plating tank or of platinum wire gauze fitted with a piece of platinum wire or narrow strip of platinum gauze for suspension purposes.

This heading also covers articles such as handbags, etc., in which the precious metal or metal clad with precious metal gives the article its essential character. Such articles may incorporate pearls, precious stones, semi-precious stones, tortoise-shell, etc., as fittings or ornamentation.

71.16 - Articles of natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed).

7116.10 - Of natural or cultured pearls

7116.20 - Of precious or semi-precious stones (natural, synthetic or reconstructed)

This heading covers all articles (**other than** those **excluded** by Notes 2 (B) and 3 to this Chapter), wholly of natural or cultured pearls, precious or semi-precious stones, or consisting partly of natural or cultured pearls or precious or semi-precious stones, but **not** containing precious metals or metals clad with precious metal (**except** as minor constituents) (see Note 2 (B) to this Chapter).

It thus includes :

- (A) **Articles of personal adornment and other decorated articles** (e.g., clasps and frames for handbags, etc; combs, brushes; ear-rings; cuff-links, dress-studs and the like) containing natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), set or mounted on base metal (whether or not plated with precious metal), ivory, wood, plastics, etc.

It includes pearls or stones graded according to size, quality, shade, etc., and constituting an article ready for use as jewellery. But the heading **excludes** ungraded or graded pearls and ungraded stones merely temporarily strung for facility of transport without any setting or fitting of metal or other material; these fall in **heading 71.01, 71.03 or 71.04** (see Explanatory Notes to headings 71.01 to 71.03).

Under Note 2 (B) to this Chapter the goods of this heading may contain precious metal or metal clad with precious metal as minor constituents (e.g., a pearl necklace with a gold fastener). On the other hand the heading **does not cover** goods (e.g., ear-rings with gold clips) in which the precious metal or metal clad with precious metal amounts to more than minor constituents (**heading 71.13**).

- (B) **Other articles** consisting wholly or partly of precious or semi-precious stones; these may also contain other materials including precious metal or metal clad with precious metal, **provided that** the precious metal or metal clad with precious metal is present as minor constituents only. Subject to these conditions, the heading therefore covers crosses and rings (frequently in agate), bracelets (other than wrist-watch bracelets), goblets and cups (often in garnet); statuettes and ornamental articles (e.g., of jade); mortars and pestles (e.g., in agate), knife edges or bearings of agate or other precious or semi-precious stones for weighing apparatus; agate thread spinning guides; decorative corks with heads of agate, etc.; agate burnishing tools used for gilding, for polishing leather, paper, etc.; agate rings for fishing rods, paper-knives, ink-stands, paperweights, ashtrays (e.g., of agate or onyx).

The heading **does not cover** :

- (a) Goods of **Chapter 82** with a working part of precious or semi-precious stones (natural, synthetic or reconstructed) on a support of base metal, metal carbide or cermet, whether or not assembled (e.g., mounted glaziers' diamonds).
- (b) Machinery, mechanical appliances or electrical goods and parts thereof of **Section XVI**, (see Note 3 (k) to this Chapter).
- (c) Articles of **Chapter 90**, such as mounted or unmounted optical elements of quartz, suitable for fitting to instruments or appliances.
- (d) Worked precious or semi-precious stones, mounted or not, being parts of clocks or watches, or parts suitable for use both in clocks or watches and in other articles (see Note 4 to **Chapter 91**).

71.17 - Imitation jewellery.

- Of base metal, whether or not plated with precious metal :

7117.11 -- Cuff-links and studs

7117.19 -- Other

7117.90 - Other

For the purposes of this heading, the expression **imitation jewellery**, as defined in Note 11 to this Chapter, is restricted to small objects of personal adornment, such as those listed in paragraph (A) of the Explanatory Note to heading 71.13, e.g., rings, bracelets (other than wrist-watch bracelets), necklaces, ear-rings, cuff-links, etc., **but not including** buttons and other articles of **heading 96.06**, or dress combs, hair-slides or the like, and hair-pins of **heading 96.15**, **provided** they do not incorporate precious metal or metal clad with precious metal (except as plating or as minor constituents as defined in Note 2 (A) to this Chapter, e.g., monograms, ferrules and rims) nor natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed).

The heading also covers unfinished or incomplete articles of imitation jewellery (ear-rings, bracelets, necklaces, etc.), such as :

- (a) Semi-finished split rings, consisting of anodised aluminium wire, usually twisted or surface worked, whether or not fitted with a crude clasp, sometimes used as ear-rings without further working;
- (b) Ornamental motifs of base metal, whether or not polished, assembled by small links into strips of indefinite length.

It is to be noted that articles of personal use of a kind normally carried in the pocket, in the handbag or on the person, such as those listed in paragraph (B) of the Explanatory Note to heading 71.13 (cigarette cases, powder boxes, etc.) **are not regarded as imitation jewellery**.

The heading also **excludes** :

- (a) Articles specified in Note 3 to this Chapter.
- (b) Articles of **heading 83.08** (buckles, buckle-clasps, clasps, hooks, eyelets, etc.).

71.18 - Coin (+).

7118.10 - Coin (other than gold coin), not being legal tender

7118.90 - Other

This heading applies to coins of any metal (including precious metals) of officially prescribed weight and design, issued under government control for use as legal tender. Consignments of individual coins or of sets of coins which are legal tender in the country of issue are classified in this heading even if they are put up for general sale in presentation cases. The heading includes coin which is no longer legal tender but it **excludes** collectors' pieces (see Explanatory Note to heading 97.05).

Coins are made by stamping out blanks from sheet metal; these are then "struck" with the appropriate dies to produce simultaneously the designs on the two faces.

The heading **does not cover** :

- (a) Medals even if "struck" in the same way as coins; these usually fall in **heading 71.13, 71.14 or 71.17** or **heading 83.06** (see corresponding Explanatory Notes).
- (b) Coins mounted in brooches, tie-pins or other objects of personal adornment (**heading 71.13 or 71.17**).
- (c) Broken, cut or battered coins of a kind usable only as scrap or waste metal.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 7118.10.

This subheading includes :

- (1) Coins which were legal tender but have been withdrawn from circulation.
- (2) Coins struck in one country to be put into circulation in another country; at the time of crossing the frontier, they are not yet issued as legal tender by the competent authority.

ANNEX

List of precious or semi-precious stones falling in heading 71.03.

Mineral	Commercial name
Amblygonite	Amblygonite Montebrasite
Amphiboles (group of)	
Actinolite	Actinolite, Nephrite, Jade
Tremolite	Tremolite
Rhodonite	Rhodonite
Andalusite	Andalusite Chiastolite
Apatite	Apatite (all colours)
Aragonite	Aragonite, Ammolite
Axinite	Axinite
Azurite	Azurite (Chessylite) Azurite-Malachite
Benitoite	Benitoite
Beryl	Emerald Aquamarine Colourless Beryl-Goshenite Yellow Beryl Pink Beryl-Morganite Heliodor Golden Beryl Green Beryl Red Beryl, Bixbite Beryllonite
Beryllonite	Brazilianite
Brazilianite	Calcite
Calcite	Cassiterite
Cassiterite	Cerussite
Cerussite	Chrysoberyl
Chrysoberyl	Chrysoberyl Cat's-eye Alexandrite Alexandrite Cat's-eye
Chrysocolla	Chrysocolla
Cordierite	Cordierite
Corundum	Iolite Ruby Star-Ruby Sapphire Star-Sapphire Sapphire Cat's-eye Sapphire or Corundum with colour designation Padparadschah (orange) Black Star-Sapphire, etc.

Danburite	Danburite
Datolite	Datolite
Diaspore	Diaspore
Dumortierite	Dumortierite
Epidote	Epidote
Euclase	Euclase
Feldspar (group of)	
Albite	Albite
Microcline	Maw-sit-sit/Jadeite Albite
Oligoclase	Labradorite
Orthoclase	Labradorite, Spectrolite Amazonite, Microcline Aventurine Feldspar Sunstone Orthoclase (yellow) Moonstone
Fluorite	Fluorite
(Fluorspar)	(Fluorspar)
Garnet (group of)	
Almandine	Garnet, Almandine
Andradite	Garnet, Rhodolite Garnet, Andradite Garnet, Demantoid
Grossular	Garnet, Melanite Garnet, Grossular varied colours Garnet, Grossular Chrome Tsavorite
Pyrope	Garnet, Hessonite
Spessartite	Garnet, Pyrope
Hematite	Garnet, Spessartite
Idocrase	Hematite
Kornerupine	Idocrase
Kyanite	Vesuvianite
Lazurite	Californite
Lazulite	Kornerupine
Malachite	Kyanite
Marcasite	Lazurite
Obsidian (volcanic glass)	Lapis-lazuli
Olivine	Lapis
	Lazulite
	Malachite
	Marcasite
	Obsidian
	Peridot

Opal	Opal, Black Opal Boulder Opal Fire Opal Harlequin Opal Moss Opal, Prase Opal Opal Matrix Water Opal Wood Opal
Prehnite	Prehnite
Pyrites	Pyrites (Marcasite)
Pyrophyllite	Pyrophyllite
Pyroxene (group of)	
Diopside	Diopside
Jadeite	Enstatite-Hypersthene Jadeite, Jade
Spodumene	Chloromelanite Spodumene (all colours) Kunzite
Quartz	Hiddenite Agate (various colours) Fire Agate Onyx Sardonyx Amethyst Aventurine Quartz Aventurine Blue Quartz Chalcedony Chrysoprase Citrine, yellow quartz Cornelian Green Quartz, Prasiolite Heliotrope, Bloodstone, Jasper Multicoloured Jasper Orbicular Jasper Silex Morion, Cairngorm Moss-Agate Agate Dendritic Banded Agate Prase Quartz Cat's-eye Quartz Falcon's-eye Quartz Tiger's-eye Rock Crystal, Quartz Rose Quartz Smoky Quartz Violet Quartz

Rhodochrosite	Rhodochrosite
Scapolite	Scapolite
Serpentine	Bowenite Serpentine Verd Antique Williamsite
Sinhalite	Sinhalite
Sodalite	Sodalite
Smithsonite	Smithsonite, Bonamite
Sphalerite	Sphalerite Blende
Spinel	Spinel (all colours)
Sphene (Titanite)	Pleonaste Black Spinel
Topaz	Sphene
Tourmaline	Topaz (all colours) Tourmaline (all colours)
Tugtupite	Anchroite
Turquoise	Dravite Indigolite Rubellite Tourmaline Cat's-eye
Variscite	Tugtupite
Verdite	Turquoise Turquoise Matrix
Vesuvianite (see Idocrase)	Variscite Verdite
Zircon	Zircon (all colours)
Zoisite	Zoisite (all colours) Tanzanite Thulite

Section XV

BASE METALS AND ARTICLES OF BASE METAL

Notes.

1.- This Section does not cover :

- (a) Prepared paints, inks or other products with a basis of metallic flakes or powder (headings 32.07 to 32.10, 32.12, 32.13 or 32.15);
- (b) Ferro-cerium or other pyrophoric alloys (heading 36.06);
- (c) Headgear or parts thereof of heading 65.06 or 65.07;
- (d) Umbrella frames or other articles of heading 66.03;
- (e) Goods of Chapter 71 (for example, precious metal alloys, base metal clad with precious metal, imitation jewellery);
- (f) Articles of Section XVI (machinery, mechanical appliances and electrical goods);
- (g) Assembled railway or tramway track (heading 86.08) or other articles of Section XVII (vehicles, ships and boats, aircraft);
- (h) Instruments or apparatus of Section XVIII, including clock or watch springs;
- (ij) Lead shot prepared for ammunition (heading 93.06) or other articles of Section XIX (arms and ammunition);
- (k) Articles of Chapter 94 (for example, furniture, mattress supports, lamps and lighting fittings, illuminated signs, prefabricated buildings);
- (l) Articles of Chapter 95 (for example, toys, games, sports requisites);
- (m) Hand sieves, buttons, pens, pencil-holders, pen nibs, monopods, bipods, tripods and similar articles or other articles of Chapter 96 (miscellaneous manufactured articles); or
- (n) Articles of Chapter 97 (for example, works of art).

2.- Throughout the Nomenclature, the expression " parts of general use " means :

- (a) Articles of heading 73.07, 73.12, 73.15, 73.17 or 73.18 and similar articles of other base metals;
- (b) Springs and leaves for springs, of base metal, other than clock or watch springs (heading 91.14); and
- (c) Articles of headings 83.01, 83.02, 83.08, 83.10 and frames and mirrors, of base metal, of heading 83.06.

In Chapters 73 to 76 and 78 to 82 (but not in heading 73.15) references to parts of goods do not include references to parts of general use as defined above.

Subject to the preceding paragraph and to Note 1 to Chapter 83, the articles of Chapter 82 or 83 are excluded from Chapters 72 to 76 and 78 to 81.

- 3.- Throughout the Nomenclature, the expression "base metals" means : iron and steel, copper, nickel, aluminium, lead, zinc, tin, tungsten (wolfram), molybdenum, tantalum, magnesium, cobalt, bismuth, cadmium, titanium, zirconium, antimony, manganese, beryllium, chromium, germanium, vanadium, gallium, hafnium, indium, niobium (columbium), rhenium and thallium.
- 4.- Throughout the Nomenclature, the term "cermets" means products containing a microscopic heterogeneous combination of a metallic component and a ceramic component. The term "cermets" includes sintered metal carbides (metal carbides sintered with a metal).
- 5.- Classification of alloys (other than ferro-alloys and master alloys as defined in Chapters 72 and 74) :
- An alloy of base metals is to be classified as an alloy of the metal which predominates by weight over each of the other metals;
 - An alloy composed of base metals of this Section and of elements not falling within this Section is to be treated as an alloy of base metals of this Section if the total weight of such metals equals or exceeds the total weight of the other elements present;
 - In this Section the term "alloys" includes sintered mixtures of metal powders, heterogeneous intimate mixtures obtained by melting (other than cermets) and intermetallic compounds.
- 6.- Unless the context otherwise requires, any reference in the Nomenclature to a base metal includes a reference to alloys which, by virtue of Note 5 above, are to be classified as alloys of that metal.

7.- Classification of composite articles :

Except where the headings otherwise require, articles of base metal (including articles of mixed materials treated as articles of base metal under the Interpretative Rules) containing two or more base metals are to be treated as articles of the base metal predominating by weight over each of the other metals.

For this purpose :

- Iron and steel, or different kinds of iron or steel, are regarded as one and the same metal;
- An alloy is regarded as being entirely composed of that metal as an alloy of which, by virtue of Note 5, it is classified; and
- A cermet of heading 81.13 is regarded as a single base metal.

8.- In this Section, the following expressions have the meanings hereby assigned to them :

(a) Waste and scrap

Metal waste and scrap from the manufacture or mechanical working of metals, and metal goods definitely not usable as such because of breakage, cutting-up, wear or other reasons.

(b) Powders

Products of which 90 % or more by weight passes through a sieve having a mesh aperture of 1 mm.

GENERAL

This Section covers base metals (including those in a chemically pure state) and many articles thereof. A list of goods of base metal not covered by this Section is reproduced at the end of this Explanatory Note. The Section also includes native metals separated from their gangues, and the mattes of copper, nickel or cobalt. Metallic ores and native metals still enclosed in their gangues are **excluded (headings 26.01 to 26.17)**.

In accordance with Note 3 to this Section, throughout the Nomenclature, the expression "base metals" means : iron and steel, copper, nickel, aluminium, lead, zinc, tin, tungsten (wolfram), molybdenum, tantalum, magnesium, cobalt, bismuth, cadmium, titanium, zirconium, antimony, manganese, beryllium, chromium, germanium, vanadium, gallium, hafnium, indium, niobium (columbium), rhenium and thallium.

Each of the Chapters 72 to 76 and 78 to 81 covers particular unwrought base metals and products of those metals such as bars, rods, wire or sheets, as well as articles thereof, **except** certain specified articles of base metal which, without regard to the nature of the constituent metal, are classified in **Chapter 82 or 83**, these Chapters being **limited** to the specified articles.

(A) ALLOYS OF BASE METALS

In accordance with Note 6 to this Section, except where the context otherwise requires (e.g., in the case of steel alloys), any reference to a base metal in Chapters 72 to 76 and 78 to 81 or elsewhere in the Nomenclature also includes the alloys of that metal. Similarly, any reference in Chapter 82 or 83 or elsewhere to "base metal" includes alloys classified as alloys of base metals.

Under Note 5 to Chapter 71 and Note 5 to this Section alloys of base metals are classified as follows :

(1) Alloys of base metals with precious metals.

These alloys are classified as base metals **provided** that no one of the precious metals (silver, gold and platinum) constitutes as much as 2 % by weight of the alloy. Other alloys of base metals with precious metals are classified in **Chapter 71**.

(2) Alloys of base metals.

These alloys are classified with the metal which predominates by weight, with the **exception** of ferro-alloys (see the Explanatory Note to heading 72.02) and master alloys of copper (see the Explanatory Note to heading 74.05).

(3) Alloys of base metals of this Section with non-metals or with the metals of heading 28.05.

These are classified as alloys of base metals of this Section **provided** the total weight of the base metals of this Section equals or exceeds the total weight of the other elements present. If this is not the case, the alloys are generally classified in **heading 38.24**.

(4) **Sintered mixtures, heterogeneous intimate mixtures obtained by melting (other than cermets) and intermetallic compounds.**

Sintered mixtures of metal powders and heterogeneous intimate mixtures obtained by melting (**other than** cermets) are treated as alloys. The latter type of mixture includes in particular ingots of variable composition obtained by melting down scrap metal.

The classification of mixtures of metal powders which have not been sintered is, however, governed by Note 7 to this Section (composite articles - see Part (B) below).

Intermetallic compounds composed of two or more base metals are also treated as alloys. The essential difference between intermetallic compounds and alloys is that the arrangement of the atoms of different kinds in the crystal lattice of an intermetallic compound is orderly, whereas in an alloy it is disorderly.

(B) ARTICLES OF BASE METALS

In accordance with Section Note 7, base metal articles containing two or more base metals are classified as articles of that metal which **predominates by weight** over each of the other metals, **except** where the headings otherwise require (e.g., copper-headed iron or steel nails are classified in heading 74.15 even if the copper is not the major constituent). The same rule applies to articles made partly of non-metals, **provided** that, under the General Interpretative Rules, the base metal gives them their essential character.

In calculating the proportions of the metals present for the purposes of this rule, it should be noted that :

- (1) All varieties of iron and steel are regarded as the same metal.
- (2) An alloy is regarded as being entirely composed of that metal as an alloy of which it is classified (e.g., for these purposes, a part made of brass would be treated as if it were wholly of copper).
- (3) A cermet of heading 81.13 is regarded as a single base metal.

(C) PARTS OF ARTICLES

In general, identifiable parts of articles are classified as such parts in their appropriate headings in the Nomenclature.

However, parts of general use (as defined in Note 2 to this Section) presented separately are **not** considered as parts of articles, but are classified in the headings of this Section appropriate to them. This would apply, for example, in the case of bolts specialised for central heating radiators or springs specialised for motor cars. The bolts would be classified in heading 73.18 (as bolts) and not in heading 73.22 (as parts of central heating radiators). The springs would be classified in heading 73.20 (as springs) and not in heading 87.08 (as parts of motor vehicles).

*
* * *

It should be noted that watch or clock springs are **excluded** by Note 2 (b) to this Section and fall in **heading 91.14**.

In addition to the goods listed in Note 1 to this Section, the following are also **excluded** :

- (a) Amalgams of base metals (**heading 28.53**).
 - (b) Colloidal suspensions of base metals (generally heading **30.03** or **30.04**).
 - (c) Dental cements and other dental fillings (**heading 30.06**).
 - (d) Sensitised photographic plates of metal for, e.g., photo-engraving (**heading 37.01**).
 - (e) Flash-light materials for photographic uses of **heading 37.07**.
 - (f) Metallised yarn (**heading 56.05**); woven fabrics of such yarn or of metal thread, of a kind used in articles of apparel, as furnishing fabrics or the like (**heading 58.09**).
 - (g) Embroidery and other goods described in **Section XI**, of metal thread.
Parts of footwear, **other than** those mentioned in Note 2 to Chapter 64 (in particular, protectors, eyelets, hooks and buckles) (**heading 64.06**).
 - (ij) Coin (**heading 71.18**).
 - (k) Waste and scrap of primary cells, primary batteries and electric accumulators; spent primary cells, spent primary batteries and spent electric accumulators (**heading 85.48**).
 - (l) Wire brushes (**heading 96.03**).
-

Chapter 72

Iron and steel

Notes.

1.- In this Chapter and, in the case of Notes (d), (e) and (f) throughout the Nomenclature, the following expressions have the meanings hereby assigned to them :

(a) Pig iron

Iron-carbon alloys not usefully malleable, containing more than 2 % by weight of carbon and which may contain by weight one or more other elements within the following limits :

- not more than 10 % of chromium
- not more than 6 % of manganese
- not more than 3 % of phosphorus
- not more than 8 % of silicon
- a total of not more than 10 % of other elements.

(b) Spiegeleisen

Iron-carbon alloys containing by weight more than 6 % but not more than 30 % of manganese and otherwise conforming to the specification at (a) above.

(c) Ferro-alloys

Alloys in pigs, blocks, lumps or similar primary forms, in forms obtained by continuous casting and also in granular or powder forms, whether or not agglomerated, commonly used as an additive in the manufacture of other alloys or as de-oxidants, de-sulphurising agents or for similar uses in ferrous metallurgy and generally not usefully malleable, containing by weight 4 % or more of the element iron and one or more of the following :

- more than 10 % of chromium
- more than 30 % of manganese
- more than 3 % of phosphorus
- more than 8 % of silicon
- a total of more than 10 % of other elements, excluding carbon, subject to a maximum content of 10 % in the case of copper.

(d) Steel

Ferrous materials other than those of heading 72.03 which (with the exception of certain types produced in the form of castings) are usefully malleable and which contain by weight 2 % or less of carbon. However, chromium steels may contain higher proportions of carbon.

(e) Stainless steel

Alloy steels containing, by weight, 1.2 % or less of carbon and 10.5 % or more of chromium, with or without other elements.

(f) Other alloy steel

Steels not complying with the definition of stainless steel and containing by weight one or more of the following elements in the proportion shown :

- 0.3 % or more of aluminium
- 0.0008 % or more of boron
- 0.3 % or more of chromium
- 0.3 % or more of cobalt
- 0.4 % or more of copper
- 0.4 % or more of lead
- 1.65 % or more of manganese
- 0.08 % or more of molybdenum
- 0.3 % or more of nickel
- 0.06 % or more of niobium
- 0.6 % or more of silicon
- 0.05 % or more of titanium
- 0.3 % or more of tungsten (wolfram)
- 0.1 % or more of vanadium
- 0.05 % or more of zirconium
- 0.1 % or more of other elements (except sulphur, phosphorus, carbon and nitrogen), taken separately.

(g) Remelting scrap ingots of iron or steel

Products roughly cast in the form of ingots without feeder-heads or hot tops, or of pigs, having obvious surface faults and not complying with the chemical composition of pig iron, spiegeleisen or ferro-alloys.

(h) Granules

Products of which less than 90 % by weight passes through a sieve with a mesh aperture of 1 mm and of which 90 % or more by weight passes through a sieve with a mesh aperture of 5 mm.

(ij) Semi-finished products

Continuous cast products of solid section, whether or not subjected to primary hot-rolling; and Other products of solid section, which have not been further worked than subjected to primary hot-rolling or roughly shaped by forging, including blanks for angles, shapes or sections.

These products are not presented in coils.

(k) Flat-rolled products

Rolled products of solid rectangular (other than square) cross-section, which do not conform to the definition at (ij) above in the form of :

- coils of successively superimposed layers, or
- straight lengths, which if of a thickness less than 4.75 mm are of a width measuring at least ten times the thickness or if of a thickness of 4.75 mm or more are of a width which exceeds 150 mm and measures at least twice the thickness.

Flat-rolled products include those with patterns in relief derived directly from rolling (for example, grooves, ribs, chequers, tears, buttons, lozenges) and those which have been perforated, corrugated or polished, provided that they do not thereby assume the character of articles or products of other headings.

Flat-rolled products of a shape other than rectangular or square, of any size, are to be classified as products of a width of 600 mm or more, provided that they do not assume the character of articles or products of other headings.

(l) Bars and rods, hot-rolled, in irregularly wound coils

Hot-rolled products in irregularly wound coils, which have a solid cross-section in the shape of circles, segments of circles, ovals, rectangles (including squares), triangles or other convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). These products may have indentations, ribs, grooves or other deformations produced during the rolling process (reinforcing bars and rods).

(m) Other bars and rods

Products which do not conform to any of the definitions at (ij), (k) or (l) above or to the definition of wire, which have a uniform solid cross-section along their whole length in the shape of circles, segments of circles, ovals, rectangles (including squares), triangles or other convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). These products may :

- have indentations, ribs, grooves or other deformations produced during the rolling process (reinforcing bars and rods);
- be twisted after rolling.

(n) Angles, shapes and sections

Products having a uniform solid cross-section along their whole length which do not conform to any of the definitions at (ij), (k), (l) or (m) above or to the definition of wire.

Chapter 72 does not include products of heading 73.01 or 73.02.

(o) Wire

Cold-formed products in coils, of any uniform solid cross-section along their whole length, which do not conform to the definition of flat-rolled products.

(p) Hollow drill bars and rods

Hollow bars and rods of any cross-section, suitable for drills, of which the greatest external dimension of the cross-section exceeds 15 mm but does not exceed 52 mm, and of which the greatest internal dimension does not exceed one half of the greatest external dimension. Hollow bars and rods of iron or steel not conforming to this definition are to be classified in heading 73.04.

- 2.- Ferrous metals clad with another ferrous metal are to be classified as products of the ferrous metal predominating by weight.
- 3.- Iron or steel products obtained by electrolytic deposition, by pressure casting or by sintering are to be classified, according to their form, their composition and their appearance, in the headings of this Chapter appropriate to similar hot-rolled products.

◦
◦ ◦

Subheading Notes.

- 1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Alloy pig iron

Pig iron containing, by weight, one or more of the following elements in the specified proportions :

- more than 0.2 % of chromium
- more than 0.3 % of copper
- more than 0.3 % of nickel
- more than 0.1 % of any of the following elements : aluminium, molybdenum, titanium, tungsten (wolfram), vanadium.

(b) Non-alloy free-cutting steel

Non-alloy steel containing, by weight, one or more of the following elements in the specified proportions :

- 0.08 % or more of sulphur
- 0.1 % or more of lead
- more than 0.05 % of selenium
- more than 0.01 % of tellurium
- more than 0.05 % of bismuth.

(c) Silicon-electrical steel

Alloy steels containing by weight at least 0.6 % but not more than 6 % of silicon and not more than 0.08 % of carbon. They may also contain by weight not more than 1 % of aluminium but no other element in a proportion that would give the steel the characteristics of another alloy steel.

(d) High speed steel

Alloy steels containing, with or without other elements, at least two of the three elements molybdenum, tungsten and vanadium with a combined content by weight of 7 % or more, 0.6 % or more of carbon and 3 to 6 % of chromium.

(e) Silico-manganese steel

Alloy steels containing by weight :

- not more than 0.7 % of carbon,

- 0.5 % or more but not more than 1.9 % of manganese, and
- 0.6 % or more but not more than 2.3 % of silicon, but no other element in a proportion that would give the steel the characteristics of another alloy steel.

2.- For the classification of ferro-alloys in the subheadings of heading 72.02 the following rule should be observed :

A ferro-alloy is considered as binary and classified under the relevant subheading (if it exists) if only one of the alloy elements exceeds the minimum percentage laid down in Chapter Note 1 (c); by analogy, it is considered respectively as ternary or quaternary if two or three alloy elements exceed the minimum percentage.

For the application of this rule the unspecified "other elements" referred to in Chapter Note 1 (c) must each exceed 10 % by weight.

GENERAL

This Chapter covers the ferrous metals, i.e., pig iron, spiegeleisen, ferro-alloys and other primary materials (sub-Chapter I), as well as certain products of the iron and steel industry (ingots and other primary forms, semi-finished products and the principal products derived directly therefrom) of iron or non-alloy steel (sub-Chapter II), of stainless steel (sub-Chapter III) and of other alloy steel (sub-Chapter IV).

Further worked articles, such as castings, forgings, etc., and sheet piling, welded angles, shapes and sections, railway or tramway track construction material and tubes are classified in **Chapter 73** or, in certain cases, in other Chapters.

As raw material, the iron and steel industry uses various natural iron ores (oxides, hydrated oxides, carbonates) listed in the Explanatory Note to heading 26.01, pyrites cinder (the sintered iron oxides remaining after burning off the sulphur from pyrite, marcasite, pyrrhotite, etc.) and waste and scrap of iron or steel.

(I) Conversion (reduction) of iron ore

Iron ore is converted by reduction either into pig iron, in blast furnaces or electric furnaces, or into a spongy form (sponge iron) or into lumps by various direct reduction processes; only when iron of exceptional purity is required for special use (e.g., in the chemical industry) is it obtained by electrolysis or other chemical processes.

(A) Conversion of iron ore by blast furnace process

Most iron obtained from iron ore is still extracted by the blast furnace process. This process uses mainly ore as raw material, but waste and scrap metal, pre-reduced iron ores and other ferrous waste can also be used.

Blast furnace reductants consist essentially of hard coke, sometimes combined with small quantities of coal or liquid or gaseous hydrocarbons.

The iron so obtained is in the form of molten pig iron. The by-products are slag, blast furnace gas and blast furnace dust.

Most of the molten pig iron thus produced is converted directly into steel in steelworks.

Some may be used in foundries (ironworks), for the manufacture of ingot moulds, cast iron tubes and pipes, etc.

The remainder may be cast into the form of pigs or blocks, in casting machines or in sand-beds; or it may be produced in the form of irregularly shaped lumps, sometimes known as " plate iron ", or be granulated by being poured into water.

Solid pig iron is either remelted in steelworks with ferrous scrap, to produce steel, or melted in iron foundries, in cupolas or electric furnaces, again with ferrous scrap, and converted into castings.

(B) Conversion of iron ore in direct reduction plants

In contrast to the process described above, here the reductants are usually gaseous or liquid hydrocarbons or coal, so that the need for hard coke is eliminated.

In these processes, the reduction temperature is lower so that the resulting products (generally known as sponge iron) are obtained, without passing through the molten state, in the form of sponge, pre-reduced pellets or lumps. For this reason, their carbon content is usually lower than that of blast furnace pig iron (where molten metal is in close contact with the carbon). Most of these crude products are melted in steelworks and converted into steel.

(II) Steel production

Pig or cast iron in molten or solid form and the ferrous products obtained by direct reduction (sponge iron) constitute, with waste and scrap, the primary steelmaking materials. To these materials are added certain slag-forming additives such as quick-lime, fluorspar, de-oxidants (e.g., ferro-manganese, ferro-silicon, aluminium) and various alloying elements.

Steelmaking processes fall into two main categories viz : " pneumatic " processes in which molten pig iron is refined in a converter or by blowing air, and hearth processes, such as open hearth or electric furnace.

The pneumatic processes require no external source of heat. They are used when the charge consists mainly of molten pig iron. The oxidation of certain elements present in the pig iron (e.g., carbon, phosphorus, silicon and manganese) generates enough heat to keep the steel liquid and even to remelt any added scrap. These processes include those in which pure oxygen is blown into the molten metal (Linz-Donawitz processes : LD or LDAC, OBM, OLP, Kaldo and others) and those, now becoming obsolete, in which air, sometimes oxygen-enriched, is used (Thomas and Bessemer processes).

Open-hearth refining processes, however, require an external source of heat. They are used when a solid charge (e.g., waste or scrap iron, sponge iron and solid pig iron) forms the raw material.

The two main processes in this category are the Martin furnace process in which the heat is provided by heavy oil or gas, and the arc or induction furnace process, where the heat is supplied by electricity.

For the production of certain steels two different processes may be applied successively (duplex process). For example, refining may begin in a Martin furnace and end in an electric furnace; or steel melted in an electric furnace may be transferred to a special converter where decarburisation is completed by blowing oxygen and argon on to the charge (a process used, for example, in the production of stainless steel).

Many new processes have been evolved for producing steels of special composition or with special properties. These processes include electric arc melting in a vacuum, melting by electronic bombardment and the electroslag process. In all these processes the steel is produced from a self-consuming electrode which, on melting, drips into a water-cooled ingot mould. The mould may be made in one piece, or the bottom may be removable so that the solidified casting can be withdrawn from below.

Liquid steel obtained by the above-mentioned processes, with or without further refining, is generally run into a receiving ladle. At this stage alloying elements or de-oxidising agents, in solid or liquid form, may be added. This may be done in a vacuum to ensure freedom from gaseous impurities.

Steels obtained by all these processes are divided, according to their content of alloying elements, into "non-alloy steels" and "alloy steels" (stainless or other). They are further divided in accordance with their special properties into free-cutting steel, silicon-electrical steel, high speed steel or silico-manganese steel, for example.

(III) Production of ingots or other primary forms and of semi-finished products

Although molten steel may be cast (in foundries) into its final shape in moulds (steel castings), most molten steel is cast into ingots in ingot moulds.

At the casting or pouring stage and at the solidification stage, steel is divided into three main groups : rimming (or "effervescent") steel, killed (or "non-effervescent") steel and semi-killed (or "balanced") steel. Steel cast or poured in the rimming state is so named because during and after the pouring process there is a reaction between the iron oxide and carbon dissolved in the steel rendering it "effervescent". During the cooling stage, the impurities concentrate in the central core and upper half of the ingots. The outer layer, which is not affected by these impurities, will subsequently give a better surface appearance to the rolled products obtained from these ingots. This more economical kind of steel is also used for cold dishing.

In many cases, steel cannot be satisfactorily cast in the "effervescent" state. This applies, in particular, to alloy steels and high carbon steels. In these cases, the steel must be killed, i.e., de-oxidised. De-oxidation may be partially carried out by treatment in a vacuum, but is more usually achieved by the addition of elements such as silicon, aluminium, calcium or manganese. In this way, the residual impurities are more evenly distributed throughout the ingot, giving a better assurance, for certain uses, that the properties of the steel will be the same throughout its mass.

Some steels may be partly de-oxidised and are then known as semi-killed (or balanced) steels.

After they have solidified and their temperature has been equalised, the ingots are rolled into semi-finished products (blooms, billets, rounds, slabs, sheet bars) on primary cogging or roughing mills (blooming, slabbing, etc.) or converted by drop hammer or on a forging press into semi-finished forgings.

An increasing amount of steel is being cast directly into the form of semi-finished products in **continuous casting** machines. Their cross-sectional shape may, in certain cases, approach that of finished products. Semi-finished products obtained by the continuous casting process are characterised by their external surface appearance which usually shows transverse rings of different colours at more or less regular distances, as well as by the appearance of their cut cross-section which usually shows radial crystallisation resulting from rapid cooling. Continuously cast steel is always killed.

(IV) Production of finished products

Semi-finished products and, in certain cases, ingots are subsequently converted into finished products.

These are generally subdivided into **flat products** ("wide flats", including "universal plates", "wide coil", sheets, plates and strip) and **long products** (bars and rods, hot-rolled, in irregularly wound coils, other bars and rods, angles, shapes, sections and wire).

These products are obtained by plastic deformation, either hot, directly from ingots or semi-finished products (by hot-rolling, forging or hot-drawing) or cold, indirectly from hot finished products (by cold-rolling, extrusion, wire-drawing, bright-drawing), followed in some cases by finishing operations (e.g., cold-finished bars obtained by centre-less grinding or by precision turning).

According to Note 3 to this Chapter, iron and steel products obtained by electrolytic deposition, by casting under pressure or by sintering are to be classified, according to their form, their composition and their appearance, in the headings of this Chapter appropriate to similar hot-rolled products.

For the purpose of this Note, the following expressions have the meanings hereby assigned to them :

(1) Casting under pressure (die casting)

This process consists of injecting an alloy in molten or pasty form into a mould under a more or less high pressure.

Such a process facilitates production in large quantities and ensures dimensional precision.

(2) Sintering

This is an operation of powder metallurgy by means of which a compacted powder product, obtained by moulding, usually coupled with pressing, is subsequently heated in a special furnace.

This operation, which gives the final properties to the sintered materials, is carried out under specified conditions of temperature, timing and atmosphere. It produces an agglomeration in solid form. Sintering may also be carried out in a vacuum.

(A) Hot plastic deformation

(1) Hot-rolling

means rolling at a temperature between the point of rapid recrystallisation and that of the beginning of fusion. The temperature range depends on various factors such as the composition of the steel. As a rule, the final temperature of the work-piece in hot-rolling is about 900°C.

- (2) **Forging** means the hot deformation of the metal in the mass by means of drop hammers or on forging presses, to obtain pieces of any shape.
- (3) In **hot-drawing**, the steel is heated and passed through a die to produce bars, tubes or sections of various shapes.
- (4) **Hot drop forging and drop stamping** means producing metal shapes or sections (usually on the conveyor line) by the hot shaping of cut blanks in dies (closed or with burr joints) by means of special tools. The work, carried out by impact or pressure, is generally effected in successive phases, following preliminary operations of rolling, hammering, hand forging or bending.

(B) Cold plastic deformation

- (1) **Cold-rolling** is carried out at ambient temperatures, i.e., below the recrystallisation temperature.
- (2) **Cold drop forging and drop stamping** means producing shapes or sections by cold processes similar to those described in Item A (4) above.
- (3) **Extrusion** is a process, generally cold, for deforming steel in the mass under high pressure between a die and a press tool, in a space enclosed on all sides except that through which the charge passes, to assume the desired shape.
- (4) **Wire-drawing** is a cold process in which bars or rods in irregularly wound coils are drawn through one or more dies at high speed to obtain coiled wire of smaller diameter.
- (5) **Bright-drawing** is a cold process in which bars or rods, whether or not in irregularly wound coils, are drawn (at relatively low speed) through one or more dies to obtain products of smaller or different shaped section.

Cold-worked products can be distinguished from hot-rolled or hot-drawn products by the following criteria :

- the surface of cold-worked products has a better appearance than that of products obtained by a hot process and never has a layer of scale;
- the dimensional tolerances are smaller for cold-worked products;
- thin-flat products (thin “ wide coil ”, sheets, plates and strip) are usually produced by cold-reduction;
- microscopic examination of cold-worked products reveals a marked deformation of the grains and grain orientation parallel to the direction of working. By contrast, products obtained by hot processes show almost regular grains owing to recrystallisation;

In addition, cold-worked products have the following properties which may be shared by certain hot-rolled or hot-drawn products :

- (a) because of the strain or work hardening they have undergone, cold-worked products are very hard and possess great tensile strength, though these properties may diminish appreciably with heat treatment;

- (b) elongation at fracture is very low in cold-worked products; it is higher in products that have undergone suitable heat treatment.

The very light cold-rolling process (known as a skin pass or pinch pass) which is applied to certain hot-rolled flat products without significant reduction of their thickness does not change their character of finished hot-rolled products. This cold pass under low pressure acts essentially on the surface of the products only, whereas cold-rolling in the true sense (also known as cold-reduction) changes the crystalline structure of the work piece by considerably reducing its cross-section.

(C) Subsequent manufacture and finishing

The finished products may be subjected to further finishing treatments or converted into other articles by a series of operations such as :

- (1) **Mechanical working**, i.e., turning, milling, grinding, perforation or punching, folding, sizing, peeling, etc.; however, it should be noted that rough turning merely to eliminate the oxidation scale and crust and rough trimming are not regarded as finishing operations leading to a change in classification.
- (2) **Surface treatments** or other operations, including cladding, to improve the properties or appearance of the metal, protect it against rusting and corrosion, etc. Except as otherwise provided in the text of certain headings, such treatments do not affect the heading in which the goods are classified. They include :
 - (a) Annealing, hardening, tempering, case-hardening, nitriding and similar heat treatments to improve the properties of the metal.
 - (b) Descaling, pickling, scraping and other processes to remove the oxide scale and crust formed during the heating of the metal.
 - (c) Rough coating intended solely to protect products from rust or other oxidation, to prevent slipping during transport and to facilitate handling e.g., paints containing an active anti-rust pigment (red lead, zinc powder, zinc oxide, zinc chromate, iron oxide, iron minium, jewellers' rouge), and non-pigmented coatings with a basis of oil, grease, wax, paraffin wax, graphite, tar or bitumen.
 - (d) Surface finishing treatment, including:
 - (i) polishing and burnishing or similar treatment;
 - (ii) artificial oxidation (by various chemical processes, such as immersion in an oxidising solution), patina finishing, blueing (blue annealing) browning or bronzing (by various techniques), which also form a film of oxide on the surface of the product, to improve its appearance. The operations increase resistance to rusting;

(iii) chemical surface treatments, such as :

- phosphatising, which consists of immersing the product in a solution of metallic acid phosphates, particularly those of manganese, iron and zinc; this process is known as parkerising or bonderising, depending on the period of the operation and the temperature of the bath;
- oxalating, borating, etc., using methods similar to those for phosphatising, with the appropriate salts or acids;
- chromating, which consists of immersing the product in a solution whose main contents are chronic acid or chromates; this process is for the surface treatment of e.g., steel plate plated or coated with zinc.

These chemical surface treatments have the advantage of protecting the surface of metal, facilitating any later cold deformation of the products treated and the application of paints or other non-metallic protective coatings.

(iv) coating with metal (metallisation) the main processes being :

- immersion in a bath of molten metal or metal alloy e.g., hot-dip galvanising, tinning, hot-coating with lead, and aluminium coating;
 - electroplating (cathodic deposition of a coating metal on the product to be coated, by electrolysis of a suitable solution of metallic salts), e.g., with zinc, cadmium, tin, lead, chromium, chromium/chromate, copper, nickel, gold or silver;
 - impregnation or diffusion (by heating the product to be coated with the required coating metal in powder form e.g., sherardising (cementation with zinc) and calorising (cementation with aluminium) and chromising (with diffusion of chromium);
 - spraying (atomising the molten coating metal and directing the spray on to the product to be coated), e.g., the Schoop process and the gas pistol, arc, plasma and electrostatic spray processes;
 - metallisation by evaporating the coating metal in a vacuum. etc.;
 - metallisation by bombarding the coating metal with ions in a glow discharge (ion plating);
 - coating by cathode vaporisation (sputtering).
- (v) coating with non-metallic substances, e.g., enamelling, varnishing, lacquering, painting, surface printing, coating with ceramics or plastics, including special processes such as glow discharge, electrophoresis, electrostatic projection and immersion in an electrostatic fluidised bath followed by radiation firing, etc.

- (e) Cladding, i.e., the association of layers of metals of different colours or natures by molecular interpenetration of the surfaces in contact. This limited diffusion is characteristic of clad products and differentiates them from products metallised in the manner specified in the preceding paragraphs (e.g., by normal electroplating).

The various cladding processes include pouring molten cladding metal on to the basic metal, followed by rolling; simple hot-rolling of the cladding metal to ensure efficient welding to the basic metal; any other method of deposition or superimposing of the cladding metal followed by any mechanical or thermal process to ensure welding (e.g., electro-cladding), in which the cladding metal (nickel, chromium, etc.) is applied to the basic metal by electroplating, molecular interpenetration of the surfaces in contact then being obtained by heat treatment at the appropriate temperature with subsequent cold-rolling.

Ferrous products clad with non-ferrous metals remain in their respective headings in Chapter 72 **provided** that iron or steel is the predominating metal by weight (see Note 7 to Section XV). Iron or steel products, clad with another ferrous metal, which, according to the composition of the original products, or of the cladding metal, could be classified in two sub-Chapters (II, III or IV) have similarly to be classified according to the metal predominating by weight (see Note 2 to this Chapter); e.g., a bar of non-alloy ordinary steel clad with stainless steel is therefore classified in sub-Chapter II if the former metal predominates by weight, or in sub-Chapter III if not.

- (f) Removal of small portions of the metal for testing purposes.
(g) Lamination, for example, the superimposing of metal layers over an intermediate layer of viscoelastic material, the latter layer serving as a sound, etc., insulator.

*
* * *

The classification of alloys of ferrous metals and of composite articles is dealt with in the General Explanatory Note to Section XV.

Sub-Chapter I

PRIMARY MATERIALS; PRODUCTS IN GRANULAR OR POWDER FORM

GENERAL

The sub-Chapter covers :

- (1) The primary materials of iron and steel metallurgy (pig iron, spiegeleisen, ferro-alloys, ferrous products obtained by direct reduction of iron ore and other spongy ferrous products, waste and scrap and remelting scrap ingots) and iron having a minimum purity by weight of 99.94 % (headings 72.01 to 72.04).
- (2) Granules and powders, of pig iron, spiegeleisen, iron or steel (heading 72.05).

72.01 - Pig iron and, Spiegeleisen in pigs, blocks or other primary forms.

7201.10 - Non-alloy pig iron containing by weight 0.5 % or less of phosphorus

7201.20 - Non-alloy pig iron containing by weight more than 0.5 % of phosphorus

7201.50 - Alloy pig iron; spiegeleisen

(A) PIG IRON

Pig iron is defined by Note 1 (a) to this Chapter. However, chromium steels containing more than 2 % of carbon are by application of Note 1 (d) to this Chapter to be classified with the other alloyed steels in sub-Chapter IV.

Pig iron is the main primary product of the iron and steel industry, being produced principally by reducing and smelting iron ore in blast furnaces or by smelting ferrous waste and scrap in electric furnaces or cupola furnaces. It is an iron-carbon alloy also containing other elements such as silicon, manganese, sulphur and phosphorus, derived from the ore, scrap, flux or fuel, and sometimes also other elements such as chromium and nickel, added to impart special properties.

The heading covers both crude pig iron and pig iron which has been remelted for convenience and to obtain a certain degree of refining, blending or alloying, **provided** the composition of the metal remains within the limits specified in the definition under Note 1 (a). Pig iron may be in the form of pigs, blocks, lumps, whether or not broken, or in the molten state, but the heading does not extend to shaped or worked articles (e.g., rough or finished castings or tubes).

Pig iron is characteristically brittle and unworkable; this can be remedied to some extent by annealing which gives the product superficially some of the properties of steel, the product being known as "malleable cast iron" (whiteheart or blackheart). In practice, the treatment is applied generally to cast articles, which are classified elsewhere, but any such material in the primary forms of pigs, blocks, etc., would fall in this heading **provided** the carbon content exceeds 2 % by weight.

Alloy pig iron is pig iron containing, by weight, one or more of the elements mentioned in Subheading Note 1 (a) in the proportions specified in that Note.

(B) SPIEGELEISEN

Spiegeleisen is defined in Note 1 (b) to this Chapter. It is sometimes considered in the trade as a ferro-alloy but is classified in the same heading as pig iron since it is generally obtained directly from ores.

It is used principally in steel manufacture to de-oxidise and recarburise the iron, and for alloying. It shows a glittering surface on fracture because of the high manganese content, and is presented in the same forms as pig iron.

72.02 - Ferro-alloys.

- Ferro-manganese :

7202.11 -- Containing by weight more than 2 % of carbon

7202.19 -- Other

- Ferro-silicon :

7202.21 -- Containing by weight more than 55 % of silicon

7202.29 -- Other

7202.30 - Ferro-silico-manganese

- Ferro-chromium :

7202.41 -- Containing by weight more than 4 % of carbon

7202.49 -- Other

7202.50 - Ferro-silico-chromium

7202.60 - Ferro-nickel

7202.70 - Ferro-molybdenum

7202.80 - Ferro-tungsten and ferro-silico-tungsten

- Other :

7202.91 -- Ferro-titanium and ferro-silico-titanium

7202.92 -- Ferro-vanadium

7202.93 -- Ferro-niobium

7202.99 -- Other

Ferro-alloys are defined in Note 1(c) to this Chapter.

Ferro-alloys differ from pig iron in that they contain a smaller proportion of iron which merely acts as a "solvent" for large proportions of alloy elements (e.g., manganese, chromium, tungsten (wolfram), silicon, boron or nickel) and in that they may contain 2 % or less of carbon.

Ferro-alloys are not normally used for rolling, forging or other working, at least not for industrial purposes, even though some are malleable. They are used in the iron or steel industry mainly to add definite proportions of alloying elements to steel or pig iron in order to obtain special qualities, generally in those cases where the use of the pure elements themselves would be impracticable or uneconomic. Some are also used as de-oxidants, de-sulphurisers or de-nitrating agents or for killing steel, while others are used in welding or for metal deposition.

Certain ferro-alloys can be used directly for casting. To fall in the heading, ferro-alloys must be in the form of pigs, blocks, lumps or similar primary forms, in granules or powder forms or in forms obtained by continuous casting (e.g., billets).

Ferro-silicon is also used, in the form of spherical granule powders the surface of which has been hardened by a special process, as a dense medium (" pulp ") in gravimetric separation (selective flotation) of metal ores; however, it remains in this heading.

The heading also covers products of this type previously reduced to granules or powder and agglomerated into briquettes, cylinders, thin slabs, etc., by means of cement or other binders and, in certain cases, with exothermic additives.

Though some ferro-alloys (e.g., ferro-manganese or ferro-silicon) can be produced in blast furnaces, they are more usually prepared in electric furnaces, or in crucibles by the " thermit " process, etc.

The principal varieties are :

- (1) Ferro-manganese
- (2) Ferro-silicon
- (3) Ferro-silico-manganese
- (4) Ferro-chromium
- (5) Ferro-silico-chromium
- (6) Ferro-nickel
- (7) Ferro-molybdenum
- (8) Ferro-tungsten (ferro-wolfram) and ferro-silico-tungsten
- (9) Ferro-titanium and ferro-silico-titanium
- (10) Ferro-vanadium
- (11) Ferro-niobium
- (12) Ferro-silico-magnesium and ferro-silico-calcium.

The heading **excludes** :

- (a) Chemical products used for the same purposes and in the same way as ferro-alloys, such as molybdenum oxide, calcium molybdate and silicon carbide, and also, if they contain less than 4 % by weight of iron, calcium silicide and manganese silicide (**Chapter 28**).
- (b) Ferro-uranium (**heading 28.44**).
- (c) Ferro-cerium and other pyrophoric ferrous alloys in all forms (**heading 36.06**).
- (d) Products which in some countries are sometimes known as ferro-nickels or ferro-nickel-chromes, and which are malleable and are not normally used as "addition materials" in iron and steel metallurgy (**headings 72.18 to 72.29 or Chapter 75**).

72.03 - Ferrous products obtained by direct reduction of iron ore and other spongy ferrous products, in lumps, pellets or similar forms; iron having a minimum purity by weight of 99.94 %, in lumps, pellets or similar forms.

7203.10 - Ferrous products obtained by direct reduction of iron ore

7203.90 - Other

This heading covers ferrous products produced by reducing the ore without fusion (see the General Explanatory Notes to this Chapter, Part (I) - (B)). These products are obtained from ore in lumps or in granules or from concentrated ore in the form of briquettes or pellets. They usually contain more than 80 % by weight of metallic iron and have a spongy structure (sponge iron). They are used in the manufacture of steel. The products of this heading, in the form of briquettes or pellets, should not be confused with those consisting of concentrated ores of heading 26.01; the former differ from the latter, notably, by the shiny appearance of their cut surface.

Ferrous products obtained by direct reduction are easily differentiated from other spongy ferrous products (obtained from molten pig iron by the atomisation technique) by the fact that the former has a rough and porous surface, whereas the latter has a rounded surface showing clearly that it has gone through the molten state.

The heading also covers very pure iron (i.e., iron having an impurity content not exceeding 0.06 %). This iron, used in research laboratories and by certain branches of the iron-working industry (e.g., in powder metallurgy), is a good diluent for metals.

The heading also **excludes** steel wool, etc., sometimes known as " steel sponge " (**heading 73.23**).

72.04 - Ferrous waste an scrap; remelting scrap ingots of iron or steel.

7204.10 - Waste and scrap of cast iron

- Waste and scrap of alloy steel :

7204.21 -- Of stainless steel

7204.29 -- Other

7204.30 - Waste and scrap of tinned iron or steel

- Other waste and scrap :

7204.41 -- Turnings, shavings, chips, milling waste, sawdust, filings, trimmings qand stampings, whether or not in bundles

7204.49 -- Other

7204.50 - Remelting scrap ingots

(A) WASTE AND SCRAP

The heading covers waste and scrap of iron or steel, as defined in Note 8 (a) to Section XV.

Such waste and scrap of iron or steel is of a miscellaneous nature and generally takes the form of :

- (1) Waste and scrap from the manufacture or mechanical working of iron or steel (e.g., crop ends, filings and turnings).
- (2) Articles of iron or steel, definitively not usable as such because of breakage, cutting-up, wear or other reasons; iron or steel waste and scrap is usually prepared by means of the following processes, in order to adapt it to the dimensions and qualities required by the users :
 - (a) Shearing or flame-cutting of heavy and long pieces.
 - (b) Compression into bales, particularly in the case of light scrap, using for example a hydraulic press.

- (c) Fragmentation (shredding) of motor vehicle bodies and other light scrap, followed by separation (which may be magnetic) with a view to obtaining a high density product that is fairly clean.
- (d) Crushing and agglomeration into briquettes of iron and steel filings and turnings.
- (e) Breaking up of old iron articles.

Waste and scrap is generally used for the recovery of metal by remelting or for the manufacture of chemicals.

But the heading **excludes** articles which, with or without repair or renovation, can be re-used for their former purposes or can be adapted for other uses; it also **excludes** articles which can be refashioned into other goods without first being recovered as metal. Thus, it **excludes**, for example, structural steelwork usable after renewal of worn-out parts; worn railway lines which are usable as pitprops or may be converted into other articles by re-rolling; steel files capable of re-use after cleaning and sharpening.

The heading also **excludes** :

- (a) Slag, dross, scalings or other waste from the manufacture of iron or steel, even if suitable for the recovery of the metal (**heading 26.19**).
- (b) Waste and scrap not usable directly in the iron or steel industry, since it is radio-active (**heading 28.44**).
- (c) Broken pieces of pig iron or spiegeleisen (**heading 72.01**).

(B) REMELTING SCRAP INGOTS

These products are defined in Note 1 (g) to this Chapter. They consist of ingots or pigs normally of high alloy steel, obtained by remelting and casting of fine shaped waste or scrap (e.g., grinding dust or fine turning chips). They are not rolled and are used as addition products in steel manufacture. They have a rough and uneven surface, with bubbles, crevices, splits and shrinkage holes, caused by the fact that casting was done in used chill moulds. The casting in ingot form is done without a funnel. Consequently, they show no sign of feeder heads or hot tops (deadheads), but have an irregular surface, sometimes in the shape of a trough at the upper end. This surface often has splits in the shape of craters in which proportions of porous dross can be observed.

72.05 - Granules and powders, of pig iron, spiegeleisen, iron or steel.

7205.10 - Granules

- Powders :

7205.21 -- Of alloy steel

7205.29 -- Other

(A) GRANULES

Granules are defined in Note 1 (h) to this Chapter.

This heading covers granules, i.e., shot, more or less round in shape, and angular " grits ".

Shot is produced by pouring liquid iron or steel into cold water or into a jet of steam; the grits are obtained by the crushing of shot, or by cold crushing sheets, etc., of hardened metal.

These goods remain in this heading whether or not they have been graded by size.

Shot and grit are used for cleaning up and descaling or surface hardening (shot peening) metal, for polishing or engraving on metal or glass, for working stone, etc. They are also sometimes added to concrete as a hardener or to increase its impermeability to X-rays or gamma rays.

This heading also covers **wire pellets** produced by cutting iron or steel wire, and used for the purposes mentioned above.

(B) POWDERS

Powders are defined in Note 8 (b) to Section XV.

Powders of pig iron, spiegeleisen, iron or steel are materials suitable for compacting or agglomeration and are produced by atomisation of molten iron or steel, by the reduction of iron oxides (dry process), by crushing pig iron, sponge iron or steel wire, by precipitation (wet process), by decomposition of ferro-carbonyl, by the electrolysis of aqueous solutions of iron salts or by pulverising iron or steel (including pulverised filings).

These powders (including sponge iron powder) can be sintered into various articles, including cores for electromagnetic coils in telephony, in magnetos, etc. They are also used in the manufacture of welding electrodes and welding powders, in the chemical industry (especially as reducing agents), and sometimes in the preparation of pharmaceutical products (powder obtained by pulverising iron filings).

*
* * *

The heading **does not cover** :

- (a) Radioactive iron powders (isotopes) (**heading 28.44**).
- (b) Iron powders put up as medicaments in the sense of **heading 30.03** or **30.04**.
- (c) Granules and powders of ferro-alloys (**heading 72.02**).

- (d) Waste filings and turnings of iron or steel (**heading 72.04**).
 - (e) Small defective bearing balls which, though often used for the same purposes as shot, are classified in **heading 73.26** in accordance with Note 6 to Chapter 84. Such bearing balls differ from shot because they have a more regular and finished appearance and are made of better quality steel.
-

Sub-chapter II
IRON AND NON-ALLOY STEEL

GENERAL

Provided that they are of iron or non-alloy steel this sub-Chapter covers :

- (1) Ingots or other primary forms such as puddled bars, pilings, blocks, lumps, including steel in the molten state (heading 72.06).
- (2) Semi-finished products such as blooms, billets, rounds, slabs, sheet bars, pieces roughly shaped by forging, blanks for angles, shapes and sections (heading 72.07).
- (3) Flat-rolled products (headings 72.08 to 72.12).
- (4) Bars and rods, hot-rolled, in irregularly wound coils (heading 72.13) and other bars and rods (heading 72.14 or 72.15).
- (5) Angles, shapes and sections (heading 72.16).
- (6) Wire (heading 72.17).

72.06 - Iron and non-alloy steel in ingots or other primary forms (excluding iron of heading 72.03).

7206.10 - Ingots

7206.90 - Other

(I) INGOTS

Ingots are the primary form into which ferrous metal is cast after production by one of the processes described in the General Explanatory Note to this Chapter. They are usually square, rectangular or octagonal in cross-section, and one end is thicker than the other to facilitate removal from the moulds. They have a regular and uniform surface and are essentially free from faults.

Ingots are subsequently rolled or forged generally into semi-finished products but sometimes directly into bars, sheets or other finished products.

(II) OTHER PRIMARY FORMS

In addition to steel in the molten state, the heading also covers blocks, lumps, puddled bars and pilings.

Blocks and lumps are chiefly obtained from "agglomerates" or "build-ups" produced by direct reduction of iron ore or by electrolytic deposition. When the major part of the slag is removed from the lumps or balls, in the pasty state, using a press or by "shingling" or hammering them, **puddled bars and pilings** are obtained which after rolling, provide a product with a characteristic fibrous structure by virtue of its slag content. These products are useful for special applications, e.g., anchor chains and hoisting hooks.

The heading **does not cover** :

- (a) Remelting scrap ingots (**heading 72.04**).
- (b) Products obtained by continuous casting (**heading 72.07**).

72.07 - Semi-finished products of iron or non-alloy steel.

- Containing by weight less than 0.25 % of carbon :

7207.11 -- Of rectangular (including square) cross-section, the width measuring less than twice the thickness

7207.12 -- Other, of rectangular (other than square) cross-section

7207.19 -- Other

7207.20 - Containing by weight 0.25 % or more of carbon

Semi-finished products are defined in Note 1 (ij) to this Chapter. For the purpose of this Note, the expression "subjected to primary hot-rolling" applies to products which have been subjected to a rolling operation which has given them a rough appearance.

The heading covers blooms, billets, rounds, slabs, sheet bars, pieces roughly shaped by forging, blanks for angles, shapes or sections, and all products obtained by continuous casting.

(A) BLOOMS, BILLETS, ROUNDS, SLABS AND SHEET BARS

All these products are obtained by hot-rolling or forging the ingots, puddled bars or pilings classified in heading 72.06. They are semi-finished products intended for further hot-rolling or forging. They are therefore not required to be made exactly to size; the edges are not accurate and the surfaces are often convex or concave and may retain marks caused during the manufacturing processes (e.g., roller marks).

Blooms are usually square in cross-section and are larger than **billets**; the latter may be either square or rectangular. Both are used for re-rolling to bars, rods, angles, shapes and sections, or for the manufacture of forgings.

Rounds are of circular or of polygonal cross-section of more than four sides and are chiefly used as intermediate products for the manufacture of seamless steel tubes. They may be distinguished from bars and rods not only by the general characteristics common to the semi-finished products but also by the fact that they are usually supplied in lengths of from 1 to 2 metres and their ends are often cut by blow lamp, which is not the case for bars, which are normally cut more accurately.

Slabs and sheet bars are also rectangular (other than square) in section but they have widths considerably greater than their thicknesses, slabs being thicker than sheet bars. Slabs are therefore usually re-rolled to plates, while sheet bars are normally used to produce sheets or strip. Tinplate bars are a type of sheet bar used in the production of tinplate. With regard to the distinction between slabs and sheet bars and certain plates, see the Explanatory Note to heading 72.08 below.

(B) PIECES ROUGHLY SHAPED BY FORGING

These are semi-finished products of rough appearance and large dimensional tolerances, produced from blocks or ingots by the action of power hammers or forging presses. They may take the form of crude recognisable shapes in order that the final article can be fabricated without excessive waste, but the heading covers **only** those pieces which require considerable further shaping in the forge, press, lathe, etc. The heading would, for example, cover an ingot roughly hammered into the shape of a flattened zig-zag and requiring further shaping to produce a marine crankshaft, but it would **not cover** a crankshaft forging ready for final machining. The heading similarly **excludes** drop forgings and pressings produced by forging between matrices since the articles produced by these operations are ready for final machining.

(C) BLANKS FOR ANGLES, SHAPES OR SECTIONS

Blanks for angles, shapes or sections may have a cross-section of complex form adapted to that of the finished product and the corresponding rolling process. The heading covers, for example, blanks for wide-flanged beams or girders.

(D) SEMI-FINISHED PRODUCTS OBTAINED BY CONTINUOUS CASTING

This group covers all semi-finished products of iron or non-alloy steel, under any form, obtained by continuous casting.

In this process steel is conveyed from the ladle in a distributor which feeds the different casting flow lines. These flow lines include :

- (a) A mould, without bottom, with its cooling devices;
- (b) Outside the mould a system for atomising water in order to cool the cast metal;
- (c) A group of conveyor rollers allowing the regular extraction of the solidified metal; and
- (d) A system of cutting-off machines, followed by an evacuation device.

For the criteria to differentiate between products obtained by continuous casting and other products, see paragraph (III) of the General Explanatory Note to this Chapter.

72.08 - Flat-rolled products of iron or non-alloy steel, of a width of 600 mm or more, hot-rolled, not clad, plated or coated (+).

7208.10 - In coils, not further worked than hot-rolled, with patterns in relief

- Other, in coils, not further worked than hot-rolled, pickled :

7208.25 -- Of a thickness of 4.75 mm or more

7208.26 -- Of a thickness of 3 mm or more but less than 4.75 mm

7208.27 -- Of a thickness of less than 3 mm

- Other, in coils, not further worked than hot-rolled :

7208.36 -- Of a thickness exceeding 10 mm

7208.37 -- Of a thickness of 4.75 mm or more but not exceeding 10 mm

7208.38 -- Of a thickness of 3 mm or more but less than 4.75 mm

7208.39 -- Of a thickness of less than 3 mm

7208.40 - Not in coils, not further worked than hot-rolled, with patterns in relief

- Other, not in coils, not further worked than hot-rolled :

7208.51 -- Of a thickness exceeding 10 mm

7208.52 -- Of a thickness of 4.75 mm or more but not exceeding 10 mm

7208.53 -- Of a thickness of 3 mm or more but less than 4.75 mm

7208.54 -- Of a thickness of less than 3 mm

7208.90 - Other

Flat-rolled products are defined in Note 1 (k) to this Chapter.

The products of this heading may have been subjected to the following surface treatments :

- (1) Descaling, pickling, scraping and other processes to remove the oxide scale and crust formed during the heating of metal.
- (2) Rough coating intended solely to protect products from rust or other oxidation, to prevent slipping during transport and to facilitate handling e.g., paints containing an active anti-rust pigment for example, red lead, zinc powder, zinc oxide, zinc chromate, iron oxide (iron minium, jewellers' rouge), and non-pigmented coatings with a basis of oil, grease, wax, paraffin wax, graphite, tar or bitumen.
- (3) Polishing, burnishing or similar treatments.

- (4) Artificial oxidation (by various chemical processes, such as immersion in an oxidising solution), patina finishing, blueing (blue annealing), browning or bronzing (by various techniques), which also form a film of oxide on the surface of the product, to improve its appearance. The operations increase resistance to rusting.
- (5) Chemical surface treatments, such as :
 - phosphatising, which consists of immersing the product in a solution of metallic acid phosphates, particularly those of manganese, iron and zinc; this process is known as parkerising or bonderising, depending on the period of the operation and the temperature of the bath;
 - oxalating, borating, etc., using methods similar to those for phosphatising, with the appropriate salts or acids;
 - chromating, which consists of immersing the product in a solution whose main contents are chromic acid or chromates.

These chemical surface treatments have the advantage of protecting the surface of metal, facilitating any later cold deformation of the products treated and the application of paints or other non-metallic protective coatings.

Flat-rolled products of this heading may have patterns in relief derived directly from rolling, such as grooves, ribs, chequers, tears, buttons, lozenges, or they may have been worked after rolling (e.g., perforated, corrugated, bevelled or rounded at the edges), **provided** they do not thereby assume the character of articles or products of other headings.

The heading **does not**, however, **include** flat-rolled products which have been coated, plated or clad with metal or coated with non-metallic substances such as paints, enamels or plastics (**heading 72.10**).

The heading also **excludes** such flat-rolled products which have been clad with precious metals (**Chapter 71**).

“Corrugated flat-rolled products” means those having a regular wave pattern in the form of a curved (e.g., sinusoidal) line. For the purpose of determining classification, the width of the corrugated side is to be taken as its effective width in the corrugated form. However, the heading **excludes** so-called ribbed products having an angular profile (e.g., square, triangular or trapezoidal) (generally **heading 72.16**).

The heading also includes flat-rolled products of a shape **other than** rectangular or square, of any size, **provided** they do not assume the character of articles or products of other headings.

The heading covers, *inter alia*, “wide coils”, “sheets” and “plates”.

This heading also covers certain products named “wide flats” (some of which are called “universal plates” in some parts of the world).

For the purposes of this heading, “wide flats” are products of rectangular (**other than** square) cross-section, not in coils, hot-rolled on four faces in a closed box pass or universal mill, of a thickness of not less than 4 mm, and of a width of 600 mm or more but not exceeding 1,250 mm.

Therefore, " wide flats " have much straighter and more accurately finished sides and sharper edges than those of " wide coil ", " sheets " or " plates ". They are never re-rolled but are used in structural steelwork, etc., without further machining of the edges.

" Wide coil ", " plates " and " sheets " are produced by hot-rolling ingots, slabs and sheet bars, sometimes followed by cutting transversally or longitudinally.

" Wide coil " can be distinguished from " sheets " and " plates " since " plates " and " sheets " are presented flat while " wide coil " is presented wound in coils of successively superimposed layers with almost flat sides.

Hot-rolled " wide coils " are either used direct in the same way as " sheets " and " plates " or converted into other products such as " sheets " and " plates ", welded tubes, formed angles, shapes or sections.

" Sheets " and " plates " are used in the construction of ships, railway rolling-stock, tanks, boilers, bridges and other structural work where great strength is required. Certain " sheets " and " plates " may have dimensions similar to those of slabs and sheet bars. However, they can be distinguished from slabs and sheet bars since :

- (1) They are most often cross-rolled (longitudinally and transversely) and sometimes oblique-rolled whereas slabs and sheet bars are roughly rolled longitudinally only (in the slabbing or roughing mill).
- (2) Their edges are normally sheared or flame-cut and show traces of the shears or flame whereas slabs and sheet bars have round edges.
- (3) Tolerances as to thickness and surface defects are very strict whereas slabs and sheet bars are not of uniform thickness and show various surface defects.

*
* *

The heading **does not cover** :

- (a) Expanded metal of iron or steel (**heading 73.14**).
- (b) Blanks of articles of **Chapter 82**.

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 7208.10, 7208.25, 7208.26, 7208.27, 7208.36, 7208.37, 7208.38, 7208.39, 7208.40, 7208.51, 7208.52, 7208.53 and 7208.54

In addition to hot-rolling, the products of these subheadings may have been subjected to the following working or surface treatments :

- (1) Hot flattening.
- (2) Annealing, hardening, tempering, case-hardening, nitriding and similar heat treatments to improve the properties of the metal.

- (3) Except where the context otherwise requires, the surface treatments described in Items (1) and (2) of the second paragraph of the Explanatory Note to heading 72.08.

Descaling may be achieved :

- (a) by acid pickling or reduction treatment (chemical or heat processes), whether or not in conjunction with milk of lime treatment (liming);
- (b) by mechanical descaling (planing, rough grinding, rough sanding, sand-blasting, etc.).

Mechanically descaled products can generally be identified by the following characteristics :

- (i) planed steel has a bright surface with rough continuous parallel marks which are clearly visible to the naked eye and perceptible to the touch;
- (ii) roughly ground or roughly sanded surfaces are generally uneven, with a dull finish. The marks left by the grinding tool are clearly visible. Fine abrasion, on the other hand, produces an absolutely smooth surface with a bright finish which may even be reflective. Often, the marks left by the working tool are virtually invisible.

- (4) Skin or pinch passing as described in the last paragraph of Section (IV) (B) of the General Explanatory Note to this Chapter.
- (5) Stamping, punching, printing, etc., with simple inscriptions, such as trademarks.
- (6) Cutting into rectangular (including square) shape.
- (7) Operations intended exclusively to detect flaws in the metal.

72.09 - Flat-rolled products of iron or non-alloy steel, of a width of 600 mm or more, cold-rolled (cold-reduced), not clad, plated or coated (+).

- In coils, not further worked than cold-rolled (cold-reduced) :

7209.15 -- Of a thickness of 3 mm or more

7209.16 -- Of a thickness exceeding 1 mm but less than 3 mm

7209.17 -- Of a thickness of 0.5 mm or more but not exceeding 1 mm

7209.18 -- Of a thickness of less than 0.5 mm

- Not in coils, not further worked than cold-rolled (cold-reduced) :

7209.25 -- Of a thickness of 3 mm or more

7209.26 -- Of a thickness exceeding 1 mm but less than 3 mm

7209.27 -- Of a thickness of 0.5 mm or more but not exceeding 1 mm

7209.28 -- Of a thickness of less than 0.5 mm

7209.90 - Other

The provisions of the Explanatory Note to heading 72.08 apply, *mutatis mutandis*, to the products of this heading.

Criteria for distinguishing between the cold-rolled products of this heading and the hot-rolled products of heading 72.08 are set out in the General Explanatory Note to this Chapter - see Part (IV) (B).

Because of their special properties (better surface finish, better aptitude to cold-forming, stricter tolerances, generally reduced thickness, higher mechanical strength, etc.), the products of this heading are in general used for purposes different from those of their hot-rolled counterparts, which they increasingly tend to replace. They are used, in particular, in the manufacture of automobile bodies, metal furniture, domestic appliances, central heating radiators and for producing angles, shapes and sections by a cold process (either forming or profiling). They are easy to coat (by tin-plating, electroplating, varnishing, enamelling, lacquering, painting, coating with plastics, etc.).

They are often delivered after annealing, normalising or other heat treatment. If they are very thin (generally less than 0.5 mm) and if their surface has been pickled to render them suitable for tin-plating, varnishing or printing, they may be described as "black plate", even when coiled.

Subheading Explanatory Note.

Subheadings 7209.15, 7209.16, 7209.17, 7209.18, 7209.25, 7209.26, 7209.27 and 7209.28

In addition to cold-rolling, the products of these subheadings may have been subjected to the following working or surface treatments :

- (1) Flattening.
- (2) Annealing, hardening, tempering, case-hardening, nitriding and similar heat treatments to improve the properties of the metal.
- (3) Pickling.
- (4) Surface treatments described in Item (2) of the second paragraph of the Explanatory Note to heading 72.08.
- (5) Stamping, punching, printing, etc., with simple inscriptions, such as trademarks.
- (6) Cutting into rectangular (including square) shape.
- (7) Operations intended exclusively to detect flaws in the metal.

72.10 - Flat-rolled products of iron or non-alloy steel, of a width of 600 mm or more, clad, plated or coated (+).

- Plated or coated with tin :

7210.11 -- Of a thickness of 0.5 mm or more

7210.12 -- Of a thickness of less than 0.5 mm

7210.20 - Plated or coated with lead, including terne-plate

7210.30 - Electrolytically plated or coated with zinc

- Otherwise plated or coated with zinc :

7210.41 -- Corrugated

7210.49 -- Other

7210.50 - Plated or coated with chromium oxides or with chromium and chromium oxides

- Plated or coated with aluminium :

7210.61 -- Plated or coated with aluminium-zinc alloys

7210.69 -- Other

7210.70 - Painted, varnished or coated with plastics

7210.90 - Other

This heading covers the same kind of products as described in heading 72.08 or 72.09, but, to fall in this heading, they must be clad, plated or coated.

For the purpose of this heading, the expression "clad, plated or coated" applies to the products which were subjected to one of the treatments described in Part (C) (2), Items (d) (iv), (d) (v) and (e) of the General Explanatory Note to this Chapter.

This heading **excludes** :

(a) Flat products clad with precious metal (**Chapter 71**).

(b) Products of **heading 83.10**.

◦ ◦ ◦

Subheading Explanatory Notes.

For the purpose of the subheadings of heading 72.10, products subjected to more than one type of coating, plating, or cladding are to be classified according to the last process. However, chemical surface treatments, such as chromating, are not regarded as the last process.

Subheadings 7210.30, 7210.41 and 7210.49

The products of subheading 7210.30 have been subjected to the processing described in Part (IV) (C) (2) (d) (iv), second indent of the General Explanatory Note to Chapter 72 and the products of subheadings 7210.41 and 7210.49 to any of the other processing operations described in Part (IV) (C) (2) (d) (iv) of that Explanatory Note.

To distinguish between products electrolytically plated or coated with zinc and products otherwise plated or coated with zinc, the following procedure can be used :

- The products are first to be examined for the presence or otherwise of spangle by visual or microscopic observations.
- If spangle is detected, they are hot-dipped zinc-coated products. If spangle is not detected, even when magnified 50 times, the coating should be chemically analysed.
- If aluminium is detected, or lead is detected in excess of 0.5 %, they are hot-dipped zinc-coated products. If not, they are electrolytically zinc-coated products.

72.11 - Flat-rolled products of iron or non-alloy steel, of a width of less than 600 mm, not clad, plated or coated (+).

- Not further worked than hot-rolled :

7211.13 -- Rolled on four faces or in a closed box pass, of a width exceeding 150 mm and a thickness of not less than 4 mm, not in coils and without patterns in relief

7211.14 -- Other, of a thickness of 4.75 mm or more

7211.19 -- Other

- Not further worked than cold-rolled (cold-reduced) :

7211.23 -- Containing by weight less than 0.25 % of carbon

7211.29 -- Other

7211.90 - Other

This heading covers the same kind of products described in heading 72.08 or 72.09 but, to fall in this heading, they must be of a width of less than 600 mm.

The provisions of the Explanatory Notes to headings 72.08 and 72.09 apply, *mutatis mutandis*, to products of this heading except those relating to width (see also the General Explanatory Note to this Chapter).

Products of this heading include "wide flats" ("universal plates") of a width exceeding 150 mm but less than 600 mm, and hoop and strip.

Hoop and strip are usually produced by hot re-rolling the semi-finished products of heading 72.07. They may be subsequently cold-rolled to give a thinner product and a better quality finish. Strip is also produced by slitting "wide coil", "sheets" or "plates" of heading 72.08 or 72.09.

Products of this heading may be worked (e.g., corrugated, ribbed, chequered, embossed, bevelled or rounded at the edges), **provided** that they do not thereby assume the character of articles or of products of other headings.

They are used for many purposes, e.g., hooping of boxes, casks and other containers; as a basis for tin-plate; manufacture of welded tubes, tools (e.g., saw blades), cold-formed angles, shapes or sections, conveyor and machinery belting, in the automobile industry and for the production of many other articles (by stamping, folding, etc.).

The heading **does not cover** :

- (a) Twisted hoop of a kind used for fencing, of iron or steel (**heading 73.13**).
- (b) Corrugated strip with one edge serrated or bevelled, being corrugated nails in the length used for assembling wooden parts (**heading 73.17**).
- (c) Blanks of articles of **Chapter 82** (including razor blade blanks in strips).

Subheading Explanatory Notes.

Subheadings 7211.13, 7211.14 and 7211.19

See the Explanatory Note to subheadings 7208.10, 7208.25, 7208.26, 7208.27, 7208.36, 7208.37, 7208.38, 7208.39, 7208.40, 7208.51, 7208.52, 7208.53 and 7208.54.

Subheadings 7211.23 and 7211.29

See the Explanatory Note to subheadings 7209.15, 7209.16, 7209.17, 7209.18, 7209.25, 7209.26, 7209.27 and 7209.28.

72.12 - Flat-rolled products of iron or non-alloy steel, of a width of less than 600 mm, clad, plated or coated (+).

- 7212.10 - Plated or coated with tin
- 7212.20 - Electrolytically plated or coated with zinc
- 7212.30 - Otherwise plated or coated with zinc
- 7212.40 - Painted, varnished or coated with plastics
- 7212.50 - Otherwise plated or coated
- 7212.60 - Clad

This heading covers the same kind of products as described in heading 72.10 but, to fall in this heading, they must be of a width of less than 600 mm.

This heading **does not cover** insulated electric strip (**heading 85.44**).

◦
◦ ◦

Subheading Explanatory Notes.

See the Explanatory Note to the subheadings of heading 72.10 in respect of products subjected to more than one type of coating, plating or cladding.

Subheadings 7212.20 and 7212.30

See the Explanatory Note to subheadings 7210.30, 7210.41 and 7210.49.

72.13 - Bars and rods, hot-rolled, in irregularly wound coils, of iron or non-alloy steel.

7213.10 - Containing indentations, ribs, grooves or other deformations produced during the rolling process

7213.20 - Other, of free-cutting steel

- Other :

7213.91 -- Of circular cross-section measuring less than 14 mm in diameter

7213.99 -- Other

Bars and rods, hot-rolled, in irregularly wound coils, are defined in Note 1 (l) to this Chapter.

These products (also known as wire rod) are mainly used for drawing into wire (heading 72.17) but they are also used for other purposes especially in building work (e.g., as welded netting), in the nut and bolt industry, in the cold-drawing industry, etc., and for the manufacture of welding rods.

The heading also includes bars and rods for concrete reinforcement; such products are rolled with protuberances or indentations (e.g., teeth, grooves, flanges), **provided** their general cross-sectional shape corresponds to one of the geometrical shapes defined in Chapter Note 1 (l). These protuberances or indentations must be designed solely to improve the bond with concrete, etc.

The heading **does not cover** bars and rods of this kind, straightened and cut to length (**heading 72.14**).

72.14 - Other bars and rods of iron or non-alloy steel, not further worked than forged, hot-rolled, hot-drawn or hot-extruded, but including those twisted after rolling.

7214.10 - Forged

7214.20 - Containing indentations, ribs, grooves or other deformations produced during the rolling process or twisted after rolling

7214.30 - Other, of free-cutting steel

- Other :

7214.91 -- Of rectangular (other than square) cross-section

7214.99 -- Other

Other **bars and rods** are defined in Note 1 (m) to this Chapter.

Bars and rods of this heading are usually produced by hot-rolling or forging blooms, billets, puddled bars or pilings; they are also sometimes produced by hot-drawing or hot-extrusion. In general, bars and rods can be distinguished from other rolled, forged or drawn products since :

- (1) They present a more accurate and finished appearance than puddled bars (heading 72.06), blooms, billets, rounds, slabs and sheet bars (heading 72.07). Their cross-section is uniform and when it is square or rectangular has sharp edges.
- (2) They have a greater thickness relative to their width than the products of heading 72.08 or 72.11.

The bars and rods of this heading are mainly delivered in straight lengths or in folded bundles.

The products of this heading may have been subjected to the following surface treatments :

- (1) Descaling, pickling, scraping and other processes to remove the oxide scale and crust formed during the heating of metal.
- (2) Rough coating intended solely to protect products from rust or other oxidation, to prevent slipping during transport and to facilitate handling e.g., paints containing an active anti-rust pigment for example, red lead, zinc powder, zinc oxide, zinc chromate, iron oxide (iron minium, jewellers' rouge), and non-pigmented coatings with a basis of oil, grease, wax, paraffin wax, graphite, tar or bitumen.
- (3) Removal of small portions of the metal for testing purposes.

The heading also covers :

- (1) Bars and rods which are rolled with protuberances or indentations (e.g. teeth, grooves, flanges), **provided** their general cross-sectional shape corresponds to one of the geometrical shapes defined in Chapter Note 1 (m); these protuberances or indentations must be designed solely to improve the bond with concrete, etc.

- (2) Bars and rods which have been individually twisted after rolling, e.g., bars which are rolled with two or more longitudinal flanges, which are given a spiral form by twisting (steel "twists"); and
- (3) Bars and rods having a single perforation to facilitate transportation.

The heading, however, **excludes** :

- (a) Products consisting of two or more rolled bars twisted together (**heading 73.08**).
- (b) Pieces cut from bars and rods with a length not exceeding the greatest cross-sectional dimension (**heading 73.26**).

72.15 - Other bars and rods of iron or non-alloy steel (+).

7215.10 - Of free-cutting steel, not further worked than cold-formed or cold-finished

7215.50 - Other, not further worked than cold-formed or cold-finished

7215.90 - Other

The heading covers bars and rods **other than** those of heading **72.13** or **72.14**.

The bars and rods of this heading may :

- (1) be obtained by cold-forming or cold-finishing, i.e., have been subjected either to a cold pass through one or more dies (cold-drawn bars) or to a grinding or turning process (grinded or sized bars).
- (2) have been subjected to working (such as drilling or sizing, or to further surface treatments than are allowed for products of heading 72.14, such as plating, coating, or cladding (see Part (IV) (C) of the General Explanatory Note to this Chapter), provided that they do not thereby assume the character of articles or of products falling within other headings;

Bars and rods, cold-formed or cold-finished, are delivered in straight lengths and can therefore be distinguished from wire of heading 72.17 which is always in coils.

The heading **excludes** :

- (a) Other bars and rods of iron or non-alloy steel twisted after hot-rolling (**heading 72.14**).
- (b) Hollow drill bars and rods (**heading 72.28**).
- (c) Products consisting of two or more rolled bars twisted together (**heading 73.08**).
- (d) Tapered bars and rods of iron or steel (**heading 73.26**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 7215.10 and 7215.50

In addition to cold-forming or cold-finishing, the products of these subheadings may have been subjected to the following working or surface treatments :

- (1) Straightening.
- (2) Surface treatments described in Item (2) of the second paragraph of the Explanatory Note to heading 72.08.
- (3) Stamping, punching, printing, etc., with simple inscriptions, such as trademarks.
- (4) Operations intended exclusively to detect flaws in the metal.

72.16 - Angles, shapes and sections of iron or non-alloy steel (+).

7216.10 - U, I or H sections, not further worked than hot-rolled, hot-drawn or extruded, of a height of less than 80 mm

- L or T sections, not further worked than hot-rolled, hot-drawn or extruded, of a height of less than 80 mm :

7216.21 -- L sections

7216.22 -- T sections

- U, I or H sections, not further worked than hot-rolled, hot-drawn or extruded of a height of 80 mm or more :

7216.31 -- U sections

7216.32 -- I sections

7216.33 -- H sections

7216.40 - L or T sections, not further worked than hot-rolled, hot-drawn or extruded, of a height of 80 mm or more

7216.50 - Other angles, shapes and sections, not further worked than hot-rolled, hot-drawn or extruded

- Angles, shapes and sections, not further worked than cold-formed or cold-finished :

7216.61 -- Obtained from flat-rolled products

7216.69 -- Other

- Other :

7216.91 -- Cold-formed or cold-finished from flat-rolled products

7216.99 -- Other

Angles, shapes and sections are defined in Note 1 (n) to this Chapter.

The sections most commonly falling in this heading are H, I, T, capital omega, Z and U (including channels), obtuse, acute and right (L) angles. The corners may be square or rounded, the limbs equal or unequal, and the edges may or may not be "bulbed" (bulb angles or shipbuilding beams).

Angles, shapes and sections are usually produced by hot-rolling, hot-drawing, hot-extrusion or hot-forging or forging blooms or billets.

The heading includes goods which have been cold-formed or cold-finished (by cold-drawing, etc.) and also covers angles, shapes and sections made by forming on a roll type machine or by forming sheets, plates or strip on a press. So-called "ribbed sheets and plates" having an angular profile are also classified here.

The products of this heading may have been subjected to working such as drilling, punching or twisting or to surface treatment such as coating, plating or cladding - see Part IV (C) of the General Explanatory Note to this Chapter, **provided** they do not thereby assume the character of articles or of products falling in other headings.

The heavier angles, shapes and sections (e.g., girders, beams, pillars and joists) are used in the construction of bridges, buildings, ships, etc.; lighter products are used in the manufacture of agricultural implements, machinery, automobiles, fences, furniture, sliding door or curtain tracks, umbrella ribs and numerous other articles.

The heading **does not cover** :

- (a) Welded angles, shapes and sections, and sheet piling (**heading 73.01**), and railway or tramway track construction material (**heading 73.02**).
 - (b) Articles prepared for use in structures (**heading 73.08**).
- ○ ○

Subheading Explanatory Notes.

Subheadings 7216.10, 7216.21, 7216.22, 7216.31, 7216.32, 7216.33 and 7216.40

In order to classify **U, I, H, L** or **T sections** in these subheadings, the height should be determined as follows :

- **U, I or H sections** : the distance between the external surfaces of the two parallel planes.
- **L sections** : the height of the largest external side.
- **T sections** : the total height of the section.

An **I section** (narrow or medium flange) is a product with flanges of a width not exceeding 0.66 of the height of the section and less than 300 mm.

Subheadings 7216.10, 7216.21, 7216.22, 7216.31, 7216.32, 7216.33, 7216.40 and 7216.50

The provisions of the Explanatory Note to heading 72.14 concerning surface treatments also apply to the products of these subheadings.

Subheadings 7216.61 and 7216.69

See the Explanatory Note to subheadings 7215.10 and 7215.50.

72.17 - Wire of iron or non-alloy steel (+).

7217.10 - Not plated or coated, whether or not polished

7217.20 - Plated or coated with zinc

7217.30 - Plated or coated with other base metals

7217.90 - Other

Wire of this heading is defined in Note 1 (o) to this Chapter.

Wire is mostly produced from hot-rolled bars and rods of heading 72.13 by drawing them through a die but may also be obtained by any other cold-forming process (e.g., cold-rolling). Wire is presented in coils (with non-aligned spirals or with aligned spirals, with or without support).

Wire which has been worked (e.g., by crimping) remains in this heading, provided it does not thereby assume the character of articles or of products of other headings.

Wire covered with a material such as textile where the iron or steel core is the essential element and the other material serves solely as covering (e.g., iron and steel wire for the manufacture of hat frames (milliners' wire), and stems for artificial flowers or hair curlers) is also classified in this heading.

Wire is put to very many uses, e.g., manufacture of fencing, gauze, netting, nails, rope, pins, needles, tools and springs.

The heading **does not cover** :

- (a) Metallised yarn (**heading 56.05**), twine or cord reinforced with wire (**heading 56.07**).
- (b) Stranded wire, ropes, cables and the like of **heading 73.12**.
- (c) Barbed wire; twisted single flat wire (barbed or not) of a kind used for fencing (**heading 73.13**).
- (d) " Duplex " wire as used for making textile loom healds and formed by soldering together two wire strands after drawing, wire twisted into eyelets or loops at one or both ends for tying (**heading 73.26**).
- (e) Coated welding electrodes, etc. (**heading 83.11**).
- (f) Saw-toothed wire for use as card clothing (all-steel card clothing) (**heading 84.48**).
- (g) Insulated electric wire (including enamelled wire) (**heading 85.44**).
- (h) Musical instrument strings (**heading 92.09**).

○
○ ○

Subheading Explanatory Note.

See the Explanatory Note to the subheadings of heading 72.10 in respect of products subjected to more than one type of coating, plating or cladding.

Sub-Chapter III
STAINLESS STEEL

GENERAL

Heat-resisting steel, creep-resisting steel and any other steel complying with the specified criteria in Note 1 (e) to this Chapter are to be classified as stainless steel.

Because of its high resistance to corrosion, stainless steel is put to a very wide range of uses, e.g., in the manufacture of silencers, catalytic converters or transformer tanks.

This sub-Chapter covers stainless steel in the forms mentioned in headings 72.18 to 72.23.

72.18 - Stainless steel in ingots or other primary forms; semi-finished products of stainless steel.

7218.10 - Ingots and other primary forms

- Other :

7218.91 - - Of rectangular (other than square) cross-section

7218.99 - - Other

The provisions of the Explanatory Note to headings 72.06 and 72.07 apply, *mutatis mutandis*, to the products of this heading.

72.19 - Flat-rolled products of stainless steel, of a width of 600 mm or more (+).

- Not further worked than hot-rolled, in coils :

7219.11 -- Of a thickness exceeding 10 mm

7219.12 -- Of a thickness of 4.75 mm or more but not exceeding 10 mm

7219.13 -- Of a thickness of 3 mm or more but less than 4.75 mm

7219.14 -- Of a thickness of less than 3 mm

- Not further worked than hot-rolled, not in coils :

7219.21 -- Of a thickness exceeding 10 mm

7219.22 -- Of a thickness of 4.75 mm or more but not exceeding 10 mm

7219.23 -- Of a thickness of 3 mm or more but less than 4.75 mm

7219.24 -- Of a thickness of less than 3 mm

- Not further worked than cold-rolled (cold-reduced) :

7219.31 -- Of a thickness of 4.75 mm or more

7219.32 -- Of a thickness of 3 mm or more but less than 4.75 mm

7219.33 -- Of a thickness exceeding 1 mm but less than 3 mm

7219.34 -- Of a thickness of 0.5 mm or more but not exceeding 1 mm

7219.35 -- Of a thickness of less than 0.5 mm

7219.90 - Other

The provisions of the Explanatory Notes to headings 72.08 to 72.10 apply, *mutatis mutandis*, to the products of this heading.

○
○ ○

Subheading Explanatory Notes.

72.23 - Wire of stainless steel.

The provisions of the Explanatory Note to heading 72.17 apply, *mutatis mutandis*, to the products of this heading.

The heading **does not cover** very fine sterile stainless steel wire used for surgical sutures (**heading 30.06**).

Sub-Chapter IV

OTHER ALLOY STEEL; HOLLOW DRILL BARS AND RODS, OF ALLOY OR NON-ALLOY STEEL

GENERAL

Other alloy steel is defined in Note 1 (f) to this Chapter and **hollow drill bars and rods** in Note 1 (p) to this Chapter.

This sub-Chapter covers alloy steel other than stainless steel, in the form of ingots or other primary forms, semi-finished products (e.g., blooms, billets, rounds, slabs, sheet bars, pieces roughly shaped by forging), flat-rolled products, whether or not in coils (so-called wide-flats, wide coil, sheets, plates or strip), bars and rods, angles, shapes or sections, or wire.

All these products may be worked **provided** that they do not thereby assume the character of articles or of products falling in other headings (see the Explanatory Notes to headings 72.06 to 72.17).

The metals most commonly present in other alloy steel are manganese, nickel, chromium, tungsten (wolfram), molybdenum, vanadium and cobalt; the most common non-metal additive is silicon. These alloying materials confer special properties to the steel, e.g., resistance to shock and wear (e.g., manganese steels); improved electrical qualities (silicon steels); improved tempering qualities (e.g., vanadium steels); or increased cutting speed (e.g., chrome-tungsten steels).

Other alloy steels are used for many purposes requiring special qualities (e.g., durability, increased hardness, resilience, strength), for example, in armaments, tools and cutlery, and machinery.

Alloy steels of this sub-Chapter include :

- (1) Alloy engineering and structural steels usually containing the following elements : chromium, manganese, molybdenum, nickel, silicon and vanadium.
- (2) Alloy steels having improved tensile strength and welding properties containing in particular very small quantities of boron (0.0008 % or more by weight) or of niobium (0.06 % or more by weight).
- (3) Alloy steels, containing chromium or copper, which are weather resistant.
- (4) Alloy steels for so-called "magnetic" sheets (having a low magnetic loss) generally containing 3 to 4 % of silicon and possibly aluminium.
- (5) Free-cutting alloy steels which not only conform to the requirements of Note 1 (f) but also contain at least one of the following elements : lead, sulphur, selenium, tellurium or bismuth.
- (6) Alloy bearing steels (generally containing chromium).
- (7) Alloy manganese silicon spring steels (containing manganese, silicon and possibly chromium or molybdenum) and other alloy steels for springs.

- (8) Non-magnetic alloy steels resistant to shock and abrasion, having a high manganese content.
- (9) High speed steels : alloy steels containing, with or without other alloy elements, at least two of the three elements molybdenum, tungsten and vanadium with a combined content by weight of 7 % or more, 0.6 % or more of carbon and 3 to 6 % of chromium.
- (10) Non-distorting tool steels : containing generally by weight 12 % or more of chromium and 2 % or more of carbon.
- (11) Other alloy tool steels.
- (12) Permanent magnet steels containing aluminium, nickel, and cobalt.
- (13) Non-magnetic alloy steels which are characterised by their manganese or nickel content, other than those covered by sub-Chapter III.
- (14) Steels for control rods in nuclear reactors (with high boron content).

This sub-Chapter also includes hollow drill bars and rods, of alloy or non-alloy steel (**heading 72.28**).

72.24 - Other alloy steel in ingots or other primary forms; semi-finished products of other alloy steel.

7224.10 - Ingots and other primary forms

7224.90 - Other

The provisions of the Explanatory Note to headings 72.06 and 72.07 apply, *mutatis mutandis*, to the products of this heading.

72.25 - Flat-rolled products of other alloy steel, of a width of 600 mm or more (+).

- Of silicon-electrical steel :

7225.11 -- Grain-oriented

7225.19 - - Other

7225.30 - Other, not further worked than hot-rolled, in coils

7225.40 - Other, not further worked than hot-rolled, not in coils

7225.50 - Other, not further worked than cold-rolled (cold-reduced)

- Other :

7225.91 -- Electrolytically plated or coated with zinc

7225.92 -- Otherwise plated or coated with zinc

7225.99 - - Other

The provisions of the Explanatory Notes to headings 72.08 to 72.10 apply, *mutatis mutandis*, to the products of this heading.

Three small black circles are arranged in a triangular pattern. One circle is at the top, and two are at the bottom level.

Subheading Explanatory Notes.

Subheadings 7225.30 and 7225.40

See the Explanatory Note to subheadings 7208.10, 7208.25, 7208.26, 7208.27, 7208.36, 7208.37, 7208.38, 7208.39, 7208.40, 7208.51, 7208.52, 7208.53 and 7208.54.

Subheading 7225.50

See the Explanatory Note to subheadings 7209.15, 7209.16, 7209.17, 7209.18, 7209.25, 7209.26, 7209.27 and 7209.28.

Subheadings 7225.91 and 7225.92

See the Explanatory Note to subheadings 7210.30, 7210.41 and 7210.49.

72.26 - Flat-rolled products of other alloy steel, of a width of less than 600 mm (+).

- Of silicon-electrical steel :

7226.11 -- Grain-oriented

7226.19 - - Other

7226.20 - Of high speed steel

- Other :

7226.91 -- Not further worked than hot-rolled

7226.92 -- Not further worked than cold-rolled (cold-reduced)

7226.99 - - Other

The provisions of the Explanatory Note to heading 72.11 and 72.12 apply, *mutatis mutandis*, to the products of this heading.

Three small black circles arranged in a triangular pattern, with one circle at the top and two at the bottom.

Subheading Explanatory Notes.

Subheading 7226.91

See the Explanatory Note to subheadings 7208.10, 7208.25, 7208.26, 7208.27, 7208.36, 7208.37, 7208.38, 7208.39, 7208.40, 7208.51, 7208.52, 7208.53 and 7208.54.

Subheading 7226.92

See the Explanatory Note to subheadings 7209.15, 7209.16, 7209.17, 7209.18, 7209.25, 7209.26, 7209.27 and 7209.28.

72.27 - Bars and rods, hot-rolled, in irregularly wound coils, of other alloy steel.

7227.10 - Of high speed steel

7227.20 - Of silico-manganese steel

7227.90 - Other

The provisions of the Explanatory Note to heading 72.13 apply, *mutatis mutandis*, to the products of this heading.

72.28 - Other bars and rods of other alloy steel; angles, shapes and sections, of other alloy steel; hollow drill bars and rods, of alloy or non-alloy steel (+).

7228.10 - Bars and rods, of high speed steel

7228.20 - Bars and rods, of silico-manganese steel

7228.30 - Other bars and rods, not further worked than hot-rolled, hot-drawn or extruded

7228.40 - Other bars and rods, not further worked than forged

7228.50 - Other bars and rods, not further worked than cold-formed or cold-finished

7228.60 - Other bars and rods

7228.70 - Angles, shapes and sections

7228.80 - Hollow drill bars and rods

(A) OTHER BARS AND RODS; ANGLES, SHAPES AND SECTIONS

The provisions of the Explanatory Notes to headings 72.14 to 72.16 apply, *mutatis mutandis*, to the products of this heading.

(B) HOLLOW DRILL BARS AND RODS

Hollow drill bars and rods are defined in Note 1 (p) to this Chapter. They are also known as drill steel.

Drill steel is produced by piercing billets of alloy or non-alloy steel which are then re-rolled. The usual cross-sections are round, hexagonal, octagonal or quarter octagonal (square with the corners lopped off). The steel may be cut into short pieces for the manufacture of drill bits which fall in heading 82.07; they are also used in lengths up to five or six metres to transmit power when drilling at a distance. The hole down the length conducts liquid to the cutting point both for lubrication and to minimise the spreading of dust.

Subheading Explanatory Note.

Subheading 7228.50

See the Explanatory Note to subheadings 7215.10 and 7215.50.

72.29 - Wire of other alloy steel.

7229.20 - Of silico-manganese steel

7229.90 - Other

The provisions of the Explanatory Note to heading 72.17 apply, *mutatis mutandis*, to the products of this heading.

Chapter 73

Articles of iron or steel

Notes.

- 1.- In this Chapter the expression "cast iron" applies to products obtained by casting in which iron predominates by weight over each of the other elements and which do not comply with the chemical composition of steel as defined in Note 1 (d) to Chapter 72.
- 2.- In this Chapter the word "wire" means hot or cold-formed products of any cross-sectional shape, of which no cross-sectional dimension exceeds 16 mm.

GENERAL

This Chapter covers a certain number of specific articles in headings 73.01 to 73.24, and in headings 73.25 and 73.26 a group of articles not specified or included in Chapter 82 or 83 and not falling in other Chapters of the Nomenclature, of iron (including cast iron as defined in Note 1 to this Chapter) or steel.

For the purposes of this Chapter, the expressions "tubes and pipes" and "hollow profiles" have the following meanings hereby assigned to them:

(1) Tubes and pipes

Concentric hollow products, of uniform cross-section with only one enclosed void along their whole length, having their inner and outer surfaces of the same form. Steel tubes are mainly of circular, oval, rectangular (including square) cross-sections but in addition may include equilateral triangular and other regular convex polygonal cross-sections. Products of cross-section other than circular, with rounded corners along their whole length, and tubes with upset ends, are also to be considered as tubes. They may be polished, coated, bent (including coiled tubing), threaded and coupled or not, drilled, waisted, expanded, cone shaped or fitted with flanges, collars or rings.

(2) Hollow profiles

Hollow products not conforming to the above definition and mainly those not having their inner and outer surfaces of the same form.

The General Explanatory Note to Chapter 72 applies, *mutatis mutandis*, to this Chapter.

73.01 - Sheet piling of iron or steel, whether or not drilled, punched or made from assembled elements; welded angles, shapes and sections, of iron or steel.

7301.10 - Sheet piling

7301.20 - Angles, shapes and sections

Sheet piling consists of sections obtained by rolling, drawing, pressing, press-folding or forming on roller machines, or by assembling rolled parts (e.g. by riveting, welding, crimping). These sections can be fitted to each other by being simply interlocked or even by having their longitudinal sides juxtaposed. For this purpose, both types have, on the longitudinal sides at least, connecting devices (e.g. grooves, flanges, interlocks).

This heading includes :

- (1) Sheet piling angle or corner pieces, which are sections intended to form corners; for this purpose either folded sections or sections which are cut along their length are used, the parts so obtained being then welded or riveted to form an angle.
- (2) Joining sheet piling sections with three or four arms for making partition walls.
- (3) Connecting sheet piling sections whose shape enables them to be used for connecting different types of sheet piling.
- (4) Sheet piling conduits and columns which are driven into the ground in such a manner that they join together without being forcibly interlocked. The sheet piling conduits are corrugated in shape. Sheet piling columns are made up of two sections welded together.

Sheet piling is generally used for making walls in sandy, waterlogged or submerged ground for civil engineering works such as dams, dykes or trenches.

The heading also includes welded angles, shapes and sections. The Explanatory Note to heading 72.16 applies, *mutatis mutandis*, to profiles obtained by welding.

The heading **does not cover** :

- (a) Welded hollow profiles (**heading 73.06**).
- (b) Sheet piling assembled into piles which have no "interlocks" available for external connection (**heading 73.08**).

73.02 - Railway or tramway track construction material of iron or steel, the following : rails, check-rails and rack rails, switch blades, crossing frogs, point rods and other crossing pieces, sleepers (cross-ties), fish-plates, chairs, chair wedges, sole plates (base plates), rail clips, bedplates, ties and other material specialized for jointing or fixing rails.

7302.10 - Rails

7302.30 - Switch blades, crossing frogs, point rods and other crossing pieces

7302.40 - Fish-plates and sole plates

7302.90 - Other

This heading covers iron or steel railway and tramway track construction material, whether of normal or narrow gauge.

- (1) **Rails** for railways or tramways are hot-rolled products. The heading covers all lengths of such rails including bull head rails, flange (or flat-bottomed) rails, grooved tram rails, slot rails for electric tramways, and conductor-rails, etc.

This heading covers all rails of the type normally used for railway or tramway track, irrespective of their intended use (over-head transporters, mobile cranes, etc.). It **does not**, however, **cover** rails not of the railway or tramway type (e.g., sliding door rails and lift rails).

Check-rails, also known as guard rails or safety rails, are fixed to track rails to prevent derailments at crossings and curves.

Rack rails are intended for steep gradient railways. One type consists of two long parallel bars connected by closely spaced transverse rods; the spaces between these rods are designed to engage the teeth of the cogged wheel beneath the locomotive. A second type consists of a toothed rail which engages similarly with the cogged wheel.

All the above rails may be straight, curved or drilled with bolt holes.

- (2) **Switch blades, crossing frogs, point rods and other crossing pieces** which may be cast or otherwise obtained, are used at the junctions or intersections of the permanent way.
- (3) **Iron or steel "sleepers" (cross-ties)** are used to support the rails and keep them parallel.

They are usually pressed into final shape after rolling, but they may also be assembled by welding or riveting several elements together. They normally have a cross-section in the form of a "U" or a very short-legged capital omega, and they remain in the heading whether or not drilled, punched, slotted, or fitted with chairs or sole plates, or with integral formed rail fastening housings.

- (4) **Fish-plates** are hot-rolled, forged or cast products of various shapes (flat, shouldered, angled, etc.) used for jointing one rail to the next. They fall in the heading whether or not drilled or punched.
- (5) **Chairs** (usually of cast iron) are used to fix bull-head rails to the sleepers; they are secured by coach screws or bolts.

Chair wedges are used to hold the rails in the chairs.

Sole plates (base plates, sleeper plates) are used in fixing flat-bottomed rails to sleepers. They protect the sleepers and are fixed to them by cramps, bolts, coach screws, spikes or, in the case of steel, by welding.

Rail clips are likewise used to fix flat-bottomed rails to the sleepers; they are bolted to the sleepers and clamp the flat bottom of the rail to them.

The heading also covers other **rigid railway rail fixing devices**, such as those obtained by bending a steel bar into an approximate L-shape, the shortest side pressing against the flange of the rail and the longest side, with its end slightly flattened but not pointed, being fixed in a hole previously drilled in the sleeper.

Furthermore, **resilient rail fastening devices** are covered by this heading. These are manufactured from spring steel and clamp the rail to the sleeper or sole plate. The clamping force is obtained by a geometrical deflection of the fastening from the "as manufactured" condition. A pad or insulating device, usually of rubber or plastics, is interposed between the fastening and the rail or the fastening and the sleeper.

- (6) **Bedplates and ties** are used to fix the rails in their parallel position.

Some special spacing-ties and angle-bars are designed to be bolted on to a number of successive wooden sleepers; being thus fixed at right angles to the sleepers they serve to prevent deformation (or "creep") of the track at certain points.

- (7) **Other specialised rail anchors** are devices attached or clamped to the rail where longitudinal creep occurs. These bear against the sleeper or sole plate tending to prevent such longitudinal movement.

The heading **does not cover** :

- (a) Screws, bolts, nuts, rivets and spikes used for fixing track construction materials (**headings 73.17 and 73.18**).
- (b) Assembled track, turntables, platform buffers and loading gauges (**heading 86.08**).

73.03 - Tubes, pipes and hollow profiles, of cast iron.

This heading applies to tubes, pipes and hollow profiles manufactured of cast iron as defined in Note 1 to this Chapter.

They may be manufactured by casting in moulds or by centrifugal casting; in the latter case, the molten iron is poured into a horizontal cylinder which is rapidly rotated so that the metal is forced centrifugally against the walls where it solidifies.

These tubes, pipes and hollow profiles may be straight or curved, plain, finned or gilled. They may be socketed, flanged integrally or flanged by welding or threading. To facilitate assembly, socketed pipes have one end expanded to receive the end of a second pipe. Flanged pipes can be assembled by means of collars, nuts, bolts, clamps, etc., while threaded or plain end pipes are assembled by means of couplings, rings or collars.

This heading also covers tubes, pipes and hollow profiles with multiple or branch openings, and those which are covered, for example, with zinc, plastics, bitumen.

Tubes and pipes of this heading are mainly used for pressure or gravity pipelines for water, sewer evacuation, for low pressure gas distribution, as gutter or drain-pipes or for drainage.

The heading **does not cover** :

- (a) Tube or pipe fittings (**heading 73.07**).
- (b) Tubes, pipes and hollow profiles made up into identifiable parts of articles, classified in their respective headings, such as sections of central heating radiators (**heading 73.22**) and machinery parts (**Section XVI**).

73.04 - Tubes, pipes and hollow profiles, seamless, of iron (other than cast iron) or steel (+).

- Line pipe of a kind used for oil or gas pipelines :

7304.11 -- Of stainless steel

7304.19 -- Other

- Casing, tubing and drill pipe, of a kind used in drilling for oil or gas :

7304.22 -- Drill pipe of stainless steel

7304.23 -- Other drill pipe

7304.24 -- Other, of stainless steel

7304.29 -- Other

- Other, of circular cross-section, of iron or non-alloy steel :

7304.31 -- Cold-drawn or cold-rolled (cold-reduced)

7304.39 -- Other

- Other, of circular cross-section, of stainless steel :

7304.41 -- Cold-drawn or cold-rolled (cold-reduced)

7304.49 -- Other

- Other, of circular cross-section, of other alloy steel :

7304.51 -- Cold-drawn or cold-rolled (cold-reduced)

7304.59 -- Other

7304.90 - Other

Tubes, pipes and hollow profiles of this heading may be manufactured by the following processes :

(A) Hot-rolling of an intermediate product, which can be either an ingot, rolled and peeled, a billet or a round obtained by rolling or continuous casting. This process of manufacture includes :

(1) Piercing in a cross rolling mill (Mannesmann process), in a disc mill or in a cone type piercer to obtain a hollow blank of greater wall thickness and outside diameter and of lesser length than the final product.

(2) Hot-rolling upon a mandrel or a plug :

- in a three slanted rolls elongator (Assel or Transval) used in major part for the manufacture of bearing tubes or a two slanted rolls elongator with guiding discs (Diescher process) or a three slanted planetary elongator or

- in a " continuous tube rolling mill " having different sets of rolls upon a " free floating " or semi-floating restrained mandrel (Neuval or Dalmine process) or
 - in a pilger mill or
 - in a Stiefel mill or
 - in a push bench by pushing the blank in a series of rolls or
 - in a stretch reducing mill. In this case the product obtained is a finished tube.
- (B) Hot-extrusion in a press using glass (Ugine-Sejournet process) or another lubricant, of a round. This method actually includes the following operations : piercing, expansion or not, and extrusion.
- The operations described above are followed by different finishing operations :
- hot-finishing : in this case, the blank after reheating passes through a sizing mill or a stretching mill and finally a straightening mill or
 - cold-finishing on a mandrel, by cold-drawing on a bench or cold-rolling (cold-reducing) in a pilger mill (Mannesmann or Megaval process). These operations give the possibility to obtain from hot-rolled or extruded tubes, used as blanks, tubes of lesser wall thickness (it should be noted that the Transval process allows tubes of reduced wall thickness to be directly produced) or diameter, also tubes of tighter tolerances on diameter or wall thickness. Cold-working methods also cover honing and roller burnishing to obtain polished surfaces (tubes with a low degree of roughness) required, e.g., for pneumatic jacks or hydraulic cylinders.
- (C) Casting or centrifugal casting.
- (D) Deep drawing of a disc placed over a forming mould, the blank produced being subsequently hot-drawn.
- (E) Forging.
- (F) Machining of bars followed by cold-drawing or cold-rolling (cold-reducing) operations (**excluding** hollow drill bars of **heading 72.28**).

See the General Explanatory Note to this Chapter concerning the distinction between tubes and pipes on the one hand and hollow profiles on the other.

*
* * *

The products of this heading may be coated, for example, with plastics or with glass wool combined with bitumen.

This heading also covers finned or gilled tubes or pipes and hollow profiles such as integrally finned or gilled tubes with longitudinal or transversal fins.

The products of this heading include, in particular, line pipes of a kind used for oil or gas, casing, tubing and drill pipes of a kind used in drilling for oil or gas, tubes and pipes suitable for use in boilers, superheaters, heat exchangers, condensers, refining furnaces, feedwater heaters for power stations, galvanised or black tubes (so-called gas tubes) for high or medium pressure steam, or gas or water distribution in buildings, as well as tubes for water or gas street distribution mains. In addition tubes and pipes are used for the manufacture of parts for automobiles or for machinery, of rings for ball bearings, cylindrical, tapered or needle bearings or for other mechanical uses, for scaffolding, tubular structures or building construction.

The heading **excludes** :

- (a) Tubes and pipes of cast iron (**heading 73.03**) and tubes and pipes of iron or steel of **heading 73.05** or **73.06**.
- (b) Hollow profiles of cast iron (**heading 73.03**) and hollow profiles of iron or steel of **heading 73.06**.
- (c) Tube or pipe fittings of iron or steel (**heading 73.07**).
- (d) Flexible tubing of iron or steel with or without fittings (including thermostatic bellows and expansion joints) (**heading 83.07**).
- (e) Insulated electrical conduit tubing (**heading 85.47**).
- (f) Tubes, pipes and hollow profiles made up into specific identifiable articles, e.g., those prepared for use in structures (**heading 73.08**), tubular sections of central heating radiators (**heading 73.22**), exhaust manifolds for internal combustion piston engines (**heading 84.09**), other machinery parts (**Section XVI**), exhaust boxes (silencers) and exhaust pipes of vehicles of Chapter 87 (e.g., **heading 87.08** or **87.14**), saddle pillars and frames for cycles (**heading 87.14**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheadings 7304.11, 7304.19, 7304.22, 7304.23, 7304.24 and 7304.29

These subheadings cover all such articles irrespective of the standards or technical specifications which they meet (e.g., American Petroleum Institute (API) standards 5L or 5LU for line pipe and API standards 5A, 5AC or 5AX for casing, tubing and drill pipe).

Subheadings 7304.31, 7304.39, 7304.41, 7304.49, 7304.51 and 7304.59

In order to distinguish between the cold worked products and the other products of these subheadings, see the General Explanatory Note to Chapter 72, Part IV (B), second paragraph.

73.05 - Other tubes and pipes (for example, welded, riveted or similarly closed), having circular cross-sections, the external diameter of which exceeds 406.4 mm, of iron or steel (+).

- Line pipe of a kind used for oil or gas pipelines :

7305.11 -- Longitudinally submerged arc welded

7305.12 -- Other, longitudinally welded

7305.19 -- Other

7305.20 - Casing of a kind used in drilling for oil or gas

- Other, welded :

7305.31 -- Longitudinally welded

7305.39 -- Other

7305.90 - Other

The tubes and pipes of this heading are obtained, for example, by welding or riveting preformed, unclosed, tubular shapes produced from flat-rolled products.

The tubular shapes can be produced :

- longitudinally or spirally in a continuous operation by means of a set of rollers, for flat-rolled products in coils; or
- longitudinally in a non-continuous operation by means of a press or rolling machine, for flat-rolled products not in coils.

In the case of welded articles, the abutting edges are welded without filler metal by flash-welding, by electrical resistance or induction welding, or by submerged arc welding with filler metal and flux or gas protection to prevent oxidation. As regards products obtained by riveting, the abutting edges are overlapped and joined by rivets.

The products of this heading may be coated with, for example, plastics or with glass wool combined with bitumen.

They include line pipes of a kind used for oil or gas, casings for oil or gas wells, tubes for long distance waterlines or slurry mains for coal or other solid materials, tubes for piling or structural columns, as well as hydroelectric conduits, usually reinforced with rings.

*
* * *

The heading **does not cover** :

- (a) Tubes, pipes and hollow profiles, of heading **73.03, 73.04 or 73.06**.
- (b) Tube or pipe fittings of iron or steel (**heading 73.07**).
- (c) Tubes or pipes made up into specific identifiable articles.

○
○ ○

Subheading Explanatory Notes.

Subheadings 7305.11, 7305.12, 7305.19 and 7305.20

The provisions of the Explanatory Note to subheadings 7304.11, 7304.19, 7304.22, 7304.23, 7304.24 and 7304.29 apply, *mutatis mutandis*, to these subheadings.

Subheading 7305.11

This subheading covers tubes manufactured from steel plate by forming in a press or by rolling, and by welding by an electric arc with the addition of metal and with flux to prevent oxidation of the metal at the moment of fusion.

After welding there is a raised bead of metal, the “ weld bead ”, which is clearly visible on the external surface of the finished tube.

Subheading 7305.12

This subheading covers mainly tubes manufactured from coils of steel by continuous forming through a train of forming rolls and electric welding by resistance or induction without the addition of metal. After welding there is no raised bead of metal on the external surface of the finished tube.

73.06 - Other tubes, pipes and hollow profiles (for example, open seam or welded, riveted or similarly closed), of iron or steel (+).

- Line pipe of a kind used for oil or gas pipelines :

7306.11 -- Welded, of stainless steel

7306.19 -- Other

- Casing and tubing of a kind used in drilling for oil or gas :

7306.21 -- Welded, of stainless steel

7306.29 -- Other

7306.30 - Other, welded, of circular cross-section, of iron or non-alloy steel

7306.40 - Other, welded, of circular cross-section, of stainless steel

7306.50 - Other, welded, of circular cross-section, of other alloy steel

- Other, welded, of non-circular cross-section :

7306.61 -- Of square or rectangular cross-section

7306.69 -- Of other non-circular cross-section

7306.90 - Other

The provisions of the Explanatory Note to heading 73.05 apply, *mutatis mutandis*, to the articles of this heading.

This heading also includes :

- (1) Tubes and pipes welded by forging, known as butt-welded tubes and pipes.
- (2) Tubes and pipes with closed edges, i.e. tubes and pipes, in which the edges touch or cover each other and which are known as open seam tubes. However, products having an open slit along the whole length are classified as sections in **heading 72.16, 72.22 or 72.28**.
- (3) Tubes and pipes in which the abutting edges are joined by clipping.

Certain longitudinally welded tubes and pipes of this heading have undergone hot or cold drawing or rolling to obtain products having a reduced outside diameter or wall thickness and tighter size tolerances. These cold-working methods also allow different surface finishes to be obtained including **polished surfaces**, as mentioned in the Explanatory Note to heading 73.04.

See the General Explanatory Note to this Chapter concerning the distinction between tubes and pipes and hollow profiles.

*
* * *

This heading includes, in particular, line pipes of a kind used for oil or gas, casing and tubing of a kind used in drilling for oil or gas, tubes and pipes suitable for use in boilers, superheaters, heat exchangers, condensers, feed-water heaters for power stations, galvanised or black tubes (so-called gas tubes) for high or medium pressure steam or water distribution in buildings, as well as tubes for water or gas street distribution mains. In addition tubes, pipes and hollow profiles are used for the manufacture of parts for automobiles or for machinery, bicycle frames, prams, or for other structural uses, scaffolding or tubular structures or building construction. "Open seam" tubes are used, for example, as frames for metal furniture.

This heading also includes tubes, pipes and hollow profiles coated with plastics or with glass wool combined with bitumen as well as finned or gilled tubes with longitudinal or transversal fins.

The heading **excludes** :

- (a) Tubes and pipes of cast iron (**heading 73.03**) and tubes and pipes of iron or steel of **heading 73.04** or **73.05**.
- (b) Hollow profiles of cast iron (**heading 73.03**) and hollow profiles of iron or steel of **heading 73.04**.
- (c) Tube or pipe fittings of iron or steel (**heading 73.07**).
- (d) Flexible tubing of iron or steel, with or without fittings (including thermostatic bellows and expansion joints) (**heading 83.07**).
- (e) Insulated electrical conduit tubing (**heading 85.47**).
- (f) Tubes, pipes and hollow profiles made up into specific identifiable articles, e.g., those prepared for use in structures (**heading 73.08**), tubular sections of central heating radiators (**heading 73.22**), exhaust manifolds for internal combustion piston engines (**heading 84.09**), other machinery parts (**Section XVI**), exhaust boxes (silencers) and exhaust pipes of vehicles of Chapter 87 (e.g., **heading 87.08** or **87.14**), saddle pillars and frames for cycles (**heading 87.14**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 7306.11, 7306.19, 7306.21 and 7306.29

The provisions of the Explanatory Note to subheadings 7304.11, 7304.19, 7304.22, 7304.23, 7304.24 and 7304.29 apply, *mutatis mutandis*, to these subheadings.

73.07 - Tube or pipe fittings (for example, couplings, elbows, sleeves), of iron or steel.

- Cast fittings :

7307.11 -- Of non-malleable cast iron

7307.19 -- Other

- Other, of stainless steel :

7307.21 -- Flanges

7307.22 -- Threaded elbows, bends and sleeves

7307.23 -- Butt welding fittings

7307.29 -- Other

- Other :

7307.91 -- Flanges

7307.92 -- Threaded elbows, bends and sleeves

7307.93 -- Butt welding fittings

7307.99 -- Other

This heading covers fittings of iron or steel, mainly used for connecting the bores of two tubes together, or for connecting a tube to some other apparatus, or for closing the tube aperture. This heading **does not** however **cover** articles used for installing pipes and tubes but which do not form an integral part of the bore (e.g., hangers, stays and similar supports which merely fix or support the tubes and pipes on walls, clamping or tightening bands or collars (hose clips) used for clamping flexible tubing or hose to rigid piping, taps, connecting pieces, etc.) (**heading 73.25 or 73.26**).

The connection is obtained :

- by screwing, when using cast iron or steel threaded fittings;
- or by welding, when using butt-welding or socket-welding steel fittings. In the case of butt-welding, the ends of the fittings and of the tubes are square cut or chamfered;
- or by contact, when using removable steel fittings.

This heading therefore includes flat flanges and flanges with forged collars, elbows and bends and return bends, reducers, tees, crosses, caps and plugs, lap joint stub-ends, fittings for tubular railings and structural elements, off sets, multi-branch pieces, couplings or sleeves, clean out traps, nipples, unions, clamps and collars.

The heading **excludes** :

- (a) Clamps and other devices specially designed for assembling parts of structures (**heading 73.08**).
- (b) Bolts, nuts, screws, etc., suitable for use in the assembly of tube or pipe fittings (**heading 73.18**).
- (c) Thermostatic bellows and expansion joints (**heading 83.07**).
- (d) Hangers, stays and the like, as described above; and tube plugs, threaded or not, fitted with a ring, hook, etc. (e.g., those used for fixing washing lines) (**heading 73.26**).
- (e) Fittings equipped with taps, cocks, valves, etc. (**heading 84.81**).
- (f) Insulated joints for electrical conduit tubing (**heading 85.47**).
- (g) Connections for assembling bicycle or motorcycle frames (**heading 87.14**).

73.08 - Structures (excluding prefabricated buildings of heading 94.06) and parts of structures (for example, bridges and bridge-sections, lock-gates, towers, lattice masts, roofs, roofing frame-works, doors and windows and their frames and thresholds for doors, shutters, balustrades, pillars and columns), of iron or steel; plates, rods, angles, shapes, sections, tubes and the like, prepared for use in structures, of iron or steel.(+)

7308.10 - Bridges and bridge-sections

7308.20 - Towers and lattice masts

7308.30 - Doors, windows and their frames and thresholds for doors

7308.40 - Equipment for scaffolding, shuttering, propping or pit-propping

7308.90 - Other

This heading covers complete or incomplete metal structures, as well as parts of structures. For the purpose of this heading, these structures are characterised by the fact that once they are put in position, they generally remain in that position. They are usually made up from bars, rods, tubes, angles, shapes, sections, sheets, plates, wide flats including so-called universal plates, hoop, strip, forgings or castings, by riveting, bolting, welding, etc. Such structures sometimes incorporate products of other headings such as panels of woven wire or expanded metal of heading 73.14. Parts of structures include clamps and other devices specially designed for assembling metal structural elements of round cross-section (tubular or other). These devices usually have protuberances with tapped holes in which screws are inserted, at the time of assembly, to fix the clamps to the tubing.

Apart from the structures and parts of structures mentioned in the heading, the heading also includes products such as :

Pit head frames and superstructures; adjustable or telescopic props, tubular props, extensible coffering beams, tubular scaffolding and similar equipment; sluice-gates, piers, jetties and marine moles; lighthouse superstructures; masts, gangways, rails, bulkheads, etc., for ships; balconies and verandahs; shutters, gates, sliding doors; assembled railings and fencing; level-crossing gates and similar barriers; frameworks for greenhouses and forcing frames; large-scale shelving for assembly and permanent installation in shops, workshops, storehouses, etc.; stalls and racks; certain protective barriers for motorways, made from sheet metal or from angles, shapes or sections.

The heading also covers parts such as flat-rolled products, "wide flats" including so-called universal plates, strip, rods, angles, shapes, sections and tubes, which have been prepared (e.g., drilled, bent or notched) for use in structures.

The heading further covers products consisting of separate rolled bars twisted together, which are also used for reinforced or pre-stressed concrete work.

The heading **does not cover** :

(a) Assembled sheet piling (**heading 73.01**).

(b) Cofferage panels intended for pouring concrete, having the character of moulds (**heading 84.80**).

- (c) Constructions clearly identifiable as machinery parts (**Section XVI**).
- (d) Constructions of **Section XVII** such as railway and tramway track fixtures and fittings, and mechanical signalling equipment, of **heading 86.08**; chassis frames for railway rolling-stock, etc., or motor vehicles (**Chapter 86 or 87**), and the floating structures of **Chapter 89**.
- (e) Movable shelved furniture (**heading 94.03**).

○
○ ○

Subheading Explanatory Note.

Subheading 7308.30

This subheading also covers security doors of steel, for all types of dwellings.

73.09 - Reservoirs, tanks, vats and similar containers for any material (other than compressed or liquefied gas), of iron or steel, of a capacity exceeding 300 l, whether or not lined or heat-insulated, but not fitted with mechanical or thermal equipment.

These containers are normally installed as fixtures for storage or manufacturing use, e.g., in factories, chemical works, dye works, gasworks, breweries, distilleries and refineries, and to a smaller extent in houses, shops, etc. This heading covers containers for any material **other than** compressed or liquefied gas. Containers for such gas are classified in **heading 73.11**, irrespective of their capacity. Containers fitted with mechanical or thermal equipment such as agitators, heating or cooling coils or electrical elements fall in **Chapter 84** or **85**.

On the other hand containers which have simply been fitted with taps, valves, level gauges, safety valves, manometers, etc., remain in this heading.

The containers may be open or closed, lined with ebonite, plastics or non-ferrous metals, or fitted with heat-insulating covering (e.g., asbestos, slag wool or glass wool), whether or not this lagging is protected by an outer sheet metal casing.

The heading also includes containers insulated by means of double walls or double bottoms **subject to** there being no provision for circulating heating or cooling fluids between the walls. (Containers with such provision are **excluded**, see **heading 84.19**.)

The heading includes:

Petrol or oil reservoirs; vats used in malt-houses for soaking barley; fermentation vats for liquids (wine, beer, etc.); decanting or clarifying vats for liquids of all kinds; vats for tempering and annealing metal goods; water storage tanks (domestic or otherwise) including expansion reservoirs for central heating equipment; containers for solids.

The heading also **excludes** containers specially designed and equipped for carriage by one or more modes of transport (**heading 86.09**).

73.10 - Tanks, casks, drums, cans, boxes and similar containers, for any material (other than compressed or liquefied gas), of iron or steel, of a capacity not exceeding 300 l, whether or not lined or heat-insulated, but not fitted with mechanical or thermal equipment.

7310.10 - Of a capacity of 50 l or more

- Of a capacity of less than 50 l :

7310.21 -- Cans which are to be closed by soldering or crimping

7310.29 -- Other

Whereas the preceding heading applies to containers of a capacity exceeding 300 l, normally installed as fixtures in factories, etc., this heading covers sheet or plate iron or steel containers of a capacity not exceeding 300 l, but of a size easily moved or handled, commonly used for the commercial conveyance and packing of goods, and such containers installed as fixtures.

The larger containers covered by this heading include tar or oil drums; petrol cans; milk churns; casks and drums for alcohol, latex, caustic soda, calcium carbide, dyestuffs or other chemicals. The smaller containers include boxes, cans, tins, etc., mainly used as sales packings for butter, milk, beer, preserves, fruit or fruit juices, biscuits, tea, confectionery, tobacco, cigarettes, shoe cream, medicaments, etc.

Casks and drums in particular may be hooped or otherwise fitted to facilitate rolling or handling, or be reinforced. All the containers may be equipped with tap-holes, bungs, lids or other closures to facilitate filling and emptying.

The heading also includes casks, etc., insulated by means of double walls or bottoms **subject** to there being no provision for circulating heating or cooling fluids between the walls. (Containers with such provisions are **excluded**, see **heading 84.19**.)

This heading also **excludes** :

- (a) Articles of **heading 42.02**.
- (b) Biscuit barrels, tea caddies, sugar tins and similar household or kitchen containers and canisters (**heading 73.23**).
- (c) Cigarette cases, powder compacts, tool boxes and similar containers for personal or professional use (**heading 73.25** or **73.26**).
- (d) Safes, cash or deed boxes, and the like (**heading 83.03**).
- (e) Articles of **heading 83.04**.
- (f) Ornamental boxes (**heading 83.06**).
- (g) Containers specially designed and equipped for carriage by one or more modes of transport (**heading 86.09**).
- (h) Vacuum flasks and other vacuum vessels complete with their cases, of **heading 96.17**.

73.11 - Containers for compressed or liquefied gas, of iron or steel.

This heading covers containers of any capacity used for the transport or storage of compressed or liquefied gases (e.g., helium, oxygen, argon, hydrogen, acetylene, carbon dioxide or butane).

Some are strong cylinders, tubes, bottles, etc., tested at high pressure; these may be weldless or welded (e.g., at the bases, round the middle or along the length). Others consist of an inner vessel and one or more outer shells, the intervening space being packed with insulating material, maintained under vacuum or arranged to contain a cryogenic fluid, thus enabling certain liquefied gases to be kept at atmospheric pressure or low pressure.

These containers may be fitted with control, regulating and measuring devices such as valves, taps, pressure gauges, level indicators, etc.

Some (e.g., for acetylene) contain an inert porous substance such as kieselguhr, charcoal or asbestos, with a binder such as cement and sometimes impregnated with acetone, to facilitate filling and to prevent the risk of explosion if acetylene were compressed alone.

In others, such as those designed to supply liquid or gas as required, the liquefied gas is vapourised solely under the influence of the atmospheric temperature, by passing through a coil attached to the inner wall of the outer shell.

The heading **excludes** steam accumulators (**heading 84.04**).

73.12 - Stranded wire, ropes, cables, plaited bands, slings and the like, of iron or steel, not electrically insulated.

7312.10 - Stranded wire, ropes and cables

7312.90 - Other

The heading covers stranded wire (or wire strand) obtained by closely twisting together two or more single wires, and cables and ropes of all sizes which are in turn formed by twisting such strands together. **Provided** they remain essentially articles of iron or steel wire, ropes and cables may be laid on textile cores (hemp, jute, etc.) or covered with textiles, plastics, etc.

Ropes and cables are generally round in cross-section, but the heading also includes bands, usually of rectangular (including square) section, formed by plaiting single or stranded wires.

The heading includes such ropes, cables, bands, etc., whether or not they are cut to length, or fitted with hooks, spring hooks, swivels, rings, thimbles, clips, sockets, etc. (**provided** that they do not thereby assume the character of articles of other headings), or made up into single or multiple slings, strops, etc.

These goods are used for hoisting (with cranes, winches, pulleys, lifts, etc.) in mining, quarrying, shipping, etc.; for hauling or towing; as hawsers; as transmission belting; as rigging or guying for masts, pylons, etc.; as fencing strand; as stone sawing strand (usually three-ply stranded wire of special steel), etc.

The heading **does not include** :

- (a) Barbed wire, and loosely twisted, non-barbed, double fencing wire ("torsades") (**heading 73.13**).
- (b) Insulated electric cable (**heading 85.44**).
- (c) Brake cables, accelerator cables and similar cables suitable for use in vehicles of **Chapter 87**.

73.13 - Barbed wire of iron or steel; twisted hoop or single flat wire, barbed or not, and loosely twisted double wire, of a kind used for fencing, of iron or steel.

This heading covers the following types of fencing or enclosure hoop and wire (wire as defined in Chapter Note 2) :

- (1) Barbed wire consisting of iron or steel wires twisted together rather loosely, with barbs or sometimes small sharp pieces of strip metal at frequent intervals.
- (2) Narrow flat hoop or wire toothed at intervals and used as an alternative to barbed wire.
- (3) Twisted hoop or single flat wire. This ribbon fencing wire is often used under the name of "torsades". It consists of narrow hoop, strip or flat wire which may be lightly twisted. These goods fall in the heading whether or not they are barbed.
- (4) Loosely twisted wire consisting of two wires of iron or steel and clearly suitable for fencing uses. This is also known as "torsades".

The heading also includes "dannerts" and similar barbed wire entanglements, sometimes already mounted on wooden or metal poles, used for military purposes, for fencing, etc.

The hoop and wire used are generally galvanised or otherwise coated (e.g., covered with plastics).

The heading **excludes** closely twisted stranded wire or cable, also sometimes used for fencing (**heading 73.12**).

73.14 - Cloth (including endless bands), grill, netting and fencing, of iron or steel wire; expanded metal of iron or steel (+).

- Woven cloth :

7314.12 -- Endless bands for machinery, of stainless steel

7314.14 -- Other woven cloth, of stainless steel

7314.19 -- Other

7314.20 - Grill, netting and fencing, welded at the intersection, of wire with a maximum cross-sectional dimension of 3 mm or more and having a mesh size of 100 cm² or more

- Other grill, netting and fencing, welded at the intersection :

7314.31 -- Plated or coated with zinc

7314.39 -- Other

- Other cloth, grill, netting and fencing :

7314.41 -- Plated or coated with zinc

7314.42 -- Coated with plastics

7314.49 -- Other

7314.50 - Expanded metal

(A) CLOTH (INCLUDING ENDLESS BANDS), GRILL, NETTING AND FENCING

The products of this group are, in the main, produced by interlacing, interweaving, netting, etc., iron or steel wire by hand or machine. The methods of manufacture broadly resemble those used in the textile industry (for simple warp and weft fabrics, knitted or crocheted fabrics, etc.).

The group includes wire grill in which the wires are welded at the points of contact or bound at those points by means of an additional wire, whether or not the wires are also interlaced.

The term "wire" means hot- or cold-formed products of any cross-sectional shape, of which no cross-sectional dimension exceeds 16 mm, such as rolled wire, wire rod and flat strip cut from sheet (see Note 2 to this Chapter).

The material of the heading may be used for many purposes e.g., for the washing, drying or filtering of many materials; to make fencing, food protecting covers and insect screening, safety guards for machinery, conveyor belting, shelving, mattresses, upholstery, sieves and riddles, etc.; and for reinforcing concrete, etc.

The material may be in rolls, in endless bands (e.g., for belting) or in sheets, whether or not cut to shape; it may be of two or more ply.

(B) EXPANDED METAL

Expanded metal is a network of diamond shaped meshes formed by stretching sheet or strip metal in which parallel incisions have been cut.

The material is fairly rigid and strong, and is used instead of wire grill or perforated sheets for fencing, safety guards for machines, flooring of foot-bridges or crane runways, reinforcement of various building materials (e.g., concrete, cement, plaster, glass), etc.

*
* * *

Apart from articles made up of wire netting which are **excluded** generally from this heading, the following fall in other Chapters, viz. :

- (a) Woven fabric of metal thread, of a kind used in articles of apparel, as furnishing fabric or the like (**heading 58.09**).
- (b) Plastics or asbestos reinforced with wire mesh, wired glass (**Chapters 39, 68 and 70**, respectively); bricardon lath (a wire mesh incorporated in kilned clay and used for building purposes) (**Chapter 69**); paper roofing sheets usually tarred and reinforced with wire mesh (**Chapter 48**). However, woven wire, etc., lightly coated in plastics (even if the meshes are filled), and wire netting or grill with a backing of paper as used in cementing, plastering, etc., remain in this heading.
- (c) Wire cloth, etc., made into the form of machinery parts, e.g., by assembly with other materials (**Chapter 84 or 85**).
- (d) Wire cloth, etc., made up into hand sieves and riddles (**heading 96.04**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 7314.12, 7314.14 and 7314.19

The term "woven cloth" applies only to wire products manufactured in the same manner as textile woven fabrics, with two thread systems crossing at right angles.

Cloth is generally plain weave, although it may also be twill or other weave. The weft is a continuous strand which runs back and forth across the warp. Cloth is produced on continuous action looms. The points at which the strands intersect may be reinforced (for example, by binding with an extra strand). Wovens of this kind may consist of relatively widely-spaced strands, giving a square-mesh grill effect. The crimped varieties are made from crimped strands; the crimps interlock, making the points of intersection more rigid. Alternatively, the cloth may be woven from straight strands, then pressed; the resulting deformation at the points of intersection reinforces the weave.

Cloth may be put up in rolls or in sheets cut to length or cut to shape; the edges of the sheets may be welded or brazed.

73.15 - Chain and parts thereof, of iron or steel.

- Articulated link chain and parts thereof :

7315.11 -- Roller chain

7315.12 -- Other chain

7315.19 -- Parts

7315.20 - Skid chain

- Other chain :

7315.81 -- Stud-link

7315.82 -- Other, welded link

7315.89 -- Other

7315.90 - Other parts

This heading covers chains of cast iron (usually malleable cast iron), wrought iron or steel, regardless of their dimensions, process of manufacture or, in general, their intended use.

It includes articulated link chain (e.g., roller chain, inverted tooth ("silent") chain and Galle chain), non-articulated link chain including stud-link chain (whether forged, cast, welded, stamped from sheet or strip metal or made from wire, etc.), and ball chain.

The heading includes :

- (1) Transmission chains for cycles, automobiles or machinery.
- (2) Anchor or mooring chains; lifting, haulage or towing chains; automobile skid chains.
- (3) Mattress chains, chains for sink stoppers, lavatory cisterns, etc.

All these chains may be fitted with terminal parts or accessories (e.g., hooks, spring hooks, swivels, shackles, sockets, rings and split rings and tee pieces). They may or may not be cut to length, or obviously intended for particular uses.

Iron or steel parts of chains specialised as such e.g., side links, rollers, spindles, etc., for articulated chain, links and shackles for non-articulated chain, also fall in this heading.

The heading **does not cover** :

- (a) Chains having the character of imitation jewellery in the sense of **heading 71.17** (e.g., watch chains and trinket chains).

- (b) Chains fitted with cutting teeth, etc., and used as chain saws or cutting tools (**Chapter 82**), or other articles in which chains play a subsidiary role such as bucket chains, conveyor hook chains or stretchers for textile finishing.
- (c) Door guards fitted with chains (**heading 83.02**).
- (d) Surveying chains (**heading 90.15**).

73.16 - Anchors, grapnels and parts thereof, of iron or steel.

This heading refers **only** to the type of **anchors** used for mooring ships of all tonnages, offshore-platforms, buoys, beacons, floating mines, etc.; it **does not include** other articles sometimes called "anchors" (e.g., those used for joining masonry or for fixing rafters to the walls of buildings).

Anchors may be fitted with a cross piece or stock, sometimes of wood, and the arms of flukes may or may not be rigid.

The heading also covers **grapnels**; these are smaller than anchors and have more than two arms (usually four) but no stock. They are used for anchoring small craft, to seize hold of other craft, etc., to retrieve sunken objects and to obtain a grip on trees, rocks, etc.

The heading also covers **parts** of anchors or grapnels.

73.17 - Nails, tacks, drawing pins, corrugated nails, staples (other than those of heading 83.05) and similar articles, of iron or steel, whether or not with heads of other material, but excluding such articles with heads of copper.

The heading covers :

(A) **Nails, tacks, staples (other than those of heading 83.05) and similar articles**, usually manufactured by the following methods :

- (1) Cold pressing from wire of the required thickness. Such wire nails usually have flat or rounded heads, though some are headless and pointed at one or both ends. Tapered shank nails and tacks are made in the same way except that they are sheared obliquely.
- (2) Forging (by hand or machine) from an iron shank of the required thickness which is hammered to a point, after which the head is stamped out by a nail-making machine.
- (3) Cutting from sheet or strip followed, if necessary, by finishing either mechanically or by hand.
- (4) Hot-rolling bars in nail mills which shape the head and shank simultaneously.
- (5) Die stamping of the head from a small disc of metal, the previously prepared shank being fixed at the same time. This process is normally used for nails with rounded heads such as upholstery nails.
- (6) Casting.

There are many types of these goods including :

Wire nails of uniform cross-section as used by carpenters, etc.; moulders' nails; glazing nails; cobblers' nails; staples (insulated or not) pointed at both ends, for electric wiring, picture frames, fencing, etc. and other staples not presented in strips; pointed screw-nails with twisted shanks and unslotted heads; tacks and sprigs for cobblers, upholsterers, etc.; hobnails for heavy duty footwear; nails for pictures, mirrors, fencing, etc.; unthreaded nails for shoeing animals; unthreaded frost studs for animals; small triangles, etc. (usually of tin-plate) used for fixing window-panes; decorative studs for upholsterers; studs for marking railway sleepers.

(B) **Other special types of nails, spikes, etc., such as :**

- (1) **Forged cramps or dogs** (generally with angular shanks which are bent at right angles and pointed at the ends) used for fastening masonry, heavy timbers, etc.; dog spikes used for fixing the rails to the sleepers.
- (2) **Corrugated nails** with one edge serrated or bevelled, for assembling wooden parts; they are classified in this heading even if presented in the length (in the form of strip).

(3) **Hook-nails and ring nails** which may be stamped from sheet metal or forged. One end is pointed and the other bent at right angles or into a ring used to suspend various objects.

(4) **Drawing pins** of all kinds, for drawing-boards, offices, etc., with flat or rounded heads.

(5) **Carding tacks** for textile carding machines and the like.

All the above-mentioned goods remain in the heading whether or not they have heads of non-ferrous metal (**other than** copper or its alloys) or of other substances (porcelain, glass, wood, rubber, plastics, etc.), and whether or not they have been plated, copper-plated, gilded, silvered, varnished, etc., or covered with other material.

The heading **does not include** :

- (a) Screw hooks, screw rings, pointed drive screws with slotted heads and unpointed drive screws (**heading 73.18**).
- (b) Shoe-protectors, with or without affixing points; picture hooks with fixing nails; belt fasteners (**heading 73.26**).
- (c) Nails, tacks, etc., with heads of copper or copper alloys (**heading 74.15**).
- (d) Staples in strips (e.g., for offices, upholstery, packaging) (**heading 83.05**).
- (e) Piano pegs (**heading 92.09**).

73.18 - Screws, bolts, nuts, coach screws, screw hooks, rivets, coppers, cotter-pins, washers (including spring washers) and similar articles, of iron or steel (+).

- Threaded articles :

7318.11 -- Coach screws

7318.12 -- Other wood screws

7318.13 -- Screw hooks and screw rings

7318.14 -- Self-tapping screws

7318.15 -- Other screws and bolts, whether or not with their nuts or washers

7318.16 -- Nuts

7318.19 -- Other

- Non-threaded articles :

7318.21 -- Spring washers and other lock washers

7318.22 -- Other washers

7318.23 -- Rivets

7318.24 -- Cotters and cotter-pins

7318.29 -- Other

(A) SCREWS, BOLTS AND NUTS

Bolts and nuts (including bolt ends), screw studs and other screws for metal, whether or not threaded or tapped, screws for wood and coach-screws are threaded (in the finished state) and are used to assemble or fasten goods so that they can readily be disassembled without damage.

Bolts and screws for metal are cylindrical in shape, with a close and only slightly inclined thread; they are rarely pointed, and may have slotted heads or heads adapted for tightening with a spanner or they may be recessed. A bolt is designed to engage in a nut, whereas screws for metal are more usually screwed into a hole tapped in the material to be fastened and are therefore generally threaded throughout their length whereas bolts usually have a part of the shank unthreaded.

The heading includes all types of fastening bolts and metal screws regardless of shape and use, including **U-bolts**, **bolt ends** (i.e., cylindrical rods threaded at one end), **screw studs** (i.e., short rods threaded at both ends), and **screw studding** (i.e., rods threaded throughout).

Nuts are metal pieces designed to hold the corresponding bolts in place. They are usually tapped throughout but are sometimes blind. The heading includes wing nuts, butterfly nuts, etc. Lock nuts (usually thinner and castellated) are sometimes used with bolts.

Blanks for bolts and untapped nuts are also included in the heading.

Screws for wood differ from bolts and screws for metal in that they are tapered and pointed, and they have a steeper cutting thread since they have to bite their own way into the material. Further, wood screws almost always have slotted or recessed heads and they are never used with nuts.

Coach screws (screw spikes) are large wood screws with square or hexagonal unslotted heads. They are used to fix railway lines to the sleepers and to assemble rafters and similar heavy woodwork.

The heading includes **self-tapping (Parker) screws**; these resemble wood screws in that they have a slotted head and a cutting thread and are pointed or tapered at the end. They can therefore cut their own passage into thin sheets of metal, marble, slate, plastics, etc.

The heading also covers all **unpointed drive screws (or screw nails)**, and also those which are pointed **provided** that their heads are slotted. Drive screws have very steep threads and are often driven into the material with a hammer, but often can be withdrawn only by use of a screwdriver.

This group **excludes** :

- (a) Pointed screw-nails with unslotted heads (**heading 73.17**).
- (b) Screw stoppers (**heading 83.09**).
- (c) Threaded mechanisms, sometimes called screws, used to transmit motion, or otherwise to act as an active part of a machine, (e.g., Archimedian screws; worm mechanisms and threaded shafts for presses; valve and cock closing mechanisms, etc.) (**Chapter 84**).
- (d) Piano pegs and similar threaded parts of musical instruments (**heading 92.09**).

(B) SCREW HOOKS AND SCREW RINGS

These are used to suspend or fix other objects and differ from the hook-nails of the preceding heading only in that they are threaded.

(C) RIVETS

Rivets differ from the goods described above in that they are non-threaded; they are usually cylindrical with round, flat, pan shaped or countersunk heads.

They are used for the permanent assembly of metal parts (e.g., in large frameworks, ships and containers).

The heading **excludes** tubular or bifurcated rivets for all purposes (**heading 83.08**) but rivets which are only partly hollow remain classified in this heading.

(D) COTTER-PINS AND COTTERS

Cotter-pins, usually of bifurcated form, are used for fitting in holes in spindles, shafts, bolts, etc., to prevent objects mounted thereon from moving along them.

Cotters and taper pins are used for similar purposes but are usually larger and more solid, they may be designed, like cotter-pins, to pass through holes (in which case they are often wedge-shaped), or for fitting into grooves or slots cut round the shaft, spindle, etc., in which case they may be of various shapes such as horseshoe or conical.

Circlips are produced in different forms ranging from a simple ring with a gap to more complex shapes (with eyelets or notches to facilitate application by means of special pliers). They are always intended, whatever their shape, to be placed in a groove, either around a shaft or inside a cylindrical bore, to prevent the relative movement of parts.

(E) WASHERS

Washers are usually small, thin discs with a hole in the centre; they are placed between the nut and one of the parts to be fixed to protect the latter. They may be plain, cut, split (e.g., Grower's spring washers), curved, cone shaped, etc.

Subheading Explanatory Notes.

Subheading 7318.12

The term "screw" does not cover screw hooks and screw rings; these are classified in subheading 7318.13.

Subheading 7318.14

This subheading covers the **Parker** (self-tapping) **screws** described in Explanatory Note to heading 73.18, Part (A), eighth paragraph.

73.19 - Sewing needles, knitting needles, bodkins, crochet hooks, embroidery stilettos and similar articles, for use in the hand, of iron or steel; safety pins and other pins of iron or steel, not elsewhere specified or included.

7319.40 - Safety pins and other pins

7319.90 - Other

**(A) SEWING NEEDLES, KNITTING NEEDLES, BODKINS,
CROCHET HOOKS, EMBROIDERY STILETTOS AND
SIMILAR ARTICLES**

This heading covers needles used by hand for sewing, knitting, embroidering, crochet work, carpet-making, etc.

It includes :

- (1) **Sewing needles**, darning needles, embroidery needles, packing needles, mattress needles, sail-making needles, book-binding needles, upholstery needles, carpet-making and rug-making needles, cobblers' needles (including awls with an eye), needles with triangular ends for leatherwork, etc.
- (2) **Knitting needles** (long needles without eyes).
- (3) **Bodkins** of all kinds (including football lacers) for threading laces, string, ribbon, etc.
- (4) **Crochet hooks** (needles tapered to a hook at one end and used for crochet-work).
- (5) **Embroidery stilettos**, used to perforate the fabric in embroidery work.
- (6) **Netting needles**, pointed at one or both ends.

Certain of these articles are sometimes fitted with handles.

The heading also includes **blanks**, e.g., unfinished shanks (whether or not with eyes); needles with eyes but not sharpened or polished; embroidery stiletto and bodkin blades not yet fitted with a handle.

The heading **does not cover** :

- (a) Shoemakers' awls without eyes, and stiletto-type leather-working, office, etc., pricking or piercing tools (**heading 82.05**).
- (b) Machine needles for knitting, lace-making, embroidery, etc. (**heading 84.48**); sewing machine needles (**heading 84.52**).
- (c) Pick-up cartridge needles (**heading 85.22**).
- (d) Needles for medical, surgical, dental or veterinary use (**heading 90.18**).

(B) SAFETY PINS AND OTHER PINS NOT ELSEWHERE SPECIFIED OR INCLUDED

The pins of this group may have heads or other accessory parts of other base metals, glass, plastics, etc., **provided** that they do not become articles of an ornamental character and that they remain essentially iron or steel pins. The group includes :

- (1) Safety pins.
- (2) Ordinary pins.

The group also includes pointed shanks for brooches, badges (whether or not with swivel joints or connections), hatpins, etc.; pins and pointed shanks for fixing labels, mounting insects, etc.

The heading **does not cover** :

- (a) Tie-pins, badges, etc., hat-pins and similar articles of personal adornment (**heading 71.17**).
- (b) Drawing pins (**heading 73.17**).
- (c) Hair-slides; hair-pins; curling pins, curling grips, hair-curlers and the like (**heading 85.16 or 96.15**).

73.20 - Springs and leaves for springs, of iron or steel.

7320.10 - Leaf-springs and leaves therefor

7320.20 - Helical springs

7320.90 - Other

The heading covers iron or steel springs of all types, irrespective of their use, **other than** clock or watch springs of **heading 91.14**.

Springs are made from sheet metal, wire or rod of an elastic quality, in such a way that they have the property of returning to their original form even after considerable displacement. The heading includes the following types of springs :

- (A) **Leaf-springs** (single or laminated) chiefly used in the suspension systems of vehicles (e.g., railway locomotives and rolling stock, automobiles and carts).
- (B) **Helical springs** of which the two major groups are :
 - (1) **Helical coil springs**, comprising compression, tension and torsion springs, made from wire or rod of round or rectangular section. They are used for numerous purposes (e.g., in vehicles and general engineering).
 - (2) **Volute springs**, usually conical and made from wire or rod of rectangular or oval section or from flat strip. They are mainly used in shock-absorbers, buffers on rolling stock couplings, secateurs, hair clippers, etc.
- (C) **Flat springs and flat spiral springs** as used in spring operated motors, in locks, etc.
- (D) **Discs springs and ring springs** (as used in railway buffers, etc.).

Springs may be equipped with U-bolts (e.g., for leaf-springs) or other fittings for assembly or attachment.

Leaves for springs are also classified in this heading.

The heading **excludes** :

- (a) Springs for shafts or sticks of umbrellas or sunshades (**heading 66.03**).
- (b) Spring washers (**heading 73.18**).
- (c) Springs assembled with other articles to form, for example, automatic door closers (**heading 83.02**), identifiable parts of machinery (**Section XVI**) or of the apparatus and instruments of **Chapters 90, 91**, etc.
- (d) Shock absorbers, and torsion bars of **Section XVII**.

73.21 - Stoves, ranges, grates, cookers (including those with subsidiary boilers for central heating), barbecues, braziers, gas-rings, plate warmers and similar non-electric domestic appliances, and parts thereof, of iron or steel.

- Cooking appliances and plate warmers :

7321.11 -- For gas fuel or for both gas and other fuels

7321.12 -- For liquid fuel

7321.19 -- Other, including appliances for solid fuel

- Other appliances :

7321.81 -- For gas fuel or for both gas and other fuels

7321.82 -- For liquid fuel

7321.89 -- Other, including appliances for solid fuel

7321.90 - Parts

This heading covers a group of appliances which meet all of the following requirements :

- (i) be designed for the production and utilisation of heat for space heating, cooking or boiling purposes;
- (ii) use solid, liquid or gaseous fuel, or other source of energy (e.g., solar energy);
- (iii) be normally used in the household or for camping.

These appliances are identifiable, according to type, by one or more characteristic features such as overall dimensions, design, maximum heating capacity, furnace or grate capacity in the case of solid fuel, size of tank where liquid fuel is used. The yardstick for judging these characteristics is that the appliances in question must not operate at a level in excess of household requirements.

This heading includes :

- (1) Stoves, heaters, grates and fires of the type used for space heating, braziers, etc.
- (2) Gas and oil radiators incorporating heating elements, for the same use.
- (3) Kitchen ranges, stoves and cookers.
- (4) Ovens incorporating heating elements (e.g., for roasting, pastry and bread-making).
- (5) Spirit or pressure stoves, camping stoves, travelling stoves, etc.; gas-rings; plate warmers incorporating provision for heating elements.
- (6) Wash boilers with grates or other heating elements.

The heading also covers stoves incorporating subsidiary boilers for central heating. On the other hand the heading **excludes** appliances also using electricity for heating purposes, as in the case of combined gas-electric cookers for example (**heading 85.16**).

All these articles may be enamelled, nickel-plated, copper-plated, etc., fitted with accessories of other base metals, or lined with heat-resisting materials.

The heading also covers clearly identifiable iron or steel parts of the above-mentioned appliances (e.g., internal oven shelves, cooking-plates and rings, ash-pans, removable fire-boxes and fire-baskets, gas burners, oil burners, doors, grills, feet, guard rails, towel rails and plate racks).

The heading also **excludes** :

- (a) Central heating radiators, air heaters or hot air distributors, and parts thereof, of **heading 73.22**.
- (b) Ovens and boilers not adapted for fitting with heating elements (**heading 73.23**).
- (c) Blow lamps and portable forges (**heading 82.05**).
- (d) Furnace burners (**heading 84.16**).
- (e) Industrial or laboratory furnaces and ovens of **heading 84.17**.
- (f) Heating, cooking, roasting, distilling, etc., machinery or plant, and similar laboratory equipment of **heading 84.19**. That heading covers, *inter alia* :
 - (i) Non-electrical instantaneous or storage water-heaters (whether for domestic or non-domestic use).
 - (ii) Certain specialised heating, cooking, etc., apparatus which are not normally used in the household (for example, counter-type coffee percolators; deep fat friers; sterilisers, warming cupboards, drying cabinets and other steam or indirectly heated apparatus, often incorporating heating coils, double walls, double bottoms, etc.).
- (g) Electro-thermic apparatus of **heading 85.16**.

73.22 - Radiators for central heating, not electrically heated, and parts thereof, of iron or steel; air heaters and hot air distributors (including distributors which can also distribute fresh or conditioned air), not electrically heated, incorporating a motor-driven fan or blower, and parts thereof, of iron or steel.

- Radiators and parts thereof :

7322.11 - - Of cast iron

7322.19 - - Other

7322.90 - Other

This heading includes :

- (1) **Radiators** for central heating, i.e., space heating appliances consisting usually of an assembly of "sections" of flanged or gilled tubes or of hollow panels through which the water or steam from the boiler is circulated. Such radiators may be enclosed in casings of wood or metal.

This group also includes apparatus consisting of a combination of a radiator through which hot or cold water is circulated and of ejector nozzles through which conditioned air under pressure is passed. The two components are mounted in a common housing fitted with a grille. When the radiator unit is turned off, this apparatus serves as a distributor of conditioned air.

The heading **does not cover** air conditioning units (**heading 84.15**) or electric radiators (**heading 85.16**).

- (2) **Identifiable "sections" and other parts of radiators.**

The following are **not** regarded as parts :

- (a) Pipes and fittings to connect up central heating boilers and radiators (**headings 73.03 to 73.07**).
- (b) Radiator stands (**heading 73.25 or 73.26**).
- (c) Steam or hot water taps, cocks, etc. (**heading 84.81**).

- (3) **Air heaters**, using any type of fuel (e.g., coal, fuel oil, gas).

These self-contained heaters, fixed or mobile, consist mainly of a combustion chamber (with burner) or a grate, a heat exchanger (tube assembly, etc.) which transfers the heat given off by the combustion gases passing through it to the air travelling along its outer surface, and a motor-driven fan or blower. Generally these heaters are furnished with an exhaust flue for burnt gases.

Air heaters (fixed or mobile), which generate hot air for direct diffusion, differ from radiators incorporating their own heating elements (as described in the Explanatory Note to heading 73.21) by the fact that they incorporate a blowing device (fan or blower) which serves to distribute or direct the supply of hot air to the various areas which are to be heated.

Air heaters may be equipped with various ancillary devices such as burners (with their pump), electric fans to supply air to the burners, regulating or control instruments (thermostats, pyrostats, etc.), air filters, etc.

- (4) **Hot air distributors** which consist of an air heating element usually comprising an assembly of flanged or gilled tubes and an electric fan, mounted in a common housing provided with air outlets (grille or adjustable shutters).

These distributors are designed for connection to a central heating boiler and may be designed to stand on the ground, to be fixed to a wall or to be hung from the ceiling, from beams, pillars, etc.

Some of these appliances may also be provided with an outside-air intake enabling them to be used as fresh air distributors when their heating element is turned off.

The heading **does not**, however, **include** distributors of conditioned air which mix, under the control of a room thermostat, hot and cold air supplied under high pressure and which consist essentially of a mixing chamber and two inlet nozzles fitted with control valves operated by pneumatic actuators, the whole being mounted in a common housing and incorporating neither a radiator nor a motor-driven fan or blower (**heading 84.79**).

*
* *

Air heaters and hot air distributors are included in this heading wherever they are intended to be used. The heading therefore covers air heaters for space heating and for drying various materials (fodder, grain, etc.), and apparatus for heating vehicles of Section XVII. However, hot air distributors which use the heat produced by the engine of the vehicle and must necessarily be connected to the engine, fall to be classified in **Section XVII** by application of Note 1 (g) to Section XV and Note 3 to Section XVII.

- (5) **Identifiable parts** of air heaters or hot air distributors (heat exchangers, nozzles, direct diffusion conduits, dampers, grilles, etc.).

The following are, however, **not** regarded as **parts** :

- Pipes and fittings to connect up boilers with certain hot air distributors (**headings 73.03 to 73.07**).
- Fans (**heading 84.14**), air filters (**heading 84.21**), checking and automatically controlling appliances (**Chapter 90**), etc.

73.23 - Table, kitchen or other household articles and parts thereof, of iron or steel; iron or steel wool; pot scourers and scouring or polishing pads, gloves and the like, of iron or steel.

7323.10 - Iron or steel wool; pot scourers and scouring or polishing pads, gloves and the like

- Other :

7323.91 -- Of cast iron, not enamelled

7323.92 -- Of cast iron, enamelled

7323.93 -- Of stainless steel

7323.94 -- Of iron (other than cast iron) or steel, enamelled

7323.99 -- Other

(A) TABLE, KITCHEN OR OTHER HOUSEHOLD ARTICLES AND PARTS THEREOF

This group comprises a wide range of iron or steel articles, **not more specifically covered** by other headings of the Nomenclature, used for table, kitchen or other household purposes; it includes the same goods for use in hotels, restaurants, boarding-houses, hospitals, canteens, barracks, etc.

These articles may be cast, or of iron or steel sheet, plate, hoop, strip, wire, wire grill, wire cloth, etc., and may be manufactured by any process (moulding, forging, punching, stamping, etc.). They may be fitted with lids, handles or other parts or accessories of other materials **provided** that they retain the character of iron or steel articles.

The group includes :

- (1) **Articles for kitchen use** such as saucepans, steamers, pressure cookers, preserving pans, stew pans, casseroles, fish kettles; basins; frying pans, roasting or baking dishes and plates; grid-irons, ovens **not** designed to incorporate heating elements; kettles; colanders; frying baskets; jelly or pastry moulds; water jugs; domestic milk cans; kitchen storage tins and canisters (bread bins, tea caddies, sugar tins, etc.); salad washers; kitchen type capacity measures; plate racks, funnels.
- (2) **Articles for table use** such as trays, dishes, plates, soup or vegetable dishes, sauce tureens; sugar basins, butter dishes; milk or cream jugs; hors-d'oeuvres dishes; coffee pots and percolators (but **not including** domestic percolators provided with a heat source (**heading 73.21**)), tea pots; cups, mugs, tumblers; egg-cups, finger bowls; bread or fruit dishes and baskets; tea pot or similar stands; tea-strainers, cruets; knife-rests; wine cooling buckets, etc., wine pouring cradles; serviette rings, table cloth clips.

- (3) **Other household articles** such as wash coppers and boilers; dustbins, buckets, coal scuttles and hods; watering-cans; ash-trays; hot water bottles; bottle baskets; movable boot-scrappers; stands for flat irons; baskets for laundry, fruit, vegetables, etc.; letter-boxes; clothes-hangers, shoe trees; luncheon boxes.

The group also includes iron or steel **parts** of the articles listed above, such as lids, grips, handles, separating compartments for pressure cookers, etc.

(B) IRON OR STEEL WOOL; POT SCOURERS AND SCOURING OR POLISHING PADS, GLOVES AND THE LIKE

Iron or steel wool consists of very fine wire or strip matted together and usually put up in packets ready for retail sale.

Pot scourers, scouring or polishing pads, gloves and the like are made up from wire, strip, steel wool, etc., sometimes fitted with a handle; **provided** that they are essentially metal articles, these goods remain in the heading whether or not they are interwoven with textile materials.

Except for iron or steel wool which has a variety of uses, these goods are mainly used in the household (e.g., for scouring kitchen utensils or sanitary appliances, for polishing metal articles, for the care of floor-boards, parquet flooring, other wood floor coverings and other wood articles).

* * *

The heading **excludes** :

- (a) Cans, boxes and similar containers, of **heading 73.10**.
- (b) The stoves, grates, kitchen ranges, cookers, fires, etc., covered by **heading 73.21**.
- (c) Waste paper baskets (**heading 73.25** or **73.26** as the case may be).
- (d) Household articles having the character of tools, e.g., shovels of all kinds; cork-screws; cheese graters, etc.; larding needles; can openers; nut-crackers; bottle openers; curling irons, pressing irons; fire-tongs; egg whisks; waffling irons; coffee-mills, pepper-mills; mincers; juice extractors, vegetable pressers, vegetable mashers (**Chapter 82**).
- (e) Cutlery and spoons, forks, ladles, etc., of **headings 82.11 to 82.15**.
- (f) Safes, strong boxes, cash and deed boxes (**heading 83.03**).
- (g) Ornaments (**heading 83.06**).
- (h) Household scales (**heading 84.23**).
- (ij) Household electrical equipment of **Chapter 85** (in particular the appliances and apparatus of **headings 85.09** and **85.16**).
- (k) Small hanging meat safes and other furniture of **Chapter 94**.
- (l) Lamps and lighting fittings of **heading 94.05**.
- (m) Hand sieves (**heading 96.04**), cigarette lighters and other lighters (**heading 96.13**), vacuum flasks and other vacuum vessels of **heading 96.17**.

73.24 - Sanitary ware and parts thereof, of iron or steel.

7324.10 - Sinks and wash basins, of stainless steel

- Baths :

7324.21 - - Of cast iron, whether or not enamelled

7324.29 - - Other

7324.90 - Other, including parts

This heading comprises a wide range of iron or steel articles, **not more specifically covered** by other headings of the Nomenclature, used for sanitary purposes.

These articles may be cast, or of iron or steel sheet, plate, hoop, strip, wire, wire grill, wire cloth, etc., and may be manufactured by any process (moulding, forging, punching, stamping, etc.). They may be fitted with lids, handles or other parts or accessories of other materials **provided** that they retain the character of iron or steel articles.

The heading includes, baths, bidets, hip-baths, foot-baths, sinks, wash basins, toilet sets; soap dishes and sponge baskets; douche cans, sanitary pails, urinals, bedpans, chamber-pots, water closet pans and flushing cisterns whether or not equipped with their mechanisms, spittoons, toilet paper holders.

The heading **excludes** :

- (a) Cans, boxes and similar containers of **heading 73.10**.
- (b) Small hanging medicine and toilet wall cabinets and other furniture of **Chapter 94**.

73.25 - Other cast articles of iron or steel.

7325.10 - Of non-malleable cast iron

- Other :

7325.91 -- Grinding balls and similar articles for mills

7325.99 -- Other

This heading covers **all cast** articles of iron or steel, not elsewhere specified or included.

The heading includes, inspection traps, gratings, drain covers and similar castings for sewage, water, etc. systems; hydrant pillars and covers; drinking fountains; pillar-boxes, fire alarm pillars, bollards, etc.; gutters and gutter spouts; mine tubing; balls for use in grinding and crushing mills; metallurgical pots and crucibles **not** fitted with mechanical or thermal equipment; counterweights; imitation flowers, foliage, etc. (**except** articles of **heading 83.06**); mercury bottles.

This heading **does not cover** castings which are products falling in other headings of the Nomenclature (e.g., recognisable parts of machinery or mechanical appliances) or unfinished castings which require further working but have the essential character of such finished products.

The heading also **excludes** :

- (a) Articles of a kind described above obtained by processes other than casting (e.g., sintering) (**heading 73.26**).
- (b) Statues, vases, urns and crosses of the type used for decoration (**heading 83.06**).

73.26 - Other articles of iron or steel (+).

- Forged or stamped, but not further worked :

7326.11 -- Grinding balls and similar articles for mills

7326.19 -- Other

7326.20 - Articles of iron or steel wire

7326.90 - Other

This heading covers all iron or steel articles obtained by forging or punching, by cutting or stamping or by other processes such as folding, assembling, welding, turning, milling or perforating **other than** articles included in the preceding headings of this Chapter or covered by Note 1 to Section XV or included in **Chapter 82** or **83** or more specifically covered elsewhere in the Nomenclature.

The heading includes :

- (1) Horseshoes; boot or shoe protectors whether or not incorporating affixing points; tree climbing irons; non-mechanical ventilators; Venetian blinds; binding hoops for casks; iron or steel fittings for electric wiring (e.g., stays, clips, brackets); suspension or connecting devices for insulator chains (suspension rods, shackles, extensions, eyes or rings with stud connections, ball sockets, suspension clamps, dead-end clamps, etc.); **non-calibrated** steel balls (see Note 6 to Chapter 84); fencing posts, tent pegs, stakes for tethering livestock, etc.; hoops for garden borders, trainers for trees, sweet peas, etc.; turnbuckles for bracing fencing wires; tiles (**except** those for use in construction, which fall in **heading 73.08**) and gutters; clamping or tightening bands or collars (hose clips) used for clamping flexible tubing or hose to rigid piping, taps, etc.; hangers, stays and similar supports for fixing piping and tubing (**except** clamps and other devices specially designed for assembling tubular elements for metal structures, which fall in **heading 73.08**); capacity measures (**other than** domestic types - **heading 73.23**); thimbles; road studs; forged hooks, e.g., for cranes; snap hooks for all purposes; ladders and steps; trestles; supports or chaplets (**other than** moulders' nails, see **heading 73.17**) for foundry moulding cores; imitation flowers or foliage of wrought iron or steel (**but not including** articles of **heading 83.06** and imitation jewellery of **heading 71.17**).
- (2) Articles of wire, such as snares, traps, mouse-traps, eelpots and the like; wire ties for fodder, etc.; tyre tringles; duplex or twin wire for making textile loom healds and formed by soldering together two single wires; nose-rings for animals; mattress hooks, butchers' hooks, tile hangers, etc.; waste paper baskets.
- (3) Certain boxes and cases, e.g., tool boxes or cases, not specially shaped or internally fitted to contain particular tools with or without their accessories (see the Explanatory Note to heading 42.02); botanists', etc., collection or specimen cases, trinket boxes; cosmetic or powder boxes and cases; cigarette cases, tobacco boxes, cachou boxes, etc., but **not including** containers of **heading 73.10**, household containers (**heading 73.23**), nor ornaments (**heading 83.06**).

The heading also covers vacuum cup holders (suction grips) consisting of a base, a handle and a vacuum lever, and rubber discs, intended to be attached temporarily to an object (glass in particular) with a view to enabling the object to be moved.

This heading **does not cover** forgings which are products falling in other headings of the Nomenclature (e.g., recognisable parts of machinery or mechanical appliances) or unfinished forgings which require further working but have the essential character of such finished products.

The heading also **excludes** :

- (a) Articles of **heading 42.02**.
- (b) Reservoirs, tanks, vats and similar containers, of **heading 73.09** or **73.10**.
- (c) Cast articles of iron or steel (**heading 73.25**).
- (d) Office desk equipment, such as book ends, ink-stands, pen trays, blotters, paperweights and office-stamp stands (**heading 83.04**).
- (e) Statues, vases, urns and crosses of the type used for decoration (**heading 83.06**).
- (f) Large scale shelving for permanent installation in shops, workshops, storehouses, etc. (**heading 73.08**) and shelved furniture of **heading 94.03**.
- (g) Skeleton wire frames for making textile or paper lampshades (**heading 94.05**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 7326.11 and 7326.19

After forging or stamping, the products of these subheadings may have been subjected to the following working or surface treatments :

Removal of burrs, runouts and other stamping defects by rough burring, grinding, hammering, chiselling or filling; removal of annealing by acid dipping; simple sand-blasting; roughing or rough bleaching and other operations intended exclusively to detect flaws in the metal; application of rough coatings of graphite, oil, tar, red lead or similar products, clearly intended to protect the subjects against rust or other types of oxidation; stamping, punching, printing, etc., with simple inscriptions, such as trademarks.

Chapter 74

Copper and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Refined copper

Metal containing at least 99.85 % by weight of copper; or

Metal containing at least 97.5 % by weight of copper, provided that the content by weight of any other element does not exceed the limit specified in the following table :

TABLE - Other elements

Element		Limiting content % by weight
Ag	Silver	0.25
As	Arsenic	0.5
Cd	Cadmium	1.3
Cr	Chromium	1.4
Mg	Magnesium	0.8
Pb	Lead	1.5
S	Sulphur	0.7
Sn	Tin	0.8
Te	Tellurium	0.8
Zn	Zinc	1
Zr	Zirconium	0.3
Other elements*, each		0.3

* Other elements are, for example, Al, Be, Co, Fe, Mn, Ni, Si.

(b) Copper alloys

Metallic substances other than unrefined copper in which copper predominates by weight over each of the other elements, provided that :

- (i) the content by weight of at least one of the other elements is greater than the limit specified in the foregoing table; or
- (ii) the total content by weight of such other elements exceeds 2.5 %.

(c) Master alloys

Alloys containing with other elements more than 10 % by weight of copper, not usefully malleable and commonly used as an additive in the manufacture of other alloys or as de-oxidants, de-sulphurising agents or for similar uses in the metallurgy of non-ferrous metals. However, copper phosphide (phosphor copper) containing more than 15 % by weight of phosphorus falls in heading 28.53.

(d) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

Wire-bars and billets with their ends tapered or otherwise worked simply to facilitate their entry into machines for converting them into, for example, drawing stock (wire-rod) or tubes, are however to be taken to be unwrought copper of heading 74.03.

(e) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(f) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(g) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 74.03), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

Headings 74.09 and 74.10 apply, *inter alia*, to plates, sheets, strip and foil with patterns (for example, grooves, ribs, chequers, tears, buttons, lozenges) and to such products which have been perforated, corrugated, polished or coated, provided that they do not thereby assume the character of articles or products of other headings.

(h) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be taken to be tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

Three small black circles are arranged in a triangular pattern: one at the top center and two at the bottom corners.

Subheading Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Copper-zinc base alloys (brasses)

Alloys of copper and zinc, with or without other elements. When other elements are present :

- zinc predominates by weight over each of such other elements;
 - any nickel content by weight is less than 5 % (see copper-nickel-zinc alloys (nickel silvers)); and
 - any tin content by weight is less than 3 % (see copper-tin alloys (bronzes)).

(b) Copper-tin base alloys (bronzes)

Alloys of copper and tin, with or without other elements. When other elements are present, tin predominates by weight over each of such other elements, except that when the tin content is 3 % or more the zinc content by weight may exceed that of tin but must be less than 10 %.

(c) Copper-nickel-zinc base alloys (nickel silvers)

Alloys of copper, nickel and zinc, with or without other elements. The nickel content is 5 % or more by weight (see copper-zinc alloys (brasses)).

(d) Copper-nickel base alloys

Alloys of copper and nickel, with or without other elements but in any case containing by weight not more than 1 % of zinc. When other elements are present, nickel predominates by weight over each of such other elements.

GENERAL

This Chapter covers copper and its alloys, and certain articles thereof.

Copper is extracted from various ores (see Explanatory Note to heading 26.03) and is also worked up from the metal in its native state, or recovered from waste and scrap.

Copper is recovered from its sulphide ores by a dry extraction process in which the powdered and concentrated ore is roasted where necessary to drive off excess sulphur and smelted in a furnace to produce **copper matte** or regulus.

In some cases the concentrated ore is smelted in an air or oxygen flash smelting furnace (" flash smelting ") without prior roasting.

The matte is treated in a converter to eliminate most of the iron and sulphur and produce "blister copper" (so-called because it has a rough and blistery surface). The blister copper is refined in a reverberatory furnace to produce fire-refined copper and, where required, may be further refined by electrolysis.

For oxide ores and also for certain other ores and residues a wet process (leaching) is used (see Explanatory Note to heading 74.01).

*
* * *

Copper is very ductile and malleable; it is, after silver, the best conductor of heat and electricity. It is used in the pure state, particularly in the form of wire for electrical use, or in the form of coils or plates as a refrigerating element, but for general purposes it is mainly used in the form of alloys.

*
* * *

Under the provisions of Note 5 to Section XV (see the General Explanatory Note to that Section), the **copper-base metal alloys** which may be classified with copper include :

- (1) Copper-zinc base alloys (**brasses**) (see Subheading Note 1 (a)) in variable proportions of copper and zinc, e.g., common brass, used for many purposes; gilding metal (tombac) used particularly in the manufacture of imitation jewellery and fancy goods.

Copper-zinc alloys containing small quantities of other elements form special brasses, with characteristic properties. Special brasses include high-tensile brass (often known as manganese bronze), used in shipbuilding, as well as leaded brasses, iron brass, aluminium brass and silicon brass.

- (2) Copper-tin base alloys (**bronzes**) (see Subheading Note 1 (b)), and sometimes containing other elements which confer special properties. The bronzes include coinage bronze; hard-bronze for gearing, bearings or other machinery parts; bell-metal; statuary bronze; leaded bronze used for bearings; phosphor bronze (or de-oxidised bronze) used in the manufacture of springs and woven wire gauze for filters, screens, etc.
- (3) Copper-nickel-zinc base alloys (**nickel silvers**) (see Subheading Note 1 (c)) having a good corrosion resistance and strength. They are used mainly in telecommunications equipment (in the telephone industry *inter alia*); other uses include use in equipment for instrument parts, taps and high quality plumbing hardware, slide fasteners, various applications in the electrical field such as clamps, springs, connectors, receptacles, etc., ornamental and architectural metalwork and chemical and food processing equipment. Certain grades of these alloys are also used in the manufacture of tableware, etc.
- (4) Copper-nickel base alloys (**cupro-nickels**) (see Subheading Note 1 (d)), which often contain small amounts of aluminium or iron. They represent a family of alloys featuring resistance to the corrosive effects of sea water and, therefore, find wide use in a variety of marine or shipbuilding applications, particularly for condensers or piping, and in the manufacture of coins or electrical resistors.
- (5) **Aluminium bronze** composed essentially of copper with aluminium and employed in engineering where high strength properties, corrosion resistance and hardness are important factors.
- (6) **Beryllium copper** (sometimes known as beryllium bronze) composed essentially of copper with beryllium and, because of its hardness, high strength and resistance to corrosion, used for springs of many types, as moulds for plastics, as resistance welding electrodes, and for non-sparking tools.
- (7) **Copper-silicon** consisting essentially of copper and silicon and having high strength and resistance to corrosion. It is used, e.g., for the manufacture of storage tanks, bolts and fasteners.
- (8) **Chromium copper** mainly used for resistance welding electrodes.

*
* *

This Chapter covers :

- (A) Mattes and other intermediate products of copper metallurgy and unwrought copper and waste and scrap (headings 74.01 to 74.05).
- (B) Copper powders and flakes (heading 74.06).
- (C) Products generally obtained by rolling, extruding, drawing or forging the copper of heading 74.03 (headings 74.07 to 74.10).

- (D) Various articles specified in headings 74.11 to 74.18 and other articles falling in heading 74.19 which covers all other copper articles other than those covered by Note 1 to Section XV or those included in **Chapter 82** or **83**, or more specifically covered elsewhere in the Nomenclature.

The products and articles of copper are frequently subjected to various treatments to improve the properties or appearance of the metal, etc. These treatments are generally those referred to in the General Explanatory Note to Chapter 72, and do not affect the classification of the goods.

*
* * *

The classification of **composite goods**, particularly made up articles, is explained in the General Explanatory Note to Section XV.

74.01 - Copper mattes; cement copper (precipitated copper).

(A) Copper mattes.

This is obtained by the fusion of roasted copper sulphide ores to separate the copper sulphide from the gangue and the other metals which form a slag that floats on the surface of the matte. The matte consists essentially of copper and iron sulphides and is generally in the form of black or brown granules (obtained by pouring the molten matte into water) or a crude mass, with a dull, metallic appearance.

(B) Cement copper (precipitated copper).

Cement copper (precipitated copper) is a product obtained by precipitation (cementation), i.e., by adding iron to the aqueous solution resulting from the leaching of certain roasted ores or residues. It is a finely divided black powder containing oxides and insoluble impurities. It is sometimes used in anti-fouling paints and agricultural fungicides but is more often added to the charge which goes to a melting furnace to produce copper matte.

Cement copper must not be confused with the copper powder of **heading 74.06**, which does not contain impurities.

74.02 - Unrefined copper; copper anodes for electrolytic refining.

This heading covers :

- (1) **Black copper.** It consists of an impure form of copper produced by smelting oxidised copper ores or impure copper scrap, usually in a blast furnace. The copper content varies widely, usually in the range of approximately 60 to 85 % by weight.
- (2) **Blister copper.** It consists of an impure form of copper produced by blowing air through molten copper matte. During the conversion process, sulphur, iron and other impurities are oxidised. The copper content is normally about 98 % by weight.
- (3) **Copper anodes for electrolytic refining.**

Copper **partially refined by complete fusion** is cast into anodes for further refining by electrolysis. These anodes are usually in the form of slabs cast with two lugs for suspending them in the electrolytic refining tank. They should not be confused with anodes for **electro-copper-plating (heading 74.19)**.

74.03 - Refined copper and copper alloys, unwrought.

- Refined copper :

7403.11 -- Cathodes and sections of cathodes

7403.12 -- Wire-bars

7403.13 -- Billets

7403.19 -- Other

- Copper alloys :

7403.21 -- Copper-zinc base alloys (brass)

7403.22 -- Copper-tin base alloys (bronze)

7403.29 -- Other copper alloys (other than master alloys of heading 74.05)

This heading covers unwrought refined copper and copper alloys as defined in Chapter Notes 1 (a) and 1 (b) respectively.

Refined copper containing at least 99.85 % by weight of copper is obtained by electrolytic refining, electrolytic extraction, chemical refining or fire refining. Other refined copper (containing at least 97.5 % by weight of copper) is normally produced by alloying the above-mentioned refined copper with one or more other elements up to the maximum content limits as shown in the table in Chapter Note 1 (a).

Refined copper is cast into ingots or ingot-bars for remelting (e.g., for alloying purposes) or into wire-bars, slabs for rolling, billets (including those of circular cross-section) and similar forms for rolling, extruding, drawing or forging into plates, sheets, strip, wire, tubes and other products.

Electrolytically refined copper is sometimes presented in the form of cathodes consisting of plates or sheets with two loops attached by which the original starting sheets were suspended in the electrolytic refining tank, or with the loops cut off, or cut into sections.

Refined copper may also be in the form of **shot** mainly used for alloying purposes and sometimes for grinding into powder. Copper powders and flakes are, however, classified in **heading 74.06**.

This heading further covers cast and sintered slabs, bars, rods and ingots, etc., **provided** they have not been worked after production otherwise than by simple trimming or de-scaling (to remove the set or top surface consisting largely of cuprous oxide) or by shaving, chipping, grinding, etc., to eliminate setting or other casting defects or which have been machined on one surface for inspection purposes (quality control).

Sintered products are obtained from copper powder or copper alloy powders or from copper powder mixed with other metal powders, by pressing (compacting) and sintering (heating to an appropriate temperature below the fusion point of the metals). In the sintered state the products are porous and of low strength and are normally rolled, extruded, forged, etc., to achieve useful density. These rolled, etc., products are **excluded** (e.g., **headings 74.07, 74.09**).

The heading also includes wire-bars and billets with their ends tapered or otherwise worked simply to facilitate their entry into machines for converting them into, for example, wire drawing stock (wire-rod) or tubes.

Subject to the above-mentioned conditions concerning working after production, the cast bars and rods of this heading may include, in particular :

- (1) Products (sometimes known as " jets "), accurately cast in special moulds, of round, square or hexagonal section and usually not exceeding 1 m in length.
- (2) Longer products obtained by the continuous casting process in which molten metal is poured continuously into a water-cooled mould where it is rapidly solidified.

Both the " jets " and the continuously cast bars are often used for the same purposes as rolled, drawn or extruded bars.

74.04 - Copper waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading, **except** that cuprous slag, ash and residues fall in **heading 26.20**. Copper waste of this heading includes drawing sludge, derived from the drawing of copper and consisting mainly of copper powder mixed with the lubricants used for the drawing process.

This heading **does not cover** ingots, or similar unwrought forms cast from remelted copper waste and scrap (**heading 74.03**).

74.05 - Master alloys of copper.

Master alloys are defined in Chapter Note 1 (c).

The master alloys of this heading are alloys containing more than 10 % by weight of copper together with other elements, and which, because of their composition, are too brittle for normal metal working. They are therefore used either to introduce into brass, bronze or aluminium bronze, other elements with a higher melting point than those alloys, or highly oxidisable elements (e.g., aluminium, cadmium, arsenic, magnesium) or elements sublimable at the fusion temperature, or else to facilitate the preparation of certain alloys by adding de-oxidising, de-sulphurising or similar elements (e.g., calcium).

The copper acts as a solvent or diluent of the other elements and must be present in amounts sufficient to reduce the melting point or the oxidising or sublimating action of the master alloy. If the proportion of copper is too high, however, that metal unduly dilutes the other elements introduced into the alloys. The copper content generally ranges between 30 and 90 % in these products but may, in special cases, be above or below these limits.

The heading therefore **excludes**, for example, any copper-nickel alloy, even if intended for use as a master alloy, since copper-nickel alloys are usefully malleable in all proportions. Other alloys, for example copper manganese and copper-silicon alloys, may or may not be malleable according to the proportions of the constituent metals present; in such cases the heading covers **only** those alloys which are not usefully malleable.

Master alloys of this heading include copper aluminium, copper beryllium, copper boron, copper cadmium, copper chromium, copper iron, copper magnesium, copper manganese, copper molybdenum, copper silicon, copper titanium or copper vanadium.

Master alloys are generally in the form of small blocks or cakes divided for easy breaking, brittle sticks or pellets, and have the appearance of crude foundry products.

Copper phosphide (phosphor copper) containing more than 15 % by weight of phosphorus falls in **heading 28.53**.

74.06 - Copper powders and flakes.

7406.10 - Powders of non-lamellar structure

7406.20 - Powders of lamellar structure; flakes

This heading covers copper powders as defined in Note 8 (b) to Section XV and copper flakes, **other than** cement copper (precipitated copper) which is a black powder of **heading 74.01**. Subject to the provisions of Note 7 to Section XV, it also covers copper powders mixed with other base metal powders (e.g., "bronze powder" consisting of a simple mixture of copper and tin powders).

Copper powders are mainly produced by electrodeposition or by atomisation (i.e., by injecting a thin stream of molten metal into a high-velocity cross-jet of water, steam, air or other gases).

In addition to the above two main processes, copper powders may also be produced on a smaller scale by gaseous reduction of finely divided oxides, precipitation from solutions or by comminution of solids. Powders of lamellar structure and flakes are normally produced by grinding foil. The lamellar shape can be seen by the naked eye or through a magnifying glass in the case of flakes, but a microscope is needed for true powders.

The method of manufacture determines such characteristics as the particle size and shape (which may be more or less irregular, globular, spherical or lamellar). Powders with a lamellar structure are often polished and may retain traces of greasy or waxy substances (e.g., stearic acid or paraffin wax) used in the course of their preparation.

The powders are used for compacting and sintering into bearings, bushings and many other technical components. They are also used as chemical or metallurgical reagents, for soldering and brazing, in the manufacture of special cements, for coating non-metallic surfaces as a basis for electroplating, etc. The flakes are mainly used as a metallic pigment in the manufacture of inks and paints. The flakes are used directly as metallic colouring matter by blowing them, e.g., on to a varnished surface to which they adhere.

The heading **does not cover** :

- (a) Certain powders or flake-powders used in the preparation of paints and sometimes known as "bronzes" or "golds" but which are in fact chemical compounds, such as certain antimony salts, tin disulphides, etc. (**Chapter 28**, or **Chapter 32** if in the form of prepared paints).
- (b) Powders or flakes, prepared as colours, paints or the like (e.g., made up with other colouring matter or put up as suspensions, dispersions or pastes, with a binder or solvent) (**Chapter 32**).
- (c) Copper shot of **heading 74.03**.
- (d) Spangles cut from copper foil (**heading 83.08**).

74.07 - Copper bars, rods and profiles.

7407.10 - Of refined copper

- Of copper alloys :

7407.21 -- Of copper-zinc base alloys (brass)

7407.29 -- Other

Bars and rods are defined in Chapter Note 1 (d) and **profiles** in Chapter Note 1 (e).

The products of this heading are usually obtained by rolling, extrusion or drawing, but may also be obtained by forging (whether with the press or hammer). They may subsequently be cold-finished (if necessary after annealing) by cold-drawing, straightening, or other processes which give the products a finish of higher precision. They may also be worked (e.g., drilled, punched, twisted or crimped), **provided** that they do not thereby assume the character of articles or of products of other headings. The heading also covers hollow profiles including finned or gilled tubes and pipes obtained by extrusion. However, tubes and pipes to which fins or gills have been attached, e.g., by welding, are **excluded** - generally **heading 74.19**.

Bars and rods obtained by casting (including the so-called " jets " and continuously cast bars) or by sintering fall in **heading 74.03** **provided** they have not been subsequently worked after production otherwise than by simple trimming or descaling. If, however, they have been worked beyond this stage, they are classified in this heading, **provided** that they have not thereby assumed the character of articles or of products of other headings.

Wire-bars and billets with their ends tapered or otherwise worked simply to facilitate their entry into machines for converting them into, e.g., wire drawing stock (wire-rod) or tubes, are, however, classified in **heading 74.03**.

74.08 - Copper wire.

- Of refined copper :

7408.11 -- Of which the maximum cross-sectional dimension exceeds 6 mm

7408.19 -- Other

- Of copper alloys :

7408.21 -- Of copper-zinc base alloys (brass)

7408.22 -- Of copper-nickel base alloys (cupro-nickel) or copper-nickel-zinc base alloys (nickel silver)

7408.29 -- Other

Note 1 (f) defines **wire**.

Wire is obtained by rolling, extrusion or drawing, and is presented in coils. The second paragraph of the Explanatory Note to heading 74.07 applies, *mutatis mutandis*.

This heading **does not include** :

- (a) Very fine sterile bronze wire used for surgical sutures (**heading 30.06**).
- (b) Metallised yarn of **heading 56.05**.
- (c) Twine or cord reinforced with wire (**heading 56.07**).
- (d) Stranded wire, cables and other goods of **heading 74.13**.
- (e) Coated welding electrodes, etc. (**heading 83.11**).
- (f) Insulated electric wire and cable (including enamelled wire) (**heading 85.44**).
- (g) Musical instrument strings (**heading 92.09**).

74.09 - Copper plates, sheets and strip, of a thickness exceeding 0.15 mm.

- Of refined copper :

7409.11 -- In coils

7409.19 -- Other

- Of copper-zinc base alloys (brass) :

7409.21 -- In coils

7409.29 -- Other

- Of copper-tin base alloys (bronze) :

7409.31 -- In coils

7409.39 -- Other

7409.40 - Of copper-nickel base alloys (cupro-nickel) or copper-nickel-zinc base alloys (nickel silver)

7409.90 - Of other copper alloys

This heading covers the products defined in Chapter Note 1 (g) when of a thickness exceeding 0.15 mm.

Plates and sheets are usually obtained by the hot- or cold-rolling of certain products of heading 74.03; copper strip may be rolled, or obtained by slitting sheets.

All such goods remain in the heading if worked (e.g., cut to shape, perforated, corrugated, ribbed, channelled, polished, coated, embossed or rounded at the edges) **provided** they do not thereby assume the character of articles or of products of other headings (see Chapter Note 1 (g)).

The limiting thickness of 0.15 mm includes coatings of varnish, etc.

The heading **does not include** :

- (a) Foil of a thickness not exceeding 0.15 mm (**heading 74.10**).
- (b) Expanded metal, of copper (**heading 74.19**).
- (c) Insulated electric strip (**heading 85.44**).

74.10 - Copper foil (whether or not printed or backed with paper, paperboard, plastics or similar backing materials), of a thickness (excluding any backing) not exceeding 0.15 mm.

- Not backed :

7410.11 - - Of refined copper

7410.12 - - Of copper alloys

- Backed :

7410.21 - - Of refined copper

7410.22 - - Of copper alloys

This heading covers the products defined in Chapter Note 1 (g) when of a thickness not exceeding 0.15 mm.

Foil classified in this heading is obtained by rolling, hammering or electrolysis. It is in very thin sheets (in any case, **not exceeding 0.15 mm** in thickness). The thinnest foils, used for imitation gilding, etc., are very flimsy; they are generally interleaved with sheets of paper and put up in booklet form. Other foil, such as that used for making fancy goods, is often backed with paper, paperboard, plastics or similar backing materials, either for convenience of handling or transport, or in order to facilitate subsequent treatment, etc. Foil remains in the heading whether or not it has been embossed, cut to shape (rectangular or otherwise), perforated, coated (gilded, silvered, varnished, etc.), or printed.

The limiting thickness of 0.15 mm includes coatings of varnish, etc., but, on the other hand, backings of paper, etc., are excluded.

The heading **does not include** :

- (a) Stamping foils (also known as blocking foils) composed of copper powder agglomerated with gelatin, glue or other binder, or of copper deposited on paper, plastics or other support, and used for printing book covers, hat bands, etc. (**heading 32.12**).
- (b) Printed copper foil labels being identifiable individual articles by virtue of the printing (**heading 49.11**).
- (c) Metallised yarn of **heading 56.05**.
- (d) Plates, sheets and strip, of a thickness exceeding 0.15 mm (**heading 74.09**).
- (e) Foil in the form of Christmas tree decorations (**heading 95.05**).

74.11 - Copper tubes and pipes

7411.10 - Of refined copper

- Of copper alloys :

7411.21 -- Of copper-zinc base alloys (brass)

7411.22 -- Of copper-nickel base alloys (cupro-nickel) or copper-nickel-zinc base alloys (nickel silver)

7411.29 -- Other

Chapter Note 1 (h) defines **tubes and pipes**.

The Explanatory Notes to headings 73.04 to 73.06 apply, *mutatis mutandis*, as regards the scope of the heading and the methods of manufacture of the goods.

Most copper tubes and pipes are seamless but may sometimes be made by brazing or welding together the edges of strip or by other processes. The seamless tubes and pipes are usually produced by piercing and extruding a billet to form a tube blank which is hot-rolled or drawn through a die to the finished size. For some purposes the tubes and pipes may be extruded to their final size without drawing.

Copper tubes and pipes have many industrial applications (e.g., in cooking, heating, cooling, distilling, refining or evaporating apparatus) and are used in buildings for domestic or general water or gas supplies. Copper alloy condenser tubes are widely employed in ships and power stations because of their strong resistance to corrosion, particularly salt water.

The heading **does not cover** :

- (a) Hollow profiles including finned or gilled tubes and pipes obtained by extrusion (**heading 74.07**).
- (b) Tube or pipe fittings (**heading 74.12**).
- (c) Tubes and pipes to which fins or gills have been attached, e.g., by welding (generally **heading 74.19**).
- (d) Flexible tubing (**heading 83.07**).
- (e) Tubes and pipes made up into identifiable articles of other Chapters, e.g., machinery parts (**Section XVI**).

74.12 - Copper tube or pipe fittings (for example, couplings, elbows, sleeves).

7412.10 - Of refined copper

7412.20 - Of copper alloys

The Explanatory Note to heading 73.07 applies, *mutatis mutandis*, to this heading.

The heading **does not cover** :

- (a) Bolts and nuts used for assembling or fixing pipes or tubes (**heading 74.15**).
- (b) Fittings with taps, cocks, valves, etc. (**heading 84.81**).

74.13 - Stranded wire, cables, plaited bands and the like, of copper, not electrically insulated.

The Explanatory Note to heading 73.12 applies, *mutatis mutandis*, to this heading.

Because of its excellent electric conductivity, copper is commonly used in the manufacture of electric wires and cables; these remain in the heading whether or not with a core of steel or other metal, **provided** the copper predominates by weight (see Note 7 to Section XV).

However, the heading **does not cover** insulated electric wire and cable (**heading 85.44**).

[74.14]

74.15 - Nails, tacks, drawing pins, staples (other than those of heading 83.05) and similar articles, of copper or of iron or steel with heads of copper; screws, bolts, nuts, screw hooks, rivets, cotters, cotter-pins, washers (including spring washers) and similar articles, of copper (+).

7415.10 - Nails and tacks, drawing pins, staples and similar articles

- Other articles, not threaded :

7415.21 -- Washers (including spring washers)

7415.29 -- Other

- Other threaded articles :

7415.33 -- Screws; bolts and nuts

7415.39 -- Other

The Explanatory Notes to headings 73.17 and 73.18 apply, *mutatis mutandis*, to this heading, except that the heading also includes **copper-headed nails with iron or steel shanks** (mainly used in upholstery or ornamental work).

Shoe protectors, with or without affixing points, are excluded (**heading 74.19**).

Subheading Explanatory Note.

Subheading 7415.33

The term “screw” does not cover screw hooks and screw rings; these are classified in **subheading 7415.39**.

[74.16]

[74.17]

74.18 - Table, kitchen or other household articles and parts thereof, of copper; pot scourers and scouring or polishing pads, gloves and the like, of copper; sanitary ware and parts thereof, of copper.

7418.10 - Table, kitchen or other household articles and parts thereof; pot scourers and scouring or polishing pads, gloves and the like:

7418.20 - Sanitary ware and parts thereof

The Explanatory Notes to headings 73.21, 73.23 and 73.24 apply, *mutatis mutandis*, to this heading.

This heading covers, *inter alia*, copper cooking or heating apparatus of a kind used for domestic purposes, e.g., small appliances such as petrol, paraffin, spirit stoves, as normally used for travelling, camping, etc. and for certain household uses. The heading also covers domestic apparatus of the kind described in the Explanatory Note to heading 73.22.

The heading **excludes**:

- (a) Household articles having the character of tools (**Chapter 82**) (see the Explanatory Note to heading 73.23).
- (b) Blow lamps (**heading 82.05**).
- (c) Cutlery and spoons, forks, ladles, etc. (**headings 82.11 to 82.15**).
- (d) Ornaments of **heading 83.06**.
- (e) Heating, cooking, roasting, distilling, etc., machinery or plant, or similar laboratory equipment, of **heading 84.19**, for example:
 - (1) Non-electrical instantaneous or storage water heaters (whether for domestic or non-domestic use).
 - (2) Counter-type coffee percolators and certain other specialised heating, cooking, etc., apparatus not used in the household.
- (f) Household equipment of Chapter 85 (in particular, apparatus and appliances of **heading 85.09** or **85.16**).
- (g) Articles of **Chapter 94**.
- (h) Hand sieves (**heading 96.04**).
- (ij) Cigarette lighters and other lighters (**heading 96.13**).
- (k) Scent and similar sprays (**heading 96.16**).

74.19 - Other articles of copper (+).

7419.10 - Chain and parts thereof

- Other :

7419.91 -- Cast, moulded, stamped or forged, but not further worked

7419.99 - - Other

This heading covers all articles of copper **other than** those covered by the preceding headings of this Chapter or by Note 1 to Section XV, or articles specified or included in **Chapter 82** or **83**, or more specifically covered elsewhere in the Nomenclature.

This heading covers, in particular:

- (1) Safety pins and other pins (**excluding** hatpins and other ornamental pins, and drawing pins), of copper, not elsewhere specified or included.
 - (2) Reservoirs, tanks, vats and similar containers for any material, of copper, of any capacity, whether or not lined or heat-insulated, but not fitted with mechanical or thermal equipment (see the Explanatory Notes to headings 73.09 and 73.10).
 - (3) Containers for compressed or liquefied gas (see the Explanatory Note to heading 73.11).
 - (4) Chain and parts thereof, of copper (see the Explanatory Note to heading 73.15), **excluding** chains having the character of imitation jewellery (e.g., watch chains and trinket chains) (**heading 71.17**).
 - (5) Articles of copper of the types listed in the Explanatory Notes to headings 73.25 and 73.26.
 - (6) Electroplating anodes of copper or of copper alloys (e.g., brass) (see Part (A) of the Explanatory Note to heading 75.08).
 - (7) Tubes and pipes to which fins or gills have been attached, e.g., by welding, not elsewhere specified or included.
 - (8) Cloth, grill and netting of copper wire and expanded metal, of copper.
 - (9) Springs **other than** clock or watch springs of **heading 91.14**.

The heading **does not cover**:

- (a) Woven fabric of metal thread, of a kind used in articles of apparel, as furnishing fabrics or the like (**heading 58.09**).
 - (b) Prepared metal brazing plates of wire mesh (**heading 83.11**).
 - (c) Wire cloth, made up into hand sieves or riddles (**heading 96.04**)

3

Subheading Explanatory Note.

Subheading 7419.91

The Explanatory Note to subheadings 7326.11 and 7326.19 applies, *mutatis mutandis*, to the products of this subheading. In the case of cast or moulded products, the sprues and feeder heads may be removed.

Chapter 75

Nickel and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(b) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(c) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(d) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 75.02), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

Heading 75.06 applies, *inter alia*, to plates, sheets, strip and foil with patterns (for example, grooves, ribs, chequers, tears, buttons, lozenges) and to such products which have been perforated, corrugated, polished or coated, provided that they do not thereby assume the character of articles or products of other headings.

(e) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular, or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be considered as tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

Subheading Notes.

- 1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Nickel, not alloyed

Metal containing by weight at least 99 % of nickel plus cobalt, provided that :

- (i) the cobalt content by weight does not exceed 1.5 %, and
- (ii) the content by weight of any other element does not exceed the limit specified in the following table :

TABLE - Other elements

Element	Limiting content % by weight
Fe Iron	0.5
O Oxygen	0.4
Other elements, each	0.3

(b) Nickel alloys

Metallic substances in which nickel predominates by weight over each of the other elements provided that :

- (i) the content by weight of cobalt exceeds 1.5 %,
- (ii) the content by weight of at least one of the other elements is greater than the limit specified in the foregoing table, or
- (iii) the total content by weight of elements other than nickel plus cobalt exceeds 1 %.

- 2.- Notwithstanding the provisions of Chapter Note 1 (c), for the purposes of subheading 7508.10 the term "wire" applies only to products, whether or not in coils, of any cross-sectional shape, of which no cross-sectional dimension exceeds 6 mm.

GENERAL

This Chapter covers nickel and its alloys, and certain articles thereof.

Nickel is a relatively hard, greyish-white metal melting at 1453 °C. It is ferro-magnetic, malleable, ductile, strong and resistant to corrosion and oxidation.

*
* * *

Nickel is used mainly in the production of many alloys especially alloy steels, for coating other metals usually by electrodeposition and as a catalyst in many chemical reactions. Unalloyed wrought nickel is also extensively used in the manufacture of chemical plant. In addition nickel and nickel alloys are used for coinage.

*
* * *

The principal nickel alloys which may fall in this Chapter under the provisions of Note 5 to Section XV include the following :

- (1) **Nickel-iron alloys.** These include materials used in submarine cables, induction coil cores, magnetic shielding, etc., because of their high magnetic permeability and low hysteresis.
- (2) **Nickel-chromium or nickel-chromium-iron alloys.** These include a variety of commercial materials featuring good strength and excellent resistance to oxidation at high temperature and scaling as well as to many corrosive environments. These materials are employed for the heater element in electrical resistance heating devices and are also used for components such as muffles and retorts used in the heat treatment of steels and other metals or in the form of pipe and tubing for high temperature chemical or petrochemical processing. Also in this group are special alloys known as "super alloys" which have been developed specifically for high strength at the elevated temperatures prevailing in aircraft turbines where they are used for turbine blades and vanes, combustion liners, transition sections, etc. Often these alloys contain molybdenum, tungsten, niobium, aluminium, titanium, etc., which are effective in significantly improving the strength of the nickel-base composition.
- (3) **Nickel-copper alloys.** These alloys, which in addition to corrosion resistance have good strength, are used in such applications as propeller shafts and fasteners and are also used in pumps, valves, tubing and other forms of equipment exposed to certain mineral or organic acids or alkalis and salts.

*
* * *

This Chapter includes :

- (A) Nickel mattes, nickel oxide sinters and other intermediate products of nickel metallurgy and unwrought nickel, and nickel waste and scrap (headings 75.01 to 75.03).

- (B) Nickel powders and flakes (heading 75.04).
- (C) Products generally obtained by rolling, forging, drawing or extruding the unwrought nickel of heading 75.02 (headings 75.05 and 75.06).
- (D) Tubes, pipes and fittings (heading 75.07), and electroplating anodes and other articles of heading 75.08, which covers all nickel articles, **other than** those covered by Note 1 to Section XV or included in **Chapter 82** or **83**, or more specifically covered elsewhere in the Nomenclature.

*
* *

Products and articles of nickel may be subjected to various treatments to improve the properties or appearance of the metal, etc. These treatments are generally those referred to at the end of the General Explanatory Note to Chapter 72, and do not affect the classification of the goods. (See, however, the special case of electroplating anodes (heading 75.08).)

*
* *

The classification of **composite articles** is explained in the General Explanatory Note to Section XV.

75.01 - Nickel mattes, nickel oxide sinters and other intermediate products of nickel metallurgy.

7501.10 - Nickel mattes

7501.20 - Nickel oxide sinters and other intermediate products of nickel metallurgy

(1) Nickel mattes.

These mattes are obtained by the processing (roasting, smelting, etc.) of nickel ores and consist, according to the ores and processes employed, of nickel-iron sulphides, nickel-iron-copper sulphides, nickel sulphides or nickel-copper sulphides.

Mattes are usually in the form of cast blocks or slabs (often broken into pieces to facilitate packing or transport), granules or powders (particularly in the case of certain nickel sulphide mattes).

These mattes are used in the production of unwrought nickel.

(2) The other intermediate products of nickel metallurgy.

These include :

(i) **Impure nickel oxides**, e.g., nickel oxide sinters, nickel oxide in powder form ("green nickel oxide"), obtained by the processing of nickeliferous sulphide or oxide ores. These impure oxides are mainly used in the manufacture of alloy steels.

Nickel oxide sinters are usually in the form of powders or in lumps up to 50 mm.

(ii) **Impure ferro-nickel** which, because of its high content of sulphur (0.5 % or more), phosphorus and other impurities, cannot be used as an alloying product in the steel industry without prior refining. **Refined ferro-nickel** is used almost solely in the steel industry to provide the nickel necessary for the manufacture of certain special steels; it is therefore classified as a ferro-alloy in **heading 72.02**, subject to the provisions of Note 1 (c) to Chapter 72.

(iii) **Nickel speiss**, i.e., a lumpy mixture of arsenides; it is not now of great commercial importance.

75.02 - Unwrought nickel.

7502.10 - Nickel, not alloyed

7502.20 - Nickel alloys

Unwrought nickel is usually in the form of ingots, pigs, pellets, flats, cubes, rondelles, briquettes, shots, cathodes or other electrodeposited shapes. These primary forms are mainly used as an additive in the manufacture of alloy steels and non-ferrous alloys and in the production of certain chemicals. Some of the forms are used in titanium baskets for nickel plating, or for the production of nickel powder.

Unrefined nickel is normally cast into anodes for refining by electrolysis. The anodes of this heading are usually in the form of slabs cast with two lugs for suspending them in the electrolytic refining tank. They should not be confused with anodes for electroplating described in the Explanatory Note to **heading 75.08**.

Cathodes are plates obtained by electrolytic deposition onto " starting sheets " of refined nickel to which two nickel loops have been attached for suspending them in the electrolytic refining tank. As the deposit of refined nickel builds up, the " starting sheets " become an integral and inseparable part of the cathodes.

Untrimmed cathodes are usually shipped without removing these loops, which often carry a growth of deposited nickel at the weld and should not be confused with the suspension hooks fitted to certain electroplating anodes. Untrimmed cathodes are also generally larger in size (approximately 96 x 71 x 1.25 cm) than electroplating anodes in sheet form which rarely exceed a width of 30.5 cm.

Cathodes which have been merely trimmed or cut into strips or small rectangular pieces remain classified in the heading irrespective of their size or the purpose for which they may be used. They can be distinguished from electroplating anodes of heading 75.08 by the fact that they are not fitted with suspension hooks or prepared (e.g., by piercing or tapping) for hooks.

This heading also **excludes** nickel powders and flakes (**heading 75.04**).

75.03 - Nickel waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading.

This heading **excludes** :

- (a) Slag, ash and residues from the manufacture of nickel (**heading 26.20**).
- (b) Ingots and similar unwrought forms cast from remelted nickel waste and scrap (**heading 75.02**).

75.04 - Nickel powders and flakes.

This heading covers **nickel powders and flakes** of all types, regardless of their intended use. Powders are defined in Note 8 (b) to Section XV.

Depending on their physical characteristics, the powders and flakes are used in the unalloyed state in plates for nickel-cadmium batteries, in the manufacture of nickel sulphate, nickel chloride and other nickel salts, as binding agents for metal carbides, for the production of nickel alloys (e.g., alloy steels) or as catalysts.

They are also used either in the pure state or alloyed or mixed with other metallic powders (e.g., iron powders), for compacting and sintering into technical articles such as magnets and for direct rolling into sheets, strip and foil.

This heading **excludes** nickel oxide sinters (**heading 75.01**).

75.05 - Nickel bars, rods, profiles and wire.

- Bars, rods and profiles :

7505.11 -- Of nickel, not alloyed

7505.12 -- Of nickel alloys

- Wire :

7505.21 -- Of nickel, not alloyed

7505.22 -- Of nickel alloys

These products, which are defined in Chapter Notes 1 (a), 1 (b) and 1 (c), correspond to similar goods of copper, **except** for the special provision for electroplating anodes (see the Explanatory Note to heading 75.08). **Subject** to this exception, the provisions of the Explanatory Notes to headings 74.07 and 74.08 apply, *mutatis mutandis*, to this heading.

The heading **does not cover** :

- (a) Metallised yarn (**heading 56.05**).
- (b) Bars, rods or profiles, prepared for use in structures (**heading 75.08**).
- (c) Insulated electric bars (commonly known as "busbars" and wire (including enamelled wire) (**heading 85.44**).

75.06 - Nickel plates, sheets, strip and foil.

7506.10 - Of nickel, not alloyed

7506.20 - Of nickel alloys

This heading covers **plates, sheets, strip and foil** which are defined in Chapter Note 1 (d); these products correspond to the copper products described in the Explanatory Notes to headings 74.09 and 74.10.

Plates and sheets may be used to clad iron or steel by welding, rolling, etc., and for the construction of equipment used, in particular, in the chemical industry.

This heading **excludes** expanded metal (**heading 75.08**).

75.07 - Nickel tubes, pipes and tube or pipe fittings (for example, couplings, elbows, sleeves).

- Tubes and pipes :

7507.11 - - Of nickel, not alloyed

7507.12 - - Of nickel alloys

7507.20 - Tube or pipe fittings

Chapter Note 1 (e) defines **tubes and pipes**.

The provisions of the Explanatory Notes to headings 73.04 to 73.07 apply, *mutatis mutandis*, to this heading.

Because of their resistance to corrosion (by acids, steam, etc.), tubes, pipes and fittings of nickel or of nickel alloys are used in apparatus for the chemical, food, papermaking industries, etc., in the manufacture of steam condensers, hypodermic needles, etc.

This heading **excludes** :

- (a) Hollow profiles (**heading 75.05**).
- (b) Nickel bolts and nuts used for assembling or fixing pipes, etc. (**heading 75.08**).
- (c) Fittings with taps, cocks, valves, etc. (**heading 84.81**).
- (d) Tubes, pipes and tube or pipe fittings made up into specific identifiable articles, e.g., machinery parts (**Section XVI**).

75.08 - Other articles of nickel.

7508.10 - Cloth, grill and netting, of nickel wire

7508.90 - Other

(A) ELECTROPLATING ANODES INCLUDING THOSE PRODUCED BY ELECTROLYSIS

This group covers refined nickel anodes for electroplating by electrolytic deposition. They may be cast, rolled, drawn, extruded or may be made from cathodes or other electrodeposited shapes of heading 75.02. These anodes are either :

- (1) in special shapes (stars, rings, particular profiles) to give the maximum anode surface suited to the articles to be plated, and in the case of bar anodes (which are usually of oval, elliptical, rhomboidal or diamond shaped cross-section) in the length appropriate for use as anodes; or
- (2) in the form of plates (flat or curved), strip, sheets, discs (flat or corrugated), hemispheres or balls. To be classified in this heading these articles must have features identifying them as electroplating anodes, i.e., they must be fitted with hooks for suspending them in the electroplating tank or be prepared for hooks (e.g., by threading, piercing or tapping).

These anodes are usually of a high degree of purity. Small amounts of certain elements may, however, remain after the production process or be added deliberately, in order, e.g., to depolarise the anodes to ensure even attack over the whole surface and avoid loss of nickel through formation of sludge. These characteristics, together with the identifying features mentioned above, distinguish electroplating anodes from the cast anodes for electrolytic refining referred to in the second paragraph of the Explanatory Note to heading 75.02, which are **excluded** from this heading.

These conventional anodes for nickel-plating are, however, being more and more frequently replaced by basket anodes, i.e. unwrought forms such as nickel rondelles in titanium baskets (see the Explanatory Note to heading 75.02).

This heading also **excludes** the following, whether or not intended for use in nickel-plating or conversion into electroplating anodes :

- (a) Plates (cathodes) obtained simply by electrolysis, untrimmed or trimmed, or cut into strips or small rectangular pieces, but not further worked (**heading 75.02**).
- (b) Pellets, unwrought (**heading 75.02**).
- (c) Bars simply cast, rolled or extruded, not complying with the requirements as to shape, length, or working referred to above (**heading 75.02** or **75.05**).
- (d) Plates, simply rolled (**heading 75.06**).

(B) OTHER

This group covers all articles of nickel **other than** those covered by the preceding group or by the preceding headings of this Chapter or by Note 1 to Section XV, or articles specified or included in Chapter 82 or 83, or more specifically covered elsewhere in the Nomenclature.

The group covers, *inter alia* :

- (1) Structures such as window frames, and fabricated parts of structures.
 - (2) Reservoirs, vats and similar containers, of any capacity, not fitted with mechanical or thermal equipment.
 - (3) Cloth, grill and netting of nickel wire, and expanded metal, of nickel.
 - (4) Nickel nails, tacks, nuts, bolts, screws and other articles of the types described in the Explanatory Notes to headings 73.17 and 73.18.
 - (5) Springs **other than** clock or watch springs of **heading 91.14**.
 - (6) Household articles and sanitary ware, and parts thereof.
 - (7) Blanks for coinage, in the form of nickel discs with raised edges.
 - (8) Nickel articles corresponding to the iron or steel articles referred to in the Explanatory Notes to headings 73.25 and 73.26.
-

Chapter 76

Aluminium and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(b) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(c) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(d) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 76.01), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

Headings 76.06 and 76.07 apply, *inter alia*, to plates, sheets, strip and foil with patterns (for example, grooves, ribs, chequers, tears, buttons, lozenges) and to such products which have been perforated, corrugated, polished or coated, provided that they do not thereby assume the character of articles or products of other headings.

(e) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be considered as tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

Subheading Notes.

- 1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Aluminium, not alloyed

Metal containing by weight at least 99 % of aluminium, provided that the content by weight of any other element does not exceed the limit specified in the following table :

TABLE - Other elements

Element	Limiting content % by weight
Fe + Si (iron plus silicon)	1
Other elements ⁽¹⁾ , each	0.1 ⁽²⁾

⁽¹⁾ Other elements are, for example Cr, Cu, Mg, Mn, Ni, Zn.
⁽²⁾ Copper is permitted in a proportion greater than 0.1 % but not more than 0.2 %, provided that neither the chromium nor manganese content exceeds 0.05 %.

(b) Aluminium alloys

Metallic substances in which aluminium predominates by weight over each of the other elements, provided that :

- (i) the content by weight of at least one of the other elements or of iron plus silicon taken together is greater than the limit specified in the foregoing table; or
 - (ii) the total content by weight of such other elements exceeds 1 %.
- 2.- Notwithstanding the provisions of Chapter Note 1 (c), for the purposes of subheading 7616.91 the term "wire" applies only to products, whether or not in coils, of any cross-sectional shape, of which no cross-sectional dimension exceeds 6 mm.

GENERAL

This Chapter covers aluminium and its alloys, and certain articles thereof.

Aluminium is obtained principally from bauxite, a crude hydrated alumina (see the Explanatory Note to heading 26.06). The first stage of the extraction is designed to convert the bauxite into pure aluminium oxide (alumina). For this purpose the ground ore is calcined and then treated with sodium hydroxide to produce a solution of sodium aluminate; this is then filtered to eliminate insoluble impurities (iron oxide, silica, etc.). The aluminium is then precipitated as aluminium hydroxide, which is calcined to give pure aluminium oxide in the form of a white powder. However, aluminium hydroxide and aluminium oxide are classified in **Chapter 28**.

In the second stage, the metal is extracted by electrolytic reduction of the alumina dissolved in fused cryolite (the latter is sodium aluminium fluoride, but it acts solely as a solvent). This electrolysis is carried out in carbon lined baths which act as the cathode; carbon bars are used as anodes. The aluminium is deposited in the bottom of the baths from where it is syphoned. It is then cast in the form of blocks, ingots, billets, slabs, wire bars, etc., usually after refining. By repeated electrolysis, aluminium can be obtained almost completely pure.

Aluminium may also be obtained by the treatment of certain other ores such as leucite (double silicate of aluminium and potassium), by re-melting aluminium waste and scrap or by processing residues (slag, dross, etc.).

*
* *

Aluminium is a bluish-white metal characterised by its lightness. It is very ductile and easily rolled, drawn, forged, stamped, and may be cast, etc. Like other soft metals, aluminium is also very suitable for extrusion and die-casting. In modern practice it can be soldered. Aluminium is an excellent conductor of heat and electricity and is a very good reflector. Since the oxide film which forms naturally on its surface protects the metal, it is often produced artificially in greater depth by anodising or chemical treatment; the surface is also sometimes coloured during these processes.

*
* *

The hardness, toughness, etc., of aluminium can be very substantially increased by alloying with other elements such as copper, magnesium, silicon, zinc or manganese. Certain of the alloys may be improved by age-hardening treatments. These processes may be followed by tempering.

The **principal aluminium alloys** which may be classified in this Chapter under the provisions of Note 5 to Section XV (see the General Explanatory Note to that Section) are :

- (1) Aluminium-copper alloys. These are aluminium based alloys with a low copper content.
- (2) Aluminium-zinc-copper alloys.
- (3) Aluminium-silicon alloys (e.g., " alpax ", " silumin ").

- (4) Aluminium-manganese-magnesium alloys.
- (5) Aluminium-magnesium-silicon alloys (e.g., "almelec", "aldrey").
- (6) Aluminium-copper-magnesium-manganese alloys (e.g., "duralumin").
- (7) Aluminium-magnesium alloys (e.g., "magnalium").
- (8) Aluminium-manganese alloys.
- (9) Aluminium-zinc-magnesium alloys.

Most of these alloys may also contain small quantities of iron, nickel, chromium, etc.; they are often marketed under trade names which vary according to the country of origin.

*
* * *

The special properties of aluminium and its alloys favour their wide use: in the aircraft, automobile or shipbuilding industries; in the building industry; in the construction of railway or tramway rolling-stock; in the electrical industry (e.g., as cables); for all types of containers (reservoirs and vats of all sizes, transport casks, drums, etc.); for household or kitchen utensils; for the manufacture of foil; etc.

*
* * *

The Chapter covers :

- (A) Unwrought aluminium, and waste and scrap (headings 76.01 and 76.02).
- (B) Aluminium powders and flakes (heading 76.03).
- (C) Products generally obtained by rolling, extruding, drawing or forging the unwrought aluminium of heading 76.01 (headings 76.04 to 76.07).
- (D) Various articles specified in headings 76.08 to 76.15, and other articles of the residual heading 76.16 which covers all other aluminium articles **other than** those included in **Chapter 82 or 83**, or more specifically covered elsewhere in the Nomenclature.

Products obtained by sintering aluminium and alumina are considered as cermets and **are excluded** from this Chapter (**heading 81.13**).

*
* * *

Products and articles of aluminium are frequently subjected to various treatments to improve the properties or appearance of the metal, to protect it from corrosion, etc. These treatments are generally those referred to at the end of the General Explanatory Note to Chapter 72, and do not affect the classification of the goods.

*
* * *

The classification of **composite goods**, particularly made up articles, is explained in the General Explanatory Note to Section XV.

76.01 - Unwrought aluminium.

7601.10 - Aluminium, not alloyed

7601.20 - Aluminium alloys

This heading covers **unwrought aluminium** in the liquid state, in blocks, ingots, billets, slabs, notched bars, wire bars, or similar forms obtained by casting electrolytic aluminium or by remelting metal waste or scrap. These goods are generally intended for rolling, forging, drawing, extruding, hammering or for remelting and for casting into shaped articles.

The heading includes aluminium pellets, mainly used in metallurgy (as de-oxidising agents, especially in the manufacture of iron or steel).

The heading also covers certain cast or sintered bars, etc. (see the Explanatory Note to heading 74.03 which applies, *mutatis mutandis*, to this heading).

The heading **excludes** aluminium powders and flakes (**heading 76.03**).

76.02 - Aluminium waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading.

Aluminium waste and scrap is an important source of raw material for the aluminium industry. It is also used as a de-oxidising or de-carburising agent in metallurgy.

The heading **does not cover** :

- (a) Slag, dross, etc., from the manufacture of iron or steel containing recoverable aluminium in the form of silicates (**heading 26.18 or 26.19**).
- (b) Slag, ash and residues from the manufacture of aluminium (**heading 26.20**).
- (c) Ingots and similar unwrought forms, cast from remelted aluminium waste and scrap (**heading 76.01**).

76.03 - Aluminium powders and flakes.

7603.10 - Powders of non-lamellar structure

7603.20 - Powders of lamellar structure; flakes

This heading covers aluminium powders as defined in Note 8 (b) to Section XV and aluminium flakes. In general these products correspond to those of copper and the Explanatory Note to heading 74.06 therefore applies, *mutatis mutandis*, to this heading. Aluminium powders and flakes are, however, also used in pyrotechnics, as heat generators (e.g., in the thermit process), to protect other metals from corrosion (e.g., calorising, metallic cementation), in rocket propellants and in the preparation of special cements.

The heading **does not cover** :

- (a) Powders or flakes, prepared as colours, paints or the like (e.g., made up with other colouring matter or put up as suspensions, dispersions or pastes with a binder or solvent) (**Chapter 32**).
- (b) Aluminium pellets (**heading 76.01**).
- (c) Spangles cut from aluminium foil (**heading 83.08**).

76.04 - Aluminium bars, rods and profiles.

7604.10 - Of aluminium, not alloyed

- Of aluminium alloys :

7604.21 -- Hollow profiles

7604.29 -- Other

These products, which are defined in Notes 1 (a) and 1 (b) to the Chapter, correspond to similar goods made of copper. The provisions of the Explanatory Note to heading 74.07 apply therefore, *mutatis mutandis*, to this heading.

The heading **does not cover** :

- (a) Rods and profiles, prepared for use in structures (**heading 76.10**).
- (b) Coated welding electrodes, etc. (**heading 83.11**).

76.05 - Aluminium wire.

- Of aluminium, not alloyed :

7605.11 -- Of which the maximum cross-sectional dimension exceeds 7 mm

7605.19 -- Other

- Of aluminium alloys :

7605.21 -- Of which the maximum cross-sectional dimension exceeds 7 mm

7605.29 -- Other

Wire is defined in Chapter Note 1 (c).

The heading **does not cover** :

- (a) Metallised yarn (**heading 56.05**).
- (b) Twine and cordage reinforced with aluminium wire (**heading 56.07**).
- (c) Stranded wire, cables and other goods of **heading 76.14**.
- (d) Coated welding electrodes (**heading 83.11**).
- (e) Insulated electric wire and cable (including enamelled or anodised wire) (**heading 85.44**).
- (f) Musical instrument strings (**heading 92.09**).

76.06 - Aluminium plates, sheets and strip, of a thickness exceeding 0.2 mm.

- Rectangular (including square) :

7606.11 -- Of aluminium, not alloyed

7606.12 -- Of aluminium alloys

- Other :

7606.91 -- Of aluminium, not alloyed

7606.92 -- Of aluminium alloys

These products, which are defined in Note 1 (d) to the Chapter, correspond to similar goods made of copper. The provisions of the Explanatory Note to heading 74.09 apply therefore, *mutatis mutandis*, to this heading.

The heading **does not cover** :

- (a) Foil of a thickness not exceeding 0.2 mm (**heading 76.07**).
- (b) Expanded metal (**heading 76.16**).

76.07 - Aluminium foil (whether or not printed or backed with paper, paperboard, plastics or similar backing materials) of a thickness (excluding any backing) not exceeding 0.2 mm (+).

- Not backed :

7607.11 -- Rolled but not further worked

7607.19 -- Other

7607.20 - Backed

This heading covers the products defined in Chapter Note 1 (d), when of a thickness not exceeding 0.2 mm.

The provisions of the Explanatory Note to heading 74.10 relating to copper foil apply, *mutatis mutandis*, to this heading.

Aluminium foil is used in the manufacture of bottle caps and capsules, for packing foodstuffs, cigars, cigarettes, tobacco, etc. Aluminium foil is also used for the manufacture of the finely divided powder of heading 76.03, in crinkled sheets for thermal insulation, for artificial silvering, and as a wound dressing in veterinary surgery.

The heading **does not cover** :

- (a) Stamping foils (also known as blocking foils) composed of aluminium powder agglomerated with gelatin, glue or other binder, or of aluminium deposited on paper, plastics or other support, and used for printing book covers, hat bands, etc. (**heading 32.12**).
- (b) Paper and paperboard for the manufacture of containers for milk, fruit juice or other food products and lined with aluminium foil (i.e., on the face which will form the inside of the containers) **provided** they retain the essential character of paper or paperboard (**heading 48.11**).
- (c) Printed aluminium foil labels being identifiable individual articles by virtue of the printing (**heading 49.11**).
- (d) Plates, sheets and strip, of a thickness exceeding 0.2 mm (**heading 76.06**).
- (e) Foil in the form of Christmas tree decorations (**heading 95.05**).

Subheading Explanatory Note.

Subheading 7607.11

In addition to cold-rolling or hot-rolling, the products of this subheading may have been subjected to the following working or surface treatments :

- (1) Heat treatments, such as stress-relieving or annealing. These treatments also eliminate residual rolling mill lubricants.
- (2) Trimming, slitting or cutting into rectangular (including square) shape, e.g., separating wide strip into narrower strip.
- (3) Separation (unwinding) of thin multiple-layer laminated sheets. This operation is necessary when two or more coils of foil are rolled simultaneously during the last rolling mill pass.
- (4) Chemical cleaning or washing. This is normally carried out to eliminate residual oil when there is no heat treatment.

76.08 - Aluminium tubes and pipes.

7608.10 - Of aluminium, not alloyed

7608.20 - Of aluminium alloys

Chapter Note 1 (e) defines **tubes and pipes**.

The tubes and pipes of this heading may be manufactured by the following processes :

- (a) by extruding a hollow cast or pierced round ingot;
- (b) by longitudinally or spirally seam welding a die or roll-formed flat-rolled semi-product (strip or sheet);
- (c) by impact extrusion;
- (d) by casting.

Extruded or welded tubes may be subjected to a cold-drawing operation to obtain tubes with thinner walls, more accurate dimensions and a better finish.

The tubes and pipes of this heading are used for many purposes, e.g., as pipelines for oil or water, as conduits for electrical wiring, in the manufacture of furniture, heat exchangers, structures.

The heading includes tubes and pipes whether or not they are threaded at the ends, fitted with sockets, flanges, collars, rings, etc.

The heading **does not cover** :

- (a) Hollow profiles (**heading 76.04**).
- (b) Tube or pipe fittings (**heading 76.09**).
- (c) Flexible tubing (**heading 83.07**).
- (d) Tubes and pipes made up into specific identifiable articles, such as those prepared for use in structures (**heading 76.10**), machinery or vehicle parts (**Sections XVI and XVII**), etc.

76.09 - Aluminium tube or pipe fittings (for example, couplings, elbows, sleeves).

The provisions of the Explanatory Notes to headings 73.07 and 74.12 apply, *mutatis mutandis*, to this heading.

The heading **does not cover** :

- (a) Clamps and other devices specially designed for assembling parts of structures (**heading 76.10**).
- (b) Hangers and brackets to support tubing; aluminium bolts and nuts used for assembling or fixing pipes or tubes (**heading 76.16**).
- (c) Fittings with taps, cocks, valves, etc. (**heading 84.81**).

76.10 - Aluminium structures (excluding prefabricated buildings of heading 94.06) and parts of structures (for example, bridges and bridge-sections, towers, lattice masts, roofs, roofing frameworks, doors and windows and their frames and thresholds for doors, balustrades, pillars and columns); aluminium plates, rods, profiles, tubes and the like, prepared for use in structures.

7610.10 - Doors, windows and their frames and thresholds for doors

7610.90 - Other

The provisions of the Explanatory Note to heading 73.08 apply, *mutatis mutandis*, to this heading.

In the case of aluminium, structural parts are sometimes bonded together with synthetic resins or rubber compounds instead of being fixed by the ordinary methods of riveting, bolting, etc.

In view of their lightness, aluminium and its alloys are sometimes used instead of iron or steel in the manufacture of structural frameworks, ships' superstructures, bridges, sliding doors, electric grid or radio pylons, telescopic pit props, door or window frames, railings, etc.

The heading **excludes** :

- (a) Assemblies identifiable as parts of articles of **Chapters 84 to 88**.
- (b) Floating structures of **Chapter 89**.
- (c) Prefabricated buildings (**heading 94.06**).

76.11 - Aluminium reservoirs, tanks, vats and similar containers, for any material (other than compressed or liquefied gas), of a capacity exceeding 300 l, whether or not lined or heat-insulated, but not fitted with mechanical or thermal equipment.

The Explanatory Note to heading 73.09 applies, *mutatis mutandis*, to this heading.

Because of its lightness and resistance to corrosion, aluminium tends to replace iron and steel in the manufacture of reservoirs, tanks, etc., particularly in the chemical industries, breweries, dairies, cheese factories.

However, the heading **excludes** containers specially designed and equipped for carriage by one or more modes of transport (**heading 86.09**).

76.12 - Aluminium casks, drums, cans, boxes and similar containers (including rigid or collapsible tubular containers), for any material (other than compressed or liquefied gas), of a capacity not exceeding 300 l, whether or not lined or heat-insulated, but not fitted with mechanical or thermal equipment.

7612.10 - Collapsible tubular containers

7612.90 - Other

The provisions of the Explanatory Note to heading 73.10 also apply, *mutatis mutandis*, to this heading.

Casks and drums of aluminium are mainly used for the transport of milk, beer, wine, etc.; aluminium cans and boxes are often used for packing foodstuffs. The heading also includes rigid tubular containers (e.g., for pharmaceutical products such as pills or tablets), and collapsible tubular containers for creams, toothpastes, etc.

This heading **does not cover** :

- (a) Articles of **heading 42.02**.
- (b) Biscuit barrels, tea caddies, sugar tins and similar household or kitchen containers and canisters (**heading 76.15**).
- (c) Cigarette cases, powder boxes, tool boxes and similar containers for personal or professional use (**heading 76.16**).
- (d) Articles of **heading 83.04**.
- (e) Ornamental boxes (**heading 83.06**).
- (f) Containers specially designed and equipped for carriage by one or more modes of transport (**heading 86.09**).
- (g) Vacuum flasks and other vacuum vessels, complete, of **heading 96.17**.

76.13 - Aluminium containers for compressed or liquefied gas.

See the Explanatory Note to heading 73.11.

76.14 - Stranded wire, cables, plaited bands and the like, of aluminium, not electrically insulated.

7614.10 - With steel core

7614.90 - Other

The Explanatory Note relating to heading 73.12 applies, *mutatis mutandis*, to this heading.

Since they are light and good conductors of electricity, aluminium and the aluminium-magnesium-silicon alloys such as "almelec" and "aldrey" are often used in place of copper in the construction of electric wires and cables.

Aluminium cables may have a core of steel or other metal **provided** the aluminium predominates by weight (see Note 7 to Section XV).

However, the heading **excludes** insulated electric wire and cable (**heading 85.44**).

76.15 - Table, kitchen or other household articles and parts thereof, of aluminium; pot scourers and scouring or polishing pads, gloves and the like, of aluminium; sanitary ware and parts thereof, of aluminium.

7615.10 - Table, kitchen or other household articles and parts thereof; pot scourers and scouring or polishing pads, gloves and the like

7615.20 - Sanitary ware and parts thereof

This heading covers the same types of articles as are described in the Explanatory Notes to headings 73.23 and 73.24, particularly the kitchen utensils, sanitary and toilet articles described therein. The heading also covers aluminium cooking or heating apparatus similar to that described in the Explanatory Note to heading 74.18.

However, the heading **does not cover** :

- (a) Cans, boxes and similar containers, of **heading 76.12**.
- (b) Household articles having the character of tools (**Chapter 82**) (see Explanatory Note to heading 73.23).
- (c) Cutlery, spoons, ladles, forks and other articles of **headings 82.11 to 82.15**.
- (d) Ornaments (**heading 83.06**).
- (e) Instantaneous or storage water heaters and other appliances of **heading 84.19**.
- (f) Household electrical equipment of **Chapter 85** (in particular the appliances and apparatus of **headings 85.09 and 85.16**).
- (g) Articles of **Chapter 94**.
- (h) Cigarette lighters and other lighters (**heading 96.13**).
- (ij) Vacuum flasks and other vacuum vessels of **heading 96.17**.

76.16 - Other articles of aluminium.

7616.10 - Nails, tacks, staples (other than those of heading 83.05), screws, bolts, nuts, screw hooks, rivets, coppers, cotter-pins, washers and similar articles

- Other :

7616.91 -- Cloth, grill, netting and fencing, of aluminium wire

7616.99 -- Other

This heading covers all articles of aluminium **other than** those covered by the preceding headings of this Chapter, or by Note 1 to Section XV, or articles specified or included in **Chapter 82 or 83**, or more specifically covered elsewhere in the Nomenclature.

This heading includes, in particular :

- (1) Nails, tacks, staples, (**other than** those of **heading 83.05**), screws, bolts, nuts, screw hooks, rivets, coppers, cotterpins, washers and similar articles of the types described in the Explanatory Notes to headings 73.17 and 73.18.
- (2) Knitting needles, bodkins, crochet hooks, embroidery stilettos, safety pins, other pins and other articles of the types described in the Explanatory Note to heading 73.19.
- (3) Chains and parts thereof of aluminium.
- (4) Cloth, grill and netting of aluminium wire, and expanded metal (see the Explanatory Note to heading 73.14). Expanded metal is used in shop display, for loudspeaker grills, as an explosion suppressant used in the transport and storage of volatile liquids and gases, etc.
- (5) Aluminium articles corresponding to the iron and steel articles referred to in the Explanatory Notes to headings 73.25 and 73.26.

The heading **does not cover** :

- (a) Woven fabric of metal thread, of a kind used in articles of apparel, as furnishing fabrics or the like (**heading 58.09**).
 - (b) Wire cloth, etc., made into the form of machinery parts (e.g., by assembling with other materials) (**Chapter 84 or 85**).
 - (c) Wire cloth, etc., made up into hand sieves or riddles (**heading 96.04**).
-

Chapter 77

*(Reserved for possible future use
in the Harmonized System)*

Chapter 78

Lead and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(b) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(c) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(d) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 78.01), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

Heading 78.04 applies, *inter alia*, to plates, sheets, strip and foil with patterns (for example, grooves, ribs, chequers, tears, buttons, lozenges) and to such products which have been perforated, corrugated, polished or coated, provided that they do not thereby assume the character of articles or products of other headings.

(e) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be considered as tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

Subheading Note.

1.- In this Chapter the expression " refined lead " means :

Metal containing by weight at least 99.9 % of lead, provided that the content by weight of any other element does not exceed the limit specified in the following table :

TABLE - Other elements

Element	Limiting content % by weight	
Ag	Silver	0.02
As	Arsenic	0.005
Bi	Bismuth	0.05
Ca	Calcium	0.002
Cd	Cadmium	0.002
Cu	Copper	0.08
Fe	Iron	0.002
S	Sulphur	0.002
Sb	Antimony	0.005
Sn	Tin	0.005
Zn	Zinc	0.002
Other	(for example Te), each	0.001

GENERAL

This Chapter covers lead and its alloys, and certain articles thereof.

Lead is mainly extracted from galena, a natural lead sulphide ore often containing silver. The crushed ore, after concentration by flotation, is generally roasted or sintered, and is then reduced by smelting. During the roasting or sintering process, the sulphide is largely converted into oxide; in the smelting process, the oxide is reduced to lead by means of coke and a flux. In this manner "bullion lead" or "work lead" is obtained; this contains a number of impurities, frequently including silver. It is therefore generally further refined to produce almost completely pure lead.

Lead is also obtained by remelting lead waste and scrap.

*
* * *

Lead is a heavy, bluish-grey metal; it is very malleable, easily melted and very soft (it can be marked easily with the thumb nail). It resists the action of most acids (e.g., sulphuric acid or hydrogen chloride) and is therefore used in the construction of chemical plant.

*
* * *

Because of its low melting point lead is easily alloyed with other elements. The **principal lead alloys** which may fall in this Chapter under the provisions of Note 5 to Section XV (see the General Explanatory Note to that Section), are the following :

- (1) Lead-tin alloys used, for example, in lead-based soft solders, in terne-plate and in foil for the packing of tea.
- (2) Lead-antimony-tin alloys used for printing type and in anti-friction bearings.
- (3) Lead-arsenic alloys used for lead shot.
- (4) Lead-antimony alloys (hard lead), used for bullets, accumulator plates, etc.
- (5) Lead-calcium, lead-antimony-cadmium, lead-tellurium alloys.

*
* * *

The Chapter covers :

- (A) Unwrought lead and waste and scrap (headings 78.01 and 78.02).
- (B) Products generally obtained by rolling or extruding the unwrought lead of heading 78.01 (headings 78.04 and 78.06); lead powders and flakes (heading 78.04).

- (C) Tubes, pipes and fittings and the other articles of the residual heading 78.06 which covers all other lead articles **other than** those covered by Note 1 to Section XV or included in **Chapter 82 or 83** or those more specifically covered elsewhere in the Nomenclature.

*
* *

Products and articles of lead may be subjected to various treatments to improve the properties or appearance of the metal, etc. These treatments are generally those referred to at the end of the General Explanatory Note to Chapter 72, and do not affect the classification of the goods.

*
* *

The classification of **composite articles** is explained in the General Explanatory Note to Section XV.

78.01 - Unwrought lead.

7801.10 - Refined lead

- Other :

7801.91 - - Containing by weight antimony as the principal other element

7801.99 - - Other

This heading covers **unwrought lead** at its different degrees of purity, from impure lead bullion or argentiferous lead to electrolytically refined lead. It may be in blocks, ingots, pigs, slabs, cakes or similar forms, or in cast sticks. Most of these forms are intended for rolling or extrusion, for manufacture of alloys, or for casting into shaped articles. The heading also covers cast anodes for electrolytic refining, cast rods intended, for example, for rolling or drawing or for re-casting into shaped articles.

The heading **excludes** lead powders or flakes (**heading 78.04**).

78.02 - Lead waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading.

This heading **does not cover** :

- (a) Slag, ash and residues from the manufacture of lead (e.g., lead matte) (**heading 26.20**).
- (b) Ingots and similar unwrought forms cast from remelted lead waste and scrap (**heading 78.01**).

[78.03]

78.04 - Lead plates, sheets, strip and foil; lead powders and flakes.

- Plates, sheets, strip and foil :

7804.11 -- Sheets, strip and foil of a thickness (excluding any backing) not exceeding 0.2 mm

7804.19 -- Other

7804.20 - Powders and flakes

Lead plates, sheets, strip and foil are defined in Chapter Note 1 (d).

The provisions of the Explanatory Notes to headings 74.09 and 74.10 apply, *mutatis mutandis*, to this heading.

The main uses of lead plates, sheets and strip are for roofing purposes, cladding, in reservoirs, vats and other chemical plant, for the manufacture of X-ray screens, etc.

Lead foil is mainly used for packing (especially for lining tea chests or cases for silk). In some cases the foil is clad or coated with tin or other metals.

The heading also covers lead powders as defined in Note 8 (b) to Section XV and lead flakes. The provisions of the Explanatory Note to heading 74.06 apply, *mutatis mutandis*, to this heading.

The heading **does not cover** lead powders and flakes, prepared as colours, paints or the like (e.g., made up with other colouring matter or put up as suspensions, dispersions or pastes with a binder or solvent) (**Chapter 32**).

[78.05]

78.06 - Other articles of lead.

This heading covers all lead articles **not included** in the preceding headings of this Chapter, or in **Chapter 82 or 83**, or more specifically covered elsewhere in the Nomenclature (see Note 1 to Section XV), whether these articles are cast, pressed, stamped, etc.

It applies, in particular, to collapsible tubes for packing colours or other products; vats, reservoirs, drums and similar containers (for acids, radioactive products or other chemicals), **not** fitted with mechanical or thermal equipment; lead weights for fishing nets, lead weights for clothing, curtains, etc.; weights for clocks, and general purpose counterweights; skeins, hanks and ropes of lead fibres or strands used for packing or for caulking pipe joints; parts of building structures; yacht keels, divers' breast plates; electroplating anodes (see Part (A) of the Explanatory Note to heading 75.08); lead bars, rods, profiles and wire defined in Notes 1 (a), 1 (b) and 1 (c) to this Chapter (**other than** cast rods intended, for example, for rolling or drawing or for re-casting into shaped articles (**heading 78.01**), and coated rods (**heading 83.11**)).

This heading also includes tubes and pipes defined in Chapter Note 1 (e) and tube or pipe fittings (for example, couplings, elbows, sleeves), of lead (**other than** fittings with taps, cocks, valves, etc. (**heading 84.81**)), tubes and pipes made up into specific identifiable articles, such as machinery parts (**Section XVI**) and insulated electric cables with an outer sheathing of lead (**heading 85.44**)). These articles correspond to the iron or steel goods referred to in the Explanatory Notes to headings 73.04 to 73.07.

Chapter 79

Zinc and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(b) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(c) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(d) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 79.01), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

Heading 79.05 applies, *inter alia*, to plates, sheets, strip and foil with patterns (for example, grooves, ribs, chequers, tears, buttons, lozenges) and to such products which have been perforated, corrugated, polished or coated, provided that they do not thereby assume the character of articles or products of other headings.

(e) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be considered as tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

Subheading Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Zinc, not alloyed

Metal containing by weight at least 97.5 % of zinc.

(b) Zinc alloys

Metallic substances in which zinc predominates by weight over each of the other elements, provided that the total content by weight of such other elements exceeds 2.5 %.

(c) Zinc dust

Dust obtained by condensation of zinc vapour, consisting of spherical particles which are finer than zinc powders. At least 80 % by weight of the particles pass through a sieve with 63 micrometres (microns) mesh. It must contain at least 85 % by weight of metallic zinc.

GENERAL

This Chapter covers zinc and zinc alloys, and certain articles thereof.

Zinc is mainly extracted from the sulphide ore (zinc blende or sphalerite), though the carbonate and silicate ores (smithsonite, hemimorphite, etc.) are also used (see the Explanatory Note to heading 26.08).

In either case, the ore is first concentrated and is then roasted or calcined to produce zinc oxide (in the case of the sulphide and carbonate ores) or water-free zinc silicate (in the case of silicate ores). Zinc is extracted from these by thermal reduction or (except in the case of silicate ores) electrolysis.

- (I) **Thermal reduction** is effected by heating the oxide or silicate with coke in closed retorts. The temperature is sufficient to vaporise the zinc which distils over into condensers where most of the metal is collected as "spelter". This impure zinc may be used directly for galvanising, or may be refined by various methods.

Some impure metal is also deposited in the retort extensions as a very fine powder known as zinc dust or blue powder.

A modern modification of the process is based on the continuous reduction of zinc oxide and distillation of zinc in vertical retorts. This process gives very pure metal suitable for making die-casting alloys.

- (II) **Electrolysis.** The zinc oxide is dissolved in dilute sulphuric acid. This solution of zinc sulphate is carefully purified to remove cadmium, iron, copper, etc., and is then electrolysed to produce a very pure zinc.

Zinc is also obtained by resmelting zinc waste and scrap.

*
* * *

Zinc is a bluish-white metal which can be rolled, drawn, stamped, extruded, etc., at suitable temperatures, and it can readily be cast. It is resistant to atmospheric corrosion and is therefore used in building (e.g., for roofing), and to form protective coverings for other metals, especially iron and steel (e.g., by hot-dip galvanising, electro-deposition, sherardising, painting or spraying).

*
* * *

Zinc is also used in the manufacture of alloys; many of these (e.g., brass), contain a predominance of other metals, but the following are the **principal zinc alloys** which may fall in this Chapter under the provisions of Note 5 to Section XV :

- (1) Zinc-aluminium alloys, usually with added copper or magnesium used for die-casting, especially for automobile parts (carburettor bodies, radiator grilles, dash-boards, etc.), cycle parts (pedals, dynamo cases, etc.), radio parts, refrigerator parts, etc. Alloys of the same metals are used to produce sheets stronger than ordinary zinc, press-tools, and as cathodic protection anodes (sacrificial anodes) for protecting pipelines, condensers, etc., against corrosion.
- (2) Zinc-copper alloys (button metal alloys), for casting, stamping, etc. See Subheading Notes 1 (a) and 1 (b) concerning the distinction between zinc and zinc alloys.

*
* * *

The Chapter covers :

- (A) Spelter and unwrought zinc, and waste and scrap (headings 79.01 and 79.02).
- (B) Zinc dust, powders and flakes (heading 79.03).
- (C) Products generally obtained by rolling, drawing or extruding the unwrought zinc of heading 79.01 (headings 79.04 and 79.05).

- (D) Tubes, pipes and fittings and the other articles of the residual heading 79.07 which covers all other zinc articles **other than** those covered by Note 1 to Section XV or included in **Chapter 82 or 83** or those more specifically covered elsewhere in the Nomenclature.

*
* *

Products and articles of zinc may be subjected to various treatments to improve the properties or appearance of the metal, etc. These treatments are generally those referred to at the end of the General Explanatory Note to Chapter 72, and do not affect the classification of the goods.

*
* *

The classification of **composite articles** is explained in the General Explanatory Note to Section XV.

79.01 - Unwrought zinc.

- Zinc, not alloyed :

7901.11 - - Containing by weight 99.99 % or more of zinc

7901.12 - - Containing by weight less than 99.99 % of zinc

7901.20 - Zinc alloys

This heading covers **unwrought zinc** in its different degrees of purity from spelter (see the General Explanatory Note above) to refined zinc, whether in blocks, plates, ingots, billets, slabs or similar forms or in pellets. The products of this heading are normally intended for use in galvanising (by the hot-dip or electrodeposition processes), for making alloys, for rolling, drawing or extrusion, or for casting into shaped articles.

The heading **excludes** zinc dust, powders and flakes (**heading 79.03**).

79.02 - Zinc waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading.

The heading **excludes** :

- (a) Slag, ash and residues from the manufacture of zinc, from galvanising processes, etc. (e.g., sludges deposited in electro-galvanising, and metallic residues from dipping tanks) (**heading 26.20**).
- (b) Ingots and similar unwrought forms cast from remelted zinc waste and scrap (**heading 79.01**).

79.03 - Zinc dust, powders and flakes.

7903.10 - Zinc dust

7903.90 - Other

The heading covers :

- (1) **Zinc dust** as defined by Subheading Note 1 (c) to this Chapter is obtained by condensation of zinc vapour which is produced either directly in a zinc ore reduction operation or by the treatment of zinc-bearing materials by boiling. These products must not be confused with the flue dusts, variously known as "zinc flue dust", "zinc oxide flue dust" or "zinc baghouse flue dust" which are classified in **heading 26.20**.
- (2) **Zinc powders** as defined in Note 8 (b) to Section XV and **zinc flakes**. The provisions of the Explanatory Note to heading 74.06 apply, *mutatis mutandis*, to this heading.

*
* * *

Zinc dust, powders and flakes are mainly used to coat other metals by metallic cementation (sherardisation), in the manufacture of paints, as chemical reducing agents, etc.

The heading also **excludes** :

- (a) Zinc dust, powders or flakes, prepared as colours, paints or the like (e.g., made up with other colouring matter or put up as suspensions, dispersions or pastes, with a binder or solvent) (**Chapter 32**).
- (b) Zinc pellets (**heading 79.01**).

79.04 - Zinc bars, rods, profiles and wire.

These products, which are defined in Chapter Notes 1 (a), 1 (b) and 1 (c), correspond to similar goods made of copper. The provisions of the Explanatory Notes to headings 74.07 and 74.08 therefore apply, *mutatis mutandis*, to this heading.

Rods and profiles of zinc are often used to make fabricated building components (heading 79.07); the main use of zinc wire is as a source of zinc for spraying the metal from an oxy-acetylene pistol.

The heading also includes brazing or welding rods of zinc base alloys (generally made by extrusion) whether or not cut to length, **provided** they are not coated with flux material. Coated rods are **excluded** (**heading 83.11**).

The heading also **excludes** cast rods intended, for example, for rolling or drawing or for re-casting into shaped articles (**heading 79.01**).

79.05 - Zinc plates, sheets, strip and foil.

This heading covers **plates, sheets, strip and foil**, which are defined in Chapter Note 1 (d); these products correspond to the copper products described in the Explanatory Notes to headings 74.09 and 74.10.

Zinc plates and sheets are used for the manufacture of roofing tiles, dry battery cell containers, photo-engraving, lithographic or other printing plates, etc.

The heading **does not cover** :

- (a) Expanded metal (**heading 79.07**).
- (b) Prepared printing plates, etc., of **heading 84.42**.

[79.06]

79.07 - Other articles of zinc.

This heading covers all articles of zinc **other than** those covered by the preceding headings of this Chapter, or by Note 1 to Section XV, or articles specified or included in **Chapter 82** or **83** or more specifically covered elsewhere in the Nomenclature.

The heading covers, *inter alia* :

- (1) Reservoirs, vats, drums and similar containers **not** fitted with mechanical or thermal equipment.
 - (2) Tubular containers for packing pharmaceutical products, etc.
 - (3) Cloth, grill and netting of zinc wire, and expanded metal.
 - (4) Zinc nails, tacks, nuts, bolts, screws and other articles of the types described in the Explanatory Notes to headings 73.17 and 73.18.
 - (5) Household or sanitary articles such as buckets, pails, sinks, baths, basins, watering-cans, douches, scrubbing boards and jugs. (Many such articles are, however, more frequently made of galvanised iron or steel and are then **excluded (headings 73.23 and 73.24)**).
 - (6) Zinc "labels" (for trees, plants, etc.) **not** bearing letters, numbers or designs, or bearing only particulars incidental to the essential information which is to be added later. "Labels" completed with all the essential information fall in **heading 83.10**.
 - (7) Stencil plates.
 - (8) Tile hangers and other miscellaneous zinc products corresponding to the iron or steel goods referred to in the Explanatory Notes to headings 73.25 and 73.26.
 - (9) (Electroplating anodes (see Part (A) of the Explanatory Note to heading 75.08).
 - (10) Cathodic protection anodes (sacrificial anodes) used for protecting pipelines, ships tanks, etc., from corrosion.
 - (11) Gutters, roof capping, skylight frames, rainwater heads, door or window frames, balustrades, railings, frameworks for greenhouses and other fabricated building components corresponding to the iron and steel articles referred to in the Explanatory Note to heading 73.08.
 - (12) Tubes and pipes defined in Chapter Note 1 (e) and tube or pipe fittings (for example couplings, elbows, sleeves), of zinc (**other than** hollow profiles (**heading 79.04**), fittings with taps, cocks, valves, etc. (**heading 84.81**) and tubes and pipes made up into specific identifiable articles, such as machinery parts (**Section XVI**)). These articles correspond to the iron or steel goods referred to in the Explanatory Notes to headings 73.04 to 73.07.
-

Chapter 80

Tin and articles thereof

Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Bars and rods

Rolled, extruded, drawn or forged products, not in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width. The expression also covers cast or sintered products, of the same forms and dimensions, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(b) Profiles

Rolled, extruded, drawn, forged or formed products, coiled or not, of a uniform cross-section along their whole length, which do not conform to any of the definitions of bars, rods, wire, plates, sheets, strip, foil, tubes or pipes. The expression also covers cast or sintered products, of the same forms, which have been subsequently worked after production (otherwise than by simple trimming or de-scaling), provided that they have not thereby assumed the character of articles or products of other headings.

(c) Wire

Rolled, extruded or drawn products, in coils, which have a uniform solid cross-section along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons (including " flattened circles " and " modified rectangles ", of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel). Products with a rectangular (including square), triangular or polygonal cross-section may have corners rounded along their whole length. The thickness of such products which have a rectangular (including " modified rectangular ") cross-section exceeds one-tenth of the width.

(d) Plates, sheets, strip and foil

Flat-surfaced products (other than the unwrought products of heading 80.01), coiled or not, of solid rectangular (other than square) cross-section with or without rounded corners (including " modified rectangles " of which two opposite sides are convex arcs, the other two sides being straight, of equal length and parallel) of a uniform thickness, which are :

- of rectangular (including square) shape with a thickness not exceeding one-tenth of the width,
- of a shape other than rectangular or square, of any size, provided that they do not assume the character of articles or products of other headings.

(e) Tubes and pipes

Hollow products, coiled or not, which have a uniform cross-section with only one enclosed void along their whole length in the shape of circles, ovals, rectangles (including squares), equilateral triangles or regular convex polygons, and which have a uniform wall thickness. Products with a rectangular (including square), equilateral triangular or regular convex polygonal cross-section, which may have corners rounded along their whole length, are also to be considered as tubes and pipes provided the inner and outer cross-sections are concentric and have the same form and orientation. Tubes and pipes of the foregoing cross-sections may be polished, coated, bent, threaded, drilled, waisted, expanded, cone-shaped or fitted with flanges, collars or rings.

◦
◦ ◦

Subheading Note.

1.- In this Chapter the following expressions have the meanings hereby assigned to them :

(a) Tin, not alloyed

Metal containing by weight at least 99 % of tin, provided that the content by weight of any bismuth or copper is less than the limit specified in the following table :

TABLE - Other elements

Element	Limiting content % by weight	
Bi	Bismuth	0.1
Cu	Copper	0.4

(b) Tin alloys

Metallic substances in which tin predominates by weight over each of the other elements, provided that :

- (i) the total content by weight of such other elements exceeds 1 %; or
- (ii) the content by weight of either bismuth or copper is equal to or greater than the limit
- (iii) specified in the foregoing table.

GENERAL

This Chapter covers tin and its alloys, and certain articles thereof.

Commercially, tin is extracted from the oxide ore cassiterite (or tin-stone) classified in heading 26.09; this ore may occur either in veins or in alluvial deposits.

The principal stages in the extraction are as follows :

- (I) Concentration of the ore by washing, or by crushing and flotation.

- (II) Treatment of the oxide by roasting, magnetic separation, or with acids or other solvents, to remove impurities such as sulphur, arsenic, copper, lead, iron and tungsten.
- (III) Reduction of the purified oxide with coke to produce a crude tin.
- (IV) Refining of the crude tin by various processes which can produce the metal in an almost completely pure condition.

Tin is also recovered from scrap tinplate by chlorination or electrolytic treatment, or by re-melting tin waste and scrap. These recovery processes can also produce very pure tin.

*
* * *

Pure tin is silvery-white and very shiny. It is not very ductile, but is malleable, easily melted and soft (although harder than lead). It can readily be cast, hammered, rolled or extruded.

Tin is very resistant to atmospheric corrosion but is attacked by concentrated acids.

*
* * *

Tin is chiefly used for tinning other base metals especially iron or steel (e.g., manufacture of tin-plate, especially for the canning industry), and in the preparation of alloys (bronze, etc.). In the pure state or alloyed, it is also used in the manufacture of apparatus, tubing and piping for the food industries; still heads; refrigerating apparatus; industrial reservoirs, tanks, etc.; solder in sticks, wire, etc.; ornamental articles and tableware (e.g., in pewter); toys; organ pipes; etc. It is also used in the form of foil or collapsible tubes.

*
* * *

The **principal alloys of tin** which may be classified in this Chapter under the provisions of Note 5 to Section XV (see the General Explanatory Note to that Section) include :

- (1) Tin-lead alloys used, for example, as tin base soft solders; in pewter-ware; in toy manufacture; for certain capacity measures.
- (2) Tin-antimony alloys, usually with copper (e.g., Britannia metal) used for tableware, manufacture of bearings, etc.
- (3) Tin-lead-antimony alloys, sometimes with copper (e.g., tin based anti-friction metals), used to make castings (especially bearings) and as packing.
- (4) Tin-cadmium alloys, sometimes also including zinc, used as anti-friction metals.

*
* * *

This Chapter covers :

- (A) Unwrought tin and tin waste and scrap (headings 80.01 and 80.02).
- (B) Products obtained generally by rolling or extruding the unwrought tin of heading 80.01 (heading 80.03 and 80.07); tin powders and flakes (heading 80.07).
- (C) Tubes, pipes and fittings and the other articles of the residual heading 80.07 which covers all other tin articles **other than** those covered by Note 1 to Section XV or included in **Chapter 82 or 83** or those more specifically covered elsewhere in the Nomenclature.

*
* * *

Products and articles of tin may be subjected to various treatments to improve the properties or appearance of the metal, etc. These treatments are generally those referred to at the end of the General Explanatory Note to Chapter 72, and do not affect the classification of the goods.

*
* * *

The classification of **composite articles** is explained in the General Explanatory Note to Section XV.

80.01 - Unwrought tin.

8001.10 - Tin, not alloyed

8001.20 - Tin alloys

This heading covers **unwrought tin** in blocks, ingots, pigs, slabs, bars, sticks or similar forms, and fragments, granules and similar products, of tin. Most of the products of this heading are intended for use in tin-plating, for rolling or extrusion, for the manufacture of alloys, or for casting into shaped articles.

This heading **excludes** tin powders and flakes (**heading 80.07**).

80.02 - Tin waste and scrap.

The provisions concerning waste and scrap in the Explanatory Note to heading 72.04 apply, *mutatis mutandis*, to this heading.

This heading **excludes** :

- (a) Slag, ash and residues from the manufacture of tin (**heading 26.20**).
- (b) Ingots and similar unwrought forms cast from remelted tin waste and scrap (**heading 80.01**).

80.03 - Tin bars, rods, profiles and wire.

These products, which are defined in Chapter Notes 1 (a), 1 (b) and 1 (c), correspond to similar goods made of copper. The provisions of the Explanatory Notes to heading 74.07 or 74.08 therefore apply, *mutatis mutandis*, to this heading.

The heading also includes rods of tin base solder (generally made by extrusion) whether or not cut to length, **provided** they are not coated with flux material. Coated rods are **excluded (heading 83.11)**.

The heading also **excludes** cast rods intended, for example, for rolling or drawing or for re-casting into shaped articles (**heading 80.01**).

[80.04]

[80.05]

[80.06]

80.07 - Other articles of tin.

This heading covers all articles of tin, **other than** those covered by the preceding headings of this Chapter or by Note 1 to Section XV, or articles specified or included in **Chapter 82 or 83**, or more specifically covered elsewhere in the Nomenclature.

It applies, in particular, to :

- (1) Vats, reservoirs, drums and other containers (**not** fitted with mechanical or thermal equipment).
 - (2) Collapsible tubes for packing dentifrices, colours or other products.
 - (3) Household articles and tableware (usually of pewter) such as jugs, trays, plates, mugs, siphon heads and beer mug lids.
 - (4) Capacity measures.
 - (5) Electroplating anodes (see Part (A) of the Explanatory Note to heading 75.08).
 - (6) Tin powders (see Note 8 (b) to Section XV) and flakes.
 - (7) Tin plates, sheets and strip; tin foil (whether or not printed or backed with paper, paperboard, plastics or similar backing materials). These articles are defined in Chapter Note 1 (d).
 - (8) Tubes and pipes defined in Chapter Note 1 (e) and tube or pipe fittings (for example couplings, elbows, sleeves), of tin (**other than** hollow profiles (**heading 80.03**), fittings with taps, cocks, valves, etc. (**heading 84.81**) and tubes and pipes made up into specific identifiable articles, such as machinery parts (**Section XVI**)). These articles correspond to the iron or steel goods referred to in the Explanatory Notes to headings 73.04 to 73.07.
-

Chapter 81

Other base metals; cermets; articles thereof

Subheading Note.

- 1.- Note 1 to Chapter 74, defining “ bars and rods ”, “ profiles ”, “ wire ” and “ plates, sheets, strip and foil ” applies, *mutatis mutandis*, to this Chapter.

GENERAL

This Chapter is **limited** to the following base metals, their alloys, and articles thereof which are **not** more specifically covered elsewhere in the Nomenclature :

- (A) Tungsten (wolfram) (heading 81.01), molybdenum (heading 81.02), tantalum (heading 81.03), magnesium (heading 81.04), cobalt, including cobalt mattes and other intermediate products of cobalt metallurgy (heading 81.05), bismuth (heading 81.06), cadmium (heading 81.07), titanium (heading 81.08), zirconium (heading 81.09), antimony (heading 81.10) and manganese (heading 81.11).
- (B) Beryllium, chromium, germanium, vanadium, gallium, hafnium, indium, niobium (colombium), rhenium and thallium (heading 81.12).

This Chapter also covers cermets (heading 81.13).

Base metals not included in this Chapter or in the preceding Chapters of Section XV are classified in **Chapter 28**.

Most of the metals classified in this Chapter are mainly used in the form of alloys or carbides, rather than in the pure state. The classification of such alloys follows the rules set out in Note 5 to Section XV; metal carbides are **excluded** from this Chapter.

*
* * *

The classification of **composite goods**, particularly made up articles, is explained in the General Explanatory Note to Section XV.

Note 8 to Section XV defines “ waste and scrap ” and “ powders ”.

81.01 - Tungsten (wolfram) and articles thereof, including waste and scrap.

8101.10 - Powders

- Other :

8101.94 -- Unwrought tungsten, including bars and rods obtained simply by sintering

8101.96 -- Wire

8101.97 -- Waste and scrap

8101.99 -- Other

Tungsten (wolfram) is mainly obtained from the ores wolframite (iron-manganese tungstate) and scheelite (calcium tungstate). The ores are converted into the oxide, which is then reduced by hydrogen in an electric furnace or by aluminium or carbon in a high temperature crucible. The powdered metal so obtained is compressed into blocks or bars which are sintered in an atmosphere of hydrogen in an electric furnace. The compact sintered bars are then hammered mechanically, and finally rolled or drawn into sheets, bars of smaller section or wire.

Tungsten is a dense, steel-grey metal, with a high melting point. It is brittle, hard and has a high resistance to corrosion.

Tungsten is used in filaments for electric light bulbs and radio valves; elements for electric furnaces; anti-cathodes for X-ray tubes; electric contacts; non-magnetic springs for electrical measuring apparatus or watches; hairlines for telescope lenses; it is also used as welding electrodes for hydrogen arc welding, etc.

The most important use of tungsten (usually as ferrrotungsten, see Chapter 72) is, however, in the preparation of special steels. It is also used in the preparation of tungsten carbide.

*
* * *

The **principal tungsten alloys** which may fall in the Chapter in accordance with Note 5 to Section XV are prepared by sintering. They include :

- (1) Tungsten-copper alloys (e.g., for electric contacts).
- (2) Tungsten-nickel-copper alloys used in the manufacture of X-ray screens, certain aircraft parts, etc.

*
* * *

Tungsten (wolfram) falls in this heading whether in the form of :

- (A) **Powders**;
- (B) **Unwrought metal**, e.g., in blocks, ingots, sintered bars and rods, or as waste and scrap (for the latter see the Explanatory Note to heading 72.04);
- (C) **Wrought metal**, e.g., rolled or drawn bars; profiles, plates and sheets, strip or wire;
- (D) **Manufactures** not covered by Note 1 to Section XV or included in **Chapter 82** or **83** or more specifically covered elsewhere in the Nomenclature. Most tungsten articles, **except** springs, are in fact classified in **Section XVI** or **XVII**; for example, a complete electric contact falls in **Chapter 85**, whereas a tungsten plate used to make such a contact would fall in this heading.

The heading **excludes** tungsten carbide, e.g., as used in the manufacture of the working tips and edges of cutting tools or dies. This carbide is classified as follows :

- (a) Unmixed powder in **heading 28.49**.
- (b) Prepared but non-sintered mixtures (e.g., mixed with carbides of molybdenum or tantalum, with or without a binding agent) in **heading 38.24**.
- (c) Plates, sticks, tips and the like for tools, sintered but unmounted, in **heading 82.09** (see corresponding Explanatory Note).

81.02 - Molybdenum and articles thereof, including waste and scrap.

8102.10 - Powders

- Other :

8102.94 -- Unwrought molybdenum, including bars and rods obtained simply by sintering

8102.95 -- Bars and rods, other than those obtained simply by sintering, profiles, plates, sheets, strip and foil

8102.96 -- Wire

8102.97 -- Waste and scrap

8102.99 -- Other

Molybdenum is mainly obtained from the ores molybdenite (molybdenum sulphide) and wulfenite (lead molybdate) which are concentrated by flotation, converted into the oxide and then reduced to the metal.

The metal is obtained either in a compact form suitable for rolling, drawing, etc., or as a powder which can be sintered like tungsten (see the Explanatory Note to heading 81.01).

Molybdenum in the compact form resembles lead in appearance, but it is extremely hard and melts at a high temperature. It is malleable and, at normal temperatures, resists corrosion.

Molybdenum is used (either as the metal or as ferro-molybdenum, of Chapter 72) for the manufacture of alloy steels. Molybdenum metal is also used in filament supports for electric light bulbs; grids of electronic valves; elements for electric furnaces; current rectifiers and electric contacts. It is also used in dentistry, and as a substitute for platinum in jewellery because it does not tarnish.

The **molybdenum alloys** in general use do not contain a predominance of molybdenum and are therefore **excluded** from this heading in accordance with Note 5 to Section XV.

Since the metallurgy of molybdenum resembles that of tungsten, the second part of the Explanatory Note to heading 81.01 (concerning the forms in which the metal is marketed, and the classification of the carbide) applies, *mutatis mutandis*, to this heading.

81.03 - Tantalum and articles thereof, including waste and scrap.

8103.20 - Unwrought tantalum, including bars and rods obtained simply by sintering; powders

8103.30 - Waste and scrap

8103.90 - Other

Tantalum is mainly extracted from the ores tantalite and niobite (columbite) (heading 26.15), by reduction of the oxide or by electrolysis of fused tantalum-potassium fluoride.

It may be obtained as a compact metal, or as a powder for sintering like tungsten or molybdenum.

Tantalum powder is black. In other forms it is white when polished and steel blue when unpolished. It is very malleable and ductile when pure. It is unusually resistant to corrosion, including the action of most acids.

Tantalum is used in the manufacture of the carbide, and (as ferro-tantalum, see Chapter 72) in preparing alloy steels. It is also used to make grids and anodes for electronic valves, current rectifiers, crucibles, heat-exchangers and other chemical apparatus, spinnerets for extruding man-made fibres, dental instruments and surgical tools. It is also used for bone-fixation, etc., in surgery, and in the manufacture of getters (to remove the last traces of gas in radio valve manufacture).

Tantalum alloys which may be classified here in accordance with Note 5 to Section XV include tantalum-tungsten alloys with a high tantalum content used, for example, in electronic valve manufacture.

The heading covers tantalum in all its forms, viz. : powder, blocks, waste and scrap; bars, wire, filaments; sheets, strip, foil; profiles; tubes and other manufactures (e.g., springs and wire cloth) **not** more specifically **covered** elsewhere.

The classification of tantalum carbide follows that of tungsten carbide (see the Explanatory Note to heading 81.01).

81.04 - Magnesium and articles thereof, including waste and scrap (+).

- Unwrought magnesium :

8104.11 -- Containing at least 99.8 % by weight of magnesium

8104.19 -- Other

8104.20 - Waste and scrap

8104.30 - Raspings, turnings and granules, graded according to size; powders

8104.90 - Other

Magnesium is extracted from a number of raw materials almost all of which fall, not in Chapter 26 (Ores), but in Chapter 25 or 31, e.g., dolomite (heading 25.18), magnesite (or gibertite) (heading 25.19) and carnallite (heading 31.04). It is also extracted from sea water or natural brines (heading 25.01) and from lyes containing magnesium chloride.

In the first stage of the industrial preparation of the metal, magnesium chloride or magnesium oxide (magnesia) is produced by methods varying according to the source of magnesium used. The extraction of the metal is then usually based on one of the two following types of reaction :

(A) **Electrolysis of fused magnesium chloride** mixed with fluxes such as alkali metal chlorides or fluorides. The separated magnesium collects on the surface of the bath around the cathodes and chlorine is withdrawn at the anodes.

(B) **Thermal reduction of magnesia** with carbon, ferro-silicon, silicon carbide, calcium carbide, aluminium, etc. The high temperature of the reaction vaporises the metal which, after rapid cooling, condenses in a very pure state.

The metal obtained by electrolysis normally requires further refinement. Magnesium obtained by thermal reduction is normally so pure that it can be melted and ingotted without further refining.

*
* * *

Magnesium is a silvery-white metal like aluminium, but it is even lighter than the latter. It can take on a high polish, but this disappears fairly quickly on exposure to air because of the formation of an oxide film which protects the metal against corrosion. Magnesium wire, strip, foil and powder burn fiercely with a dazzling light and must be handled with care. There is a risk of explosion in fine magnesium powder when mixed with air.

*
* * *

Unalloyed magnesium is used in the preparation of many chemical compounds, as a de-oxidising and de-sulphurising agent in metallurgy (e.g., in the manufacture of iron, copper, nickel and their alloys), in pyrotechnics, etc.

The pure metal has poor mechanical properties, but with other elements it forms strong alloys which can be rolled, forged, extruded and cast, and which therefore find many industrial applications in the light metal industries.

*
* *

The **principal magnesium alloys** which may be classified in this Chapter under the provisions of Note 5 to Section XV (see the General Explanatory Note to that Section) include :

- (1) Magnesium-aluminium or magnesium-aluminium-zinc alloys often containing manganese. These are magnesium based alloys of the "Elektron" or "Dow" metal type.
- (2) Magnesium-zirconium alloys, often containing added zinc.
- (3) Magnesium-manganese or magnesium-cerium alloys.

The lightness, strength and corrosion resistance of these alloys make them suitable for use in the aircraft industry (e.g., for engine casings, wheels, carburettors, magneto bases, petrol or oil tanks); in the automobile industry; in building construction; in the manufacture of machinery parts and accessories, especially of textile machines (spindles, bobbins, winders, etc.), machine-tools, typewriters, sewing machines, chain saws, lawn mowers, ladders or material handling equipment, or as lithographic plates, etc.

*
* *

The classification of magnesium products is not affected by treatments such as those described in the General Explanatory Note to Chapter 72, designed to improve the properties, appearance, etc., of the metal.

This heading covers :

- (1) **Unwrought magnesium** in ingots, notch bars, slabs, sticks, cakes, cubes and billets and similar forms. These goods are generally for rolling, drawing, extruding or forging, or for casting into shaped articles.
- (2) **Magnesium waste and scrap.** The Explanatory Note to heading 72.04 applies, *mutatis mutandis*, to this heading.

This group covers raspings, turnings and granules which have not been graded or sorted according to size. Raspings, turnings and granules which have been graded or sorted according to size are described in group (3) below.

(3) **Bars, rods, profiles, plates, sheets and strip, foil, wire, tubes and pipes, hollow profiles, powders and flakes, raspings, turnings and granules of uniform size.**

This group comprises the following commercial forms of magnesium :

- (a) Products (i.e., wrought bars, rods, profiles, wire, plates, sheets, strip and foil) obtained by rolling, drawing, extruding, forging, etc., the products of group (1) above; tubes and pipes and hollow profiles (see the corresponding Explanatory Notes to headings for similar products of other base metals).

These goods are used when a metal which is both light and strong is required (see above).

- (b) Raspings, turnings and granules of **uniform size** and all types of powders and flakes.

These products are used in pyrotechnics (fire-works, signals, etc.), as reducing agents in chemical or metallurgical processes, etc. Raspings, turnings and granules are specially made and graded to make them suitable for these purposes.

(4) **Other articles.**

This group comprises all articles of magnesium **not included** in the preceding groups or covered by Note 1 to Section XV or included in **Chapter 82 or 83**, or more specifically covered elsewhere in the Nomenclature.

As magnesium is mainly used in the manufacture of aircraft, vehicle and machinery parts (see above), most magnesium articles are classified elsewhere (especially in **Sections XVI and XVII**).

Articles classified here include :

- (a) Structures and parts of structures.
(b) Reservoirs, vats and similar containers, **not** fitted with mechanical or thermal equipment, and casks, drums and cans.
(c) Wire cloth.
(d) Bolts, nuts, screws, etc.

This heading excludes slag, ash and residues from the manufacture of magnesium (**heading 26.20**).

○
○ ○

Subheading Explanatory Note.

Subheadings 8104.11 and 8104.19

These subheadings also cover ingots and similar unwrought forms cast from remelted magnesium waste and scrap.

81.05 - Cobalt mattes and other intermediate products of cobalt metallurgy; cobalt and articles thereof, including waste and scrap.

8105.20 - Cobalt mattes and other intermediate products of cobalt metallurgy; unwrought cobalt; powders

8105.30 - Waste and scrap

8105.90 - Other

Cobalt is mainly obtained from the ores heterogenite (hydrated oxide of cobalt), linnaeite (sulphide of cobalt and nickel) and smaltite (cobalt arsenide). When smelted, the sulphide and arsenide ores produce mattes and other intermediate products. After treatment to eliminate other metals, cobalt oxide is obtained, and this is reduced with carbon, aluminium, etc. The metal is also extracted by electrolytic processes, and by treatment of the residues from the refining of copper, nickel, silver, etc.

Cobalt is a silvery, corrosion-resistant metal, harder than nickel, and is the most magnetic of the non-ferrous metals.

In its pure state, it is used as a coating for other metals (by electrolytic deposition), as a catalyst, as a binder in the manufacture of metallic carbide cutting tools, as a component of cobalt samarium magnets or of certain alloyed steels, etc.

There are many **cobalt alloys**; those which may fall in the heading in accordance with Note 5 to Section XV include :

- (1) The cobalt-chromium-tungsten ("Stellite") group (often containing small proportions of other elements). These are used in the manufacture of valves and valve seats, tools, etc., because of their resistance to wear and corrosion at high temperatures.
- (2) Cobalt-iron-chromium alloys, e.g., the low thermal expansion types and powerfully magnetic group.
- (3) Cobalt-chromium-molybdenum alloys, used in jet engines.

This heading covers cobalt mattes, other intermediate products of cobalt metallurgy and cobalt in all its forms, e.g., ingots, cathodes, granules, powders, waste and scrap and articles not elsewhere specified.

81.06 - Bismuth and articles thereof, including waste and scrap.

This metal occurs in the native state, but it is mainly obtained either by refining residues of lead, copper, etc., or by extraction from the sulphide or carbonate ores (e.g., bismuthinite and bismutite).

Bismuth is white with a reddish tint, brittle, difficult to work and a bad conductor.

It is used in scientific apparatus and in the preparation of chemical compounds for pharmaceutical use.

It forms **fusible alloys** (some melting below 100 °C) of which the following may fall in the heading in accordance with Note 5 to Section XV :

- (1) Bismuth-lead-tin alloys (sometimes with cadmium, etc.) (e.g., Dariset's, Lipowitz's, Newton's or Wood's alloys), used as solders, casting alloys, fusible elements for fire-extinguishers, boilers.
- (2) Bismuth-indium-lead-tin-cadmium alloys, used in taking surgical casts.

81.07 - Cadmium and articles thereof, including waste and scrap.

8107.20 - Unwrought cadmium; powders

8107.30 - Waste and scrap

8107.90 - Other

Cadmium is largely obtained from residues of the extraction of zinc, copper or lead, usually by distillation or electrolysis.

Cadmium resembles zinc in appearance but is softer.

It is largely used to coat other metals (by spraying or electro-deposition), as a de-oxidant in the manufacture of copper, silver, nickel, etc.

Because of its very high rate of absorption of slow neutrons, it is also used for the manufacture of mobile control and monitor rods for nuclear reactors.

The principal **cadmium alloys** which may fall in the heading in accordance with Note 5 to Section XV are cadmium-zinc alloys used for hot-dip anti-corrosion coating, as solders and for brazing.

Other alloys containing the same metals (e.g., certain bearing alloys) may, however, be **excluded**.

81.08 - Titanium and articles thereof, including waste and scrap.

8108.20 - Unwrought titanium; powders

8108.30 - Waste and scrap

8108.90 - Other

Titanium is obtained by reduction of the oxide ores rutile and brookite, and from ilmenite (titaniferous iron ore). According to the process used, the metal may be obtained in compact form, as a powder for sintering (as in the case of tungsten), as ferro-titanium (Chapter 72) or as titanium carbide.

Titanium is white and shiny when compact, dark grey when a powder; it is resistant to corrosion, hard and brittle unless very pure.

Ferro-titanium and ferro-silicon-titanium (Chapter 72) are used in steel manufacture; the metal is also alloyed with aluminium, copper, nickel, etc.

Titanium is principally used in the aircraft industry, in shipbuilding, for making, e.g., vats, agitators, heat exchangers, valves and pumps for the chemical industry, for the desalination of sea-water and for the construction of nuclear power stations.

This heading covers titanium in all forms : in particular, sponge, ingots, powder, anodes, bars and rods, sheets and plates, waste and scrap, and products **other than** those articles covered by other Chapters of the Nomenclature (generally **Section XVI** or **XVII**), such as helicopter rotors, propeller blades, pumps or valves.

The classification of the carbide follows that of tungsten carbide (see the Explanatory Note to heading 81.01).

81.09 - Zirconium and articles thereof, including waste and scrap.

8109.20 - Unwrought zirconium; powders

8109.30 - Waste and scrap

8109.90 - Other

Zirconium is obtained from the silicate ore, zircon, by reduction of the oxide, chloride, etc., or by electrolysis.

It is a silver-grey, malleable and ductile metal.

It is used in photo-flash bulbs, for the manufacture of getters or absorbents in radio valve manufacture, etc. Ferro-zirconium (Chapter 72) is used in steel manufacture, and the metal is also alloyed with nickel, etc.

Zirconium, alone or alloyed with tin ("zircalloy"), is also used in the manufacture of sheaths for nuclear fuel cartridges and of metal structures for nuclear plant. Zirconium-plutonium alloys and zirconium-uranium alloys are used as nuclear fuel. For nuclear purposes all but traces of hafnium must first be removed.

81.10 - Antimony and articles thereof, including waste and scrap.

8110.10 - Unwrought antimony; powders

8110.20 - Waste and scrap

8110.90 - Other

Antimony is mainly obtained from the sulphide ore stibnite by :

- (1) Concentration and liquation to produce the so-called " crude antimony " which is, in fact, crude sulphide proper to **heading 26.17**.
- (2) Smelting to produce impure antimony known as " singles " (regulus).
- (3) Further smelting to produce " star bowls " which, after refining, give the purest forms, " star antimony " or " French metal ".

Antimony is a lustrous white metal with a bluish tinge, brittle and easily powdered.

It has very few uses in the unalloyed form. It is however alloyed, especially with lead and tin, to harden them, to produce bearing alloys, printers' type and other casting alloys, pewter, Britannia metal, etc. (see **Chapters 78 and 80**, where these alloys normally fall because of the predominance of lead or tin).

81.11 - Manganese and articles thereof, including waste and scrap.

Manganese is extracted by reduction of the oxide ores, pyrolusite, braunite and manganite. It is also obtained by electrolysis.

The metal itself, which is grey-pink, hard and brittle, is rarely used as such.

It is however a constituent of spiegeleisen, ferromanganese, silico-manganese and certain alloy cast irons and alloy steels; these products normally fall in Chapter 72, but ferro-manganese and silico-manganese may sometimes fall in this heading if the iron content is very low (see Note 1 (c) to Chapter 72). Manganese is also alloyed with copper, nickel, aluminium, etc.

81.12 - Beryllium, chromium, germanium, vanadium, gallium, hafnium, indium, niobium (colombium), rhenium and thallium, and articles of these metals, including waste and scrap.

- Beryllium :

8112.12 -- Unwrought; powders

8112.13 -- Waste and scrap

8112.19 -- Other

- Chromium :

8112.21 -- Unwrought; powders

8112.22 -- Waste and scrap

8112.29 -- Other

- Thallium :

8112.51 -- Unwrought; powders

8112.52 -- Waste and scrap

8112.59 -- Other

- Other :

8112.92 -- Unwrought; waste and scrap; powders

8112.99 -- Other

(A) BERYLLIUM

Beryllium is obtained almost exclusively from beryl, a double silicate of beryllium and aluminium, which is classified under **heading 26.17 except** when it is in the form of a precious stone (e.g., emerald) (**Chapter 71**).

The main commercial methods of extracting this metal are :

(1) **High temperature electrolysis** of a mixture of beryllium oxyfluoride (manufactured from the ore) and barium or other fluorides. A graphite crucible is used as anode and the metal is collected on a water-cooled iron cathode.

(2) **Reduction of beryllium fluoride** using magnesium.

* * *

Beryllium is a steel-grey metal, very light and hard but extremely brittle. It can only be rolled or drawn under very special conditions.

* * *

Unalloyed beryllium is used in the manufacture of windows for X-ray tubes; as components for nuclear reactors; in the aircraft and space industry; in the armament industry; as targets for cyclotrons; in electrodes for neon signs, etc.; as a de-oxidising agent in metallurgy.

It also serves in the preparation of many alloys, for example with steel (spring-steel, etc.); with copper (e.g., the alloy known as beryllium copper, used for the manufacture of springs, of clock or watch parts, of tools, etc.); and with nickel. These alloys are, however, classified in **Chapter 72, 74 or 75** respectively since they contain only very small proportions of beryllium.

This heading covers beryllium in all its forms, i.e., unwrought metal (in blocks, pellets, cubes, etc.), products (bars, rods, wire, sheets, etc.), and articles. Goods made up into specific identifiable articles such as machinery parts, parts of instruments, etc., are, however, **excluded** (see particularly **Chapters 85 and 90**).

(B) CHROMIUM

Chromium is mainly extracted from chromite (chrome iron ore), which is converted to the sesquioxyde which is then reduced to produce chromium metal.

Chromium is steel-grey when unpolished, but white and shiny when polished. It is very hard and resistant to corrosion, but not very malleable or ductile.

Pure chromium constitutes the coating of various articles of other metals (electrolytic chromium-plating). Its main use (usually as ferro-chrome, see Chapter 72) is in the preparation of stainless steel. Most alloys of the metal (e.g., with nickel or cobalt) are, however, **excluded** from this heading in accordance with Note 5 to Section XV.

Certain chromium base alloys are used in jet engines, protective tubes for electric heating elements, etc.

(C) GERMANIUM

Germanium is extracted from residues of zinc manufacture, from the ore germanite (copper germano-sulphide) and from gasworks' flue dusts.

It is a greyish-white metal with certain special electro-ionic properties which enable it to be used in the manufacture of electronic components (e.g., diodes, transistors, valves). It is also used for alloying with tin, aluminium and gold.

(D) VANADIUM

Vanadium is mainly extracted from the ores patronite or carnotite, usually by reduction of the oxide, or from residues of iron, radium or uranium preparation. As the metal itself has few uses, it is usually produced as ferro-vanadium (Chapter 72) or as copper vanadium master alloy (Chapter 74); these are used in alloying with steel, copper, aluminium, etc.

(E) GALLIUM

Gallium is obtained as a by-product in the extraction of aluminium, zinc, copper and germanium, or from gasworks' flue dusts.

It is a soft, greyish-white metal, melting at about 30° C and with a high vaporisation point. It thus remains liquid over a large temperature range and is therefore used in place of mercury in thermometers and vapour arc lamps. It is also used in dental alloys and for silvering special mirrors.

(F) HAFNIUM

Hafnium is extracted from the same ores as zirconium (zircon, etc.) and has properties very similar to that metal.

Because of its very high rate of absorption of slow neutrons, it is in particular used for the manufacture of control and monitor rods for nuclear reactors.

(G) INDIUM

Indium is extracted from zinc residues.

It is soft, silvery and resists corrosion.

It is therefore used alone or with zinc, etc., to coat other metals. It is also alloyed with bismuth, lead or tin (alloy used in taking surgical casts), with copper or lead (bearing alloys), and with gold (in jewellery, dental alloys, etc.).

(H) NIOBIUM (COLOMBIUM)

Niobium is obtained from the ores niobite (columbite) and tantalite, which are treated to obtain niobium-potassium fluoride. The metal is then extracted by electrolysis or other methods.

It is a silvery-grey metal used in the manufacture of getters (to remove the last traces of gas in radio valve manufacture).

Niobium and its ferro-alloy (Chapter 72) are also used in the manufacture of steels and other alloys.

(IJ) RHENIUM

Rhenium is obtained as a by-product in the extraction of molybdenum, copper, etc.

It is not much used at present, but its use in plating and as a catalyst has been suggested.

(K) THALLIUM

Thallium is extracted from the residues of the treatment of pyrites and other ores. It is a soft, greyish-white metal resembling lead.

It is alloyed with lead (to raise its melting point, and to increase its strength, resistance to corrosion, etc.) and with silver (to prevent tarnishing).

81.13 - Cermets and articles thereof, including waste and scrap.

Cermets contain both a ceramic constituent (resistant to heat and with a high melting point) and a metallic constituent. The manufacturing processes used in the production of these products, and also their physical and chemical properties, are related both to their ceramic and metallic constituents, hence their name **cermets**.

The ceramic constituent usually consists of oxides, carbides, borides, etc.

The metal component consists of a metal such as iron, nickel, aluminium, chromium or cobalt.

Cermets are made by sintering, by dispersion or by other processes.

The most important cermets are obtained from :

- (1) A metal and an oxide, e.g., iron-magnesium oxide; nickel-magnesium oxide; chromium-aluminium oxide; aluminium-aluminium oxide.
- (2) Zirconium or chromium borides; these products are known as borolites.
- (3) Zirconium, chromium, tungsten, etc. carbides with cobalt, nickel or niobium.
- (4) Boron carbide and aluminium : aluminium-clad products known as boral cermets.

The heading covers cermets, whether unwrought or in the form of articles not elsewhere specified in the Nomenclature.

Cermets are used in the aircraft and nuclear industries and in missiles. They are also used in furnaces and metal foundries (e.g., as pots, spouts, tubes), in the manufacture of bearings, brake-linings, etc.

The heading **excludes** :

- (a) Cermets containing fissile or radioactive substances (**heading 28.44**).
 - (b) Plates, sticks, tips and the like for tools, of cermets with a basis of metal carbides agglomerated by sintering (**heading 82.09**).
-

Chapter 82

Tools, implements, cutlery, spoons and forks, of base metal; parts thereof of base metal

Notes.

- 1.- Apart from blow lamps, portable forges, grinding wheels with frameworks, manicure or pedicure sets, and goods of heading 82.09, this Chapter covers only articles with a blade, working edge, working surface or other working part of :
 - (a) Base metal;
 - (b) Metal carbides or cermets;
 - (c) Precious or semi-precious stones (natural, synthetic or reconstructed) on a support of base metal, metal carbide or cermet; or
 - (d) Abrasive materials on a support of base metal, provided that the articles have cutting teeth, flutes, grooves, or the like, of base metal, which retain their identity and function after the application of the abrasive.
- 2.- Parts of base metal of the articles of this Chapter are to be classified with the articles of which they are parts, except parts separately specified as such and tool-holders for hand tools (heading 84.66). However parts of general use as defined in Note 2 to Section XV are in all cases excluded from this Chapter.

Heads, blades and cutting plates for electric shavers and electric hair clippers are to be classified in heading 85.10.
- 3.- Sets consisting of one or more knives of heading 82.11 and at least an equal number of articles of heading 82.15 are to be classified in heading 82.15.

GENERAL

This Chapter covers certain specific kinds of base metal articles, of the nature of tools, implements, cutlery, tableware, etc., which are excluded from the preceding Chapters of Section XV, and are not machinery or appliances of Section XVI (see below), nor instruments or apparatus proper to Chapter 90, nor articles of heading 96.03 or 96.04.

This Chapter includes :

- (A) Tools which, apart from certain specified exceptions (e.g., blades for machine saws), are used in the hand (headings 82.01 to 82.05).
- (B) Tools of two or more of the headings 82.02 to 82.05, put up in sets for retail sale (heading 82.06).
- (C) Interchangeable tools for hand tools, for machine-tools or for power-operated hand tools (heading 82.07), knives and blades for machines or mechanical appliances (heading 82.08) and plates, sticks, tips and the like, for tools (heading 82.09).

- (D) Articles of cutlery (whether intended for professional, personal or domestic use), certain mechanical domestic appliances, spoons and forks and similar tableware and kitchen utensils (headings 82.10 to 82.15).

In general, the Chapter covers tools which can be used independently in the hand, whether or not they incorporate simple mechanisms such as gearing, crank-handles, plungers, screw mechanisms or levers. Appliances are, however, generally classified in **Chapter 84** if they are designed for fixing to a bench, a wall, etc., or if, by reason of their weight or size or the degree of force required for their use, they are fitted with base plates, stands, supporting frames, etc., for standing on the floor, bench, etc.

Thus a breast drill which the worker uses freely in the hand, without support, is a tool classified in heading 82.05 although it includes a simple gearing mechanism; on the other hand, a drill designed to be fixed to a stand or supporting framework would be classified in **heading 84.59**. Similarly, plier-type metal cutting shears are classified in heading 82.03, whereas guillotine-type shears fitted with a stand or base plate would be classified in **heading 84.62** even if hand-operated.

There are, however, **exceptions** to this rule, in both directions, depending on the nature of the appliances. Thus vices, grinding wheels with frameworks and portable forges are specifically covered by heading 82.05. Similarly certain mechanical appliances (coffee-mills, juice extractors, meat mincers, etc.) are classified in heading 82.10, to which special criteria apply (see relative Explanatory Note below). On the other hand, **Chapter 84** specifically includes certain apparatus used independently in the hand, such as appliances for spraying liquids or powders (**heading 84.24**), pneumatic tools (**heading 84.67**), non-pistol type office stapling machines (**heading 84.72**) - some of the latter being very small appliances which can hardly be described as having base plates or supporting frames.

*
* *

Tools, cutlery, etc., do not in general fall in this Chapter unless the blade, working edge, working surface or other working part is of base metal, of metal carbides (see the Explanatory Note to heading 28.49) or of cermets (see the Explanatory Note to heading 81.13); provided, however, that this condition is met, they remain in the Chapter even if fitted with non-metallic handles, bodies, etc., of a weight exceeding that of the metallic working part (e.g., a wooden plane with a metal blade).

The Chapter also, however, includes tools if the working part is of natural, synthetic or reconstructed precious or semi-precious stones (e.g., black diamonds) fitted onto a support of base metal, metal carbides or cermets; further, in certain cases, the working part may be of base metal fitted or covered with abrasive materials.

There are **exceptions** to these general rules in the case of certain articles specifically mentioned in the headings (e.g., portable forges and grinding wheels with frameworks). Moreover, very few abrasive tools remain in the scope of the Chapter (see the Explanatory Notes to headings 82.02 and 82.07), since **heading 68.04** covers grinding wheels and the like (including grinding, sharpening, polishing, trueing and cutting wheels, heads, discs and points), of natural stone, of agglomerated abrasives, or of ceramics, with or without cores, shanks, sockets, axles or the like of other materials, but without frameworks.

Interchangeable tools of base metal, for hand tools, for machine tools or for power-operated hand tools, which are **excluded** from this Chapter because their working part is not one of the materials specified in Note 1, generally fall to be classified according to the constituent material of the working part, e.g., those of rubber (**Chapter 40**), leather (**Chapter 42**), furskin (**Chapter 43**), cork (**Chapter 45**), textile fabric (**Chapter 59**), ceramic materials (**heading 69.09**). Brushes for use on machines are classified in **heading 96.03**.

Identifiable base metal parts of tools, cutlery, etc. (e.g., saw frames and plane irons) are normally classified in the same heading as the complete articles. This rule **does not**, however, apply to parts forming the subject of a special heading. Chains, nails, bolts, nuts, screws, rivets, springs (e.g. for secateurs) and other parts of general use as defined in Note 2 to Section XV are **excluded** from this Chapter and fall in their appropriate headings (**Chapters 73 to 76 and 78 to 81**).

Cutlery and other articles classified in headings 82.08 to 82.15 may be fitted with minor trimmings of precious metal or metal clad with precious metal (e.g., monograms or bands); if, however, they include other parts (e.g., handles or blades) of precious metal or metal clad with precious metal, or if they contain natural or cultured pearls, or precious or semi-precious stones (natural, synthetic or reconstructed) (except as working parts as described above), they are classified in **Chapter 71**.

*
* *

The Chapter **does not include** :

- (a) Tools, scissors and other cutlery of the type used as medical, dental, surgical or veterinary instruments or appliances (**heading 90.18**).
- (b) Tools clearly having the character of toys (**Chapter 95**).

82.01 - Hand tools, the following : spades, shovels, mattocks, picks, hoes, forks and rakes; axes, bill hooks and similar hewing tools; secateurs and pruners of any kind; scythes, sickles, hay knives, hedge shears, timber wedges and other tools of a kind used in agriculture, horticulture or forestry.

8201.10 - Spades and shovels

8201.30 - Mattocks, picks, hoes and rakes

8201.40 - Axes, bill hooks and similar hewing tools

8201.50 - Secateurs and similar one-handed pruners and shears (including poultry shears)

8201.60 - Hedge shears, two-handed pruning shears and similar two-handed shears

8201.90 - Other hand tools of a kind used in agriculture, horticulture or forestry

This heading covers hand tools mainly used in agriculture, horticulture or forestry, though some may also be used for other purposes (e.g., in road work, navvying, mining, quarrying, woodworking or household work).

The heading includes :

- (1) **Spades and shovels** including household coal shovels and special types (e.g., entrenching tools for campers, soldiers, etc.).
- (2) **Forks**, including pitchforks.
- (3) **Mattocks, picks, hoes and rakes**, including lawn-rakes, combined hoe-rakes, grubbers, weeder and cultivators.
- (4) **Axes, bill hooks and similar hewing tools**, including felling axes, hand axes, hatchets, choppers, adzes, slashers and matchets.
- (5) **Secateurs and similar one-handed pruners and shears (including poultry shears)**. These are generally composed of two shafts articulated on a pivot about three-quarters of the way along their length. One of these shafts often terminates in a concave, and the other in a convex cutting edge ("parrot bill"); they further differ from the scissors of **heading 82.13** since they have no finger rings.

These tools almost always have a spring which forces the shafts apart after cutting, and a hook or other fastening so that they can be easily opened or closed with one hand. In cutting they are manipulated with one hand, and they have a very powerful action.

This heading includes gardeners' secateurs, flower or fruit secateurs; vineyard secateurs with narrow, tapering blades, etc.

The heading **does not**, however, **cover** secateur type scissors having the secateur blades but with finger rings (see the Explanatory Note to **heading 82.13**).

- (6) **Hedge shears, two-handed pruning shears and similar two-handed shears**, including grass shears and lopping shears.
- (7) **Other hand tools of a kind used in agriculture, horticulture or forestry**. These include scythes, sickles (including bagging, reaping or grass hooks), hay or straw knives of all kinds; planters, seeders, dibbers, trowels and transplanters; fruit pickers; cow combs, curry combs and pig scrapers; bark scrapers and debarking knives; timber wedges, lumbermen's log rolling tools (log hooks, log tongs, log picks, cant hooks); lawn edging irons; sheep shears.

All these tools remain in the heading whether or not they are fitted with handles.

The heading also covers identifiable base metal parts of such tools.

The heading also **excludes** :

- (a) Sheep ear and other animal marking pliers (**heading 82.03**).
- (b) Road or stone splitting wedges; scythe blade trueing anvils (**heading 82.05**).
- (c) Pruning knives (**heading 82.11**).
- (d) Garden rollers, harrows, hay or grass mowers and similar implements, including those pushed or pulled by hand (**Chapter 84**).
- (e) Ice axes (**heading 95.06**).

82.02 - Hand saws; blades for saws of all kinds (including slitting, slotting or toothless saw blades).

8202.10 - Hand saws

8202.20 - Band saw blades

- Circular saw blades (including slitting or slotting saw blades) :

8202.31 -- With working part of steel

8202.39 -- Other, including parts

8202.40 - Chain saw blades

- Other saw blades :

8202.91 -- Straight saw blades, for working metal

8202.99 -- Other

This heading covers :

(A) **Hand saws** for wood, metal, stone or other materials, whether for trade or domestic use.

These include bow saws, hack saws, fret saws and other saws with wooden or metal frames; panel saws, back or tenon saws, compass saws; cross-cut saws (usually with a handle at each end); saws shaped like a knife (folding or not) used by gardeners or miners; special saws for watchmakers and jewellers; nests of saws; articulated saws for camping, military use, etc.; veneer saws; saws permanently combined with a mitre box, the saw giving the whole article its **essential** character.

(B) **Saw blades** of all kinds, for hand saws and for machines, and for all materials. They include :

(1) **Band saw or endless saw blades** (e.g., those for wood sawing machines).

(2) **Circular saw blades (including slitting or slotting saw blades)** for use on milling machines. The latter can be distinguished from milling cutters by the ratio of thickness to diameter which is less than for milling cutters, and by the toothing which is cut only on the periphery as with ordinary circular saws, whereas milling cutters often have teeth on their faces, or have concave or convex teeth.

(3) **Chain saw blades** (in the form of chains) for felling trees, sawing up tree trunks, etc. The teeth of such blades often comprise elements of metal carbides or cermets.

- (4) **Straight saw blades** for panel saws, tenon saws, hack saws, etc., including those for saws known as " filigree saws " (round blades toothed like a file, but used for sawing like a fret saw blade).
- (5) **Straight toothless stone cutting saw blades** (either hammered or machine dressed so as to be quite flat, or corrugated) **provided** their extremities are perforated or otherwise shaped for fixing.
- (6) **Toothless cutting discs (friction discs) for cutting through metals.**

The heading also covers **saw blade blanks**. Provided that they are toothed, strip (whether or not cut to length) and discs (with a central hole for fixing the disc to the driving shaft) are regarded as such blanks. These articles are usually of steel with a high carbon content.

Saw blades may have integral teeth, or be fitted with inserted teeth or segments (such as some circular saws). The teeth may be wholly of base metal, or of base metal fitted or covered with metal carbides, diamond (black diamonds in particular) or, in some cases, with abrasive powders. In some saws the teeth may be replaced by diamonds or by elements of metal carbides set around the periphery of the disc.

Toothless discs fitted with abrasive rims (e.g., for cutting marble, quartz or glass) or with a series of peripheral inserts of abrasive material are, however, **excluded** (see the Explanatory Note to **heading 68.04**).

The heading includes separately presented base metal parts of hand saws (e.g., frames, bows, handles and stretchers) and base metal teeth and toothed segments for insertion in saw blades.

The heading also **excludes** :

- (a) Stone sawing strand (usually three-ply stranded wire of special steel) (**heading 73.12**).
- (b) Morticing chain cutters (**heading 82.07**).
- (c) Hand saws with self-contained motor (**heading 84.67**).
- (d) Musical saws (**heading 92.08**).

82.03 - Files, rasps, pliers (including cutting pliers), pincers, tweezers, metal cutting shears, pipe-cutters, bolt croppers, perforating punches and similar hand tools.

8203.10 - Files, rasps and similar tools

8203.20 - Pliers (including cutting pliers), pincers, tweezers and similar tools

8203.30 - Metal cutting shears and similar tools

8203.40 - Pipe-cutters, bolt croppers, perforating punches and similar tools

This heading covers the following hand tools :

(A) **Files, rasps and similar tools** (including combined file-rasps), of all shapes (flat, round, half round, square, triangular, oval, etc.) and of all sizes, for metal, wood or other materials.

(B) **Pliers (including cutting pliers), pincers, tweezers and similar tools**, including :

(1) Pliers (e.g., seal closers and pliers, sheep-ear and other animal marking pliers, gas pipe pliers, pliers for inserting or extracting cotter-pins, eyelet and eyelet-closing pliers; plier type saw sets).

(2) Pincers (e.g., farriers' tongs and smiths' tongs).

(3) Tweezers (e.g., watchmakers', florists', philatelists', depilating).

(4) Nail pullers (jaw type, working on the pincer principle).

(C) **Metal cutting shears and similar tools**, including tinmen's snips, and other sheet metal or wire cutting shears.

(D) **Pipe-cutters, bolt croppers, perforating punches and similar tools**, including :

(1) Pipe cutters with cutting wheels, bolt croppers and clippers and chain cutters, of the plier type.

(2) Perforating punches, for example, button hole punches; ticket punches (**other than** those for stamping tickets with a date or other characters - **heading 96.11**); saddlers' punches, mattress punches, etc., for perforating leather, felt, etc., whether of the plier type, or of the type used with a hammer (but **not** solid nail or similar punches).

The heading also **excludes** :

(a) Punches and files (including rotary files) for machine-tools (**heading 82.07**).

(b) Nail files, nail nippers and clippers (**heading 82.14**).

(c) Sugar tongs (**heading 82.15**).

(d) Machine type metal cutting shears (**heading 84.62**) and office perforating punches having a base for fixing or standing the punch on a table, desk, etc. (**heading 84.72**).

(e) Ticket punches for stamping tickets with a date or with any other characters (**heading 96.11**).

82.04 - Hand-operated spanners and wrenches (including torque meter wrenches but not including tap wrenches); interchangeable spanner sockets, with or without handles.

- Hand-operated spanners and wrenches :

8204.11 -- Non-adjustable

8204.12 -- Adjustable

8204.20 - Interchangeable spanner sockets, with or without handles

This heading covers the following hand tools :

- (1) **Hand-operated spanners and wrenches** (e.g., with fixed or adjustable jaws; socket, box or ratchet spanners; crank handle spanners); wrenches or spanners for bicycles or cars, for coach screws, hydrants or piping (including chain type pipe wrenches); torque meter wrenches. The heading **does not**, however, **cover** tap wrenches (**heading 82.05**).
- (2) **Interchangeable spanner sockets, with or without handles**, including drives and extensions.

82.05 - Hand tools (including glaziers' diamonds), not elsewhere specified or included; blow lamps; vices, clamps and the like, other than accessories for and parts of, machine tools or water-jet cutting machines; anvils; portable forges; hand or pedal-operated grinding wheels with frameworks.

8205.10 - Drilling, threading or tapping tools

8205.20 - Hammers and sledge hammers

8205.30 - Planes, chisels, gouges and similar cutting tools for working wood

8205.40 - Screwdrivers

- Other hand tools (including glaziers' diamonds) :

8205.51 -- Household tools

8205.59 -- Other

8205.60 - Blow lamps

8205.70 - Vices, clamps and the like

8205.90 - Other, including sets of articles of two or more subheadings of this heading

This heading covers all hand tools **not included** in other headings of this Chapter or elsewhere in the Nomenclature (see the General Explanatory Notes to this Chapter), together with certain other tools or appliances specifically mentioned in the title.

It includes a large number of hand tools (including some with simple hand-operated mechanisms such as cranks, ratchets or gearing). This group of tools includes :

- (A) **Drilling, threading or tapping tools**, such as braces (including ratchet types), breast drills and hand drills; die stocks, tap wrenches and screw plates. Interchangeable tools such as drills, bits, taps and dies for use with these hand tools are **excluded** - see **heading 82.07**.
- (B) **Hammers and sledge hammers**, such as smiths', boilermakers', carpenters', farriers', quarrymen's, stone-cutters', glaziers', bricklayers' and masons' hammers, stone breaking hammers, mauls, stone roughing ("brush") hammers and hammers with accessory fittings such as picks and nail pullers.
- (C) **Planes, chisels, gouges and similar cutting tools for working wood** such as planes and routers of all kinds (smoothing, grooving, rabbet, jack planes, etc.), spoke shaves and wood scrapers, gravers and draw-knives, of a kind used by carpenters, joiners, cabinet-makers, coopers, wood carvers, etc.
- (D) **Screw drivers** (including ratchet types).

(E) **Other hand tools (including glaziers' diamonds).**

This group includes :

- (1) A number of household articles, including some with cutting blades but **not including** mechanical types (see the Explanatory Note to **heading 82.10**), having the character of tools and accordingly not proper to heading 73.23, such as :
Flat irons (gas, paraffin (kerosene), charcoal, etc., types, but **not** electric irons which fall in **heading 85.16**), curling irons; bottle openers, cork screws, simple can openers (including keys); nut-crackers; cherry stoners (spring type); button hooks; shoe horns; "steels" and other knife sharpeners of metal; pastry cutters and jiggers; graters for cheese, etc.; "lightning" mincers (with cutting wheels); cheese slicers, vegetable slicers; waffling irons; cream or egg whisks, egg slicers; butter curlers; ice picks; vegetable mashers; larding needles; pokers, tongs, rakers and cover lifts for stoves or fire places.
- (2) Watchmakers' tools such as jewel pressing tools, balance poising tools, riveting stakes, mainspring winders, jacot or pivot tools, balance screw filling tools and regulating tools.
- (3) Glaziers' diamonds, including compass-type diamond point glass cutters mounted on a graduated scale (for cutting out circles) and diamond point scribes for designing on glass. Diamonds presented separately **are excluded (heading 71.02)**.
- (4) Smiths' tools such as setts, swages, fullers, hardies and punches.
- (5) Tools, for mining, road work, etc., such as crow bars, prizing levers, stone cutting chisels, punches and wedges.
- (6) Tools for masons, moulders, cement workers, plasterers, painters, etc., such as trowels, smoothers, servers, scrapers and stripping knives, smoothers' needles and cleaners, indentation rollers, glass cutters with cutting wheels, palette knives and putty knives.
- (7) Miscellaneous hand tools such as farriers' paring knives, toeing knives, hoof pickers and hoof cutters, cold chisels and punches; riveters' drifts, snaps and punches; non-plier type nail lifters, case openers and pin punches; tyre levers; cobblers' awls (without eyes); upholsterers' or bookbinders' punches; soldering irons and branding irons; metal scrapers; non-plier type saw sets; mitre boxes; cheese samplers and the like; earth rammers; grinding wheel dressers; strapping appliances for crates, etc., **other than** those of **heading 84.22** (see the relevant Explanatory Note); spring operated "pistols" for stapling packages, paperboard, etc.; cartridge operated riveting, wall-plugging, etc., tools; glass blowers' pipes; mouth blow pipes; oil cans and oilers (including those with pump or screw mechanisms), grease guns.

- (F) **Blow lamps** (e.g., for soldering or brazing; for paint removal; for starting semi-diesel engines). These lamps are of two types, both self-contained, differing in the type of fuel used, incorporating either a fuel reservoir for mineral oil or other liquid fuel (frequently with a small pump), or a replaceable gas-filled cartridge. In some cases, a soldering or branding iron or other attachment is fitted to the tip of the lamp. The heading **does not cover** gas-operated welding appliances (**heading 84.68**).
- (G) **Vices, clamps and the like**, including hand vices, pin vices, bench or table vices, for joiners or carpenters, locksmiths, gunsmiths, watchmakers, etc., but **not** including vices forming accessories or parts of machine-tools or water-jet cutting machines. This group also includes cramps and bench holdfasts which, like vices, serve as holding tools (e.g. joiners' cramps, floor cramps and toolmakers' clamps).

The group includes metal vices faced with non-metallic jaw grips (wood, fibre, etc.) to prevent damage to the piece to be held.

The heading however **does not include** vacuum cup holders (suction grips) consisting of a base, a handle and a vacuum lever, of base metal, and rubber discs, intended to be attached temporarily to an object with a view to enabling the object to be moved (for example, **heading 73.25, 73.26 or 76.16**).

(H) Anvils; portable forges; hand- or pedal-operated grinding wheels with frameworks

This group includes :

- (1) Anvils (including two-beaked anvils) of all sizes and for all uses, e.g., smiths' anvils; watchmakers' or jewellers' anvils; shoemakers' or cobblers' lasts; hand anvils for trueing up scythe blades.
- (2) Portable forges, usually equipped with blowers and sometimes with an anvil; they are mainly used in small workshops, shipyards, etc.
- (3) Grinding wheels (hand- or pedal-operated) with wooden or other frameworks. Mechanically driven grinding wheels are classified in **Chapter 84 or 85**. Grindstones and the like presented separately are classified in **heading 68.04**

Tools containing metal but with working parts of rubber, leather, felt, etc. are classified according to the constituent materials (**Chapters 40, 42, 59**, etc.).

Apart from the exclusions referred to above, the following are also **excluded** from this heading :

- (a) Needles for hand sewing and other articles of **heading 73.19**.
- (b) Interchangeable tools designed for use in hand tools, mechanical or not, in machine-tools or in power-operated hand tools (e.g. screwdriver bits and rock drilling bits) (**heading 82.07**).
- (c) Appliances for projecting, dispersing or spraying liquids or powders (even if hand-operated) (**heading 84.24**).
- (d) Tool holders for hand tools (**heading 84.66**).
- (e) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (f) Marking out, measuring, checking or calibrating instruments (e.g., marking gauges and punches, centre punches and scribes, calipers and gauges) of **Chapter 90**.

82.06 - Tools of two or more of the headings 82.02 to 82.05, put up in sets for retail sale.

The heading covers sets of tools falling **at least** in two or more of the headings 82.02 to 82.05 **provided** they are put up in sets for retail sale (e.g., in a plastic case or in a metallic tool box).

The heading includes, *inter alia* :

- (1) Sets of car mechanic's tools including, e.g., sockets sets, spanners, ratchet wrenches, screwdrivers, pliers.
- (2) Simple combinations such as sets of spanners and screwdrivers.

Sets including tools of minor importance from other headings or Chapters of the Nomenclature remain classified in this heading, **provided that** such minority items do not change their essential character of sets of tools of two or more of the headings 82.02 to 82.05.

82.07 - Interchangeable tools for hand tools, whether or not power-operated, or for machine-tools (for example, for pressing, stamping, punching, tapping, threading, drilling, boring, broaching, milling, turning or screwdriving), including dies for drawing or extruding metal, and rock drilling or earth boring tools.

- Rock drilling or earth boring tools :

- 8207.13 - - With working part of cermets
- 8207.19 - - Other, including parts
- 8207.20 - Dies for drawing or extruding metal
- 8207.30 - Tools for pressing, stamping or punching
- 8207.40 - Tools for tapping or threading
- 8207.50 - Tools for drilling, other than for rock drilling
- 8207.60 - Tools for boring or broaching
- 8207.70 - Tools for milling
- 8207.80 - Tools for turning
- 8207.90 - Other interchangeable tools

Whereas (apart from a few exceptions such as machine saw blades) the preceding headings of this Chapter apply in the main to hand tools ready for use as they stand or after affixing handles, this heading covers an important group of **tools which are unsuitable for use independently, but are designed to be fitted**, as the case may be, **into** :

- (A) hand tools, whether or not power-operated (e.g., breast drills, braces and die-stocks),
- (B) machine-tools, of headings 84.57 to 84.65, or of heading 84.79 by reason of Note 7 to Chapter 84,
- (C) tools of heading 84.67,

for pressing, stamping, punching, tapping, threading, drilling, boring, reaming, broaching, milling, gear-cutting, turning, cutting, morticing or drawing, etc., metals, metal carbides, wood, stone, ebonite, certain plastics or other materials, or for screwdriving.

The heading also includes tools for use with the rock drilling or earth boring machines of heading 84.30.

Dies, punches, drills and other interchangeable tools for machines or appliances other than those specified above are classified as parts of the machines or appliances for which they are intended.

The tools of this heading may be either one-piece or composite articles.

The one-piece tools, made wholly from one material, are generally of alloy steel or steel with a high carbon content.

Composite tools consist of one or more working parts of base metal, of metal carbides or of cermets, of diamond or of other precious or semi-precious stones, attached to a base metal support either permanently, by welding or insetting, or as detachable parts. In the latter case, the tool consists of a base metal body and one or more working parts (blade, plate, point) locked to the body by a device comprising, for example, a bridge plate, a clamping screw or a spring cotter-pin with, where appropriate, a chip-breaking lip.

The heading further includes tools with a base metal working part fitted or covered with abrasive materials, **provided** these tools have cutting teeth, flutes, grooves, etc., which retain their identity and function even after the application of the abrasive, i.e., tools which could be put to use even if the abrasive had not been applied; most abrasive tools are, however, **excluded** (see the Explanatory Note to heading **68.04**).

The tools classified in this heading include :

- (1) **Rock drilling or earth boring tools**, including mining, oil well drilling or sounding tools (e.g. augers, boring bits and drills).
- (2) **Dies for drawing or extruding metal**, including draw plates.
- (3) **Tools for pressing, stamping or punching**, including punches and dies for cold pressing or stamping of sheet metal; drop forging dies; perforating or cutting dies and punches for machine-tools.
- (4) **Tools for tapping or threading**, such as taps and dies, chasers and chaser dies.
- (5) **Tools for drilling, other than for rock drilling**, including drills (spiral or twist drills, centre bits, etc.), brace bits, etc.
- (6) **Tools for boring or broaching**, including reaming.
- (7) **Tools for milling**, e.g. milling cutters (plain, helical, staggered or angle cutters); gear cutting hobs, etc.
- (8) **Tools for turning**.
- (9) **Other interchangeable tools**, such as :
 - (a) Tools for dressing, planing, grooving, lapping or trueing.
 - (b) Tools for morticing, moulding, or tonguing wood, including cutting chains for morticing wood.
 - (c) Tools for mixing, stirring, etc., materials such as paint, glue, mortar, mastic and coating slip.
 - (d) Screwdriver bits.

Wire drawing dies, lathe tools, etc., remain in this heading even if they have been made radioactive.

The heading also **excludes** :

- (a) Bobs, wheels and other tools with working parts of rubber, leather, felt, etc., classified according to the constituent materials (**Chapters 40, 42, 59**, etc.).
- (b) Saw blades of all kinds (**heading 82.02**).
- (c) Plane irons and similar parts of tools (**heading 82.05**).
- (d) Knives and cutting blades for machines or for mechanical appliances (**heading 82.08**).
- (e) Plates, sticks, tips and the like for tools, unmounted, of cermets (**heading 82.09**).
- (f) Spinnerets for extruding man-made fibres (**heading 84.48**).
- (g) Work and tool holders for machines or hand tools, and self-opening dieheads (**heading 84.66**).
- (h) Dies for drawing glass fibres (**heading 84.75**).
- (ij) Brushes (metallic or not) of a kind used as parts of machines (**heading 96.03**).

82.08 - Knives and cutting blades, for machines or for mechanical appliances.

8208.10 - For metal working

8208.20 - For wood working

8208.30 - For kitchen appliances or for machines used by the food industry

8208.40 - For agricultural, horticultural or forestry machines

8208.90 - Other

This heading applies to **unmounted** knives or cutting blades, rectangular, circular or of other shapes, for machines or for mechanical appliances. It **does not**, however, **cover** cutting blades or knives for the hand tools of **headings 82.01 to 82.05** (e.g., plane irons).

The heading includes knives or cutting blades :

(1) **For metal working :**

- (a) Blades and knives for fitting into tools for machine-tools, e.g., into reamers or milling cutters.
- (b) Blades for guillotine-type shears or for machine shears for cutting sheet metal, wire, bars, etc.

(2) **For wood working :**

- (a) Blades and irons for planing or similar woodworking machines.
- (b) Blades for veneer cutting machines.

(3) **For kitchen appliances or for machines used by the food industry**, such as blades and cutters for appliances or machines used in the household, or by butchers, bakers, etc. (e.g., blades for mincing machines, vegetable choppers, bread slicers, bacon or ham slicers).

(4) **For agricultural, horticultural or forestry machines**, for example, blades and knives for root cutters, straw cutters, etc. or for lawn mowers; blades and segments of blades for harvesting or reaping machines. The heading **does not**, however, **cover** coulters for ploughs or discs for harrows.

(5) **For other machines or mechanical appliances**, such as :

- (a) Blades and knives, including circular or cup-shaped blades, for machines used in splitting, paring or trimming the surface of leather.
- (b) Blades and knives for machines for cutting paper, textiles, plastics, etc.; for tobacco shredding machines, etc.

82.09 - Plates, sticks, tips and the like for tools, unmounted, of cermets.

The products of this heading are usually in the form of plates, sticks, tips, rods, pellets, rings, etc., and are characterised by great hardness, even when hot, and great rigidity.

In view of their special properties these plates, tips, etc., are welded, brazed or clamped on to lathe tools, milling tools, drills, dies, or other high-speed cutting tools used for working metals or other hard materials. They fall in this heading whether sharpened or not, or otherwise prepared, but **not** if already mounted on tools; in the latter case they fall in the **headings for tools, particularly heading 82.07**.

The heading also **excludes** :

- (a) Unmixed, non-sintered metal carbides (**heading 28.49**).
- (b) Prepared but non-sintered metal carbide mixtures (**heading 38.24**).
- (c) Ceramic plates, sticks, tips and the like, for tools (**heading 69.09**).
- (d) Sand blast nozzles and other abrasion resistant parts of machines, of cermets (**Chapter 84**).

82.10 - Hand-operated mechanical appliances, weighing 10 kg or less, used in the preparation, conditioning or serving of food or drink.

This heading covers **non-electric** mechanical appliances, generally hand-operated, not exceeding 10 kg in weight, used in the preparation, serving or conditioning of food or drink.

For the purposes of this heading an appliance is regarded as mechanical if it has such mechanisms as crank-handles, gearing, Archimedean screw-actions, pumps, etc.; a simple lever or plunger action is not in itself, however, regarded as a mechanical feature involving classification in this heading unless the appliance is designed for fixing to a wall or other surface, or is fitted with base plates, etc., for standing on a table, on the floor, etc.

The heading thus comprises appliances which would fall either in heading 82.05 or in Chapter 84 but for the fact that they **fulfil the following conditions** :

- (1) They weigh 10 kg or less.
- (2) They have the mechanical features described.

The following are examples of goods falling in the heading, **provided** they conform to the conditions set out above :

Coffee or spice mills; vegetable mincers and mashers; meat mincers and slicers; meat presses; graters for cheese, etc.; vegetable or fruit slicers, cutters and peelers, including potato chippers; bread slicers; macaroni or spaghetti cutters; appliances for stoning fruit (**other than** spring-types held independently in the hand); bottle openers and corkers; mechanical can openers (**other than** the simple can openers of **heading 82.05**); can sealers; butter churns; ice cream freezers and portion servers; egg, cream or mayonnaise beaters and mixers; fruit or meat juice extractors; ice crushers.

82.11 - Knives with cutting blades, serrated or not (including pruning knives), other than knives of heading 82.08, and blades therefor (+).

8211.10 - Sets of assorted articles

- Other :

8211.91 -- Table knives having fixed blades

8211.92 -- Other knives having fixed blades

8211.93 -- Knives having other than fixed blades

8211.94 -- Blades

8211.95 -- Handles of base metal

This heading covers knives with cutting blades, serrated or not, with the **exception** of those included in **heading 82.08**, and of certain tools and tableware sometimes called "knives" but covered implicitly or explicitly by other headings of this Chapter (for example, hay knives of **heading 82.01**, and other articles listed in the exclusions at the end of this Explanatory Note).

The heading covers :

(1) **Non-folding table knives** of all kinds, including carving or dessert knives. Their handles and blades may be made of a single piece of metal, or they may have a fitted handle of base metal, wood, horn, plastics, etc.

(2) **Non-folding knives for kitchen, trade or other uses**, generally of a less decorative appearance than the preceding type. This category includes, inter alia :

Butchers' knives; knives for bookbinders or papermakers; tanners', furriers', saddlers' or cobblers' knives, with or without handles; bee-keepers' uncapping knives; gardeners' pruning knives, etc.; hunting knives, sheath knives; oyster knives; fruit peeling knives.

(3) **Folding knives** of all kinds, with handles of base metal, wood, horn, plastics, etc. This group includes, inter alia :

Pocket knives, pen knives, jack knives, campers' knives and sports knives (all these knives may have more than one blade, or be equipped with auxiliary corkscrews, spikes, screwdrivers, scissors, can openers, etc.); pocket folding knives for pruning, budding, grafting, etc.

(4) **Knives with several interchangeable blades**, whether or not these are contained in the handles.

The heading also covers blades for the manufacture of the knives listed above which may be in the form of crude or machined blanks, polished or completely finished blades. Handles of base metal for the knives of this heading are also included.

83.01

In addition to the exclusions mentioned in the first paragraph above, the heading also **excludes** :

- (a) Bill hooks and matchets (**heading 82.01**).
- (b) Articles of cutlery of **heading 82.14**.
- (c) Fish-knives and butter-knives (**heading 82.15**).

○
○ ○

Subheading Explanatory Note.

Subheading 8211.10

The scope of subheading 8211.10 is limited to sets of different knives or sets of assorted articles, in which the knives predominate in number over the other articles.

83.01

82.12 - Razors and razor blades (including razor blade blanks in strips).

8212.10 - Razors

8212.20 - Safety razor blades, including razor blade blanks in strips

8212.90 - Other parts

This heading covers :

- (1) **Open blade razors**, including separately presented **blades** (finished or not), and separately presented base metal **handles**.
- (2) **Safety razors, and their base metal parts and blades**, finished or not.
- (3) **Plastic safety razors** presented with their blades.

The heading also covers **non-electric dry shavers** and blades, cutting plates and heads for non-electric razors.

Blanks of safety razor blades are also included in the heading when in the form of lengths of strip steel, tempered or not, **provided** they have been perforated ready for the manufacture of safety razor blades, or the outline of the blade has been incised allowing separation by slight pressure.

The heading **excludes** :

- (a) Plastic safety razors presented without their blades (**heading 39.24**).
- (b) Electric razors and heads, blades and cutting plates of such razors (**heading 85.10**).

83.01

82.13 - Scissors, tailors' shears and similar shears, and blades therefor.

The scissors classified in this heading consist of two superimposed blades, sometimes serrated, articulated on a screw or pin near the centre. In general the heading covers **only** those scissors in which each blade is fitted, at one end, with a finger ring. The blades may be in one piece, or consist of jointed cutting blades and handles.

The heading also includes certain types of scissors hinged at one end and with a single finger ring (used mainly in the textile industry).

The heading includes, *inter alia* :

- (1) **Ordinary scissors** for domestic or office use, or for sewing, etc., with straight or curved blades.
- (2) **Scissors for professional use**, e.g., tailors' or dressmakers' scissors and shears (including buttonhole scissors); hairdressers' scissors (including thinning scissors); scissors for drapers, leather workers, glovemakers or hatters.
- (3) **Manicure scissors**, including those in which the side of the blade forms a nail file.
- (4) **Small folding scissors**, e.g., pocket scissors and embroidery scissors; flower scissors; vine scissors; cigar-cutting scissors.
- (5) **Special types** such as pinking scissors; twin scissors (four bladed) for cutting strips of cloth; horse clipping scissors; hoof cutting scissors; secateur type scissors (with one convex and one concave blade) but with the characteristic scissor finger rings (e.g., for flower cutting).

The heading includes **scissor blades**, finished or not.

The heading **does not cover** :

- (a) Hedge shears, sheep shears, etc., with blades **not** fitted with finger rings, and secateurs and similar one-handed pruners and shears (including poultry shears) of **heading 82.01**.
- (b) Special farriers' two-handed shears for cutting animals' hooves (**heading 82.05**).

83.01

82.14 - Other articles of cutlery (for example, hair clippers, butchers' or kitchen cleavers, choppers and mincing knives, paper knives); manicure or pedicure sets and instruments (including nail files).

8214.10 - Paper knives, letter openers, erasing knives, pencil sharpeners and blades therefor

8214.20 - Manicure or pedicure sets and instruments (including nail files)

8214.90 - Other

This heading includes :

- (1) **Paper knives, letter openers, erasing knives, pencil sharpeners (including pocket type) and blades therefor**, but **not** pencil sharpening machines of **heading 84.72**.
- (2) **Manicure or pedicure sets and instruments, including nail files** (folding or not). Such instruments also include nail cleaners, corn-cutters, corn-extractors, cuticle cutting knives, cuticle presses and pushers, nail nippers and clippers.

Manicure or pedicure sets usually contain such instruments in boxes, cases, etc., and may include scissors, non-metallic nail polishers, hair removing tweezers, etc., which, taken separately, would be classified in their appropriate headings.

- (3) **Hair clippers, hand-operated, non-electric.**

Electric hair clippers with self-contained electric motors are classified in **heading 85.10**; mechanical clippers for animals, usually mounted on a stand and equipped with a flexible transmission, are classified in **heading 84.36**.

The heading covers not only the spare parts of hair clippers of this heading, but also cutting plates and heads for the mechanical clippers of heading 84.36.

- (4) **Butchers' or kitchen choppers, cleavers, and mincing knives.** These articles do not have the normal shape of a knife, and may be designed for use with one or both hands.

83.01

82.15 - Spoons, forks, ladles, skimmers, cake-servers, fish-knives, butter-knives, sugar tongs and similar kitchen or tableware.

8215.10 - Sets of assorted articles containing at least one article plated with precious metal

8215.20 - Other sets of assorted articles

- Other :

8215.91 -- Plated with precious metal

8215.99 -- Other

This heading includes :

- (1) Spoons of all kinds including salt or mustard spoons.
- (2) Table forks; carving forks, serving forks, cooks' forks; cake forks; oyster forks; snail forks; toasting forks.
- (3) Ladles and ladle type skimmers (for vegetables, frying, etc.).
- (4) Slices for serving fish, cake, strawberries, asparagus.
- (5) Non-cutting fish-knives and butter-knives.
- (6) Sugar tongs of all kinds (cutting or not), cake tongs, hors-d'oeuvre tongs, asparagus tongs, snail tongs, meat tongs and ice tongs.
- (7) Other tableware, such as poultry or meat grips, and lobster or unit grips.

These goods may be of one piece or fitted with handles of base metal, wood, plastics, etc.

In accordance with Chapter Note 3, the heading also includes sets consisting of one or more knives of heading 82.11 and at least an equal number of articles of this heading.

The heading **excludes** lobster cutters or poultry shears of the secateur or scissors type (**heading 82.01 or 82.13**).

83.01

Chapter 83

Miscellaneous articles of base metal

Notes.

- 1.- For the purposes of this Chapter, parts of base metal are to be classified with their parent articles. However, articles of iron or steel of heading 73.12, 73.15, 73.17, 73.18 or 73.20, or similar articles of other base metal (Chapters 74 to 76 and 78 to 81) are not to be taken as parts of articles of this Chapter.
- 2.- For the purposes of heading 83.02, the word "castors" means those having a diameter (including, where appropriate, tyres) not exceeding 75 mm, or those having a diameter (including, where appropriate, tyres) exceeding 75 mm provided that the width of the wheel or tyre fitted thereto is less than 30 mm.

GENERAL

Whereas in Chapters 73 to 76 and 78 to 81 articles are classified according to a specific metal, this Chapter, like Chapter 82, covers certain particular classes of goods **irrespective** of the base metal of which they are composed.

In general, parts of base metal are to be classified with their parent articles (see Chapter Note 1). However, the Chapter **does not cover** springs (even if specialised for locks, etc.), chains, cables, nuts, bolts, screws or nails; these goods are classified in the appropriate headings of **Chapters 73 to 76 and 78 to 81** (see Note 2 to Section XV and Note 1 to this Chapter).

83.01

83.01 - Padlocks and locks (key, combination or electrically operated), of base metal; clasps and frames with clasps, incorporating locks, of base metal; keys for any of the foregoing articles, of base metal (+).

8301.10 - Padlocks

8301.20 - Locks of a kind used for motor vehicles

8301.30 - Locks of a kind used for furniture

8301.40 - Other locks

8301.50 - Clasps and frames with clasps, incorporating locks

8301.60 - Parts

8301.70 - Keys presented separately

This heading covers fastening devices operated by a key (e.g., locks of the cylinder, lever, tumbler or Bramah types) or controlled by a combination of letters or figures (combination locks).

It also includes electrically operated locks (e.g., for street doors of blocks of flats or for lift doors). These locks may be operated, e.g., by insertion of a magnetic card, by entering the combination data on an electronic keyboard, or by radio wave signal.

The heading therefore covers, *inter alia* :

- (A) Padlocks of all types for doors, trunks, chests, bags, cycles, etc., including key-operated locking hasps.
- (B) Locks for doors or gates, letter boxes, safes, boxes or caskets, furniture, pianos, trunks, suit-cases, handbags, dispatch-cases, etc., for automobiles, railway-rolling-stock, tramcars, etc., for lifts, shutters, sliding doors, etc.
- (C) Clasps and frames with clasps, incorporating locks.

The heading also covers :

- (1) Base metal parts of the articles mentioned above clearly recognisable as such (e.g., cases, bolts, striking plates and sockets, thread escutcheons, face-plates, wards, mechanisms and cylinder barrels).
- (2) Base metal keys for the articles mentioned above, finished or not (including roughly cast, forged or stamped blanks).

The heading also includes special railway coach compartment keys, skeleton keys, etc.

The heading **does not**, however, **include** simple latches or bolts, etc. (**heading 83.02**), nor fasteners and clasps (not key or combination operated) for handbags, brief-cases, executive-cases, etc. (**heading 83.08**).

Subheading Explanatory Note.

Subheading 8301.30

This subheading covers not only locks for domestic furniture but also those for office furniture.

83.02 - Base metal mountings, fittings and similar articles suitable for furniture, doors, staircases, windows, blinds, coachwork, saddlery, trunks, chests, caskets or the like; base metal hat-racks, hat-pegs, brackets and similar fixtures; castors with mountings of base metal; automatic door closers of base metal.

8302.10 - Hinges

8302.20 - Castors

8302.30 - Other mountings, fittings and similar articles suitable for motor vehicles

- Other mountings, fittings and similar articles :

8302.41 -- Suitable for buildings

8302.42 -- Other, suitable for furniture

8302.49 -- Other

8302.50 - Hat-racks, hat-pegs, brackets and similar fixtures

8302.60 - Automatic door closers

This heading covers general purpose classes of base metal accessory fittings and mountings, such as are used largely on furniture, doors, windows, coachwork, etc. Goods within such general classes remain in this heading even if they are designed for particular uses (e.g., door handles or hinges for automobiles). The heading **does not**, however, **extend** to goods forming an essential part of the structure of the article, such as window frames or swivel devices for revolving chairs.

The heading covers :

- (A) **Hinges** of all types (e.g., butt hinges, lift-off hinges, angle hinges, strap hinges and garnets).
- (B) **Castors**, as defined in Chapter Note 2.

To fall in this heading, castors must have mountings of base metal, but the wheels may be of any material (except precious metal).

In the case of castors having pneumatic tyres, the diameter of the castor must be measured with the tyre inflated to a normal pressure.

The presence of spokes does not affect the classification of castors in this heading.

Castors not complying with the provisions of the heading text or of Chapter Note 2, are **excluded** (e.g., **Chapter 87**).

(C) **Mountings, fittings and similar articles suitable for motor vehicles** (e.g., motor cars, lorries or motor coaches), **not being** parts or accessories of **Section XVII**. For example : made up ornamental beading strips; foot rests; grip bars, rails and handles; fittings for blinds (rods, brackets, fastening fittings, spring mechanisms, etc.); interior luggage racks; window opening mechanisms; specialised ash trays; tail-board fastening fittings.

(D) **Mountings, fittings and similar articles suitable for buildings**

This group includes :

(1) Door guards fitted with chains, bars, etc.; espagnolette or casement bolts and fittings; casement fasteners and stays; fanlight or skylight openers, stays and fittings; cabin hooks and eyes; hooks and fittings for double windows; hooks, fasteners, stops, brackets and roller ends for shutters or blinds; letter-box plates; door knockers, spy holes, etc. (**other than** those fitted with optical elements).

(2) Catches (including ball spring catches), bolts, fasteners, latches, etc., (**other than** key-operated bolts of **heading 83.01**), for doors.

(3) Fittings for sliding doors or windows of shops, garages, sheds, hangars, etc. (e.g., grooves and tracks, runners and rollers).

(4) Keyhole plates and finger-plates for doors of buildings.

(5) Curtain, blind or portière fittings (e.g., rods, tubes, rosettes, brackets, bands, tassel hooks, clips, sliding or runner rings, stops); cleat hooks, guides and knot holders for blind cords, etc.; staircase fittings, such as protectors for staircase treads; stair carpet clips, stair rods, banister knobs.

Rods, tubes and bars, suitable for use as curtain or stair rods, etc., merely cut to length and drilled, remain classified according to the constituent metal.

(6) Corner braces, reinforcing plates, angles, etc., for doors, windows or shutters.

(7) Hasps and staples for doors; handles and knobs for doors, including those for locks or latches.

(8) Door stops and door closers (**other than** those of (H) below).

(E) **Mountings, fittings and similar articles suitable for furniture**

This group includes :

(1) Protective studs (with one or more points) for legs of furniture, etc.; metal decorative fittings; shelf adjusters for book-cases, etc.; fittings for cupboards, bedsteads, etc.; keyhole plates.

(2) Corner braces, reinforcing plates, angles, etc.

- (3) Catches (including ball spring catches), bolts, fasteners, latches, etc. (**other than** key-operated bolts of **heading 83.01**).
 - (4) Hasps and staples for chests, etc.
 - (5) Handles and knobs, including those for locks or latches.
- (F) (1) Fittings and similar articles for trunks, chests, suit-cases or similar travel goods, e.g., lid guides (but **not including** fasteners); handles; corner protectors; lid struts and runners; closing rods for basket-trunks; fittings for expanding cases; however, ornaments for handbags fall in **heading 71.17**.
- (2) Corner braces, reinforcing plates, angles, etc., for chests, trunks, caskets, boxes, suit-cases, etc.
 - (3) Fittings and similar articles for saddlery, such as bits, curbs, saddle-bows, stirrups; trace, harness or rein rings; horse-brasses and other fittings for harness.
 - (4) Fittings and similar articles for caskets or coffins.
 - (5) Fittings and similar articles for vessels (ships and boats).
- (G) **Hat-racks, hat-pegs, brackets** (fixed, hinged or toothed, etc.) and **similar fixtures** such as coat racks, towel racks, dish-cloth racks, brush racks, key racks.
- Coat racks, etc., having the character of furniture, such as coat racks incorporating a shelf, are classified in **Chapter 94**.
- (H) **Automatic door closers**, spring or hydraulic types, for doors, gates, etc.

83.03 - Armoured or reinforced safes, strong-boxes and doors and safe deposit lockers for strong-rooms, cash or deed boxes and the like, of base metal.

This heading covers containers and strong-room doors designed for securing valuables, jewels, documents, etc., against theft and fire.

Safes and strong-boxes of this heading are steel containers of which the walls are **armoured** (i.e., made of high-strength alloy steel) or of sheet steel reinforced with, for example, reinforced concrete. They are used in banks, offices, hotels, etc. They are fitted with very secure locks and often with air-tight doors and double walls, the intervening space usually being filled with heat-resistant materials. The heading includes strong-room doors (whether or not with door frames) and safe deposit lockers for strong-rooms as used in banks, safe deposits, factories, etc., where larger storage space is required.

The heading also includes metal cash or deed boxes (with or without internal compartments). These are portable boxes (incorporating a key-operated or a combination lock), sometimes with double walls, which by virtue of their design, constituent material, etc., offer reasonable protection against theft and fire. Collecting-boxes, money-boxes, etc., also fall in the heading, **provided** they have similar provisions for security; otherwise they are classified according to the constituent metal or as toys.

The heading **does not cover** :

- (a) Security doors of steel, for all types of dwellings (**heading 73.08**).
- (b) Containers specially designed to resist fire, impact and crushing and whose walls in particular do not offer any serious resistance to attempts at breaking them open by drilling or cutting (**heading 94.03**).

83.04 - Filing cabinets, card-index cabinets, paper trays, paper rests, pen trays, office-stamp stands and similar office or desk equipment, of base metal, other than office furniture of heading 94.03.

The heading covers filing cabinets, card-index cabinets, sorting boxes and similar office equipment used for the storage, filing or sorting of correspondence, index cards or other papers, **provided** the equipment is not designed to stand on the floor or is not otherwise covered by Note 2 to Chapter 94 (**heading 94.03**) (see the General Explanatory Note to Chapter 94). The heading also includes paper trays for sorting documents, paper rests for typists, desk racks and shelving, and desk equipment (such as book-ends, paperweights, ink-stands and ink-pots, pen trays, office-stamp stands and blotters).

The heading **does not**, however, **cover** waste paper baskets which are classified according to the constituent metal (e.g., in **heading 73.26**).

83.05 - Fittings for loose-leaf binders or files, letter clips, letter corners, paper clips, indexing tags and similar office articles, of base metal; staples in strips (for example, for offices, upholstery, packaging), of base metal.

8305.10 - Fittings for loose-leaf binders or files

8305.20 - Staples in strips

8305.90 - Other, including parts

This heading covers base metal fittings of the clip, cord, spring lever, ring, screw, etc., types, for loose-leaf binders or box files. It further includes protecting rings, bands and corners for ledgers or other stationery books; also office stationery in metal of the type used in fastening together or index-marking papers (e.g., letter clips, paper clips, paper fasteners, letter corners, card indexing tags, file tags, spike files); staples in strips of the kind used in stapling machines, in offices, for upholstery, for packaging, etc.

The heading **excludes** :

- (a) Drawing pins (e.g., **heading 73.17 or 74.15**).
- (b) Clasps and fasteners for books, ledgers, etc. (**heading 83.01 or 83.08**).

83.06 - Bells, gongs and the like, non-electric, of base metal; statuettes and other ornaments, of base metal; photograph, picture or similar frames, of base metal; mirrors of base metal.

8306.10 - Bells, gongs and the like

- Statuettes and other ornaments :

8306.21 -- Plated with precious metal

8306.29 -- Other

8306.30 - Photograph, picture or similar frames; mirrors

(A) BELLS, GONGS AND THE LIKE, NON-ELECTRIC

This group covers **non-electric** bells and gongs of base metal. It includes bells for places of religious worship, schools, public buildings, factories, ships, fire-engines, etc.; door bells; table bells; hand-bells; cattle or other animal bells; bells for bicycles, scooters or perambulators; bells for fishing tackle (without the addition of external clamps, clips or other mounting devices); door chimes, table gongs, etc.; decorated bells such as those for tourist souvenirs.

This heading also covers metallic parts such as clappers, handles and domes (including those suitable equally for electric or other types of bells). It also includes metallic buttons and turn-keys for non-electric table or door bells.

This heading **does not include** :

- (a) Iron or steel frameworks for supporting church bells, etc. (**heading 73.08**).
- (b) Bell pulls, leverings and fittings for mechanical type door bells (e.g., **heading 73.25, 73.26**).
- (c) Electric bells and other signalling apparatus of **heading 85.31**.
- (d) Clock chimes and gongs (**heading 91.14**).
- (e) Carillons and gongs, of the nature of musical instruments of **heading 92.06 or 92.07**.
- (f) Articles incorporating bells, e.g., dog collars (**heading 42.01**), certain musical instruments (e.g., tambourines) (**Chapter 92**), toys (**heading 95.03**), fishing rod bells mounted on external clamps, clips or other devices (**heading 95.07**).

(B) STATUETTES AND OTHER ORNAMENTS

This group comprises a wide range of ornaments of base metal (whether or not incorporating subsidiary non-metallic parts) of a kind **designed essentially for decoration**, e.g., in homes, offices, assembly rooms, places of religious worship, gardens.

It should be noted that the group **does not include** articles of more specific headings of the Nomenclature, even if those articles are suited by their nature or finish as ornaments.

The group covers articles which have no utility value but are wholly ornamental, and articles whose only usefulness is to contain or support other decorative articles or to add to their decorative effect, for example :

- (1) Busts, statuettes and other decorative figures; ornaments (including those forming parts of clock sets) for mantelpieces, shelves, etc. (animals, symbolic or allegorical figures, etc.); sporting or art trophies (cups, etc.); wall ornaments incorporating fittings for hanging (plaques, trays, plates, medallions **other than** those for personal adornment); artificial flowers, rosettes and similar ornamental goods of cast or forged metal (usually of wrought iron); knick-knacks for shelves or domestic display cabinets.
- (2) Articles for religious use such as reliquaries, chalices, ciboriums, monstrances or crucifixes.
- (3) Table-bowls, vases, pots, jardinières (including those of cloisonné enamel).

* * *

The group also includes, in the circumstances explained below, certain goods of the two following categories even though they have a utility value :

- (A) Household or domestic articles whether they are potentially covered by specific headings for such goods (i.e., headings 73.23, 74.18 and 76.16) or by the "other articles" headings (e.g., in the case of articles of nickel and tin in particular). These household or domestic articles are generally designed essentially to serve useful purposes, and any decoration is usually secondary so as not to impair the usefulness. If, therefore, such decorated articles serve a useful purpose no less efficiently than their plainer counterparts, they are classified as domestic goods rather than in this group. On the other hand, if the usefulness of the article is clearly subordinate to its ornamental or fancy character, it should be classified in this group, for example, trays so heavily embossed that their usefulness is virtually nullified; ornaments incorporating a purely incidental tray or container usable as a trinket dish or ash-tray; and miniatures having no genuine utility value (miniature kitchen utensils).
- (B) Articles, other than household or domestic articles, of the type which would otherwise fall in the collective headings at the end of each of the Chapters for metals (e.g., smokers' sets, jewel cases, cigarette boxes, incense stands, incense pots, match holders). These goods are classified in this group if clearly designed primarily for ornamental purposes.

(C) PHOTOGRAPH, PICTURE OR SIMILAR FRAMES; MIRRORS OF BASE METAL

This group comprises **photograph, picture, mirror, etc., frames of base metal**, of all shapes and dimensions. These remain in the group if fitted with supports or with backings of paperboard, wood or other material. The group includes frames fitted with plain glass, but glass mirrors with metal frames are **excluded (heading 70.09)**.

Printed pictures and photographs presented in frames of base metal are also classified in this heading when the essential character of the whole is given by the frames; in other cases such articles are classified in **heading 49.11**.

In the case of framed paintings, drawings, pastels, collages and similar decorative plaques, and original engravings, prints and lithographs, to determine whether the framed articles are to be classified as a whole or whether the frames are to be classified separately, see Note 5 to Chapter 97 and the Explanatory Notes to headings 97.01 and 97.02.

This group also includes **metallic mirrors (other than optical elements**, see the Explanatory Notes to **headings 90.01** and **90.02**), e.g., wall or pocket mirrors and rear-view mirrors, generally made of steel or of chromium, nickel or silver-plated steel or brass. They may be framed, backed or fitted with supports, or be presented complete with cases or straps of leather, textile or other materials.

*
* *

The heading also **excludes** :

- (a) Partitions and balustrades of wrought iron or other metals (e.g., **heading 73.08**).
- (b) Knives, spoons, forks, etc. (**Chapter 82**).
- (c) Locks and parts thereof (**heading 83.01**).
- (d) Fittings and mountings for furniture, doors, staircases and windows (**heading 83.02**).
- (e) The instruments and apparatus of **Chapter 90** (e.g., barometers and thermometers even if in an essentially decorative presentation).
- (f) Clocks and cases therefor, even if the latter are decorative or consist, for example, of statuettes or similar objects clearly designed to act as clock cases (**Chapter 91**).
- (g) Articles of **Chapter 94**.
- (h) Toys and games (**Chapter 95**).
- (ij) Table lighters (**heading 96.13**); scent and similar sprays (**heading 96.16**).
- (k) Works of art, collectors' pieces and antiques (**Chapter 97**).

83.07 - Flexible tubing of base metal, with or without fittings.

8307.10 - Of iron or steel

8307.90 - Of other base metal

There are two main types of flexible metal tubing, differing according to the process of manufacture :

- (1) Flexible tubing composed of a shaped strip rolled spirally, with or without fastening of the edge. Tubing of this type may be rendered water or gas tight by packing with rubber, asbestos, textiles, etc. It is then suitable for use as watertight protection for electric cables or flexible transmission systems; vacuum cleaner tubing; conduits for compressed air, steam, gas, water, petrol, oil or other fluids in engines, machine-tools, pumps, transformers, hydraulic or pneumatic appliances, blast furnaces, etc. Similar tubing not rendered watertight is used as conduits for sand, grain, dust, shavings, etc., and also, in certain cases, for protecting electric cables, other flexible transmission piping, rubber tubing, etc.
- (2) Corrugated flexible tubing obtained, e.g., by deformation of a smooth-surfaced pipe. This tubing is by its nature water and air tight, and can be used without further processing for the purposes described in paragraph (1) above.

In order to increase their resistance to pressure, both types of flexible tubing may be reinforced or equipped with one or more braided sleeves of wire or metal strip. These sleeves are sometimes protected by spiralled wire, and may also be covered with plastics, rubber or textile material.

The heading also covers flexible tubing composed of tightly spiralled wire (e.g., as used as sheathing for "Bowden" cables or cycle brake cables). It **does not cover** similar products which are not used as tubes or pipes (e.g., extending curtain wire) (generally **heading 73.26**).

Flexible tubing in short lengths for thermic or antivibratory uses (known as thermostatic bellows or expansion joints) remains in this heading.

The heading also includes tubing fitted with sockets, joints, etc.

This heading also **excludes** :

- (a) Rubber tubing incorporating or fitted with external metallic reinforcement (**heading 40.09**).
- (b) Flexible tubing made into the form of machinery or vehicle parts, etc., e.g., by assembly with other materials (**Sections XVI and XVII**).

83.08 - Clasps, frames with clasps, buckles, buckle-clasps, hooks, eyes, eyelets and the like, of base metal, of a kind used for clothing or clothing accessories, footwear, jewellery, wrist-watches, books, awnings, leather goods, travel goods or saddlery or for other made up articles; tubular or bifurcated rivets, of base metal; beads and spangles, of base metal.

8308.10 - Hooks, eyes and eyelets

8308.20 - Tubular or bifurcated rivets

8308.90 - Other, including parts

This heading includes :

- (A) **Hooks, eyes and eyelets**, for clothing, footwear, awnings, tents or sails.
- (B) **Tubular or bifurcated rivets** of all kinds. These are used in clothing, footwear, awnings, tents, travel goods, leather goods, belting, etc.; they also serve in engineering (e.g., in aircraft construction). The heading also covers **break mandrel blind rivets**, where during the setting operation the mandrel is pulled into or against the rivet body and breaks at or near the junction of the mandrel shank and its upset end.
- (C) **Clasps, fasteners, and frames with clasps**, for handbags, purses, brief-cases, executive-cases or other travel goods, or for books or wrist-watches; but the heading **excludes** locks (including locking clasps), and frames with clasps, incorporating locks (**heading 83.01**).
- (D) **Buckles** (with or without tongues) and **buckle-clasps**, whether or not ornamental, for clothes, belts, braces, suspenders, gloves, footwear, gaiters, wrist-watches, haversacks, travel goods and leather goods.
- (E) **Metal beads and spangles** used, *inter alia*, for making imitation jewellery, or for decorating textile material, embroidery, clothing, etc. They are generally made of copper, copper alloys or aluminium (often gilded or silvered), and are designed to be fixed in position by glueing, sewing, etc. Beads are generally spherical or tubular or sometimes faceted; spangles, generally of geometrical form (round, hexagonal, etc.), are cut from metal foil and usually pierced.

The articles referred to in (A), (C) and (D) above may contain parts of leather, textiles, plastics, wood, horn, bone, ebonite, mother of pearl, ivory, imitation precious stones, etc., **provided** they retain the essential character of articles of base metal. They may also be ornamented by working of the metal.

This heading also **excludes** :

- (a) Ornaments, other than buckles, for hats, handbags, shoes, belts, etc. (**heading 71.17**).
- (b) Metal flakes (**Chapters 74 to 76**, in particular).
- (c) Rivets, other than tubular or bifurcated rivets; snap hooks (usually **Chapters 73 to 76**).
- (d) Press-studs and push-buttons (**heading 96.06**).
- (e) Slide fasteners and parts thereof (**heading 96.07**).

83.09 - Stoppers, caps and lids (including crown corks, screw caps and pouring stoppers), capsules for bottles, threaded bungs, bung covers, seals and other packing accessories, of base metal.

8309.10 - Crown corks

8309.90 - Other

The heading covers a range of articles of base metal (often with washers or other fittings of plastics, rubber, cork, etc.) used for corking or capsuling drums, barrels, bottles, etc., or for sealing cases or other packages.

The heading includes :

- (1) Metal stoppers, caps and lids, e.g., crown corks, crown caps or crown seals; stoppers, caps and covers of the screw, clip, lever, spring, etc., types as used for corking or capping beer bottles, mineral water bottles, preserve jars, tubular containers or the like.

The heading **does not**, however, **cover** spring lever stoppers predominantly of plastics, porcelain, etc.

- (2) Bungs for metal drums.
- (3) Pouring, dropping, anti-drip stoppers for bottles of liqueurs, oils, medicaments, etc.
- (4) Tear off capsules for milk bottles, etc., fabricated capsules of lead or tin foil, of the type used for certain champagne or wine bottles.
- (5) Bung covers, in the form of discs, etc., cut from sheet metal and fixed over the bung as a protection.
- (6) Special wire fittings as used to secure the corks of bottles of champagne, etc.
- (7) Seals of all kinds, generally of lead or tin-plate, used to secure crates, packages, buildings, railway wagons, vehicles, etc., including guarantee seals.
- (8) Case corner protectors.
- (9) Fastenings for sealing bags, sachets or similar containers, consisting of one or two steel wires sandwiched between two strips of plastics or two strips of paper.
- (10) Tops with an incised flap and a ring pull, made of base metal, used, for example, for drink or food cans.

83.10 - Sign-plates, name-plates, address-plates and similar plates, numbers, letters and other symbols, of base metal, excluding those of heading 94.05.

With the exception of illuminated signs, illuminated name-plates and the like, having a permanently fixed light source, and parts thereof not elsewhere specified or included, of heading 94.05, this heading covers base metal plates which bear (by enamelling, varnishing, printing, engraving, perforation, stamping, moulding, embossing, shaping or any other process) words, letters, numbers or designs giving all the essential information required for a sign-plate, name-plate, advertising plate, address-plate or other similar plate. It is a characteristic of such plates that they are normally designed to be permanent fixtures (e.g., road sign-plates, advertising plates, machine name-plates) or to be used many times (e.g., cloakroom tokens and tags).

Some plates may be designed for the subsequent insertion of details subsidiary to the information already on the plate (e.g., the insertion of the individual serial number on a plate showing all the essential information about a machine). The heading excludes, however, plates, "labels", tags and the like which bear printing, etc., that is merely incidental to the essential information which is to be added later in manuscript or otherwise.

The heading includes :

- (1) Name-plates for districts, streets, etc.; number or name-plates for buildings, tombs, etc.; sign-plates for public services (police, fire-brigade, etc.), prohibitions ("No smoking", "Game Preserve", etc.); sign-post or traffic sign-plates, etc.
- (2) Symbols for inns, shops, factories.
- (3) Advertising sign-plates.
- (4) Address-plates for houses, doors, letter-boxes, vehicles, dog-collars, etc.; horticultural labels; tags for latch keys, tags and tokens for cloakrooms.
- (5) Similar plates and symbols for machines, meters, cars (e.g., number plates), etc.

The heading also includes separate letters, numbers or designs (or sets thereof), employed to make up sign-plates as described above, for shop window displays, train-indicator sign boards, etc.

Stencil plates are, however, classified according to their constituent metal.

The heading **does not include** :

- (a) Plates **not** bearing letters, numbers or designs, or bearing **only** particulars incidental to the essential information which is to be added later (e.g., headings 73.25, 73.26, 76.16, 79.07).
- (b) Printers' type (heading 84.42); type for typewriters and plates for addressing machines (heading 84.73).
- (c) Signalling plates, discs and semaphores of heading 86.08.

83.11 - Wire, rods, tubes, plates, electrodes and similar products, of base metal or of metal carbides, coated or cored with flux material, of a kind used for soldering, brazing, welding or deposition of metal or of metal carbides; wire and rods, of agglomerated base metal powder, used for metal spraying.

8311.10 - Coated electrodes of base metal, for electric arc-welding

8311.20 - Cored wire of base metal, for electric arc-welding

8311.30 - Coated rods and cored wire, of base metal, for soldering, brazing or welding by flame

8311.90 - Other

This heading covers wire, rods, tubes, plates, electrodes and similar products, of base metal or of metal carbides, of a kind used for soldering, brazing, welding or deposition of metal or of metal carbides, **provided** they are coated or cored with flux material; in the latter case, the outer part is usually composed of a tube or sometimes of a spirally wrapped strip. Wire, rods, tubes, plates, electrodes, etc., of base metal not coated or cored with flux material are **excluded** (**Chapters 72 to 76 and 78 to 81**).

The materials used for coating or coring are the flux (e.g., zinc chloride, ammonium chloride, borax, quartz, resin or lanolin) which would otherwise have to be added separately during the soldering, brazing, welding or deposition process. The electrodes, etc., may also contain the additive metal in powder form. In electric welding, the coating may also contain some heat-resistant material (asbestos, etc.) to direct the electric arc onto the part to be welded.

For electric arc-welding, coated electrodes or cored wire are used. The former consists of a metal core and a coating of non-metal material which may be of various thicknesses and compositions. Cored wire is a hollow product filled with material similar to that used for the coating of electrodes. This wire is presented in coils or on spools.

Prepared metal brazing plates are inserted between the parts to be joined (usually for iron or steel). They consist of a metal strip, wire cloth or grill, coated with the flux; they may be specially shaped for use, or in strip form suitable for cutting as required.

The heading also includes wire and rods obtained by extruding base metal powder (usually nickel) agglomerated with an excipient based on plastics, and used for spraying metal onto various materials (e.g., metals or cement).

The heading **does not cover** wire and rods of cored solder where, **apart from flux material**, the solder consists of an alloy containing 2 % or more by weight of any one precious metal (**Chapter 71**).

SECTION XVI

MACHINERY AND MECHANICAL APPLIANCES; ELECTRICAL EQUIPMENT; PARTS THEREOF; SOUND RECORDERS AND REPRODUCERS, TELEVISION IMAGE AND SOUND RECORDERS AND REPRODUCERS, AND PARTS AND ACCESSORIES OF SUCH ARTICLES

Notes.

1. This Section does not cover:
 - (a) Transmission or conveyor belts or belting, of plastics of Chapter 39, or of vulcanised rubber (heading 40.10), or other articles of a kind used in machinery or mechanical or electrical appliances or for other technical uses, of vulcanised rubber other than hard rubber (heading 40.16);
 - (b) Articles of leather or of composition leather (heading 42.05) or of furskin (heading 43.03), of a kind used in machinery or mechanical appliances or for other technical uses;
 - (c) Bobbins, spools, cops, cones, cores, reels or similar supports, of any material (for example, Chapter 39, 40, 44 or 48 or Section XV);
 - (d) Perforated cards for Jacquard or similar machines (for example, Chapter 39 or 48 or Section XV);
 - (e) Transmission or conveyor belts or belting of textile material (heading 59.10) or other articles of textile material for technical uses (heading 59.11);
 - (f) Precious or semi-precious stones (natural, synthetic or reconstructed) of headings 71.02 to 71.04, or articles wholly of such stones of heading 71.16, except unmounted worked sapphires and diamonds for styli (heading 85.22);
 - (g) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
 - (h) Drill pipe (heading 73.04);
 - (ij) Endless belts of metal wire or strip (Section XV);
 - (k) Articles of Chapter 82 or 83;
 - (l) Articles of Section XVII;
 - (m) Articles of Chapter 90;
 - (n) Clocks, watches or other articles of Chapter 91;
 - (o) Interchangeable tools of heading 82.07 or brushes of a kind used as parts of machines (heading 96.03); similar interchangeable tools are to be classified according to the constituent material of their working part (for example, in Chapter 40, 42, 43, 45 or 59 or heading 68.04 or 69.09);
 - (p) Articles of Chapter 95 or
 - (q) Typewriter or similar ribbons, whether or not on spools or in cartridges (classified according to their constituent material, or in heading 96.12 if inked or otherwise prepared for giving impressions), or monopods, bipods, tripods and similar articles, of heading 96.20.

2. Subject to Note 1 to this Section, Note 1 to Chapter 84 and Note 1 to Chapter 85, parts of machines (not being parts of the articles of heading 84.84, 85.44, 85.45, 85.46 or 85.47) are to be classified according to the following rules :
- (a) Parts which are goods included in any of the headings of Chapter 84 or 85 (other than headings 84.09, 84.31, 84.48, 84.66, 84.73, 84.87, 85.03, 85.22, 85.29, 85.38 and 85.48) are in all cases to be classified in their respective headings;
 - (b) Other parts, if suitable for use solely or principally with a particular kind of machine, or with a number of machines of the same heading (including a machine of heading 84.79 or 85.43) are to be classified with the machines of that kind or in heading 84.09, 84.31, 84.48, 84.66, 84.73, 85.03, 85.22, 85.29 or 85.38 as appropriate. However, parts which are equally suitable for use principally with the goods of headings 85.17 and 85.25 to 85.28 are to be classified in heading 85.17.
 - (c) All other parts are to be classified in heading 84.09, 84.31, 84.48, 84.66, 84.73, 85.03, 85.22, 85.29 or 85.38 as appropriate or, failing that, in heading 84.87 or 85.48.
- 3.- Unless the context otherwise requires, composite machines consisting of two or more machines fitted together to form a whole and other machines designed for the purpose of performing two or more complementary or alternative functions are to be classified as if consisting only of that component or as being that machine which performs the principal function.
- 4.- Where a machine (including a combination of machines) consists of individual components (whether separate or interconnected by piping, by transmission devices, by electric cables or by other devices) intended to contribute together to a clearly defined function covered by one of the headings in Chapter 84 or Chapter 85, then the whole falls to be classified in the heading appropriate to that function.
- 5.- For the purposes of these Notes, the expression " machine " means any machine, machinery, plant, equipment, apparatus or appliance cited in the headings of Chapter 84 or 85.

GENERAL

(I) GENERAL CONTENT OF THE SECTION

- (A) Subject to certain **exclusions** provided for in the Notes to this Section and to Chapters 84 and 85 and apart from goods covered more specifically in other Sections, this Section covers all mechanical or electrical machinery, plant, equipment, apparatus and appliances and parts thereof, together with certain apparatus and plant which is neither mechanical nor electrical (such as boilers and boiler house plant, filtering apparatus, etc.) and parts of such apparatus and plant.

The main **exclusions** from the Section are :

- (a) Spools, cops, bobbins, reels, etc., of any material (classified according to their constituent material). However, warp beams should not be regarded as bobbins, spools or similar supports and fall in **heading 84.48**.
- (b) Parts of general use as defined in Note 2 to Section XV, such as wire, chains, bolts, screws and springs, of iron or steel (**heading 73.12, 73.15, 73.18 or 73.20**) and similar articles of other base metals (**Chapters 74 to 76 and 78 to 81**), locks of **heading 83.01**, fittings and mountings for doors, windows, etc., of **heading 83.02**. Similar goods of plastics are also excluded from this Section and fall in **Chapter 39**.

- (c) Interchangeable tools of **heading 82.07**; other similar interchangeable tools are classified according to the constituent material of their working part (e.g., in **Chapter 40** (rubber), **Chapter 42** (leather), **Chapter 43** (fur), **Chapter 45** (cork) or **Chapter 59** (textile) or in **heading 68.04** (abrasive, etc.), or **heading 69.09** (ceramics), etc.).
 - (d) Other articles of **Chapter 82** (e.g., tools, tool-tips, knives and cutting blades, non-electrical hair clippers, and certain mechanical domestic appliances) and articles of **Chapter 83**.
 - (e) Articles of **Section XVII**.
 - (f) Articles of **Section XVIII**.
 - (g) Arms and ammunition (**Chapter 93**).
 - (h) Machinery and apparatus having the character of toys, games or sports requisites and identifiable parts and accessories thereof (including non-electric motors and engines but **excluding** pumps for liquids and filtering or purifying machinery for liquids or gases, which fall in **heading 84.13** or **84.21**, respectively, and also excluding electric motors, electric transformers and radio remote control apparatus, which fall in heading **85.01**, **85.04** or **85.26**, respectively) which are suitable for use solely or principally with toys, games or sports requisites (**Chapter 95**).
 - (ij) Brushes of a kind used as parts of machines (**heading 96.03**).
- (B) In general, the goods of this Section may be of any material. In the great majority of cases they are of base metal, but the Section also covers certain machinery of other materials (e.g., pumps wholly of plastics) and parts of plastics, of wood, precious metals, etc.

The Section **does not**, however, **cover** :

- (a) Transmission or conveyor belts or belting, of plastics (**Chapter 39**); articles of unhardened vulcanised rubber (e.g., transmission or conveyor belts or belting) (**heading 40.10**), rubber tyres, tubes, etc. (**headings 40.11 to 40.13**) and washers, etc. (**heading 40.16**).
- (b) Articles of leather or composition leather (e.g., pickers for textile looms) (**heading 42.05**), or of fur skin (**heading 43.03**).
- (c) Textile articles, e.g., transmission or conveyor belts (**heading 59.10**), felt pads and polishing discs (**heading 59.11**).
- (d) Certain ceramic goods of **Chapter 69** (see General Explanatory Notes to Chapters 84 and 85).
- (e) Certain glass articles of **Chapter 70** (see General Explanatory Notes to Chapters 84 and 85).
- (f) Articles wholly of precious or semi-precious stones (natural, synthetic or reconstructed) (**heading 71.02**, **71.03**, **71.04** or **71.16**), except unmounted worked sapphires or diamonds for styli (**heading 85.22**).
- (g) Endless belts of metal wire or strip (**Section XV**).

(II) PARTS (Section Note 2)

In general, parts which are suitable for use solely or principally with particular machines or apparatus (including those of heading 84.79 or heading 85.43), or with a group of machines or apparatus falling in the same heading, are classified in the same heading as those machines or apparatus subject, of course, to the **exclusions** mentioned in Part (I) above. Separate headings are, however, provided for :

- (A) Parts of the engines of heading 84.07 or 84.08 (heading 84.09).
- (B) Parts of the machinery of headings 84.25 to 84.30 (heading 84.31).
- (C) Parts of the textile machines of headings 84.44 to 84.47 (heading 84.48).
- (D) Parts of the machines of headings 84.56 to 84.65 (heading 84.66).
- (E) Parts of the office machines of headings 84.70 to 84.72 (heading 84.73).
- (F) Parts of the machines of heading 85.01 or 85.02 (heading 85.03).
- (G) Parts of apparatus of headings 85.19 or 85.21 (heading 85.22).
- (H) Parts of apparatus of headings 85.25 to 85.28 (heading 85.29).
- (IJ) Parts of apparatus of heading 85.35, 85.36 or 85.37 (heading 85.38).

The above rules do **not** apply to parts which in themselves constitute an article covered by a heading of this Section (**other than** headings 84.87 and 85.48); these are in all cases classified in their own appropriate heading even if specially designed to work as part of a specific machine. This applies in particular to :

- (1) Pumps and compressors (headings 84.13 and 84.14).
- (2) Filtering machinery and apparatus of heading 84.21.
- (3) Lifting and handling machinery (heading 84.25, 84.26, 84.28 or 84.86).
- (4) Taps, cocks, valves, etc. (heading 84.81).
- (5) Ball or roller bearings, and polished steel balls of a tolerance not exceeding 1 % or 0.05 mm, whichever is less (heading 84.82).
- (6) Transmission shafts, cranks, bearing housings, plain shaft bearings, gears and gearing (including friction gears and gear-boxes and other speed changers), flywheels, pulleys and pulley blocks, clutches and shaft couplings (heading 84.83).
- (7) Gaskets and similar joints of heading 84.84.
- (8) Electric motors of heading 85.01.
- (9) Electrical transformers and other machines and apparatus of heading 85.04.
- (10) Electric accumulators assembled into battery packs (heading 85.07).
- (11) Electric heating resistors (heading 85.16).
- (12) Electrical capacitors (heading 85.32).
- (13) Electrical apparatus for switching, protecting, etc., electrical circuits (switches, fuses, junction boxes, etc.) (headings 85.35 and 85.36).

- (14) Boards, panels, consoles, desks, cabinets and other apparatus for electric control or the distribution of electricity (heading 85.37).
- (15) Lamps of heading 85.39.
- (16) Valves and tubes of heading 85.40 and diodes, transistors, etc., of heading 85.41.
- (17) Electrical carbons (e.g., arc lamp carbons, carbon electrodes and carbon brushes) (heading 85.45).
- (18) Insulators of any material (heading 85.46).
- (19) Insulating fittings for electrical machines, etc., of heading 85.47.

Other parts which are recognisable as such, but are not suitable for use solely or principally with a particular machine or class of machine (i.e., which may be common to a number of machines falling in different headings), are classified in heading 84.87 (if not electrical) or in heading 85.48 (if electrical), unless they are **excluded** by the provisions set out above.

The above provisions for the classification of parts do not apply to parts of the goods falling in heading 84.84 (gaskets, etc.), 85.44 (insulated wire), 85.45 (electrical carbons), 85.46 (insulators) or 85.47 (conduit tubing); in general, such parts are classified in the appropriate materials Chapter.

Machinery parts remain classified in this Section whether or not finished ready for use. However, rough forgings of iron or steel are classified in **heading 72.07**.

(III) ACCESSORY APPARATUS

(See General Interpretative Rules 2 (a) and 3 (b) and Section Notes 3 and 4)

Accessory instruments and apparatus (e.g., manometers, thermometers, level gauges or other measuring or checking instruments, output counters, clockwork switches, control panels, automatic regulators) presented with the machine or apparatus with which they normally belong are classified with that machine or apparatus, if they are designed to measure, check, control or regulate one specific machine or apparatus (which may be a combination of machines (see Part VI below) or a functional unit (see Part VII below)). However, accessory instruments and apparatus designed to measure, check, control or regulate several machines (whether or not of the same type) fall in their own appropriate heading.

(IV) INCOMPLETE MACHINES

(See General Interpretative Rule 2 (a))

Throughout the Section any reference to a machine or apparatus covers not only the complete machine, but also an incomplete machine (i.e., an assembly of parts so far advanced that it already has the main essential features of the complete machine). Thus a machine lacking only a flywheel, a bed plate, calender rolls, tool holders, etc., is classified in the same heading as the machine, and not in any separate heading provided for parts. Similarly a machine or apparatus normally incorporating an electric motor (e.g., electro-mechanical hand tools of heading 84.67) is classified in the same heading as the corresponding complete machine even if presented without that motor.

(V) UNASSEMBLED MACHINES

(See General Interpretative Rule 2 (a))

For convenience of transport many machines and apparatus are transported in an unassembled state. Although in effect the goods are then a collection of parts, they are classified as being the machine in question and not in any separate heading for parts. The same applies to an incomplete machine having the features of the complete machine (see Part (IV) above), presented unassembled (see also in this connection the General Explanatory Notes to Chapters 84 and 85). However, unassembled components in excess of the number required for a complete machine or for an incomplete machine having the characteristics of a complete machine, are classified in their own appropriate heading.

(VI) MULTI-FUNCTION MACHINES AND COMPOSITE MACHINES

(Section Note 3)

In general, multi-function machines are classified according to the principal function of the machine.

Multi-function machines are, for example, machine-tools for working metal using interchangeable tools, which enable them to carry out different machining operations (e.g., milling, boring, lapping).

Where it is not possible to determine the principal function, and where, as provided in Note 3 to the Section, the context does not otherwise require, it is necessary to apply General Interpretative Rule 3 (c); such is the case, for example, in respect of multi-function machines potentially classifiable in several of the headings 84.25 to 84.30, in several of the headings 84.58 to 84.63 or in several of the headings 84.70 to 84.72.

Composite machines consisting of two or more machines or appliances of different kinds, fitted together to form a whole, consecutively or simultaneously performing **separate** functions which are generally complementary and are described in different headings of Section XVI, are also classified according to the principal function of the composite machine.

The following are examples of such composite machines: printing machines with a subsidiary machine for holding the paper (heading 84.43); a cardboard box making machine combined with an auxiliary machine for printing a name or simple design (heading 84.41); industrial furnaces combined with lifting or handling machinery (heading 84.17 or 85.14); cigarette making machinery combined with subsidiary packaging machinery (heading 84.78).

For the purposes of the above provisions, machines of different kinds are taken to be **fitted together to form a whole** when incorporated one in the other or mounted one on the other, or mounted on a common base or frame or in a common housing.

Assemblies of machines should not be taken to be fitted together to form a whole unless the machines are designed to be permanently attached either to each other or to a common base, frame, housing, etc. This **excludes** assemblies which are of a temporary nature or are not normally built as a composite machine.

The bases, frames or housings may be provided with wheels so that the composite machine can be moved about as required during use, **provided** it does not thereby acquire the character of an article (e.g., a vehicle) more specifically covered by a particular heading of the Nomenclature.

Floors, concrete bases, walls, partitions, ceilings, etc., even if specially fitted out to accommodate machines or appliances, should not be regarded as a common base joining such machines or appliances to form a whole.

Note 3 to Section XVI **need not be invoked** when the composite machine is covered as such by a particular heading, for example, some types of air conditioning machines (heading 84.15).

It should be noted that multi-purpose machines (e.g., machine-tools capable of working metals and other materials or eyeletting machines used equally well in the paper, textile, leather, plastics, etc., industries) are to be classified according to the provisions of Note 7 to Chapter 84.

(VII) FUNCTIONAL UNITS (Section Note 4)

This Note applies when a machine (including a combination of machines) consists of separate components which are intended to contribute together to a clearly defined function covered by one of the headings in Chapter 84 or, more frequently, Chapter 85. The whole then falls to be classified in the heading appropriate to that function, whether the various components (for convenience or other reasons) remain separate or are interconnected by piping (carrying air, compressed gas, oil, etc.), by devices used to transmit power, by electric cables or by other devices.

For the purposes of this Note, the expression "intended to contribute together to a clearly defined function" covers only machines and combinations of machines essential to the performance of the function specific to the functional unit as a whole, and thus excludes machines or appliances fulfilling auxiliary functions and which do not contribute to the function of the whole.

The following are examples of functional units of this type within the meaning of Note 4 to this Section :

- (1) Hydraulic systems consisting of a hydraulic power unit (comprising essentially a hydraulic pump, an electric motor, control valves and an oil tank), hydraulic cylinders and the pipes or hoses needed to connect the cylinders to the hydraulic power unit (heading 84.12).
- (2) Refrigerating equipment consisting of components which are not fitted together to form a whole and are interconnected by means of piping through which the coolant circulates (heading 84.18).
- (3) Irrigation systems consisting of a control station comprising filters, injectors, metering valves, etc., underground distribution and branchlines, and a surface network (heading 84.24).
- (4) Milking machines with separate component parts (vacuum pump, pulsator, teat-cups and pails) interconnected by hoses or piping (heading 84.34).
- (5) Brewhouse machinery comprising, inter alia, sprouting or germination machines, malt crushing machines, mashing vats, straining vats (heading 84.38). Auxiliary appliances (e.g., bottling machines, label-printing machines), are however not included and should be classified in their own appropriate heading.
- (6) Letter sorting systems consisting essentially of coding desks, pre-sorting channel systems, intermediate sorters and final sorters, the whole being controlled by an automatic data processing machine (heading 84.72).

- (7) Asphalt plant consisting of separate components, such as feed hoppers, conveyors, dryers, vibrating screens, mixers, storage bins and control units, placed side by side (heading 84.74).
- (8) Machinery for assembling electric filament lamps, of which the component parts are interconnected by conveyors, and which include equipment for the heat-treatment of glass, pumps and lamp-testing units (heading 84.75).
- (9) Welding equipment consisting of the welding head or tongs, with a transformer, generator or rectifier to supply the current (heading 85.15).
- (10) Portable radiotelephone transmitters and their associated hand microphone (heading 85.17).
- (11) Radar apparatus with the associated power packs, amplifiers, etc. (heading 85.26).
- (12) Satellite television reception systems consisting of a receiver, a parabolic aerial reflector dish, a control rotator for the reflector dish, a feed horn (wave guide), a polarizer, a low-noise-block (LNB) down converter and an infra-red remote control (heading 85.28).
- (13) Burglar alarms, comprising, e.g., an infra-red lamp, a photoelectric cell and a bell (heading 85.31).

It should be noted that component parts not complying with the terms of Note 4 to Section XVI fall in their own appropriate headings. This applies, for example, to closed circuit video-surveillance systems, consisting of a combination of a variable number of television cameras and video monitors connected by coaxial cables to a controller, switchers, audio board/receivers and possibly automatic data processing machines (for saving data) and/or video recorders (for recording pictures).

(VIII) MOBILE MACHINERY

As regards self-propelled or other mobile machines, reference should be made to the Explanatory Notes to the headings for the machines (e.g., lifting and handling machinery, headings 84.25 to 84.28, and excavating machinery, headings 84.29 and 84.30), and to the Explanatory Notes to the Chapters and headings of Section XVII.

(IX) MACHINERY AND APPARATUS FOR USE IN LABORATORIES

Machinery and apparatus of a kind covered by this Section remain classified in the Section even if specialised for use in laboratories or in connection with scientific and measuring instruments, **provided** they do not constitute non-industrial demonstrational apparatus of **heading 90.23** nor measuring, checking, etc., instruments of **Chapter 90**. For example, small furnaces, distillation apparatus, grinders, mixers, electrical transformers and capacitors, for use in laboratories, remain classified in this Section.

Chapter 84

Nuclear reactors, boilers, machinery and mechanical appliances; parts thereof

Notes.

1.- This Chapter does not cover :

- (a) Millstones, grindstones or other articles of Chapter 68;
- (b) Machinery or appliances (for example, pumps) of ceramic material and ceramic parts of machinery or appliances of any material (Chapter 69);
- (c) Laboratory glassware (heading 70.17); machinery, appliances or other articles for technical uses or parts thereof, of glass (heading 70.19 or 70.20);
- (d) Articles of heading 73.21 or 73.22 or similar articles of other base metals (Chapters 74 to 76 or 78 to 81);
- (e) Vacuum cleaners of heading 85.08;
- (f) Electro-mechanical domestic appliances of heading 85.09; digital cameras of heading 85.25;
- (g) Radiators for the articles of Section XVII; or
- (h) Hand-operated mechanical floor sweepers, not motorised (heading 96.03).

2.- Subject to the operation of Note 3 to Section XVI and subject to Note 9 to this Chapter, a machine or appliance which answers to a description in one or more of the headings 84.01 to 84.24, or heading 84.86 and at the same time to a description in one or other of the headings 84.25 to 84.80 is to be classified under the appropriate heading of the former group or under heading 84.86, as the case may be, and not the latter group.

Heading 84.19 does not, however, cover :

- (a) Germination plant, incubators or brooders (heading 84.36);
- (b) Grain dampening machines (heading 84.37);
- (c) Diffusing apparatus for sugar juice extraction (heading 84.38);
- (d) Machinery for the heat-treatment of textile yarns, fabrics or made up textile articles (heading 84.51); or
- (e) Machinery, plant or laboratory equipment, designed for a mechanical operation, in which a change of temperature, even if necessary, is subsidiary.

Heading 84.22 does not cover :

- (a) Sewing machines for closing bags or similar containers (heading 84.52); or
- (b) Office machinery of heading 84.72.

Heading 84.24 does not cover :

- (a) Ink-jet printing machines (heading 84.43); or
- (b) Water-jet cutting machines (heading 84.56).

- 3.- A machine-tool for working any material which answers to a description in heading 84.56 and at the same time to a description in heading 84.57, 84.58, 84.59, 84.60, 84.61, 84.64 or 84.65 is to be classified in heading 84.56.
- 4.- Heading 84.57 applies only to machine-tools for working metal, other than lathes (including turning centres), which can carry out different types of machining operations either :
- by automatic tool change from a magazine or the like in conformity with a machining programme (machining centres),
 - by the automatic use, simultaneously or sequentially, of different unit heads working on a fixed position workpiece (unit construction machines, single station), or
 - by the automatic transfer of the workpiece to different unit heads (multi-station transfer machines).
- 5.- (A) For the purposes of heading 84.71, the expression "automatic data processing machines" means machines capable of :
- Storing the processing program or programs and at least the data immediately necessary for the execution of the program;
 - Being freely programmed in accordance with the requirements of the user;
 - Performing arithmetical computations specified by the user; and
 - Executing, without human intervention, a processing program which requires them to modify their execution, by logical decision during the processing run.
- (B) Automatic data processing machines may be in the form of systems consisting of a variable number of separate units.
- (C) Subject to paragraphs (D) and (E) below, a unit is to be regarded as being part of an automatic data processing system if it meets all of the following conditions :
- It is of a kind solely or principally used in an automatic data processing system;
 - It is connectable to the central processing unit either directly or through one or more other units; and
 - It is able to accept or deliver data in a form (codes or signals) which can be used by the system.
- Separately presented units of an automatic data processing machine are to be classified in heading 84.71.
- However, keyboards, X-Y co-ordinate input devices and disk storage units which satisfy the conditions of paragraphs (C) (ii) and (C) (iii) above, are in all cases to be classified as units of heading 84.71.
- (D) Heading 84.71 does not cover the following when presented separately, even if they meet all of the conditions set forth in Note 5 (C) above :
- Printers, copying machines, facsimile machines, whether or not combined;
 - Apparatus for the transmission or reception of voice, images or other data, including apparatus for communication in a wired or wireless network (such as a local or wide area network);

- (iii) Loudspeakers and microphones;
 - (iv) Television cameras, digital cameras and video camera recorders;
 - (v) Monitors and projectors, not incorporating television reception apparatus.
- (E) Machines incorporating or working in conjunction with an automatic data processing machine and performing a specific function other than data processing are to be classified in the headings appropriate to their respective functions or, failing that, in residual headings.
- 6.- Heading 84.82 applies, inter alia, to polished steel balls, the maximum and minimum diameters of which do not differ from the nominal diameter by more than 1 % or by more than 0.05 mm, whichever is less.
- Other steel balls are to be classified in heading 73.26.
- 7.- A machine which is used for more than one purpose is, for the purposes of classification, to be treated as if its principal purpose were its sole purpose.
- Subject to Note 2 to this Chapter and Note 3 to Section XVI, a machine the principal purpose of which is not described in any heading or for which no one purpose is the principal purpose is, unless the context otherwise requires, to be classified in heading 84.79. Heading 84.79 also covers machines for making rope or cable (for example, stranding, twisting or cabling machines) from metal wire, textile yarn or any other material or from a combination of such materials.
- 8.- For the purposes of heading 84.70, the term "pocket-size" applies only to machines the dimensions of which do not exceed 170 mm x 100 mm x 45 mm.
- 9.- (A) Notes 9 (a) and 9 (b) to Chapter 85 also apply with respect to the expressions "semiconductor devices" and "electronic integrated circuits", respectively, as used in this Note and in heading 84.86. However, for the purposes of this Note and of heading 84.86, the expression "semiconductor devices" also covers photosensitive semiconductor devices and light-emitting diodes (LED).
- (B) For the purposes of this Note and of heading 84.86, the expression "manufacture of flat panel displays" covers the fabrication of substrates into a flat panel. It does not cover the manufacture of glass or the assembly of printed circuit boards or other electronic components onto the flat panel. The expression "flat panel display" does not cover cathode-ray tube technology.
- (C) Heading 84.86 also includes machines and apparatus solely or principally of a kind used for :
- (i) the manufacture or repair of masks and reticles;
 - (ii) assembling semiconductor devices or electronic integrated circuits;
 - (iii) lifting, handling, loading or unloading of boules, wafers, semiconductor devices, electronic integrated circuits and flat panel displays.
- (D) Subject to Note 1 to Section XVI and Note 1 to Chapter 84, machines and apparatus answering to the description in heading 84.86 are to be classified in that heading and in no other heading of the Nomenclature.

◦
◦ ◦

Subheading Notes.

- 1.- For the purposes of subheading 8465.20, the term “machining centres” applies only to machine-tools for working wood, cork, bone, hard rubber, hard plastics or similar hard materials, which can carry out different types of machining operations by automatic tool change from a magazine or the like in conformity with a machining programme.
- 2.- For the purposes of subheading 8471.49, the term “systems” means automatic data processing machines whose units satisfy the conditions laid down in Note 5 (C) to Chapter 84 and which comprise at least a central processing unit, one input unit (for example, a keyboard or a scanner), and one output unit (for example, a visual display unit or a printer).
- 3.- For the purposes of subheading 8481.20, the expression “valves for oleohydraulic or pneumatic transmissions” means valves which are used specifically in the transmission of “fluid power” in a hydraulic or pneumatic system, where the energy source is supplied in the form of pressurised fluids (liquid or gas). These valves may be of any type (for example, pressure-reducing type, check type). Subheading 8481.20 takes precedence over all other subheadings of heading 84.81.
- 4.- Subheading 8482.40 applies only to bearings with cylindrical rollers of a uniform diameter not exceeding 5 mm and having a length which is at least three times the diameter. The ends of the rollers may be rounded.

GENERAL

(A) GENERAL CONTENT OF THE CHAPTER

Subject to the provisions of the General Explanatory Note to Section XVI, this Chapter covers all machinery and mechanical appliances, and parts thereof, not more specifically covered by **Chapter 85**, and not being :

- (a) Articles of textile material, for technical uses (**heading 59.11**).
- (b) Articles of stone, etc., of **Chapter 68**.
- (c) Ceramic articles of **Chapter 69**.
- (d) Laboratory glassware of **heading 70.17**; machinery and appliances and parts thereof, of glass (**heading 70.19** or **70.20**).
- (e) Stoves, central heating radiators and other goods of **heading 73.21** or **73.22**, and similar articles of other base metals.
- (f) Electro-mechanical domestic appliances of **heading 85.09**; digital cameras of **heading 85.25**.
- (g) Radiators for the articles of Section XVII (**Section XVII**).
- (h) Hand-operated mechanical floor sweepers, not motorised (**heading 96.03**).

In general, Chapter 84 covers machinery and mechanical apparatus and Chapter 85 electrical goods. However, certain machines are specified in headings of Chapter 85 (e.g., electro-mechanical domestic appliances) while Chapter 84 on the other hand covers certain non-mechanical apparatus (e.g., steam generating boilers and their auxiliary apparatus, and filtering apparatus).

It should also be noted that machinery and apparatus of a kind covered by Chapter 84 remain in this Chapter even if electric, for example :

- (1) Machinery powered by electric motor.

- (2) Electrically heated machinery, for example, electric central heating boilers of heading 84.03, machinery of heading 84.19 and other machinery (e.g., calenders, textile washing or bleaching machines or presses) incorporating electrical heating elements.
- (3) Machines operated electro-magnetically (e.g., electro-magnetic valves) or incorporating electro-magnetic devices (e.g., textile looms with electrical automatic stop motions, cranes with electro-magnetic lifting heads and lathes with electro-magnetic chucks).
- (4) Machines operated electronically (e.g., electronic calculating or automatic data processing machines) or incorporating photoelectric or electronic devices (e.g., rolling mills with photo-electric apparatus and machine-tools incorporating a variety of electronic control devices).

Since machinery or appliances (for example, pumps) of ceramic material and ceramic parts of machinery or appliances of any material (**Chapter 69**), laboratory glassware (**heading 70.17**) and machinery and appliances and parts thereof, of glass (**heading 70.19** or **70.20**) are **excluded** from this Chapter, it follows that even if a machine or mechanical appliance is covered, because of its description or nature, by a heading of this Chapter it is not to be classified therein if it has the character of an article of ceramic materials or of glass.

This applies, for example, to articles of ceramic material or of glass, incorporating components of minor importance of other materials, such as stoppers, joints, taps, etc., clamping or tightening bands or collars or other fixing or supporting devices (stands, tripods, etc.).

On the other hand, the following are, as a rule, to be taken to have lost the character of ceramic articles, laboratory glassware, or machinery or appliances and parts thereof, of ceramic material or of glass :

- (i) Combinations of ceramic or glass components with a high proportion of components of other materials (e.g., of metal); also articles consisting of a high proportion of ceramic or glass components incorporated or permanently mounted in frames, cases or the like, of other materials.
- (ii) Combinations of static components of ceramic material or glass with mechanical components such as motors, pumps, etc., of other materials (e.g., of metal).

(B) GENERAL ARRANGEMENT OF THE CHAPTER

- (1) Heading 84.01 covers nuclear reactors, fuel elements (cartridges), non-irradiated, for nuclear reactors and machinery and apparatus for isotopic separation.
- (2) Headings 84.02 to 84.24 cover the other machines and apparatus which are classified mainly by reference to their function, and regardless of the field of industry in which they are used.
- (3) Headings 84.25 to 84.78 cover machines and apparatus which, with certain exceptions, are classified there by reference to the field of industry in which they are used, regardless of their particular function in that field.
- (4) Heading 84.79 covers machines and mechanical appliances not covered by any preceding heading of the Chapter.
- (5) Heading 84.80 covers, in addition to moulding boxes for metal foundry and moulding patterns, moulds (**other than** ingot moulds) used, by hand or in machines, for moulding certain materials.
- (6) Headings 84.81 to 84.84 cover certain general-purpose goods suitable for use as machinery parts or as parts of goods of other Chapters.

- (7) Heading 84.86 covers machines and apparatus of a kind used solely or principally for the manufacture of semiconductor boules or wafers, semiconductor devices, electronic integrated circuits or flat panel displays, and machines and apparatus specified in Note 9 (C) to this Chapter.
- (8) Heading 84.87 covers non-electrical parts not classified elsewhere.

(C) PARTS

As regards parts in general, see the General Explanatory Note to Section XVI.

Separately presented electrical parts generally fall in one or other of the headings of **Chapter 85**, for example : electric motors (**heading 85.01**); electrical transformers (**heading 85.04**); electro-magnets, permanent magnets, electro-magnetic lifting heads for cranes and electro-magnetic chucks (**heading 85.05**); electrical starting equipment for internal combustion piston engines (**heading 85.11**); electrical switches, control panels, plugs, junction boxes, etc. (**headings 85.35 to 85.37**); electronic valves (**heading 85.40**); diodes, transistors and similar semiconductor devices (**heading 85.41**); electronic integrated circuits (**heading 85.42**); electrical carbons (**heading 85.45**); insulators (**heading 85.46**); and certain fittings of insulating material (**heading 85.47**). Unless incorporated with other parts of the machine, such goods are classified in those headings, even if designed for use solely or principally with a particular machine of this Chapter.

Other electrical parts are classified :

- (1) In heading 84.09, 84.31, 84.48, 84.66 or 84.73, if they comply with the description in those headings.
- (2) If not, in this Chapter in the same heading as the machine for which they are intended, **provided** they are designed for use solely or principally with that machine; when not so designed, they fall in **heading 85.48**.

(D) GOODS COVERED BY TWO OR MORE HEADINGS OF THE CHAPTER

(Chapter Notes 2, 7 and 9 (D))

Subject to Note 1 to Section XVI and Note 1 to Chapter 84, machines and apparatus answering to the description in heading 84.86 are to be classified in that heading and in no other heading of the Nomenclature.

Headings 84.01 to 84.24 cover machinery and apparatus (described generally by reference to their function), which can be used in various branches of industry. In the other headings the machinery or apparatus is described, in most cases, by reference to the industry or other field of activity in which they are used. Under Chapter Note 2, machinery or apparatus falling in two or more headings one of which is within the first group (i.e., headings 84.01 to 84.24) is classified in that heading of the first group. Thus motors are always classified in headings 84.06 to 84.08 and 84.10 to 84.12 without regard to their use. The same principle of classification applies for pumps, even if specialised for a particular purpose (e.g., textile spinning pumps or agricultural pumps), centrifuges, calenders, filter presses, furnaces, steam generators, etc.

Certain exceptions (specified in Chapter Note 2) have been made to this general principle as regards headings 84.19, 84.22 and 84.24. Thus the following, although potentially covered by heading 84.19, are in fact classified in later headings of the Chapter :

- (1) Agricultural germination plant, and poultry incubators and brooders (heading 84.36).
- (2) Grain dampening machines (heading 84.37).

- (3) Diffusing apparatus for sugar juice extraction (heading 84.38).
- (4) Machinery for the heat-treatment of textile yarns, fabrics or made up textile articles (heading 84.51).
- (5) Machinery, plant or laboratory equipment, in which the change of temperature, although necessary, is subsidiary to the main mechanical function.

Similarly the following, although potentially covered by heading 84.22, are in fact classified in later headings of the Chapter :

- (1) Sewing machines (e.g., for the closing of sacks) (heading 84.52).
- (2) Machines designed to insert documents or correspondence in wrappers or in envelopes and to seal them, and coin-counting or wrapping machines (heading 84.72).

Also the following, although potentially covered by heading 84.24, are in fact classified in later headings of the Chapter :

- (1) Ink-jet printing machines (heading 84.43).
- (2) Water-jet cutting machines (heading 84.56).

The rule of precedence for headings 84.01 to 84.24 applies **only** to machines considered as a whole. Composite machines or multi-function machines are classified in accordance with Note 3 to Section XVI and functional units in accordance with Note 4 to that Section (see Parts (VI) and (VII) of the General Explanatory Note to Section XVI).

Machines which fall in two or more headings, none of which is within headings 84.01 to 84.24, are classified in that heading which provides the most specific description of the goods, or according to the principal use of the machine. Multi-purpose machines which are used **equally** for a number of different purposes or industries (e.g., eyeletting machines used equally well in the paper, textile, leather, plastics, etc., industries) are classified in heading 84.79.

(E) MACHINES INCORPORATING OR WORKING IN CONJUNCTION WITH AN AUTOMATIC DATA PROCESSING MACHINE AND PERFORMING A SPECIFIC FUNCTION

(Chapter Note 5 (E))

In accordance with the provisions of Note 5 (E) to Chapter 84, the following classification principles should be applied in the case of a machine incorporating or working in conjunction with an automatic data processing machine, and performing a specific function :

- (1) A machine incorporating an automatic data processing machine and performing a specific function other than data processing is classifiable in the heading corresponding to the function of that machine or, in the absence of a specific heading, in a residual heading, and not in heading 84.71.
- (2) Machines presented with an automatic data processing machine and intended to work in conjunction therewith to perform a specific function other than data processing, are to be classified as follows :

the automatic data processing machine must be classified separately in heading 84.71 and the other machines in the heading corresponding to the function which they perform unless, by application of Note 4 to Section XVI or Note 3 to Chapter 90, the whole is classified in another heading of Chapter 84, Chapter 85 or of Chapter 90.

84.01 - Nuclear reactors; fuel elements (cartridges), non-irradiated, for nuclear reactors; machinery and apparatus for isotopic separation.

8401.10 - Nuclear reactors

8401.20 - Machinery and apparatus for isotopic separation, and parts thereof

8401.30 - Fuel elements (cartridges), non-irradiated

8401.40 - Parts of nuclear reactors

(I) NUCLEAR REACTORS

The term nuclear reactor covers, in general, all the apparatus and appliances inside the area screened off by the biological shield including, where appropriate, the shield itself. It also includes any other apparatus and appliances **outside** that area, **provided** they form an **integral** part of those contained **inside** the screen.

A nuclear reactor generally comprises :

(A) **The core**, consisting of :

- (1) **The fuel (fissile or fertile)**. This may be dissolved or dispersed in the moderator (homogeneous reactor) or concentrated in fuel elements (cartridges) (heterogeneous reactors).
- (2) **The moderator** and, where appropriate, the neutron reflector (e.g., beryllium, graphite, water, heavy water, certain hydrocarbons such as diphenyl or terphenyls).
- (3) **The coolant**. This serves to remove the heat generated by the reactor (carbon dioxide, helium, water, heavy water, molten sodium or bismuth, a molten sodium-potassium mixture, molten salts, certain hydrocarbons, etc., are frequently used for this purpose). The moderator, however, also often acts as a coolant.
- (4) **The control rods**, of materials with a high neutron absorption capacity (e.g., boron, cadmium, hafnium) or of alloys or compounds of such materials.

(B) **The mechanical structure** (for example, the reactor vessel; the fuel element (cartridges) loading grid; the piping and tubing for the conveyance of the coolant; the valves; the control rod operating mechanism, etc.).

(C) **The measuring, checking and automatic-control instruments** (e.g., neutron sources, ionisation chambers, thermocouples, telecameras, pressure or flow meters).

(D) **The thermal and biological shields** (of steel, concrete, lead, etc.).

Certain other machinery, apparatus and appliances may also be used in nuclear plant and may even be located inside the area screened off by the biological shield. These are **not** regarded as having thereby acquired the essential character of parts of a nuclear reactor and must therefore be classified in their own appropriate headings (see **exclusions (c) to (ij)** below).

The nature, characteristic features and manner of assembly of the component parts of nuclear reactors may, however, differ considerably. The various types of reactors are generally distinguished by reference to :

- (1) The energy of the neutrons propagating the chain reaction (e.g., thermal (or slow), intermediate or fast reactors).
- (2) The distribution of the fissile material in the core of the reactor (e.g., homogeneous reactors or heterogeneous reactors).
- (3) The intended use (e.g., research reactors, isotope producing reactors, material testing reactors, reactors for the conversion of fertile materials into fissile material (converters or breeders), propulsion reactors, thermal or electrical energy producing reactors).
- (4) The nature of the materials used or the principle of operation (e.g., natural uranium, enriched uranium, uranium-thorium, sodium-graphite, gaseous-graphite, pressurised water, pressurised heavy water, boiling water, swimming pool, organic moderator type reactors).

In general, the size of a reactor is so calculated as to be at least “ **critical** ”, so that any outward loss of neutrons shall never be sufficient to interrupt the chain reaction. However, for research purposes, “ **subcritical** ” reactors, which require additional sources of neutrons, may sometimes be used. These reactors are also included in this heading.

Separately presented **parts** of nuclear reactors are, in general, classified in accordance with the provisions of Note 2 to Section XVI.

Control rods and the corresponding mechanisms, the neutron sources fitted to initiate the fission reaction of the reactor, the vessel, the grid for insertion of the fuel elements (cartridges) and the pressurisers for pressurised water reactors are, therefore, classified in this heading as parts of nuclear reactors.

The following goods are, however, **not** regarded as parts of nuclear reactors :

- (a) Blocks of graphite (**heading 38.01 or 68.15**), beryllium (**heading 81.12**), or beryllium oxide (**heading 69.14**).
- (b) Metal tubes and pipes, in special forms, or merely shaped but not otherwise worked, presented unassembled, whether or not identifiable as for the construction of nuclear reactors (**Section XV**).
- (c) Steam and other vapour generating boilers (**heading 84.02**).
- (d) Heat exchangers (**heading 84.04 or 84.19**).
- (e) Steam turbines and other vapour turbines (**heading 84.06**).
- (f) Pumps (**heading 84.13 or 84.14**).
- (g) Blowers (**heading 84.14**).
- (h) Apparatus for extracting minerals from water (generally **heading 84.19 or 84.21**).
- (ij) Handling machinery for changing or extracting the fuel elements and travelling cranes (generally **heading 84.26**).
- (k) Mechanical remote control manipulators for radioactive products (**heading 84.28**).

(II) MACHINERY AND APPARATUS FOR ISOTOPIC SEPARATION

This group covers all mechanical, thermal or electrical apparatus and devices specially designed for the enrichment of a chemical element or of a compound of that element in one of its isotopes, or for the complete separation of the constituent isotopes.

The most important are those used for the production of heavy water (deuterium oxide) or for the enrichment of uranium in U 235.

The apparatus and devices used for the production of heavy water by enrichment of natural water include :

- (1) Special fractional distillation and rectification apparatus comprising a very large number of plates arranged in clusters and in cascade and utilising the slight difference in boiling point between heavy water and normal water to obtain head fractions which are continually more depleted in heavy water and tail fractions which are continually more enriched.
- (2) Apparatus which, by low-temperature fractional distillation of liquid hydrogen, separates the deuterium, which can then be combusted to obtain heavy water.
- (3) Apparatus for the production of heavy water or deuterium compounds, based on isotopic exchange, sometimes in the presence of catalytic agents, for example by the "dual-temperature" method or by contact of different liquid or gaseous hydrogenous phases.
- (4) Electrolytic cells intended for the production of heavy water by water electrolysis, and apparatus combining electrolysis with isotopic exchange between the hydrogen produced and the originating water itself.

For the enrichment of uranium in U 235, the following apparatus is most often used :

- (1) Special centrifuges called "gas" (uranium hexafluoride) centrifuges, whose cylindrical rotor ("bowl"), of plastic material or steel, rotates at very high speeds.

These centrifuges are treated internally against the corrosive effects of uranium hexafluoride. In practice, a very large number of units is used, arranged in cascade and operating down-current or counter-current.

- (2) Uranium isotope separators (gaseous diffusion type). In this equipment, gaseous uranium hexafluoride is separated into two fractions, with slightly different contents of uranium 235 compared to the starting gas, by diffusion through a porous membrane ("barrier") inside a diffusion chamber (which may be tubular). By repeating the operation many times pure uranium 235 hexafluoride can be obtained.
- (3) "Nozzle" apparatus (Becker process), in which a stream of gas (uranium hexafluoride and helium or hydrogen) is injected at high speed into a highly incurved nozzle. A "paring tube" at the outlet separates the enriched fraction of uranium hexafluoride.

Calutrons for electro-magnetic separation are also classified in this heading.

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines and apparatus of this group are also covered.

(III) FUEL ELEMENTS (CARTRIDGES) NON-IRRADIATED, FOR NUCLEAR REACTORS

Fuel elements (cartridges), non-irradiated, for nuclear reactors consist of fissile or fertile material contained in a sheath, generally of base metal (e.g., of zirconium, aluminium, magnesium, stainless steel), fitted with special attachments for handling.

Fissile fuel elements may contain natural uranium, either in the metallic state or as compounds (oxides, carbides, nitrides, etc.), uranium enriched in uranium 235 or 233 or in plutonium, either in the metallic state or as compounds, or thorium enriched in plutonium. Fertile fuel elements (for example, with thorium or depleted uranium), when placed at the periphery of the reactor to reflect neutrons, become fissile after absorbing some of the neutrons.

Fuel elements are of different types, for example :

- (1) Combustible metals or alloys thereof in the form of bars or tubes sheathed in base metal. This metallic sheath may be flanged to facilitate heat exchange, and the element may be fitted with a support and a head for convenience of insertion into and extraction from the reactor.
- (2) Dispersions of the fissile fuel in graphite in the form of bars, plates or spheres encased in graphite or consisting of other types of dispersions and cermets. These are flanged or fitted in the same way as the fuel elements (cartridges) described in (1) above.
- (3) An assembly :
 - (i) A series of sandwiched plates consisting of the fissile or fertile fuel (metal or ceramic compound) coated on the outside with inert metal.
 - (ii) Inert metal tubes filled with pellets of uranium dioxide or carbide.
or
 - (iii) Concentric fissile metal tubes sheathed with inert metal.

All these types of fuel elements (cartridges) are fitted with supports which also serve to keep them spaced apart and fixed in place; they often have an outer casing. All the sub-elements constituting these fuel elements (cartridges) are mounted on a common base and attached to a common head.

Presented separately, these sub-elements (e.g., stainless steel sheaths filled with nuclear fuel and sealed) are classified as **parts** of fuel elements (cartridges).

Microspheres of nuclear fuel coated with layers of carbon or silicon carbide, intended for introduction into spherical or prismatic fuel elements, and spent (irradiated) fuel elements (cartridges), fall in **heading 28.44**.

*
* *

The heading also **excludes** :

- (a) Furnaces for the separation of irradiated nuclear fuel by pyrometallurgical processes (**heading 84.17** or **85.14**, as the case may be).
- (b) Separators for irradiated fuels or for processing effluents, operating by fractional distillation (**other than** those for the production of heavy water) (**heading 84.19**).
- (c) Air filters specially designed to eliminate radioactive dust (physical or electrostatic types); active-charcoal purifiers for retaining radioactive iodine; ion-exchange apparatus for the separation of radioactive elements, including such apparatus operating by electrodialysis; separators for irradiated fuels or for processing effluents, whether operating by ion-exchange or operating chemically (**heading 84.21**).

84.02 - Steam or other vapour generating boilers (other than central heating hot water boilers capable also of producing low pressure steam); super-heated water boilers.

- Steam or other vapour generating boilers :

8402.11 -- Watertube boilers with a steam production exceeding 45 t per hour

8402.12 -- Watertube boilers with a steam production not exceeding 45 t per hour

8402.19 -- Other vapour generating boilers, including hybrid boilers

8402.20 - Super-heated water boilers

8402.90 - Parts

(A) STEAM OR OTHER VAPOUR GENERATING BOILERS

This group includes apparatus for generating steam or other vapour (e.g., mercury vapour) to operate prime movers (e.g., steam turbines) or other machines using steam power (e.g., steam hammers and pumps) or to supply steam to apparatus for heating, cooking, sterilising, etc., including steam generating boilers for central heating.

It includes separately presented boilers (e.g., locomotive boilers) even though they may clearly be specially constructed to form an integral part of a particular machine, apparatus or vehicle.

Steam boilers may be heated by means of a solid, liquid or gaseous fuel, or by electricity.

The desire to obtain a more efficient heating effect, or quicker vaporisation from fuel-burning boilers has led to the production of boilers differing in structure. The main types are :

- (1) **Firetube boilers** (e.g., locomotive boilers), in which the body of the boiler is traversed by tubes through which the flue gases are conducted.
- (2) **Watertube boilers**, in which a system of watertubes is surrounded by the flue gases; the internal walls of some boilers are also formed of watertubes.
- (3) **Hybrid boilers**, which are generally a combination of types (1) and (2) above.

In some boilers, the systems of tubes are connected by a collector to one or more generally cylindrical bodies which serve to store the water or separate the water from the vapour. In others, known as **forced circulation boilers**, there is sometimes no evaporation drum and the circulation of the water is accelerated by a pump.

Boilers vary considerably in size. Small boilers are usually presented assembled, the various components being enclosed in a shell or mounted on a common base. The larger boilers comprise as a rule a number of separate elements for assembly on site, either within a shell or within a structure of brickwork.

(B) SUPER-HEATED WATER BOILERS

These are boilers in which the water is submitted to fairly high pressure so that it can be heated to a temperature far in excess of the normal vaporisation point (generally of the order of 180 °C or more).

These boilers are structurally very similar to the boilers described in Part (A) above. The pressure required for their operation is obtained either by accumulating steam in, for example, an evaporator drum, or in some cases, by means of an inert gas (generally nitrogen). The super-heated water produced in the boiler must be kept constantly under pressure. It therefore circulates in closed circuit, starting from and returning to the boiler.

Super-heated water boilers are used to provide heat, generally at a distance, to industrial plant (motor vehicle body paint drying tunnels, for instance), or to large groups of buildings or district heating schemes. In the latter case, heat is provided through heat exchangers in which the super-heated water (primary fluid) transfers calories to a secondary fluid that heats the premises.

*
* * *

In order to increase or regulate their output or efficiency, the boilers of this heading are often equipped with a wide range of auxiliary apparatus. Such auxiliary apparatus includes economisers, air pre-heaters, super-heaters, de-super-heaters, steam receivers, steam accumulators, soot removers, gas recoverers, watertube fire-box walls and other apparatus of heading 84.04, and feed water purifiers, de-aerators, de-gasifiers and softeners of heading 84.21.

Such auxiliaries are classified with the boilers in this heading when they are presented together therewith, whether they already form, or are designed to form subsequently, a whole with those boilers; if presented separately they are to be classified in their own appropriate headings.

Similarly, and **provided** they are designed to form a whole therewith, grates presented with boilers are classified in this heading together with the boiler. In this respect, no distinction is made between grates already incorporated in boilers and those designed to be combined with boilers by means of a brickwork structure.

The heading **excludes** the types of boilers designed only for heating water to a temperature below its normal vaporisation point, and central heating hot water boilers of **heading 84.03** (even if capable also of producing low pressure steam).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the boilers of this heading are also covered, e.g., boiler bodies and bases, internal assemblies for boilers consisting of tubes, watertube caps, headers, boiler drums, steam domes, non-mechanical fire-boxes, inspection covers and fusible plugs.

Metal tubes or pipes which have been bent or curved but not otherwise worked, presented unassembled, are **not** identifiable as parts of boilers and are therefore to be classified in **Section XV**.

84.03 - Central heating boilers other than those of heading 84.02.

8403.10 - Boilers

8403.90 - Parts

This heading includes **central heating boilers** of any size (**other than** stoves with subsidiary boilers, of **heading 73.21**), using any type of fuel (e.g., wood, coal, coke, gas, fuel oil), for heating houses, flats, factories, workshops, greenhouses, etc., by circulation of water; it also includes electric central heating boilers.

They may be equipped with pressure regulators and gauges, water levels, taps, cocks, burners and similar parts or accessories.

Hot water boilers, even if also capable of producing low pressure steam, are also classified in this heading.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading also covers identifiable parts of central heating boilers such as boiler casings, walls, doors and manhole or inspection port covers, etc.

The following are **not** regarded as parts :

- (a) Pipes and fittings to connect up central heating boilers and radiators (generally **headings 73.03 to 73.07**).
- (b) Expansion reservoirs or chambers (**heading 73.09, 73.10 or 84.79**).
- (c) Furnace burners (**heading 84.16**).
- (d) Steam or hot water taps, cocks, etc. (**heading 84.81**).

84.04 - Auxiliary plant for use with boilers of heading 84.02 or 84.03 (for example, economisers, super-heaters, soot removers, gas recoverers); condensers for steam or other vapour power units.

8404.10 - Auxiliary plant for use with boilers of heading 84.02 or 84.03

8404.20 - Condensers for steam or other vapour power units

8404.90 - Parts

(A) AUXILIARY PLANT FOR USE WITH BOILERS OF HEADING 84.02 OR 84.03

These include :

- (1) **Economisers** for pre-heating the boiler feed water by utilising the waste heat of the flue gases or, in some types, exhaust steam. They usually consist of headers fitted with a system of cast iron or steel gilled tubing, sometimes contained within a separate chamber of sheet metal into which the flue gases or exhaust steam are discharged. In the mixing type economiser waste steam is passed directly into a chamber containing the feed water.
- (2) **Air pre-heaters**. These also make use of the waste heat. They consist of air chambers with heat-exchange systems of varying types, e.g., tubular types through which the hot flue gases circulate thus heating the air in the chamber; plate-type in which air and smoke gases circulate separately in adjoining narrow compartments. Certain types incorporate rotating baffle plates.
- (3) **Super-heaters**. These consist of headers with a high-pressure steel tube system in which the saturated steam from the boiler is further heated to remove moisture and to produce steam at high temperature. Super-heaters are often part of the main boiler assembly, but in some cases have a separate flue system.
- (4) **De-super-heaters**. These are used to prevent the development of too high a temperature in the super-heaters. Normally they are placed between two sections of the super-heater, and generally consist of a cast iron body into which the steam is passed and cooled by a flow of water.
- (5) **Steam collectors**. Cylindrical bodies for collecting the steam from a group of boilers.
- (6) **Steam accumulators**. Large insulated cylindrical steel high-pressure reservoirs for the storage of a reserve of steam.
- (7) **Thermic or heat accumulators**. These are used to store the surplus heat from steam boilers.
- (8) **Tubular furnace-walls**, i.e., a system of vertical tubing connected to conduits in which the feed water circulates, and designed to be mounted in front of the interior surface of the furnace walls. They serve the double function of preventing the over-heating of the furnace walls and at the same time pre-heating the feed water.

- (9) **Soot removers** (soot blowers), automatic or not. These remove soot and similar deposits from the tubular parts of the steam-generating installation (e.g., super-heaters, watertubes, firetubes and economisers) by the use of jets of steam or compressed air. They consist of a tube (fixed or retractable) with a number of jets controlled by a valve and coupled to the steam or compressed air conduit. In other cases soot removers take the form of retractable jets.
- (10) **Gas recoverers**. These are devices by which the exhaust gases are returned to the furnace for combustion of unburnt particles.
- (11) **Sludge scrapers**.

(B) CONDENSERS FOR STEAM OR OTHER VAPOUR POWER UNITS

These include steam condensers of various kinds, whose function is to reduce the back pressure in steam engines by cooling and condensing the exhaust steam, thus increasing the power of the engine. They include :

- (1) **Surface-condensers**. These consist of a cylindrical shell enclosing a system of tubes. The steam is led into the cylinder, and cold water circulates through the pipes (or occasionally vice versa) thus condensing the steam.
- (2) **Mixing condensers**. In these the steam is mixed directly with water. The heading includes ejector condensers in which a partial vacuum is created in the condenser chamber by a jet of water (acting in the same way as the jet in an ejector pump).
- (3) **Air-cooled condensers**. These consist of gilled steam tubing cooled by a forced current of air.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the above apparatus and appliances.

Metal tubes or pipes which have been bent or curved but not otherwise worked, presented unassembled, are not identifiable as parts of goods of this heading and are therefore to be classified in **Section XV**.

* * *

The heading **excludes** the following, whether or not for use in boiler-houses :

- (a) Pumps (including water-injectors for force-feeding the boiler), blowers, fans and other machinery of **heading 84.13 or 84.14**.
- (b) Furnace burners, mechanical grates, mechanical stokers and the like (**heading 84.16**).
- (c) Distillation and other condensers of **heading 84.19**.
- (d) Filters and purifiers for water, gases, etc. (**heading 84.21**).

84.05 - Producer gas or water gas generators, with or without their purifiers; acetylene gas generators and similar water process gas generators, with or without their purifiers.

8405.10 - Producer gas or water gas generators, with or without their purifiers; acetylene gas generators and similar water process gas generators, with or without their purifiers

8405.90 - Parts

This heading covers self-contained apparatus and plant for generating any kind of gas (e.g., producer gas, water gas and mixtures thereof, or acetylene) whatever the intended use of the gas produced (lighting, industrial heating, feeding gas engines, welding or cutting metals, chemical synthesis, etc.).

The heading also includes producer gas generators specially constructed for use in motor vehicles, but **excludes** acetylene generators which are in fact lamps requiring only the fitting of a burner (**heading 94.05**).

(A) PRODUCER GAS GENERATORS

These usually consist of a closed cylinder, generally fitted with a refractory lining or a water-cooled double wall enclosing a grate (either of fixed, shaking or revolving type), with provision for passing a current of air (or of air and steam) by suction or blowing. A thick bed of fuel is burned on the grate and the flow of air and steam is regulated so that combustion is incomplete. The decomposition of the water and the incomplete combustion of the fuel yield carbon monoxide and hydrogen. The resultant mixture of carbon monoxide, hydrogen and nitrogen (producer gas) is drawn off at the top of the apparatus.

In certain generators of the "reversed combustion" type, the air is blown from the top to the bottom and along the sides of the cylinder and the gas is collected at the bottom of the apparatus, below the grate. This allows for more complete combustion of tars, etc.

(B) WATER GAS GENERATORS

These are of similar construction, but are arranged so that air and a spray of water or steam are blown in alternate phases into the apparatus. The gas resulting from the water phase is a mixture of hydrogen and carbon monoxide (water gas) having a higher heating power than producer gas. It may be collected separately from the producer gas obtained during the air phase or the two gases may be mixed.

*
* *

Both producer gas and water gas generators may be adapted for burning many kinds of solid fuel (e.g., coal, coke, charcoal, wood, vegetable or other waste).

For certain uses, particularly for supplying gas engines, producer or water gases must be cleaned of impurities such as dust, tars, sulphurous compounds, etc., and sometimes reheated or cooled. For this purpose, the generators are often fitted with purifiers (comprising perforated cones, coke beds, scrubbers, etc.), coolers, dryers, reheaters, etc. Such purifiers and other auxiliary apparatus are classified with the generators when presented therewith, **provided** they are clearly suitable for use together. When presented separately they fall in their own respective headings (e.g., purifiers in **heading 84.21**).

(C) ACETYLENE WATER PROCESS GAS GENERATORS

These are generally of simple construction, consisting of a water-sealed gas reservoir, the movement of which, as it is charged and discharged, automatically controls the gas generating device. There are three types of generating devices :

- (1) Producing intermittent immersion of the mass of calcium carbide in the water.
- (2) Providing for the gradual addition of carbide to water.
- (3) Causing water to be dripped on to the carbide.

(D) OTHER WATER PROCESS GAS GENERATORS

These include **oxygen generators** (e.g., those used in submarines) and **ethylene generators** (e.g., those based on the action of water on certain chemicals).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are also classified here (e.g., gas generator bodies, grates, gas collectors and water-carbide mixers).

*
* *

The heading also **excludes** :

- (a) Free-piston generators for gas turbines (**heading 84.14**).
- (b) Coke ovens (e.g., town gas generators) (**heading 84.17**).
- (c) Ozone generating and diffusing apparatus, electric, designed for non-therapeutic purposes (e.g., for industrial uses, for the ozonisation of premises), and electrolytic gas generators for the generation of, e.g., nitrogen dioxide, hydrogen sulphide or prussic acid (**heading 85.43**) and ozonotherapy apparatus (**heading 90.19**).

84.06 - Steam turbines and other vapour turbines.

8406.10 - Turbines for marine propulsion

- Other turbines :

8406.81 -- Of an output exceeding 40 MW

8406.82 -- Of an output not exceeding 40 MW

8406.90 - Parts

This heading covers steam turbines which are driven by the kinetic energy of expanding steam applied to the vanes or blades of a wheel. They consist essentially of :

- (1) A rotor comprising a shaft on which is mounted a wheel (or wheels) the rim of which carries a row of closely-spaced vanes or blades generally of curved cross-section and sometimes referred to as " buckets ".
- (2) A stator consisting of a casing, in which the rotor is supported and revolves, containing a system of stationary blades or nozzles to direct the steam on to the blading of the rotor.

In " impulse " turbines the stator is provided with nozzles in which the steam expands and issues at high velocity tangentially to the bucket blades of the rotor. In a " reaction " turbine the blades on the rotor revolve between similarly shaped stationary blades mounted in the reverse form round the face of the stator, and so arranged that the steam flows axially through the blades of the stator and on to the adjacent blades of the rotor.

For greater efficiency two systems are often combined in " compound turbines ", but more often a series of rotors are mounted on a common shaft (multi-stage turbines) to allow progressive expansion of the steam.

The high rotational speed of turbines makes them particularly suitable for the direct driving of machines such as electric generators (turbo-generators), compressors, ventilators or centrifugal pumps. For some purposes (e.g., steamships and certain locomotives) turbines are fitted with reversing or reduction gear. When presented separately, these reversing or reduction gears are excluded (**heading 84.83**).

This heading also covers **mercury vapour turbines**. These are of a structure and use similar to the steam turbines described above, but use mercury vapour in place of steam.

PARTS

An essential component of a turbine is a governing mechanism so that the supply of steam or other vapour to the turbine can be adjusted to suit the load and to maintain constant speed.

This heading covers such governors and, **subject** to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), other parts of turbines (e.g., rotors and stators and their segments, rotor or stator blades).

84.07 - Spark-ignition reciprocating or rotary internal combustion piston engines (+).

8407.10 - Aircraft engines

- Marine propulsion engines :

8407.21 -- Outboard motors

8407.29 -- Other

- Reciprocating piston engines of a kind used for the propulsion of vehicles of Chapter 87 :

8407.31 -- Of a cylinder capacity not exceeding 50 cc

8407.32 -- Of a cylinder capacity exceeding 50 cc but not exceeding 250 cc

8407.33 -- Of a cylinder capacity exceeding 250 cc but not exceeding 1,000 cc

8407.34 -- Of a cylinder capacity exceeding 1,000 cc

8407.90 - Other engines

This heading covers spark-ignition reciprocating internal combustion piston engines and rotary internal combustion piston engines (Wankel engines having a trilobal disc type "piston"), **other than** those of **Chapter 95**. It includes such engines for motor vehicles.

These engines generally have the following elements : cylinder, piston, connecting-rod, crank shaft, flywheel, inlet and exhaust valves, etc. They make use of the expansion force of a charge of inflammable gas or vapour burned inside a cylinder.

The characteristic feature of these engines is that they are equipped with sparking plugs fitted into the cylinder head and with electrical devices (such as magnetos, coils and contact breakers) synchronised with the motor, for supplying high tension current.

In the more common types the fuel and air are mixed (e.g., in a carburettor) before induction into the cylinder by the suction stroke of the piston, but in some cases (e.g., certain aircraft engines and motor car engines) the fuel is introduced into the cylinder head directly by an injector.

The most usual fuel is petrol, but others include kerosene, alcohol, hydrogen, coal gas, methane, etc.

Gas engines are most frequently fed by producer gas generators which are sometimes integral with the engine, but are more often independent. In the latter case the generators are always classified in **heading 84.05**.

*
* * *

These engines may have one or several cylinders. In the latter case the connecting-rods are coupled to a single crank shaft, and the cylinders, fed separately, may be arranged in various ways, e.g., in a vertical line (upright or inverted), in two symmetrical obliquely opposed rows (V-engines), horizontally opposed on opposite sides on the crank shaft or, for certain aircraft engines, radially. The rotary piston engine (Wankel engine) operates on the same general principle as the conventional piston engines described above. However, instead of a crank shaft turned by an oscillating piston and connecting rod, the rotary piston engine has a trilobal disc ("piston") in a specially shaped housing (epitrochoid), which directly rotates a driving shaft.

The "piston" divides the housing (combustion chamber) into several compartments and each complete rotation corresponds for each lobe to a four-stroke cycle. These engines may have one or more housings with "pistons".

The engines of this heading are suitable for very many uses, e.g., in agricultural machines; for driving electric generators, pumps or compressors; for propelling aircraft, motorcars, motorcycles, autocycles, tractors or boats.

The engines of this heading may be equipped with fuel injection pumps, ignition parts, fuel or oil reservoirs, water radiators, oil coolers, water, oil or fuel pumps, blowers, air or oil filters, clutches or power drives, or starting devices (electric or other). Change speed gears may also be fitted. The engines may also be equipped with a flexible shaft.

The heading includes "outboard motors" for the propulsion of small boats, consisting of a motor of this heading, a propeller and a steering device, the whole constituting a single, indivisible unit. These motors, designed to be attached to the outside of the hull of the boat, are detachable, that is they can be attached and removed easily and are adjustable, the unit turning on the point of attachment. However, motors designed to be fixed to the inside of the hull at the rear of the boat combined with a block holding a steering propeller fixed to the exterior of the boat at the corresponding place are not regarded as outboard motors.

It also covers mobile motors consisting of engines mounted on a wheeled chassis or on runners, including those with driving mechanisms permitting their self-propulsion to a certain extent (but **not** constituting vehicles of **Chapter 87**).

*
* *

The heading **excludes** variable compression motors of the spark-ignition internal combustion piston engine type designed specially for determination of the octane and cetane value of motor fuels (**Chapter 90**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the engines of this heading are classified in **heading 84.09**.

○
○ ○

Subheading Explanatory Notes.

Subheading 8407.10

The expression "aircraft engines" means engines **designed or modified** for fitting with a propeller (airscrew) or rotor.

Subheadings 8407.31, 8407.32, 8407.33 and 8407.34

For engines with cylinders, the cylinder capacity is equal to the volume of that part of a cylinder swept by the piston between bottom dead centre and top dead centre, multiplied by the number of cylinders.

84.08 - Compression-ignition internal combustion piston engines (diesel or semi-diesel engines).

8408.10 - Marine propulsion engines

8408.20 - Engines of a kind used for the propulsion of vehicles of Chapter 87

8408.90 - Other engines

This heading covers compression-ignition internal combustion piston engines (**other than** those of **Chapter 95**), including those for motor vehicles.

These engines are of similar mechanical construction to spark-ignition internal combustion piston engines and have the same essential elements (i.e., cylinder, piston, connecting-rod, crank shaft, flywheel, inlet and exhaust valves, etc.), but differ in that the air (or sometimes air mixed with gas) is first admitted to the cylinder where it is rapidly compressed. Atomised liquid fuel is then injected into the combustion chamber where it is spontaneously ignited by the heat developed, the compression being considerably greater than in the spark-ignition engine.

In addition to diesel engines, there are intermediate compression-ignition semi-diesel engines which operate at lower compression. To start this type, the cylinder-head must be pre-heated by a blow-lamp or a glow plug must be used.

Compression-ignition internal combustion piston engines operate on heavy fluid fuels such as heavy petroleum or coal tar oils, shale oils, vegetable oils (ground-nut, castor, palm, etc.).

*
* * *

The engines of this heading may have one or several cylinders. In the latter case the connecting-rods are coupled to a single crank shaft, and the cylinders, fed separately, may be arranged in various ways, e.g., in a vertical line (upright or inverted), in two symmetrical obliquely opposed rows (V-engines), horizontally opposed on opposite sides on the crank shaft.

The engines of this heading are suitable for very many uses, e.g., in agricultural machines, for propelling motorcars, tractors, locomotives or ships or in electric power stations, etc.

The engines of this heading may be equipped with fuel injection pumps, ignition parts, fuel or oil reservoirs, water radiators, oil coolers, water or oil pumps, blowers, air or oil filters, clutches or power drives, or starting devices (electric or other). Change speed gears may also be fitted. The engines may also be equipped with a flexible shaft.

It also covers mobile motors consisting of engines mounted on a wheeled chassis or on runners, including those with driving mechanisms permitting their self-propulsion to a certain extent (but **not** constituting vehicles of **Chapter 87**).

*
* * *

The heading **excludes** variable compression motors of the compression-ignition internal combustion piston engine type designed specially for determination of the octane and cetane value of motor fuels (**Chapter 90**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the engines of this heading are classified in **heading 84.09**.

84.09 - Parts suitable for use solely or principally with the engines of heading 84.07 or 84.08.

8409.10 - For aircraft engines

- Other :

8409.91 -- Suitable for use solely or principally with spark-ignition internal combustion piston engines

8409.99 -- Other

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts of internal combustion piston engines of heading 84.07 or 84.08 (e.g., pistons, cylinders and cylinder blocks; cylinder heads; cylinder liners; inlet or exhaust valves; inlet or exhaust manifolds; piston rings; connecting-rods; carburettors; fuel nozzles).

However, the heading excludes :

- (a) Injection pumps (**heading 84.13**).
- (b) Engine crank shafts and cam shafts (**heading 84.83**); and gear-boxes (**heading 84.83**).
- (c) Electrical ignition or starting equipment (including sparking plugs and glow plugs) (**heading 85.11**).

84.10 - Hydraulic turbines, water wheels, and regulators therefor.

- Hydraulic turbines and water wheels :

8410.11 -- Of a power not exceeding 1,000 kW

8410.12 -- Of a power exceeding 1,000 kW but not exceeding 10,000 kW

8410.13 -- Of a power exceeding 10,000 kW

8410.90 - Parts, including regulators

This heading covers hydraulic turbines and water wheels which can, by themselves, transform into motive power the energy possessed by moving liquids or liquids under pressure (e.g., the flow or fall of water; pressure of water, oil or special fluids). These engines or motors may thus operate by directing a moving mass of water on to paddles, blades or helicoidal elements fitted to a wheel.

(A) HYDRAULIC TURBINES

Hydraulic turbines consist of a rotor encased in a stator which directs jets of water on to the blades, etc., of the rotor.

Hydraulic turbines are mainly of three types :

- (1) **Pelton type**, for high-pressure water supply of comparatively small volume. The rotor consists of a wheel fitted radially around its periphery with a large number of cups. The stator consists merely of a strong casing with one or more jets directing the water tangentially on to the cups.
- (2) **Francis type**, for medium or low water pressure at large volume. These comprise a one-piece cast steel rotor with large, fixed helicoidal blades, and a stator consisting of conduit tubing, usually spiralled, with large, variable angle guide blades ensuring a radial flow of water around the whole periphery of the rotor, and an axial water-outlet.
- (3) **Kaplan type**, for low pressure supplies. These are turbines, closely resembling those described above, both the stator and rotor having adjustable angle blades.

The main use of hydraulic turbines is in hydro-electric installations.

(B) WATER WHEELS

These very simple engines consist of a large wheel fitted with flat or hollow paddles of wood or metal around its periphery, the axle of the wheel being generally fitted with a step-up gear. The mechanical power produced is generally used directly in small workshops, saw-mills, flour-mills, etc.

Paddle-wheels for boats, although similar in appearance, are **excluded (heading 84.87)**.

Hydrometric paddle-wheels are also **excluded (heading 90.15)**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the hydraulic turbines or water wheels of this heading are also classified here (e.g., rotors, stators, blades and buckets for stators or rotors, casings for spiral conduits, regulators which automatically regulate the flow of water or the angle of the variable pitch rotors or stators, according to type, in order to maintain uniformity of the speed of rotation despite variations in the load, valve needles for regulators).

84.11 - Turbo-jets, turbo-propellers and other gas turbines (+).

- Turbo-jets :

8411.11 -- Of a thrust not exceeding 25 kN

8411.12 -- Of a thrust exceeding 25 kN

- Turbo-propellers :

8411.21 -- Of a power not exceeding 1,100 kW

8411.22 -- Of a power exceeding 1,100 kW

- Other gas turbines :

8411.81 -- Of a power not exceeding 5,000 kW

8411.82 -- Of a power exceeding 5,000 kW

- Parts :

8411.91 -- Of turbo-jets or turbo-propellers

8411.99 -- Other

This heading covers **turbo-jets, turbo-propellers and other gas turbines**.

The turbines of this heading are, in general, internal combustion engines which do not usually require any external source of heat as does, for example, a steam turbine.

(A) TURBO-JETS

A turbo-jet consists of a compressor, a combustion system, a turbine and a nozzle, which is a convergent duct placed in the exhaust pipe. The hot pressurised gas exiting from the turbine is converted to a high velocity gas stream by the nozzle. The reaction of this gas stream acting on the engine provides the motive force which may be used to power aircraft. In its simplest form the compressor and turbine are accommodated on a single shaft. In more complex designs the compressor is made in two parts (a two spool compressor) in which the spool of each part is driven by its own turbine through concentric shafting. Another variation is to add a ducted fan usually at the inlet to the compressor and drive this either by a third turbine or connect it to the first compressor spool. The fan acts in the nature of a ducted propeller, most of its output bypassing the compressor and turbine and joining the exhaust jet to provide extra thrust. This version is sometimes called a " bypass fan jet ".

So-called " after-burning " appliances are auxiliary units for mounting in series with certain turbo-jet engines in order to boost their power output for short periods. These appliances have their own fuel supply and utilise the excess oxygen in the gases issuing from the turbo-jet.

(B) TURBO-PROPELLERS

Such engines are similar to turbo-jets, but have a further turbine downstream of the compressor turbine, which is coupled to a conventional propeller such as is used on piston engined aircraft. This latter turbine is sometimes referred to as a “free turbine”, meaning that it is not mechanically coupled to the compressor and compressor turbine shaft. Thus most of the hot pressurised gas leaving the compressor turbine is converted into shaft power by the free turbine instead of being expanded in a nozzle as is the case in turbo-jets. In some cases, the gases leaving the free turbine may be expanded in a nozzle to provide auxiliary jet power and assist the propeller.

(C) OTHER GAS TURBINES

This group includes industrial gas-turbine units which are either specifically designed for industrial use or adapt turbo-jets or turbo-propeller units for uses other than providing motive power for aircraft.

There are two types of cycles :

- (1) The simple cycle, in which air is ingested and compressed by the compressor, heated in the combustion system and passed through the turbine, finally exhausting to the atmosphere.
- (2) The regenerative cycle, in which air is ingested, compressed and passed through the air pipes of a regenerator. The air is pre-heated by the turbine exhaust and is then passed to the combustion system where it is further heated by the addition of fuel. The air/gas mixture passes through the turbine and is exhausted through the hot gas side of the regenerator and finally to the atmosphere.

There are two types of designs :

- (a) The single-shaft gas turbine unit, in which the compressor and turbine are built on a single shaft, the turbine providing power to rotate the compressor and to drive rotating machinery through a coupling. This type of drive is most effective for constant speed applications such as electrical power generation.
- (b) The two-shaft gas turbine unit, in which the compressor, combustion system and compressor turbine are accommodated in one unit generally called a gas generator, whilst a second turbine on a separate shaft receives the heated and pressurised gas from the exhaust of the gas generator. This second turbine known as the power turbine is coupled to a driven unit, such as a compressor or pump. Two-shaft gas turbines are normally applied where load demand variations require a range of power and rotational speed from the gas turbine.

These gas turbines are used for marine craft and locomotives, for electrical power generation, and for mechanical drives in the oil and gas, pipeline and petrochemical industries.

This group also includes other gas turbines without a combustion chamber, comprising simply a stator and rotor and which use energy from gases provided by other machines or appliances (e.g., gas generators, diesel engines, free-piston generators) and compressed air or other compressed gas turbines.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the engines and motors of this heading are also classified here (e.g., gas turbine rotors, combustion chambers and vents for jet engines, parts of turbo-jet engines (stator rings, with or without blades, rotor discs or wheels, with or without fins, blades and fins), fuel feed regulators, fuel nozzles).

◦◦◦

Subheading Explanatory Note.

Subheadings 8411.11 and 8411.12

Thrust is to be taken to mean the product of the exhaust mass flow per second and the difference between the exhaust velocity and the air inlet velocity.

84.12 - Other engines and motors.

8412.10 - Reaction engines other than turbo-jets

- Hydraulic power engines and motors :

8412.21 -- Linear acting (cylinders)

8412.29 -- Other

- Pneumatic power engines and motors :

8412.31 -- Linear acting (cylinders)

8412.39 -- Other

8412.80 - Other

8412.90 - Parts

This heading covers engines and motors not included in the preceding headings (headings 84.06 to 84.08, 84.10 or 84.11) or in heading 85.01 or 85.02. It therefore covers non-electric engines and motors **other than** steam turbines and other vapour turbines, spark-ignition and compression-ignition internal combustion piston engines, hydraulic turbines, water wheels, turbo-jets, turbo-propellers or other gas turbines.

The heading includes reaction engines (other than turbo-jets), pneumatic power engines and motors, wind engines (windmills), spring-operated or weight-operated motors, etc., certain hydraulic power engines and motors, and certain steam or other vapour power units.

(A) REACTION ENGINES OTHER THAN TURBO-JETS

(1) Ram-jets.

This is a mechanically simple engine, which can function only on rapidly moving machines. It has no turbo-compressor, the feed air being forced in by the speed of motion alone and compressed in the combustion chamber under the effect of a duct. The motive force is provided by the reaction of the exhaust gases expanding through a nozzle.

(2) Pulse-jets.

This engine differs from the ram-jet in that its outlet nozzle emits a pulsating flow of gas instead of a continuous jet, due to the fact that combustion takes place intermittently. Unlike the ram-jet, it can be started from rest, the pulsing action providing for the intake of air.

Pulse-jets are used in aircraft mainly as an auxiliary take-off.

(3) Rocket engines.

These are reaction engines in which combustion is independent of external air supply, the charge comprising both fuel and the combustion agents.

There are two main types :

- (i) Liquid propellant engines. These engines consist of a combustion chamber plus one or more tanks for the storage of propellants, interconnected by a system of tubes and pumps, and a jet-pipe. The pumps are powered by means of a turbine which is fed by a separate gas generator. An important part of this type of rocket engine is formed by the injection-system. The fuels used include ethyl alcohol, hydrazine hydrate, etc., and the combustion agents are hydrogen peroxide, potassium permanganate, liquid oxygen, nitric acid, etc.
- (ii) Solid propellant engines. These engines consist of a cylindrical pressure chamber and a jet-pipe. The combustion chamber and the supply of propellant form a whole. The propellant in this type of engine consists of a combustion agent (usually ammonium perchlorate) and a fuel (usually polyurethanes). Certain types employ solid fuels of the nature of the propellants of Chapter 36.

Rockets are classified in this heading **only** when forming propulsive units proper (e.g., for auxiliary or take-off engines for aircraft, or for fitting to guided missiles or for satellite or spacecraft launch vehicles).

This group **excludes** :

- (a) Anti-hail rockets, life-line rockets and similar rockets of a pyrotechnic type (**heading 36.04**).
- (b) Satellite or spacecraft launch vehicles (**heading 88.02**).
- (c) Guided missiles incorporating power-units (**heading 93.06**).

(B) HYDRAULIC POWER ENGINES AND MOTORS

This group includes :

- (1) **Certain engines, other than** turbines or wheels of **heading 84.10**, producing mechanical power by utilising the energy of the waves or sea swell (Savonius rotor with two semi-cylindrical bladings) or of the tides.
- (2) **Water column machines** operating by the pressure of water on pistons. The water acts on two or more pistons moving inside the cylinders which in turn drive a shaft.
- (3) **Hydraulic cylinders** consisting, for example, of a brass or steel barrel and a piston operated by oil (or other liquid) under pressure applied on one side (single-acting) or on both sides (double-acting) of the piston, the energy of the liquid under pressure being converted into a linear motion. These cylinders are used on machine-tools, construction machinery, steering mechanisms, etc.

- (4) **Hydraulic valve actuators**, presented separately, consisting of a metal casing containing a piston which, by means of a pin perpendicular to the piston rod, converts the linear motion caused by the action of a liquid under pressure into a rotary motion, in order to operate a plug valve or other appliance with a rotating mechanism.
- (5) **Hydraulic servomotors** which perform the role of final or intermediate actuators in feedback control systems or regulating systems. These servomotors are used, e.g., in aircraft.
- (6) **Hydraulic systems** consisting of a hydraulic power unit (comprising essentially a hydraulic pump, an **electric** motor, control valves and an oil tank), hydraulic cylinders and the pipes or hoses needed to connect the cylinders to the hydraulic power unit, the whole forming a functional unit within the meaning of Note 4 to Section XVI (see the General Explanatory Note to that Section). These systems are used, e.g., to operate civil engineering structures.
- (7) “**Hydraulic**” jet engines (“hydrojets”) for motor boats. These consist of a powerful pump taking in the sea or river water and ejecting it as a high speed jet from an adjustable tube (or tubes) under or behind the boat.

(C) PNEUMATIC POWER ENGINES AND MOTORS

These engines use an external source of compressed air (or other gases) and, in principle, resemble a steam piston engine or, in some cases, a steam turbine. In suitable cases they may have burners or other heating devices to increase the air pressure (and hence the expansion energy) and also to prevent the cylinders from frosting due to a rapid drop in temperature.

These engines are mainly used in mines for haulage tractors and winches because of their safety as regards fire-damp explosion. They are also used in certain locomotives, on aircraft, in submarines, etc., as auxiliary starting motors for internal combustion engines, and for propelling torpedoes.

This group also includes :

- (1) Vane motors, gear motors, axial and radial piston motors for pneumatic transmission.
- (2) Pneumatic cylinders consisting, for example, of a brass or steel barrel and a piston operated by compressed air applied on one side (single-acting) or on both sides (double-acting) of the piston, the energy of the gas under pressure being converted into a linear motion. These cylinders are used on machine-tools, construction machinery, steering mechanisms, etc.
- (3) Pneumatic valve actuators, presented separately, consisting of a metal casing containing a piston which, by means of a pin perpendicular to the piston rod, converts the linear motion caused by the action of a compressed gas into a rotary motion, in order to operate a plug valve or other appliance with a rotating mechanism.

(D) WIND ENGINES (WINDMILLS)

This group includes all power units (wind engines or wind turbines), which directly convert into mechanical energy the action of the wind on the blades (often of variable pitch) of a propeller or rotor.

Usually mounted on a fairly tall metal pylon, the propellers or rotors have an arm perpendicular to their plane, forming a vane, or some similar device for orientating the apparatus according to the direction of the wind. The motive force is generally transmitted by reduction gearing through a vertical shaft to the power take-off shaft at ground level. Some wind motors ("depression motors") have hollow blades in which a pressure reduction is developed by rotation, and is transmitted to the ground by airtight conduits to drive a small reaction turbine.

Wind motors are usually of low power, and are mainly used in rural installations for driving irrigation pumps, drainage pumps or small electric generators.

Electric generator units composed of wind motors mounted integrally with an electric generator (including those for operation in aircraft slipstreams) are **excluded (heading 85.02)**.

(E) SPRING-OPERATED OR WEIGHT-OPERATED MOTORS, ETC.

These include mechanisms which, like clockworks, use the energy produced by the release of wound-up springs, or which are operated by gravity (e.g., by a counterweight or any similar device). However, such mechanisms fitted, or adapted for fitting, with escapements are **excluded (heading 91.08 or 91.09)**.

The motors of this group, particularly those of the spring-driven type, are used to operate a large variety of apparatus (e.g., musical boxes, automatic turnspits, revolving window displays, registering apparatus, engraving tools).

(F) PISTON ENGINES NOT INCORPORATING BOILERS

In these types the mechanical energy is produced by displacement of a piston inside a cylinder by the application of the pressure difference between the steam produced by the boiler and the atmospheric pressure (non-condensing engines) or the lower pressure of a condenser (condensing engines). The reciprocating or oscillating action of the piston is converted into rotary motion through a connecting-rod and crank shaft or flywheel.

The simplest types are the single-action engines in which the steam pressure acts on one end of the piston only; in other types (double-acting) the steam acts alternately on each end. In the more powerful engines the steam passes successively into two or more cylinders of increasing diameters, the connecting-rods of the respective pistons being coupled to a single crank shaft (compound, double or triple-expansion engines, etc.). Locomotive engines and ships' engines, for example, belong to this last category.

(G) STEAM OR OTHER VAPOUR POWER UNITS INCORPORATING BOILERS

The engines of this group comprise a boiler (usually of the firetube type) together with a single expansion or compound piston-type steam engine equipped with one or two flywheels which frequently also act as the power take-offs.

Engines of this kind are essentially of low or medium power output designed for more or less permanent installation but capable, because of their compact structure, of easy dismantling and removal.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI) parts of the engines and motors of this heading are also classified here (e.g., combustion chambers and vents for jet engines, fuel feed regulators, fuel nozzles, windmill airwheels, cylinders, pistons, slide-valves, centrifugal ball or flyweight-type governors, connecting-rods).

In general, parts of steam or other vapour power units incorporating boilers fall to be classified as parts of boilers (**heading 84.02**) or as parts of steam power units of this heading.

Transmission shafts and crank shafts are, however, **excluded (heading 84.83)**.

84.13 - Pumps for liquids, whether or not fitted with a measuring device; liquid elevators (+).

- Pumps fitted or designed to be fitted with a measuring device :

8413.11 -- Pumps for dispensing fuel or lubricants, of the type used in filling-stations or in garages

8413.19 -- Other

8413.20 - Hand pumps, other than those of subheading 8413.11 or 8413.19

8413.30 - Fuel, lubricating or cooling medium pumps for internal combustion piston engines

8413.40 - Concrete pumps

8413.50 - Other reciprocating positive displacement pumps

8413.60 - Other rotary positive displacement pumps

8413.70 - Other centrifugal pumps

- Other pumps; liquid elevators :

8413.81 -- Pumps

8413.82 -- Liquid elevators

- Parts :

8413.91 -- Of pumps

8413.92 -- Of liquid elevators

This heading covers most machines and appliances for raising or otherwise continuously displacing volumes of liquids (including molten metal and wet concrete), whether they are operated by hand or by any kind of power unit, integral or otherwise.

The heading also includes delivery pumps equipped with measuring or price-calculating mechanisms such as are used for supplying petrol or oil in garages, and also pumps specially designed for use with other machines, vehicles, etc. (including petrol, oil or water pumps for internal combustion engines, and pumps for man-made textile fibre spinning machines).

The machines of this heading can be subdivided, according to their system of operation, into the following five categories.

(A) RECIPROCATING POSITIVE DISPLACEMENT PUMPS

These use the linear suction or forcing action of a piston or plunger driven within a cylinder, the inlet and outlet being regulated by valves. "Single-acting" pumps utilise the thrust or suction of one end of the piston only; "double-acting" types pump at both ends of the piston thus using both the forward and reverse strokes. In simple "lift" pumps the liquid is merely raised by suction and discharged against atmospheric pressure. In "force" pumps, the compression stroke is used, in addition to the suction stroke, to force the liquid to heights or against pressure. Multi-cylinder pumps are used for increased output. The cylinders may be either in line or in a star shape.

This category includes :

- (1) **Diaphragm pumps.** These incorporate a vibrating membrane of metal, leather, etc. (actuated either directly or through a fluid transmission) by which the liquid is raised.
- (2) **"Oil-cushion" pumps** (for drainage, irrigation, pumping viscous liquids, acids, etc.). In these, a fluid immiscible with the pumped liquid acts as the membrane.
- (3) **Electro-magnetic pumps.** In these, the forward and reverse strokes of the piston are produced by electro-magnetic action (oscillation of a wing placed in a magnetic field).
- (4) **Machines using the suction or forcing action of two pistons,** such as those pumps designed to deliver wet concrete (concrete pumps). However, special purpose vehicles permanently equipped with the concrete pumps of this heading are **excluded (heading 87.05).**

(B) ROTARY POSITIVE DISPLACEMENT PUMPS

In these also, the intake and discharge of the liquid is effected by suction and compression, in this case produced by cams (lobes) or similar devices, rotated continuously on an axis. These devices make contact, at one or more points with the wall of the body of the pump, and form in this way the chambers in which the liquid is displaced.

They may be classified according to the nature of the rotating mechanism, viz. :

- (1) **Gear pumps.** The liquid is displaced by the teeth of specially shaped gears.
- (2) **Vane pumps.** The rotor is in the form of a cylinder revolving eccentrically and having projecting vanes free to move radially. The rotation permits the sliding vanes to maintain contact with the internal walls of the casing thereby displacing the liquid. This category also includes pumps which, in place of vanes, have rollers or a wheel with small flexible vanes or have a radial sliding vane attached to the body of the pump and rubbing on a smooth rotor turning with an eccentric movement.

- (3) **Rotary piston lobe type pumps** with two interacting displacing elements rotating in a casing.
- (4) **Helicoidal pumps** (screw pumps). In these the liquid is displaced longitudinally in the body of the pump under the pressure of several helicoidal threads meshed together and turning (pumps with two or more screws, pumps with helicoidal spindles, endless screw pumps).
- (5) **Peristaltic pumps**. These have a flexible tube containing the liquid running along the length of the body of the housing and a rotor with rollers at each end. The rollers exert pressure on the flexible tube and the liquid is displaced by the rotational movement.

(C) CENTRIFUGAL PUMPS

In these pumps, liquid taken in axially is set in rotation by the revolving blades of a rotor (impeller), the resulting centrifugal action forcing the liquid outwards to the periphery of an annular casing containing an outlet placed tangentially. The casing is sometimes fitted with divergent vanes (diffuser vanes) to transform the kinetic energy of the fluid into high pressure.

For very high pressures, multi-stage centrifugal pumps are used in which the liquid is directed in stages through a number of impellers on a common shaft.

Centrifugal pumps may be driven by an electric or internal combustion motor or by a turbine. Because of their high working speed they are suitable for direct coupling, whereas piston or rotary pumps require to be driven through reduction gears.

This group also covers submersible pumps, central heating circulating pumps, channel impeller pumps, side channel pumps and radial flow impeller pumps.

(D) OTHER PUMPS

The following pumps fall in this group :

- (1) **Electro-magnetic pumps**. These pumps have no moving parts, the liquid being put into circulation by the phenomenon of electrical conduction. These pumps should not be confused with certain reciprocating positive displacement pumps in which the in-and-out movement of a piston is obtained by electro-magnetic effect, nor with those which function by magnetic induction.
- (2) **Ejectors**. In this type of pump, the kinetic energy of a jet of air, steam, water, etc., under pressure ejected from a tube, induces a suction and entrainment effect on the liquid handled. These pumps comprise a complex system of divergent and convergent pipes in a closed chamber from which the system of pipes emerges.

Injectors of the Giffard type for supplying water to boilers, and injection pumps for internal combustion piston engines, working on the same principle, are also classified here.

- (3) **Emulsion pumps (gas lift pumps)**. In these, the liquid is mixed with compressed gas in the outlet pipe, the decrease in density of the emulsified liquid thus providing the lift. When compressed air is used, the pump is referred to as an air lift pump.

- (4) Pumps in which the steam or gas pressure acts directly on the surface of the liquid. Examples are :
- (a) **Gas combustion pumps** employing the explosive force of a suitable fuel or gas to lift liquids.
 - (b) **Steam pulsators (pulsometers)**, in which the delivery of the liquid pumped is achieved by displacement due to the steam entering the chamber of the pulsator; the suction is created by the subsequent pressure drop due to the condensation of the steam in the chamber.
 - (c) **Compressed air chamber elevators (Montejas)** using compressed air.
 - (d) **Hydraulic rams**, in which the increase in the energy of a moving liquid column resulting from the periodic and sudden arrest of the flow of the liquid in the supply line is used to pump a portion of the driving liquid in the discharge pipe of the apparatus.

(E) LIQUID ELEVATORS

These include :

- (1) **Elevating wheels**, with buckets, scoops, etc.
- (2) **Chain or cable elevators** with buckets, scoops, rubber cups, etc.
- (3) **Band elevators**. These consist of endless bands of textile or metal (corrugated, multi-cellular or spiral), in which the water is held by capillarity and ejected centrifugally.
- (4) **Archimedean screw-type elevators**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here, e.g., pump housings or bodies; rods specially designed to connect and drive the piston in pumps placed at some distance from the prime mover (e.g., pumping rods, " sucker rods "); pistons, plungers, vanes; cams (lobes); helicoidal screws, impeller wheels, diffuser vanes; buckets and bucket-fitted chains; bands for band-type liquid elevators; pressure chambers.

*
* *

The heading also **excludes** :

- (a) Pumps (e.g., for corrosive fluids) of ceramic material (**heading 69.09**).
- (b) Hand powered oil cans and grease guns (**heading 82.05**) and compressed air grease guns (**heading 84.67**).
- (c) Bottle-filling machines, etc., of **heading 84.22**.
- (d) Appliances for projecting, dispersing or spraying liquids (**heading 84.24**).
- (e) Motor fire-engines (**heading 87.05**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 8413.11 and 8413.19

These subheadings cover only those pumps, of whatever type, which form, or have been designed to form, a unit with a device permitting the volumetric control of the quantity of liquid discharged, whether or not this device is presented at the same time as the pump.

This control device may be very simple (for example, a calibrated globe or unit) or, on the contrary, consist of more complex mechanisms automatically controlling the stopping of the pump when a given total quantity is discharged (such as, for example, a delivery pump comprising a calibrated cylinder (measuring cylinder) and a device permitting, on the one hand, the determining of a desired quantity and, on the other, stopping the pump motor when the predetermined quantity is obtained) or fulfilling other operations connected with volumetric control proper (for example, pumps for integration of totals, prepayment pumps, price-calculating pumps, sampling pumps, automatic mixture regulating pumps and automatic dosage pumps).

On the other hand, when, for example, the measuring device is designed to be simply mounted on the tube through which the liquid set in motion by the pump flows, each of the two units (pump and measuring device) are to be classified in their own headings, even when presented together.

These subheadings cover, for example, pumps for delivering petrol or other motor fuels and lubricants as well as pumps with a measuring device for use in food shops, laboratories and various industrial activities.

84.14 - Air or vacuum pumps, air or other gas compressors and fans; ventilating or recycling hoods incorporating a fan, whether or not fitted with filters.

8414.10 - Vacuum pumps

8414.20 - Hand- or foot-operated air pumps

8414.30 - Compressors of a kind used in refrigerating equipment

8414.40 - Air compressors mounted on a wheeled chassis for towing

- Fans :

8414.51 -- Table, floor, wall, window, ceiling or roof fans, with a self-contained electric motor of an output not exceeding 125 W

8414.59 -- Other

8414.60 - Hoods having a maximum horizontal side not exceeding 120 cm

8414.80 - Other

8414.90 - Parts

This heading covers machines and appliances, hand-operated or power driven, for the compression of air or other gases, or for creating a vacuum, and also machines for circulating air or other gases.

(A) PUMPS AND COMPRESSORS

In general, air pumps, vacuum pumps and compressors function on the same principles as and are broadly of similar construction to the liquid pumps (piston, rotary, centrifugal or ejector pumps) described under the preceding heading.

In addition, however, there are certain special types, particularly for producing high vacua, such as diffusion pumps (the pump fluid being oil or mercury), molecular pumps and entrapment pumps (getter pumps, cryopumps). Diffusion pumps, however, are sometimes made of glass, in which case they are **excluded (Chapter 70)**.

Air and vacuum pumps serve many purposes : for facilitating boiling, distilling or evaporating at reduced pressure; for evacuating electric lamps or tubes, vacuum flasks, etc. Air pumps serve for pumping air at pressure (e.g., for inflating pneumatic tyres).

Unlike liquid pumps, air or other gas compressors (other than low pressure or intermittent working compressors) are water-cooled or have fins or other means for air cooling (surface cooling) to dissipate the considerable heat of compression which is generated.

There are several types of compressors, for example, reciprocating piston, centrifugal, axial and rotary compressors. A special type of compressor is the exhaust-gas turbocharger used in internal-combustion piston engines to increase power output.

Compressors are widely used : for compressing gases into gas cylinders; in chemical processes; for refrigerators, etc. and for compressing air or other gases in reservoirs to be used to force feed machines or apparatus such as compressed air engines, pneumatic picks, winches, brakes, pneumatic conveyor tubes, submarine ballast tanks, etc.

*
* *

The heading also includes free-piston generators for gas turbines, consisting of two horizontally-opposed driving pistons sliding in a common cylinder which is extended and enlarged at each end to form compression cylinders in which slide two other pistons, connected to the driving pistons, forming a pneumatic recoil. The driving pistons are forced apart by the explosion of an ignited gas, thus displacing the compression pistons. The return stroke of the compression pistons compresses air admitted into the compression cylinders, and forces it through exhaust valves together with the exhaust gases. The high pressure of the hot gases enables them to be applied directly to the rotors of gas turbines, the generator thus replacing the usual combustion chamber and compressor of the gas turbine.

As in the case of the pumps of **heading 84.13**, the air pumps and compressors of this group may be built with integral motors or turbines, the latter being most often employed for high pressure compressors operating on the principle of the multi-stage gas turbine in reverse.

(B) FANS

These machines, which may or may not be fitted with integral motors, are designed either for delivering large volumes of air or other gases at relatively low pressure or merely for creating a movement of the surrounding air.

Those of the first kind may act as air extractors or as blowers (e.g., industrial blowers used in wind tunnels). They consist of a propeller or blade-type impeller revolving in a casing or conduit, and function on the principle of rotary or centrifugal compressors.

The second type are of more simple construction, and consist merely of a driven fan rotating in free air.

Fans are used, *inter alia*, for ventilating mines and premises of all kinds, silos, ships; for extracting by suction dust, steam, smoke, hot gases, etc.; for drying many materials (leather, paper, textiles, paint, etc.); in mechanical draught apparatus for furnaces.

This group also includes **room fans**, whether or not with a tilting or oscillating device. These include ceiling fans, table fans, wall bracket fans, ring mounted fans for building into walls, window panes, etc.

This heading **excludes** fans fitted with elements additional to their motors or housing (such as large dust separating cones, filters, cooling or heating elements and heat exchangers) if such elements give them the characteristics of more complex machines of other headings, e.g., air heaters, not electrically heated (**heading 73.22**), air conditioning machines (**heading 84.15**), dust extractors (**heading 84.21**), air coolers for the industrial treatment of materials (**heading 84.19**) or for premises (**heading 84.79**), electric space heating apparatus with built-in fans (**heading 85.16**).

(C) VENTILATING OR RECYCLING HOODS INCORPORATING A FAN, WHETHER OR NOT FITTED WITH FILTERS

This group includes cooker hoods incorporating a fan, for use in the home or in restaurants, canteens, hospitals, etc., as well as laboratory hoods and industrial hoods incorporating a fan.

*
* * *

Compressors, air pumps, fans, blowers, etc., specially constructed for use with other machines remain classified in this heading and not as parts of such other machines.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here (e.g., pump or compressor bodies, blades, rotors or impellers, vanes and pistons).

*
* * *

This heading also **excludes** :

- (a) Exhaust-gas turbines (**heading 84.11**).
- (b) Emulsion pumps (**heading 84.13**).
- (c) Pneumatic elevators and conveyors (**heading 84.28**).
- (d) Machines for cleaning, sorting or grading seed, grain or dried leguminous vegetables (**heading 84.37**).

84.15 - Air conditioning machines, comprising a motor-driven fan and elements for changing the temperature and humidity, including those machines in which the humidity cannot be separately regulated (+).

8415.10 - Of a kind designed to be fixed to a window, wall, ceiling or floor, self-contained or "split-system"

8415.20 - Of a kind used for persons, in motor vehicles

- Other :

8415.81 -- Incorporating a refrigerating unit and a valve for reversal of the cooling/heat cycle (reversible heat pumps)

8415.82 -- Other, incorporating a refrigerating unit

8415.83 -- Not incorporating a refrigerating unit

8415.90 - Parts

This heading covers certain apparatus for maintaining required conditions of temperature and humidity in closed spaces. The machines may also comprise elements for the purification of air.

They are used for air conditioning offices, homes, public halls, ships, motor vehicles, etc., and also in certain industrial installations requiring special atmospheric conditions (e.g., in the textile, paper, tobacco or food industries).

The heading applies **only** to machines :

- (1) Equipped with a motor-driven fan or blower, **and**
- (2) Designed to change both the temperature (a heating or cooling element or both) and the humidity (a humidifying or drying element or both) of air, **and**
- (3) For which the elements mentioned in (1) and (2) are presented together.

In these machines the elements for humidifying or drying the air may be separate from those for heating or cooling it. However, certain types incorporate only a single unit which changes both the temperature and, by condensation, the humidity of the air. These air conditioning machines cool and dry (by condensation of water vapour on a cold coil) the air of the room in which they are installed or, if they have an outside air intake (damper), a mixture of fresh air and room air. They are generally provided with drip pans to catch the condensate.

The machines may be in the form of single units encompassing all the required elements, such as self-contained window or wall types (referred to as "through-the-wall" units). Alternatively, they may be in the form of "split-systems" which operate when connected together, i.e., a condenser unit for external installation plus an evaporator unit for internal installation. These "split-systems" are ductless and utilize a separate evaporator for each area to be air conditioned (e.g., each room).

From the structural point of view, the air conditioning machines of this heading must therefore incorporate, in addition to the motor-driven fan or blower for circulating the air, **at least** the following elements :

- An air heating device (operated by hot water, steam or hot air tubes or by electric resistances, etc.) **and** an air humidifier (generally consisting of a water spray) or an air de-humidifier;
- or** A cold water coil or a refrigerator unit evaporator (either of which changes both the temperature and, by condensation, the humidity of the air);
 - or** Some other type of cooling element with a separate device for changing the humidity of the air.

In certain cases, the de-humidifier makes use of the hygroscopic properties of absorbent materials.

This heading covers, *inter alia*, reversible heat pumps designed, through a single system fitted with a valve for reversal of the cooling/heat cycle, to perform the dual function of heating and cooling premises. In the cooling cycle, the reversing valve directs the flow of hot, high pressure vapour to the outdoor coil where the heat released during condensation is fanned into the outdoor air and then compressed refrigerant flows into an indoor coil where it vaporizes and absorbs heat and cools the air that is driven around the premises by a fan. In the heating cycle, the shifting of the valve for reversal of the cooling/heat cycle causes the refrigerant flow to reverse so that the heat is released inside the premises.

Air conditioning machines may be supplied with their means of heating or cooling from an external source. They are usually fitted with air cleaners consisting of one or more layers of filtering material, often impregnated with oil (textile material, glass wool, steel or copper wool, expanded metal, etc.) through which the air is passed to remove suspended dust, etc. They may also be provided with devices for adjusting or automatically controlling the temperature and humidity of the air.

This heading also covers apparatus which, although not fitted with a device for separately regulating the humidity of the air, change the humidity by condensation. Examples of such apparatus are the above-mentioned self-contained units and split-systems which utilize a separate evaporator for each area to be air conditioned (e.g., each room), and also apparatus for cold stores consisting of a combined cooling evaporator and motorized blower. Also included are units for heating/cooling a closed chamber (lorry, trailer or container), consisting of a compressor, a condenser and a motor in a housing mounted on the outside of the goods compartment and of a ventilator and an evaporator within the container.

However, the heading **excludes** refrigeration units designed to maintain a fixed temperature well below 0° C in a closed chamber (e.g., lorry, trailer or container), and fitted with a heating system to raise the temperature in the chamber, within certain limits, when the outside temperature is very low. Such equipment is classifiable in **heading 84.18** as refrigerating or freezing equipment, the heating function being subsidiary to the equipment's essential function, which is to keep perishable products cool during transportation.

PARTS

In accordance with the provisions of Note 2 (b) to Section XVI, this heading includes separately presented indoor units and outdoor units for split-system air conditioning machines of this heading.

Other parts for air-conditioning machines, whether or not designed for building into a self-contained unit, are to be classified in accordance with the provisions of Note 2 (a) to Section XVI (**headings 84.14, 84.18, 84.19, 84.21, 84.79, etc.**) or, if Note 2 (a) is not applicable, in accordance with Note 2 (b) or 2 (c) to Section XVI, depending on whether or not they are identifiable as suitable for use solely or principally with the air-conditioning machines of which they are parts.

*
* *

The heading **excludes** :

- (a) Air heaters and hot air distributors of **heading 73.22** which can also distribute fresh or conditioned air.
- (b) Non-reversible heat pumps of **heading 84.18** and chillers for air conditioning machines (**heading 84.18**).
- (c) Apparatus which, although incorporating a motor-driven fan, has the sole function of changing either the temperature or humidity of the air (**headings 84.79, 85.16, etc.**).

◦

Subheading Explanatory Notes.

Subheading 8415.10

This subheading covers air conditioning machines of a kind designed to be fixed to a window, wall, ceiling or floor, self-contained or "split-system".

The self-contained type air conditioners are in the form of single units encompassing all the required elements and being self-contained.

The "split-system" type air conditioners are ductless and utilize a separate evaporator for each area to be air conditioned (e.g., each room). The indoor heat exchanger unit may be mounted in various locations, for example, in a wall or window, or on a ceiling or floor.

However, this subheading **excludes** ducted central air conditioning systems which utilize ducts to carry refrigerated air from an evaporator to several areas to be cooled.

Subheading 8415.20

This subheading covers equipment which is intended mainly for passenger motor vehicles of all kinds, but which may also be fitted in other kinds of motor vehicles, for air conditioning the cabs or compartments in which persons are accommodated.

Subheading 8415.90

This subheading includes both indoor and outdoor units for split-system air conditioning machines of subheading 8415.10 when presented separately. The units are designed to be connected by electrical wiring and copper tubing through which refrigerant passes between the indoor and outdoor units.

84.16 - Furnace burners for liquid fuel, for pulverised solid fuel or for gas; mechanical stokers, including their mechanical grates, mechanical ash dischargers and similar appliances.

8416.10 - Furnace burners for liquid fuel

8416.20 - Other furnace burners, including combination burners

8416.30 - Mechanical stokers, including their mechanical grates, mechanical ash dischargers and similar appliances

8416.90 - Parts

This heading covers a range of apparatus for the mechanical or automatic firing and stoking of furnaces of all kinds, and for evacuating the ash and cinders.

(A) FURNACE BURNERS

These project a flame directly into the furnace, and dispense with the need for a grate and for ash removal. They include the following types :

(1) Heavy oil burners (atomisers).

In these the heavy fuel is atomised in the air stream, in some cases by compressed air and in others by high pressure steam or mechanically (the latter types of apparatus usually incorporate a motor, a pump and an air blower).

(2) Pulverised coal burners.

These are often of large size. A jet of pulverised coal is forced into the furnace by means of an air blast which also provides the primary air supply. The burners may sometimes incorporate a coal conveyor and a grinding mill. In another type, soft coal is pulverised and injected intermittently by the alternate action of high or low pressure steam.

(3) Gas burners.

These include both high pressure types for use with forced draught, and low pressure types for use with atmospheric air. The air and gas is in either case fed through concentric or converging tubes.

(4) Combination burners.

These provide for the simultaneous combustion of oil, gas and powdered coal, or any two of them.

(B) MECHANICAL STOKERS, MECHANICAL GRATES, MECHANICAL ASH DISCHARGERS AND SIMILAR APPLIANCES

These are various mechanical appliances for feeding solid fuels to furnaces, or for forming the fire bed. Mechanical stokers and mechanical grates are frequently combined and also equipped with devices for the automatic removal of the slag and ash after combustion, thus forming a fully automatic installation. In other cases a mechanical or automatic element may be combined with a non-mechanical element.

(1) Mechanical stokers.

These are of widely differing types. They usually comprise a coal hopper together with various devices such as Archimedean screws, mechanical shovels, sliding trays, propelling pistons, operated by hand or by power, for regulating the supply of coal and conveying it to the furnace bed. These appliances are often fitted with breakers for reducing the coal supply to uniform size. The heading covers mechanical stokers for central heating (including domestic) boilers.

(2) Mechanical grates.

These are appliances of varying design by which the coal is distributed over the fire-bed and moved forward through the furnace to secure even combustion. The most common systems are based on the principle of the caterpillar band, or take the form of oscillating inclined steps. These grates often terminate with appliances for removing the slag and ash. In other systems the slag and ash removal is effected by separate mechanical units; these are also classified in this heading.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here (e.g., burner nozzles, thrust pistons and trays for mechanical stokers; chassis for mechanical grates, link sections and links, guides and rolls for mechanical grates).

*
* * *

The heading **does not cover** non-mechanical fire-bars or grates, industrial or other. Fire-boxes consisting of fixed grates in a metal body designed to be fitted as an integral part into certain types of boilers are **excluded** and are regarded as parts of boilers and fall in **heading 84.02**. Similarly, certain other types of non-mechanical grates which are identifiable as specialised for particular machines or appliances are classified as parts for such machines and appliances (e.g., for gas generators - **heading 84.05**). On the other hand, iron fire-bars and grates of general use, for fitting into brickwork, are classified in **heading 73.21, 73.22 or 73.26** according to type.

84.17 - Industrial or laboratory furnaces and ovens, including incinerators, non-electric.

8417.10 - Furnaces and ovens for the roasting, melting or other heat-treatment of ores, pyrites or of metals

8417.20 - Bakery ovens, including biscuit ovens

8417.80 - Other

8417.90 - Parts

This heading covers non-electrical industrial or laboratory type furnaces and ovens, designed for the production of heat in chambers at high or fairly high temperatures by the combustion of fuel (either directly in the chamber or in separate combustion chambers). They are used for the heat treatment (e.g., by roasting, fusion, calcination or decomposition) of various kinds of products which may be placed on the fire-bed, in crucibles, in retorts or on shelves. It also includes steam heated ovens.

In certain types (tunnel ovens) the goods to be heat-treated are passed continuously through the oven (e.g., on a conveyor band).

The heading includes :

- (1) Ovens and furnaces for roasting ores or pyrites.
- (2) Metal-melting furnaces, including cupolas.
- (3) Ovens and furnaces for hardening, annealing or similar heat-treatment of metals.
- (4) Cementation ovens.
- (5) Bakery ovens, including biscuit ovens.
- (6) Coke ovens.
- (7) Wood carbonisation furnaces.
- (8) Rotary cement ovens and kilns and rotary plaster ovens.
- (9) Ovens and furnaces used in the glass or ceramic industries, including tunnel ovens.
- (10) Enamel baking ovens.
- (11) Furnaces specially designed for the melting, sintering or heat processing of fissile materials recovered with a view to recycling, for the separation of irradiated nuclear fuel by pyrometallurgical processes, for burning radioactive graphite or filters, or for firing earthenware or glass containing radioactive slag.
- (12) Cremation furnaces.
- (13) Incinerators and similar apparatus specially designed for the burning of waste, etc.

The heading **excludes** furnaces and ovens consisting essentially of refractory or ceramic materials, and also blocks, bricks and similar refractory or ceramic materials for building or lining furnaces and ovens (**Chapter 69**), while metallic structural material is, in general, classified in **Section XV**. On the other hand, the heading includes made up linings or other integral and specialised ceramic or refractory parts presented with, and as components of, furnaces or ovens (assembled or not) made mainly of metal.

Many industrial furnaces and ovens incorporate equipment for charging or discharging, for manipulating the doors, covers, hearths or other moving parts, or for tilting the furnace, etc. Such lifting or handling equipment is to be classified with the furnace or oven **provided** it forms an integral part thereof; otherwise it is to be classified in **heading 84.28**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here (e.g., oven or furnace doors, dampers, side-shields; observation windows, arches and tuyères for blast furnaces).

*
* * *

The heading **does not cover** :

- (a) Ovens other than industrial or laboratory types (**heading 73.21**).
- (b) Apparatus of **heading 84.19**, including oil-cracking plant, autoclaves, steamers and drying plant.
- (c) Converters (**heading 84.54**).

84.18 - Refrigerators, freezers and other refrigerating or freezing equipment, electric or other; heat pumps other than air conditioning machines of heading 84.15.

8418.10 - Combined refrigerator-freezers, fitted with separate external doors

- Refrigerators, household type :

8418.21 -- Compression-type

8418.29 -- Other

8418.30 - Freezers of the chest type, not exceeding 800 l capacity

8418.40 - Freezers of the upright type, not exceeding 900 l capacity

8418.50 - Other furniture (chests, cabinets, display counters, show-cases and the like) for storage and display, incorporating refrigerating or freezing equipment

- Other refrigerating or freezing equipment; heat pumps :

8418.61 -- Heat pumps other than air conditioning machines of heading 84.15

8418.69 -- Other

- Parts :

8418.91 -- Furniture designed to receive refrigerating or freezing equipment

8418.99 -- Other

(I) REFRIGERATORS, FREEZERS AND OTHER REFRIGERATING OR FREEZING EQUIPMENT

The refrigerators and refrigerating equipment of this heading are in the main machines or assemblies of apparatus for the production, in a continuous cycle of operations, of low temperatures (in the region of 0 °C or less) at the active cooling element, by the absorption of the latent heat of evaporation of liquefied gases (e.g., ammonia, halogenated hydrocarbons), of volatile liquids or, in the case of certain marine types, of water.

The heading therefore **excludes** :

- (a) Freezing-salt type freezers (**heading 82.10 or 84.19**).
- (b) Water-flow coolers of the simple heat-exchange type (see the Explanatory Note to **heading 84.19**).
- (c) Ice-chests, insulated cabinets, etc., not designed for fitting with refrigerating units (generally **heading 94.03**).

The refrigerators of this heading are of two main types :

(A) COMPRESSION TYPE REFRIGERATORS

Their essential elements are :

- (1) **The compressor** which receives expanded gas from the evaporator and delivers it under pressure to
- (2) **The condenser** or liquefier where the gas is cooled and liquefied, and
- (3) **The evaporator**, the active cooling element, consisting of a tubular system in which the condensed refrigerant, released through an expansion valve, evaporates rapidly with the absorption of heat from the surrounding air or, in the case of large cooling installations, from brine or a solution of calcium chloride kept in circulation around the evaporator coils.

In the marine type there is no compressor and condenser in the refrigerant (water or brine) circuit, but the evaporation is induced by a vacuum produced by an ejector pump working with a steam condenser. The latter condenses and disposes of the vapours produced, which are not returned to the system.

(B) ABSORPTION TYPE REFRIGERATORS

In these the compressor is replaced by a "generator" in which a strong aqueous solution of ammonia is heated (by gas, oil or electric element), the gas being driven off and accumulating under pressure in the condenser. The cycle of condensation followed by expansion and cooling in the evaporator continues as in the compressor type, the expanded gas being re-dissolved in the weakened solution, either in a separate absorber which feeds the generator by simple pressure effect or through a pump, or in the generator itself which, in certain types, functions as the absorber on cooling during periods when the heat is withdrawn.

In certain dry types the ammonia gas is absorbed by a solid (e.g., calcium chloride or silica-gel) instead of being in solution.

*
* *

Apparatus of the foregoing kinds are classified in this heading if in the following forms :

- (1) Units comprising a compressor (with or without motor) and condenser mounted on a common base, whether or not complete with evaporator; or self-contained absorption units. (These units are commonly fitted into domestic-type refrigerators or other refrigerating cabinets.) Certain compression type machines, known as " liquid-cooling units ", combine on a common base (with or without condensers), compressors and a heat exchanger containing an evaporator and tubing carrying the liquid to be cooled. These latter machines include those known as " chillers ", which are used in air conditioning systems.
- (2) Cabinets or other furniture or appliances incorporating a complete refrigerating unit or an evaporator of a refrigerating unit, whether or not equipped with ancillary devices such as agitators, mixers, moulds. These appliances include domestic refrigerators, refrigerated show cases and counters, ice-cream or frozen food storage containers, refrigerated water or beverage fountains, milk cooling vats, beer coolers, ice-cream makers, etc.
- (3) Refrigerating installations of larger type consisting of components which are not mounted on a common base or as self-contained units but are designed to operate together, either by direct expansion (an evaporator then being incorporated in the " cold-using " appliance), or by means of a refrigerating medium (brine) which is cooled by a refrigerating unit and piped into the " cold-using " appliances (indirect cooling). Such installations are used, for example, in cold storage plants and for manufacturing operations (manufacture of block ice, quick-freezing of food products, rapid chilling in chocolate manufacture, separating paraffin wax in petroleum refining, in chemical industries, etc.).

Ancillary apparatus essential to the application of the low temperature produced in such installations are classified in this heading **provided** they are presented together with the other components of these installations. Such apparatus include, for example, sectional or tunnel-type quick freezers, cold tables for confectionery or chocolate, etc.

*
* * *

This heading also includes refrigerating equipment operating by vaporisation of liquefied gas in an enclosed space and consisting generally of one or more liquefied-gas tanks, a thermostat, an electro-magnetic valve, a control box and electric switches and a perforated spreader tube. These components are classified here **if presented together**.

(II) HEAT PUMPS

A heat pump is a device which draws heat from a suitable heat source (principally underground or surface water, the soil or the air) and converts it with the assistance of a supplementary energy source (e.g., gas or electricity) into a source of more intense heat.

A heat-transfer fluid is generally used to transfer the heat from the source to the heat pump and from the heat pump to the medium to be treated.

There are two types of heat pumps : the **compression type** and the **absorption type**.

Compression heat pumps consist essentially of the following elements :

- (1) an evaporator which extracts energy from the environment and transmits it to the heat-transfer fluid;
- (2) a compressor which, by mechanical means, draws off the vaporised fluid from the evaporator and transfers it at increased pressure to the condenser;
- (3) a condenser, which is a heat exchanger in which the vapour liquefies, giving up heat to the medium to be treated;

In absorption heat pumps, the compressor is replaced by a boiler containing water and a refrigerant and incorporating a burner.

Heat pumps are usually designated by the association of two factors, the first being the initial source of the heat and the second the medium whose temperature is to be modified. Among the principal types of apparatus are :

- (i) Air/water or air/air heat pumps, which draw ambient heat from the atmosphere and restore it in the form of warm water or warm air.
- (ii) Water/water or water/air heat pumps, which obtain heat from an underground source or from a mass of surface water.
- (iii) Earth/water or earth/air heat pumps : in these, heat is obtained by means of a system of tubes buried in the earth.

Heat pumps may be presented as a single item of apparatus, the various elements of the circuit forming a unit. Such a unit is referred to as a monobloc type. They may also be presented as several separate items. Certain heat pumps may be presented without an evaporator when they are intended for installation in plant already containing one. They are, in such cases, to be considered as incomplete articles having the essential character of the complete articles and remain classified here.

Heat pumps are used essentially to heat buildings or provide domestic hot water. Non-reversible heat pumps are generally used for these purposes.

However, the heading **excludes** reversible heat pumps comprising a motor-driven fan and elements for changing both the temperature and the humidity. These are regarded as air conditioning machines of **heading 84.15**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading, whether for domestic or industrial uses, are also classified here, e.g., condensers, absorbers, evaporators, generators, cabinets, counters and other refrigerating furniture, of the kind referred to in paragraph (2) above, not yet fitted with a complete refrigerating unit or with an evaporator but clearly designed to receive such equipment.

Compressors fall to be classified as such in **heading 84.14**, even when specially designed for use in refrigerators. Non-specialised parts (e.g., tubes and tanks) are classified in their own appropriate headings.

*
* *

This heading also **excludes** :

- (a) Air conditioning machines incorporating a refrigerator unit or a refrigerator unit evaporator (**heading 84.15**).
- (b) Gas liquefaction apparatus (e.g., Linde apparatus) (**heading 84.19**).

84.19 - Machinery, plant or laboratory equipment, whether or not electrically heated (excluding furnaces, ovens and other equipment of heading 85.14), for the treatment of materials by a process involving a change of temperature such as heating, cooking, roasting, distilling, rectifying, sterilising, pasteurising, steaming, drying, evaporating, vaporising, condensing or cooling, other than machinery or plant of a kind used for domestic purposes; instantaneous or storage water heaters, non-electric.

- Instantaneous or storage water heaters, non-electric :

8419.11 -- Instantaneous gas water heaters

8419.19 -- Other

8419.20 - Medical, surgical or laboratory sterilisers

- Dryers :

8419.31 -- For agricultural products

8419.32 -- For wood, paper pulp, paper or paperboard

8419.39 -- Other

8419.40 - Distilling or rectifying plant

8419.50 - Heat exchange units

8419.60 - Machinery for liquefying air or other gases

- Other machinery, plant and equipment :

8419.81 -- For making hot drinks or for cooking or heating food

8419.89 -- Other

8419.90 - Parts

It should be noted that this heading **does not include** :

- (a) Domestic stoves, grates, cookers, etc., of **heading 73.21**.
- (b) Air heaters and hot air distributors, not electrically heated of **heading 73.22**.
- (c) Domestic cooking or heating apparatus of **heading 74.18**.
- (d) Apparatus for fractional distillation (for example, in the production of heavy water) and for rectification, specially designed for isotopic separation, and isotopic exchange apparatus employing the "dual-temperature" method (**heading 84.01**).
- (e) Steam generating boilers and super-heated water boilers (**heading 84.02**) and auxiliary plant therefor (**heading 84.04**).
- (f) Central heating boilers of **heading 84.03**.

- (g) Industrial or laboratory furnaces and ovens, including those for the separation of irradiated nuclear fuel by pyrometallurgical processes and microwave ovens (**heading 84.17** or **85.14**, as the case may be).
- (h) Refrigerating machinery and heat pumps of **heading 84.18**.
- (ij) Germination plant, incubators or brooders (**heading 84.36**).
- (k) Grain dampening machines (**heading 84.37**).
- (l) Diffusing apparatus for sugar juice extraction (**heading 84.38**).
- (m) Machinery for the heat-treatment of textile yarns, fabrics or made up textile articles (e.g., yarn conditioners and singeing machines) (**heading 84.51**).
- (n) Chemical vapour deposition apparatus for the manufacture of semiconductor devices (**heading 84.86**).
- (o) Industrial or laboratory equipment for the heat treatment of materials by induction or dielectric loss including microwave equipment (**heading 85.14**).
- (p) Microwave ovens for industrial or commercial use, of the type used in restaurants or similar establishments (**heading 85.14**).
- (q) Immersion heaters, not permanently incorporated for heating liquids, semi-fluid (other than solid) substances or gases, **as well as** immersion heaters permanently incorporated in a vat and designed for water heating only (**heading 85.16**).
- (r) Electric soil heating apparatus, electric space heating apparatus, and electro-thermic domestic appliances of **heading 85.16**.

With these exceptions, the heading covers machinery and plant designed to submit materials (solid, liquid or gaseous) to a heating or cooling process in order to cause a simple change of temperature, or to cause a transformation of the materials resulting principally from the temperature change (e.g., heating, cooking, roasting, distilling, rectifying, sterilising, pasteurising, steaming, drying, evaporating, vaporising, condensing or cooling processes). But the heading **excludes** machinery and plant in which the heating or cooling, even if essential, is merely a secondary function designed to facilitate the main mechanical function of the machine or plant, e.g., machines for coating biscuits, etc., with chocolate, and conches (**heading 84.38**), washing machines (**heading 84.50** or **84.51**), machines for spreading and tamping bituminous road-surfacing materials (**heading 84.79**).

The machinery and plant classified in this heading may or may not incorporate mechanical equipment.

They may be heated by any system (coal, oil, gas, steam, electricity, etc.), **except** in the case of instantaneous water heaters and storage water heaters which are classified in **heading 85.16** when heated electrically.

The heading covers **only** non-domestic equipment, **except** for the instantaneous or storage water heaters referred to later in this Explanatory Note.

The heading includes a very wide range of machinery and plant of the types described below.

(I) HEATING OR COOLING PLANT AND MACHINERY

This group covers plant of general use in many industries for the simple treatment of materials by heating, boiling, cooking, concentration, evaporation, vaporisation, cooling, etc. They include :

(A) Vessels, vats, etc., of various kinds for heating or cooling :

- (1) Vessels, vats, etc., for indirect heating or cooling with double walls or bottoms incorporating provision for the circulation of steam, chilled brine or other heating or cooling media. However, double-walled or double-bottomed vessels fall in **Section XIV** or **Section XV** (e.g., **heading 73.09**) if they do not have such provision for circulating heating or cooling media (e.g., heat-insulated containers) or in **heading 84.18** if they incorporate an evaporator of a refrigerating unit (direct cooling).
- (2) Single-wall vessels, vats, etc., incorporating provision for direct heating (including heating by perforated steam coils) **other than** such vessels normally used in the household (**heading 73.21**, generally). In general, the industrial types are distinguished by their large size and solid construction, or the provision of filters or condensing domes or of mechanical devices such as agitators or tippers.

Such vessels, whether of the single or double-walled type, are frequently constructed for working under high pressure (e.g., autoclaves), or at reduced pressures for special purposes, particularly in the chemical and allied industries.

Vessels fitted with mechanical devices but **not** incorporating means of direct or indirect heating fall in **heading 84.79 unless** clearly designed as machinery of a type specified in another heading.

This group of heating vessels includes pasteurisers, sometimes operating at reduced pressure, used to submit food or drink products (milk, butter, wines, beers, etc.) to pre-determined temperatures to eliminate harmful micro-organisms.

- (B) **Heat exchange units** in which a hot fluid (hot gas, steam or hot liquid) and a cold fluid are made to traverse parallel paths, but usually in opposite directions, separated by thin metal walls in such a manner that the one fluid is cooled and the other heated. These units are usually of the three following types, viz., in the form of :
 - (i) Concentric tube systems : one fluid flows in the annular interval, the other in the central tube.
 - (ii) A tubular system for the one fluid, enclosed in a chamber through which flows the other fluid.

or (iii) Two parallel series of interconnected narrow chambers formed of baffle plates.

As stated in the first paragraph of this Explanatory Note (exclusion (e)), the heading **does not include** auxiliary plant for steam generating boilers (**heading 84.04**) much of which (e.g., steam condensers, air pre-heaters and economisers) are of the general type of heat exchange unit mentioned above.

The following are examples of machinery and plant which, **subject** to the provisions referred to above, are covered by Part (I) of this Explanatory Note :

- (1) Freezing-salt type freezers (**other than** those of **heading 82.10**).
- (2) Condensers for nitrogen or other gases.
- (3) Pasteurising, concentrating, cooling, etc., plant for milk (including storage vats with cooling equipment).
- (4) Processing and maturing vats for the cheese industry.
- (5) Plant for concentrating, cooling, etc., fruit juices, wines, etc.
- (6) Plant for use in agriculture (e.g., autoclaves for cooking potatoes, etc., as fodder; hot water baths for re-melting honeycombs, including those with pressing screws).
- (7) Cooling columns (e.g., for the bread grain milling industry).
- (8) Autoclaves and steaming, boiling, cooking, frying, etc., plant for cooking, preparing or preserving food (e.g., cooking chests for ham; fish friers; cookers, blanching autoclaves, etc., for fruit, vegetables, etc.; autoclaves and coolers for the canning or preserving industry; jam boilers; confectionery boilers).
- (9) Macerating vessels and mashing vats with heating equipment; vessels for the decoction of hops; beer pasteurisers, coolers, etc.
- (10) Defecation vessels, juice concentration plant, vacuum boiling pans, carbonation, sulphiting or refining vats, etc., for use in the sugar industry.

Diffusing apparatus (diffusor vessel and " calorisor " presented together), for extracting the juice from sugar beet, are **excluded** (see Part (V) (B) (3) of Explanatory Note to **heading 84.38**); " calorisators " presented separately are, however, classified in this heading.

- (11) Autoclaves for melting tallow or for saponifying fats; margarine solidifying tanks, incorporating a cooled rotating cylinder on to which the margarine solidifies.
- (12) Vats, vessels, autoclaves, etc., for the chemical preparation of wood pulp or for the hydrolysis of wood.
- (13) Vats, etc., for the preparation of dyes.
- (14) Autoclaves for vulcanising rubber.
- (15) Vats, etc., for pickling or de-greasing metals.

- (16) *Immersion coils* consisting of an assembly of plastic tubes, placed in parallel or braided, and sealed at each end into a honeycomb structure to which a connector is attached. When immersed in a bath, these devices will keep it at a constant temperature, or heat or cool it, by means of a fluid or steam circulating in the tubes.
- (17) Specialised heating or cooking apparatus which are not normally used in the household (e.g., counter-type coffee percolators, tea or milk urns, steam kettles, etc., used in restaurants, canteens, etc.; steam-heated cookers, hot-plates, warming cupboards, drying cabinets, etc.; deep-fat fryers).
- (18) Automatic hot or cold beverage-dispensing machines without a device to accept payment.

The apparatus described above is essentially used industrially, but the heading also covers **non-electric instantaneous water heaters and storage water heaters, including solar water heaters, domestic or not**. If electrically heated, such appliances are **excluded (heading 85.16)**.

*
* *

It is to be noted that this heading **excludes** domestic steamers, pressure cookers and certain percolators, of base metal (**Section XV**).

(II) DISTILLING OR RECTIFYING PLANT

With the **exception** of distillation apparatus of ceramics (**heading 69.09**) or of glass (**heading 70.17** or **70.20**), this group comprises all plant designed for distilling substances (whether liquid or solid).

(A) Simple distillation plant.

This consists essentially of a retort or still body in which the liquid to be distilled is vaporised, a cooling device for condensing the vapours issuing from the retort and a receptacle(s) in which the distillate(s) is collected. They may be arranged for intermittent use (e.g., simple batch stills heated directly or by internal steam coils), or for continuous use, in which case the still body is fed continuously with liquid and is usually heated by steam tubes or coils. Continuous stills may be connected in series, the first being heated directly or with steam while the others are fed by the distillate and heated by the distillation vapours from the preceding still.

(B) Fractionating or rectifying plant.

These are more complicated continuous installations incorporating vertical fractionating columns which enable complex mixtures to be separated in one operation. The most usual type of column is divided into interconnecting sections by plates fitted with bubbling caps and down-flow tubes. Vapour rising from one section is thus brought into intimate contact with a condensed portion of the vapour in the section above and, since the temperature decreases as the vapours rise in the column, they can be separated at different levels corresponding to their boiling points.

Plant for distilling solids (coal, lignite, wood, etc.) work on the same principle, but the products are heated in furnaces classified in **heading 84.17**. This heading covers **only** the condensing or rectifying plant used for separating the volatile products evolved in the furnace.

The essential parts of distilling, etc., plants are usually made of metal (e.g., stainless steel, copper or nickel), but they may be lined with glass or refractory material. Plant for distillation at reduced or increased pressure may be fitted with vacuum pumps or compressors.

Batch stills are mainly used for the preparation of essential oils, liqueurs, etc. Continuous distillation plant (simple or fractional) is used in many industries (e.g., for the distillation of industrial alcohols, fatty acids, liquid air, synthetic motor-fuels or chemical products; in crude petroleum refining; for the distillation of wood, coal, shale, lignite, coal tar).

Also included in this group are separators for irradiated fuels or for processing effluents, operating by fractional distillation.

(III) EVAPORATING OR DRYING PLANT

This plant is constructed in various designs (sometimes for operation *in vacuo*), to suit different types of materials and their sensitivity to heat. It may be heated directly or indirectly. The heading applies, however, **only** to plant evaporating or drying at a relatively low temperature, and is not to be confused with the industrial furnaces or ovens of **heading 84.17** in which much higher temperatures are developed.

The most common forms of the industrial appliances of this heading are :

- (A) **Evaporators.** These usually take the form of vessels, providing a large surface heated directly or indirectly by steam coils, and often equipped with an evacuator for removing the vapours produced. They may be single or multiple-effect, the latter being similar in operation and construction to multiple-effect stills but without provision for the recuperation of the condensed vapour.

- (B) **Laboratory lyophilisation apparatus and freeze drying units.** These are used for the stabilising and preservation by dehydration of biological specimens such as antitoxins, bacteria, viruses, plasma and serums. The specimens are frozen, and then allowed to reheat gently under very low pressure when the ice sublimes leaving the dehydrated product.
- (C) **Tunnel dryers.** These consist of large chambers generally provided with conveyor equipment on which the products are conveyed through the chambers at a suitable speed against a current of hot air. They are used, *inter alia*, in pottery; in glass-making; in the food industry (including plant incorporating provision for smoking fish, meat, etc.); for drying wood, hay, etc.
- (D) **Rotary dryers.** These consist of revolving cylinders or drums which may be heated internally or externally. They are used in various industries (paper-making, preparation of potato flakes, etc.).
- (E) **Plate dryers.** These consist of metal chambers fitted with a number of horizontal slotted plates or shelves, sometimes internally heated. A central revolving shaft fitted with grids spreads the material over the hot plates and directs it downwards through the slots to each succeeding plate. This type of plant is used for treating malted barley.
- (F) **Spray dryers.** These function as evaporators, and consist of metal chambers fitted internally with a horizontal disc revolving at high speed. They incorporate a heater and fan to provide a current of hot air through which the liquid material is dispersed centrifugally as a fine spray by the revolving disc; the liquid is thus dried instantaneously in powder form. In another type the liquid is injected into the chamber as a fine spray against a counter-current of hot air. This type is used particularly for the preparation of powdered milk.

This group also includes machinery and apparatus for the evaporation of fissile solutions or radioactive solutions or for drying fissile or radioactive products.

The heading **does not**, however, **include** :

- (a) Centrifuges for drying radioactive precipitates (**heading 84.21**).
- (b) Machinery for drying bottles or other containers (**heading 84.22**).
- (c) Machinery specialised for the drying of textile yarns, fabrics or made up textile articles (**heading 84.51**).

(IV) ROASTING PLANT

This frequently consists of revolving cylindrical or spherical receptacles in which the products to be treated (e.g., coffee beans, cocoa beans, cereals or nuts) are subjected to controlled heat by contact with the heated walls of the containers, or by a direct stream of air forced through the heating medium (e.g., gas or oil burners or coke fires). These appliances usually incorporate devices which keep the products in constant rotation to ensure uniform treatment and to prevent charring. Other types take the form of perforated, inclined or rotating shelves in a chamber fed with heated gases.

The goods of this heading should not be confused with the industrial or laboratory furnaces and ovens of heading 84.17.

(V) STEAMING PLANT

This may be in the form of closed vessels (of the general type described earlier in this Explanatory Note) in which materials of various kinds may be subjected to humid heat (e.g., by steaming under pressure, or by the action of the vapours given off by the products themselves).

Such plant is used in various manufacturing operations (e.g., in the preparation of vegetable or animal extracts; in the food industry generally; in operations involving the use of steam for de-greasing or cleansing processes). Other types consist of larger chambers for subjecting material to more or less prolonged action of an atmosphere of steam; these are used, for example, for conditioning textile fibres in the mass, for steam-treatment of wood, etc.

The heading **excludes** machines for conditioning textile yarns or fabrics or for other steam-treatment of such textiles (heading 84.51).

(VI) STERILISING APPARATUS

These consist essentially of receptacles or chambers, heated usually by steam or boiling water (or sometimes by hot air), in which the articles or materials to be sterilised are maintained for a period at a sufficiently high temperature to kill bacteria, etc., without alteration of the composition or physical condition of the articles or materials themselves.

Many sterilisers for liquids resemble the apparatus described in Part (I) above (e.g., pasteurisers). Some large types of sterilisers may be equipped with a conveyor on which the goods are carried through the heating medium and, if necessary, subsequently through a cooling apparatus which may also form part of the plant.

The group includes not only sterilisers for industrial use (e.g., for milk, wine, fruit juices, cotton wool) but also those for installation in operating theatres, etc.

(VII) MACHINERY FOR LIQUEFYING AIR; SPECIAL LABORATORY APPARATUS AND EQUIPMENT

The heading includes **machines of the Linde or Claude type used for the liquefaction of air**.

The heading further includes **specially designed laboratory apparatus and equipment**, generally small in size (autoclaves, distilling, sterilising or steaming apparatus, dryers, etc.), but it **excludes** demonstrational apparatus of **heading 90.23**, and measuring, checking, etc., apparatus more specifically covered by **Chapter 90**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading covers parts of the above. Such parts include certain elements of distillation apparatus or rectifying columns, such as retorts, bubble caps and rings, plates and certain tube elements; revolving plates and drums, etc., for roasters or dryers.

Metal tubes and pipes which have been bent or curved but not otherwise worked, presented unassembled, are **not** identifiable as parts of goods of this heading and are therefore to be classified in **Section XV**.

84.20 - Calendering or other rolling machines, other than for metals or glass, and cylinders therefor.

8420.10 - Calendering or other rolling machines

- Parts :

8420.91 -- Cylinders

8420.99 -- Other

With the **exception** of metal-rolling or metal-working machines of **heading 84.55, 84.62 or 84.63** and of glass-working machines of **heading 84.75**, this heading covers **calendering or other rolling machines**, whether specialised to a particular industry or not.

These machines consist essentially of two or more parallel cylinders or rollers revolving with their surfaces in more or less close contact so as to perform the following operations, either by pressure of the cylinders alone or by pressure combined with friction, heat or moisture :

- (1) The rolling into sheet form of material (including bakery, confectionery, biscuit, etc., doughs, chocolate, rubber, etc.) fed to the rollers in a plastic condition.
- (2) The production of certain effects on the surface of sheet materials (**other than** metal or glass) passed between the rollers, e.g., smoothing (including ironing), lustering, glazing, polishing, embossing or graining.
- (3) The application of dressings or surface coatings.
- (4) The bonding of fabrics.

Machines of this kind are employed in various industries (e.g., the paper, textile, leather, linoleum, plastics or rubber manufacturing industries).

In certain industries particular names are given to calendering machines (e.g., ironing machines in laundries, finishing mangles for the textile industry, or supercalenders for the paper industry), but they are classified in this heading whether called calendering machines or not.

Calendering machines frequently constitute subsidiary units of other machines (e.g., paper-making machines). When the calendering machines are presented together with these other machines, classification is governed by Notes 3 and 4 to Section XVI.

On the other hand, calendering machines which merely incorporate auxiliary appliances, such as impregnating baths or rollers, winding or cutting devices, remain in this heading.

The heading also covers smoothing or ironing machines of the calender type, whether or not for domestic use.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here. These include **cylinders** clearly identifiable as for use with calendering or rolling machines of this heading. These cylinders may be made of metal, wood or other suitable material (e.g., compressed paper). They may be of various lengths and diameters, may be solid or hollow and, depending on the particular purpose for which they are required, their surface may be polished, corrugated, grained, or may bear engraved patterns. They may also be covered with other materials (e.g., leather, textile fabric or rubber). Metal cylinders are usually so designed that they can be heated internally by means of steam, gas, etc. Sets of cylinders for a particular calendering machine may comprise cylinders of different composition.

*
* *

This heading **does not include** machines which, though somewhat similar to calendering or rolling machines, do not fulfil the purposes described above, for example :

- (a) Cylinder drying machines for textiles, paper, etc. (**heading 84.19 or 84.51**).
- (b) Wine or cider presses, etc. (**heading 84.35**).
- (c) Roller crushing or grinding machines (**heading 84.36, 84.74 or 84.79**).
- (d) Cylinder machines for flour milling (**heading 84.37**).
- (e) Laundry wringing machines (**heading 84.51**).
- (f) Rolling mills (**heading 84.55**).
- (g) Sheet-metal flattening machines (**heading 84.62**) and sheet-metal embossing machines (**heading 84.63**).
- (h) Machines for making plate or other flat glass by rolling, and calenders for working glass (**heading 84.75**).

84.21 - Centrifuges, including centrifugal dryers; filtering or purifying machinery and apparatus for liquids or gases.

- Centrifuges, including centrifugal dryers :

8421.11 -- Cream separators

8421.12 -- Clothes-dryers

8421.19 -- Other

- Filtering or purifying machinery and apparatus for liquids :

8421.21 -- For filtering or purifying water

8421.22 -- For filtering or purifying beverages other than water

8421.23 -- Oil or petrol-filters for internal combustion engines

8421.29 -- Other

- Filtering or purifying machinery and apparatus for gases :

8421.31 -- Intake air filters for internal combustion engines

8421.39 -- Other

- Parts :

8421.91 -- Of centrifuges, including centrifugal dryers

8421.99 -- Other

This heading covers :

- (I) Machines which, by the use of centrifugal force, completely or partly separate substances according to their different specific gravities, or which remove the moisture from wet substances.
- (II) Filtering or purifying machinery and apparatus for liquids or gases, **other than**, e.g., filter funnels, milk strainers, strainers for filtering paints (generally **Chapter 73**).

(I) CENTRIFUGES, INCLUDING CENTRIFUGAL DRYERS

Most of these machines consist essentially of a perforated plate, drum, basket or bowl, etc., revolving at great speed in a stationary collector, usually cylindrical, against the walls of which the expelled materials are projected by centrifugal force. In some types the substances of different specific gravities are collected at different levels by means of a series of inverted separator cones. In other types the solid ingredients are retained in the perforated revolving drum, basket, etc., and the liquid ingredients expelled. Machines of this latter type may also be used to force liquids to penetrate thoroughly into materials (e.g., in dyeing or cleaning).

The heading includes :

- (1) Centrifugal driers for laundries, dyeworks, pulp mills, flour mills, etc.
- (2) Sugar refining centrifuges.
- (3) Cream separators and centrifugal clarifiers for milk.
- (4) Centrifuges for clarifying oils, wines, spirits, etc.
- (5) Centrifuges for dehydrating or de-waxing petroleum products.
- (6) Centrifuges for dehydrating wines, tallow, starches, etc.
- (7) Nitrating centrifuges for gun-cotton manufacture.
- (8) Separators for yeast cultures.
- (9) Centrifuges for the chemical industry (e.g., high-speed extractors for antibiotics).
- (10) Centrifuges, mainly used in laboratories, in which liquids are separated in superimposed layers ready for decantation.
- (11) Centrifuges for separating the plasma from blood.
- (12) Centrifuges for drying radioactive precipitates.
- (13) Centrifuges for extracting honey.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of centrifuges are also classified here (e.g., plates, drums, baskets, bowls and collectors).

*
* *

The heading **excludes** certain other types of machines operating on the centrifugal principle, e.g. :

- (a) Special centrifuges, called "gas" centrifuges, for the separation of uranium isotopes (**heading 84.01**).
- (b) Centrifugal pumps for liquids (**heading 84.13**).
- (c) Centrifugal air pumps and blowers (**heading 84.14**).
- (d) Centrifugal bolting (or sifting) machines for the milling industry (**heading 84.37**).
- (e) Centrifugal casting machines for metal (e.g., for cast iron tubes) (**heading 84.54**), or for unhardened cements (e.g., for casting concrete tubes) (**heading 84.74**).
- (f) Centrifugal grinding machines (**heading 84.74**).
- (g) Centrifugal spin dryers for semiconductor wafer manufacturing (**heading 84.86**).

(II) FILTERING OR PURIFYING MACHINERY AND APPARATUS, FOR LIQUIDS OR GASES

Much of the filtration or purification plant of this heading is purely static equipment with no moving parts. The heading covers filters and purifiers of all types (physical or mechanical, chemical, magnetic, electro-magnetic, electrostatic, etc.). The heading covers not only large industrial plant, but also filters for internal combustion engines and small domestic appliances. The heading **does not**, however, **include** filter funnels, milk strainers, vessels, tanks, etc., simply equipped with metallic gauze or other straining material, nor general purpose vessels, tanks, etc., even if intended for use as filters after insertion of a layer of gravel, sand, charcoal, etc.

In general, filtering machinery and plant of this heading is of two distinct types according to whether it is intended for liquids or gases.

(A) Filtering and purifying machinery, etc., for liquids, including water softeners.

The liquid filters of this group separate solid, fatty, colloidal, etc., particles from a liquid, for example, by passing it through a sheet, membrane or mass of porous material (e.g., cloth, felt, wire-cloth, skin, stoneware, porcelain, kieselguhr, sintered metallic powders, asbestos, paper pulp, cellulose, charcoal, animal black, sand). In the treatment of drinking water, some of these materials (e.g., porcelain and charcoal) remove bacteria, etc., in the process of filtration; filters using these materials are therefore sometimes called "water purifiers". Filters are also used to eliminate liquids from materials in the form of a slurry (e.g., from ceramic materials or ore concentrates). The heading covers liquid filters whether of the gravity, suction (or vacuum) or pressure types.

It includes, *inter alia* :

- (1) **Domestic type water filters.** Pressure type domestic filters are designed for fitting to the mains pipes or to the tap, and usually consist of a cylindrical ceramic filtering element enclosed in a metal container. Gravity types are similar but often larger. But the heading **excludes** filters made mainly of ceramics or glass (**Chapter 69** or **70**, respectively).

- (2) **Filter candles for man-made textile manufacture.** These consist of a non-corrosive container housing a textile element which filters the spinning solution.
- (3) **Oil filters for internal combustion engines, machine-tools, etc.** They are of two main types :
- (i) Those containing a filtering element, usually of superimposed layers of felt, metallic gauze, steel wool, etc.
 - (ii) Those containing permanent magnets or electromagnets for the extraction of ferrous particles from the oil.
- (4) **Filters for boiler water.** These usually consist of a large vessel fitted internally with several superimposed layers of filtering materials and, in addition to the inlet and outlet tubes, a system of pipes and valves for cleaning the filtering elements by a cross-current of water.
- (5) **Filter presses.** These consist of a horizontal series of filtering chambers formed by readily detachable vertical filter plates and frames; these are covered by a filtering medium (cloth, cellulose, etc.), and are held in place by a screw or press mechanism. The liquid is forced through the cells by a pump, and the chambers may be heated internally by steam, etc. The filtrate is drawn from the press and the residue collects in cakes between the plates. Filter presses are used for filtering or clarifying many liquids (e.g., in the chemical industry, the sugar industry, in brewing, wine making, oil purification, ore concentration, in the manufacture of ceramics, man-made textiles, etc.).
- (6) **Rotary drum vacuum filters.** These comprise a cylinder covered with filter cloth or gauze and mounted in the tank containing the liquid to be filtered. The liquid is sucked into the drum, and mechanical devices remove the solid residue from the periphery.
- (7) **Intermittent vacuum filters.** These consist of a number of "leaves" or chambers each covered with filter cloth and connected to a common vacuum line. The filter is submerged in the feed tank and the vacuum applied.
- (8) **Chemical water purifiers,** e.g., permuntite or zeolite softeners and lime water purifiers.
- (9) **Electro-magnetic water purifiers.** In these purifiers the action of an alternating magnetic field prevents the calcareous salts in the water from crystallising and forming deposits on the walls of the tubes; instead, the salts separate as sludges which can readily be removed.

The heading also covers **dialysers**, special type filters consisting essentially of a semi-permeable membrane through which liquids can pass by diffusion and thus be separated from colloidal particles.

(B) Filtering or purifying machinery, etc., for gases

These gas filters and purifiers are used to separate solid or liquid particles from gases, either to recover products of value (e.g., coal dust, metallic particles, etc., recovered from furnace flue gases), or to eliminate harmful materials (e.g., dust extraction, removal of tar, etc., from gases or smoke fumes, removal of oil from steam engine vapours).

They include :

- (1) **Filters and purifiers acting solely by mechanical or physical means**; these are of two types. In the first type, as in liquid filters, the separating element consists of a porous surface or mass (felt, cloth, metallic sponge, glass wool, etc.). In the second type, separation is achieved by suddenly reducing the speed of the particles drawn along with the gas, so that they can then be collected by gravity, trapped on an oiled surface, etc. Filters of these types often incorporate fans or water sprays.

Filters of the first type include :

- (i) **Intake air filters for internal combustion engines**. These often combine the two systems described above.
- (ii) **Bag filters**. These consist of a series of bag shaped cloth filtering elements, and often incorporate a shaker mechanism to cause the trapped particles to fall through the bottom of the bags.
- (iii) **Screen filters**. These consist of an endless filtering gauze running on two rollers and stretched across the chamber through which the gases are passed. The screen is cleaned by a scraper mechanism.
- (iv) **Rotary drum filters**, e.g., as used in sand blasting plant. They usually consist of a filter drum into which the air is drawn by suction. The drum revolves against a scraper which frees the drum of the residue.

Filters of the second type include :

- (v) **Dust extractors, smoke filters, etc.**, fitted with various types of obstructing elements to reduce the speed of the particles in the gas stream, e.g., baffle plates, partitions perforated with non-corresponding orifices, circular or spiral circuits fitted with baffles, and cones of superimposed baffle rings.
 - (vi) **Cyclones**, usually consisting essentially of sheet metal cones enclosed in a cylindrical tank. The gases are fed into the narrower part of the cone by a tangential pipe and the turbulent currents thus set up decrease sharply as the gases approach the broader section of the cone, so that the dust falls to the bottom of the tank.
- (2) **Electrostatic filters for air or other gases** in which the essential element is usually a series of vertical wires charged with static electricity. The dust in the air passing through the apparatus is attracted to and retained on the wires from which it is removed periodically.

- (3) **Gas scrubbers or absorption towers.** These are used for purifying producer gas, coal gas, etc.; they consist of tall metal columns containing coke or other fillings, and fitted at the top with water sprays.
- (4) **Other chemical filters and purifiers for air or other gases** (including catalytic converters which change carbon monoxide in the exhaust gases of motor vehicles).

*
* * *

This group also includes the following machinery employed in the nuclear industry : air filters specially designed to eliminate radioactive dust (physical or electrostatic types); active-charcoal purifiers for retaining radioactive iodine; ion-exchange apparatus for the separation of radioactive elements, including such apparatus operating by electrodialysis; separators for irradiated fuels or for processing effluents, whether operating by ion-exchange or operating chemically (by means of solvents, precipitation, etc.).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading covers parts for the above-mentioned types of filters and purifiers. Such parts include, *inter alia* :

Leaves for intermittent vacuum filters; chassis, frames and plates for filter presses; rotary drums for liquid or gas filters; baffles and perforated plates, for gas filters.

It should be noted, however, that filter blocks of paper pulp fall in **heading 48.12** and that many other filtering elements (ceramics, textiles, felts, etc.) are classified according to their constituent material.

*
* * *

The heading also **excludes** :

- (a) Gas diffusion apparatus for the separation of uranium isotopes (**heading 84.01**).
- (b) Air conditioning machines of **heading 84.15** or air de-humidifiers of **heading 84.79**.
- (c) Wine-presses, cider-presses, etc. (**heading 84.35**).
- (d) Artificial kidney (dialysis) apparatus (**heading 90.18**).

84.22 - Dish washing machines; machinery for cleaning or drying bottles or other containers; machinery for filling, closing, sealing or labelling bottles, cans, boxes, bags or other containers; machinery for capsuling bottles, jars, tubes and similar containers; other packing or wrapping machinery (including heat-shrink wrapping machinery); machinery for aerating beverages (+).

- Dish washing machines :

8422.11 -- Of the household type

8422.19 -- Other

8422.20 - Machinery for cleaning or drying bottles or other containers

8422.30 - Machinery for filling, closing, sealing, or labelling bottles, cans, boxes, bags or other containers; machinery for capsuling bottles, jars, tubes and similar containers; machinery for aerating beverages

8422.40 - Other packing or wrapping machinery (including heat-shrink wrapping machinery)

8422.90 - Parts

This heading covers dish washing machines (for plates, glasses, spoons, forks, etc.), whether or not incorporating provision for drying, including electrically-operated types, whether or not domestic. The heading also covers machines of different types designed for cleaning or drying bottles or other containers, for filling or closing such containers (including machines for aerating beverages) and, generally, for packing (including heat-shrink wrapping) goods for sale, transport or storage. These include :

- (1) Machines (whether or not steam-operated) for cleaning, washing, rinsing or drying bottles, jars, cans, boxes, casks, milk churns, cream separator bowls or other containers. These machines sometimes incorporate provision for disinfection or sterilisation.
- (2) Machines for filling containers (e.g., casks, barrels, cans, bottles, jars, tubes, ampoules, boxes, packets or bags), frequently equipped with subsidiary automatic volume or weight control and with devices for closing the containers.
- (3) Bottle or jar closing, corking or capping machines; can closers and sealers (including those closing by soldering).

- (4) Wrapping or cartoning machines, including those with provision for forming, printing, tying, stapling, taping, glueing, closing or otherwise finishing the packing. The heading includes machines for packing filled cans or bottles into external containers (crates, boxes, etc.).
- (5) Labelling machines, including those which also print, cut and gum the labels.
- (6) Machines for aerating beverages. These are, in effect, bottle filling and closing machines with provision for supplying carbon dioxide gas simultaneously with the liquid.
- (7) Baling or banding machines, including hand-operated portable appliances, provided with plates or similar devices enabling them to be rested, while in use, on the bales, cases or other packages to be strapped.

Machines of this heading frequently perform several of the foregoing functions. They may also incorporate provision for filling or sealing *in vacuo* or under other controlled atmospheric conditions.

Machines which in addition to packing, wrapping, etc., also perform other operations remain classified in the heading **provided** the additional operations are incidental to the packing, etc. Thus machines which pack or wrap goods into the forms or presentations in which they are normally distributed and sold in commerce, are classified in this heading, whether or not the machines also contain devices for weighing or measuring. Similarly the heading includes machines incorporating devices which, as a secondary function, cut, mould or press previously prepared products into purely presentational forms without affecting their essential character (e.g., machines for moulding butter or margarine into blocks, etc., and wrapping them). The heading **does not**, however, **cover** machines whose primary function is not to pack, wrap, etc., but to manufacture raw or semi-finished materials into finished products (e.g., combined cigarette making and packaging machines).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the above-mentioned machinery. It should be noted, however, that in the case of composite machines, parts of any component machine which would not on its own fall in this heading, are classified in their own appropriate headings, e.g., parts of weighing machines (**heading 84.23**), of carton or paper bag making machines (**heading 84.41**) or of printing machines (**heading 84.43**).

*
* * *

The heading **excludes** :

- (a) Domestic type bottling or canning machines and other domestic mechanical appliances weighing 10 kg or less (**heading 82.10**).
- (b) Straw or fodder balers (**heading 84.33**).
- (c) Paper bag or carton making machines (**heading 84.41**).
- (d) Sewing machines for sewing up sacks, etc., after filling (**heading 84.52**).
- (e) Presses for compressing scrap metal into bales, etc. (**heading 84.62**).
- (f) Case nailing machines (**heading 84.65**).
- (g) Machines for inserting letters in envelopes, or for wrapping them with paper bands (**heading 84.72**).

○
○ ○

Subheading Explanatory Note.

Subheading 8422.11

This subheading covers dish washing machines, whether or not electrically operated, of the household type, irrespective of their intended use. The external dimensions of such machines to be stood on the floor are of the following order :

width : up to 65 cm

height : up to 95 cm

depth : up to 70 cm

The dimensions of machines and appliances to be stood on a table or counter are appreciably smaller.

84.23 - Weighing machinery (excluding balances of a sensitivity of 5 cg or better), including weight operated counting or checking machines; weighing machine weights of all kinds (+).

8423.10 - Personal weighing machines, including baby scales; household scales

8423.20 - Scales for continuous weighing of goods on conveyors

8423.30 - Constant weight scales and scales for discharging a predetermined weight of material into a bag or container, including hopper scales

- Other weighing machinery :

8423.81 -- Having a maximum weighing capacity not exceeding 30 kg

8423.82 -- Having a maximum weighing capacity exceeding 30 kg but not exceeding 5,000 kg

8423.89 -- Other

8423.90 - Weighing machine weights of all kinds; parts of weighing machinery

With the **exception** of balances of a sensitivity of 5 cg or better (**heading 90.16**), this heading covers :

- (A) Machinery and appliances for the direct determination of the weight of objects, whether electronically (by means of transducers), by balancing the object against exchangeable weights, by manipulation of movable (cursor) weights on a calibrated beam (steelyard or other), or by automatic recording on a scale or indicator in machines operating by means of springs, levers or counterweights, or hydraulically, etc.
- (B) Appliances working on a weight determination principle but recording automatically in other units (e.g., volume, number, price or length) having a direct relation to weight.
- (C) Predetermined weight machines for checking the uniformity of, or indicating defects in, products by reference to weight, or for dispensing fixed weights of goods ready for packing.

The numerous types of machines falling in the heading include the following :

- (1) Spring balances.
- (2) Household or shop scales.
- (3) Letter or parcel scales.
- (4) Personal weighing machines (coin operated or not), including baby scales.
- (5) Portable or mobile platform type scales.

- (6) Weighbridges (hydraulic or other) and other weighing platforms.
- (7) Scales for weighing goods on conveyor bands, overhead conveyors, etc.
- (8) Weight operated counting scales.
- (9) Constant weight scales such as check scales (indicating excess or deficiency over standard weight) and continuous weighers for checking the uniformity of textile or other materials.
- (10) Hopper scales, for automatically weighing materials discharged from hoppers, including those weighing ingredients from several hoppers in compounding a mixture.
- (11) Scales for discharging a predetermined weight of material into a bag or container, but **not including** such machines which also pack or wrap the goods in the forms or presentations in which they are normally distributed and sold in commerce.
- (12) Automatic balances for weighing a continuous flow of liquid.
- (13) Apparatus fully automatic, which weighs and labels prepacked goods, comprising a weighing machine, a calculator and a printer with built-in package totaliser and label ejector.

These various weighing machines may incorporate provision for automatically printing weight tickets, for recording and totalling a series of weighing operations, for projecting or magnifying the reading, etc.

The heading also covers weights of all kinds and of any material, whether or not in sets or cases, for any type of weighing machine, including separately presented weights for precision machines of **heading 90.16**; weights presented with such precision machines are, however, classified therewith. Cursor weights (including those of platinum) are also covered by this heading.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading includes parts for the weighing machines of this heading. Such parts include :

Scale beams, calibrated or not; scale pans and platforms; base-plates, supports and casings; knife-edges, pivots and pivot bearings (**except** those wholly of agate or other precious or semi-precious stones (**heading 71.16**)); hydraulic dash-pots (oscillation dampers); weight indicator dials.

*
* *

The heading **does not cover** :

- (a) Hydrostatic (or specific gravity) balances (**heading 90.16**).
- (b) Machines for balancing mechanical parts (**heading 90.31**).
- (c) Instruments such as dynamometers of a kind primarily designed for measuring tractive, compressive forces, etc., and not for weighing goods, persons, animals, etc. (**heading 90.24** or **90.31**).

○
○ ○

Subheading Explanatory Note.

Subheading 8423.20

The scales for continuous weighing of goods on conveyors of this subheading, which may be either of the totaliser or integrating kind, measure and record the weight of materials as they go past in buckets, on chains or the like.

84.24 - Mechanical appliances (whether or not hand-operated) for projecting, dispersing or spraying liquids or powders; fire extinguishers, whether or not charged; spray guns and similar appliances; steam or sand blasting machines and similar jet projecting machines (+).

8424.10 - Fire extinguishers, whether or not charged

8424.20 - Spray guns and similar appliances

8424.30 - Steam or sand blasting machines and similar jet projecting machines

- Agricultural or horticultural sprayers :

8424.41 -- Portable sprayers

8424.49 -- Other

- Other appliances :

8424.82 -- Agricultural or horticultural

8424.89 -- Other

8424.90 - Parts

This heading covers machines and appliances for projecting, dispersing or spraying steam, liquids or solid materials (e.g., sand, powders, granules, grit or metallic abrasives) in the form of a jet, a dispersion (whether or not in drips) or a spray.

This heading, however, **does not include** water-jet or water-abrasive jet cutting machines which are designed for precise cutting of a variety of materials (e.g., stone, composites, rubber, glass, metal). These machines typically operate under pressures of 3,000 to 4,000 bars with a stream of water or water mixed with fine abrasives, at a velocity of 2 to 3 times the speed of sound (**heading 84.56**).

(A) FIRE EXTINGUISHERS, WHETHER OR NOT CHARGED

This group covers extinguishers, filled or not, of the kind which use foam-producing or other charges, including simple extinguishers fitted with taps, valves, percussion caps or other opening devices.

The heading **does not include** :

- (a) Fire extinguishing grenades and charges for fire extinguishers (**heading 38.13**).
- (b) Fire fighting pumps with or without internal reservoirs, **heading 84.13** (non-automobile types) or **heading 87.05** (automobile types).

(B) SPRAY GUNS AND SIMILAR APPLIANCES

Spray guns and similar hand controlled appliances are usually designed for attaching to compressed air or steam lines, and are also connected, either directly or through a conduit, with a reservoir of the material to be projected. They are fitted with triggers or other valves for controlling the flow through the nozzle, which is usually adjustable to give a jet or more or less divergent spray. They are used for spraying paint or distemper, varnishes, oils, plastics, cement, metallic powders, textile dust, etc.. They may also be used for projecting a powerful jet of compressed air or steam for cleaning stonework in buildings, statuary, etc.

The group also includes separately presented hand controlled "anti-smudge" spraying devices for fitting to printing machines, and hand controlled metal spraying pistols operating either on the principle of a blow pipe, or by the combined effect of an electric heating device and a jet of compressed air.

Hand controlled spray guns with self-contained electric motor, incorporating a pump and a container for the material to be sprayed (paint, varnish, etc.), are also covered by the heading.

(C) STEAM OR SAND BLASTING MACHINES AND SIMILAR JET PROJECTING MACHINES

Sand blasting machines and the like are often of heavy construction and sometimes incorporate compressors. They are used for de-scaling or cleaning metal articles, for etching or putting a matt surface on glass, stone, etc., by subjecting the articles to the action of high pressure jets of sand, metal abrasives, etc. They are usually fitted with dust extractors to remove the residual sand and dust. The heading also covers steam blast appliances used, for example, for de-greasing machined metal, etc.

(D) SYRINGES, SPRAYS AND POWDER DISTRIBUTORS

These are used for insecticides, fungicides, etc., in agriculture, horticulture or the home. The heading includes such appliances, with or without integral reservoirs, of the type operated by hand (including simple piston pump sprays) or by foot pedal, as well as powder bellows, knapsack sprayers and transportable sprayers. The heading also includes mobile spraying machines in which the motor providing the power for pumping or spraying can also be geared to provide a limited movement of the apparatus for working purposes, but it **does not include** machines constituting true vehicles within the meaning of **heading 87.05**.

Provided they incorporate mechanical devices for producing or dispersing the spray or jet, or for automatically orientating the spray head (including simple mechanisms activated by water pressure), the heading includes the following types of appliances, whether fixed, transportable or mobile :

- (1) Sprinklers and sprays for lawns, orchards, etc. (e.g., rotary sprays and oscillating sprays).
- (2) Hydraulic guns designed for dislodging minerals (e.g., gold bearing sands) from mountain sides, etc., by projecting powerful jets of water and water-jet bark strippers used by the paper industry.

The heading also includes mechanical windscreens and headlamp washing devices for motor vehicles, and flame guns of the type used for destroying weeds or for other agricultural purposes.

The heading **does not include** :

- (a) Insecticides put up under pressure in containers fitted with simple pressure release valves (**heading 38.08**).
- (b) Hose pipe nozzles (**Section XV**, or **heading 84.81** if fitted with taps, cocks, valves or other appliances for regulating the liquid flow).
- (c) Medical instruments of **heading 90.18**.
- (d) Scent sprays and similar toilet sprays (**heading 96.16**).

(E) IRRIGATION SYSTEMS

These irrigation systems, consisting of various components linked together usually include :

- (i) a control station (mesh filters, fertiliser injectors, metering valves, non-return valves, pressure regulators, pressure gauges, air vents, etc.);
- (ii) an underground network (distribution lines and branchlines which carry the water from the control station to the irrigation zone); and
- (iii) a surface network (dripper lines incorporating the drippers).

Such systems are classified in this heading as functional units within the meaning of Note 4 to Section XVI (see the General Explanatory Note to that Section).

*
* * *

This heading also covers :

- (1) Machines for coating various objects (for example, cups, cartons, boxes) by spraying with paraffin wax or molten wax.
- (2) Electrostatic painting apparatus consisting of a spray gun connected to a paint container by a flexible tube carrying paint, and also connected to a high-tension generator by an electric cable. The electrostatic field created between the object to be painted and the gun attracts the paint particles sprayed by compressed air to that object and prevents dispersion.
- (3) Industrial robots specially designed for projecting, dispersing or spraying liquids or powders.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading includes parts for the appliances and machines of this heading. Parts falling in this heading thus include, *inter alia*, reservoirs for sprayers, spray nozzles, lances and turbulent sprayer heads not of a kind described in **heading 84.81**.

*
* * *

The heading also **excludes** :

- (a) Hand-powered oil cans and grease guns (**heading 82.05**) and compressed air grease guns and other force-feed lubricating equipment (**heading 84.67**).
- (b) Steam blast soot removers for boilers (**heading 84.04**).
- (c) Furnace burners (**heading 84.16**).
- (d) Machines for cleaning barrels or other containers by jets of water, steam, sand, etc. (**heading 84.22**).

- (e) Ink-jet printing machines (**heading 84.43**).
- (f) Automatic vending machines of the scent spraying type (**heading 84.76**).
- (g) Machines for spreading mortar or concrete or for spraying gravel onto road or similar surfaces (**heading 84.79**).
- (h) Salt and sand spreaders for clearing snow, designed to be mounted on a lorry (**heading 84.79**).
- (ij) Spraying appliances for etching, developing, stripping, or cleaning semiconductor wafers and flat panel displays; deflash machines for cleaning and removing contaminants from the metal leads of semiconductor packages prior to the electroplating process (deflash by high pressure spray) (**heading 84.86**).
- (k) Electric machines and apparatus for hot spraying of metals or cermets, of **heading 85.15**.
- (l) Jet-type dental drills (**heading 90.18**) and aerosol therapy apparatus (nebulisers) (**heading 90.19**).

◦
◦ ◦

Subheading Explanatory Notes.

Subheading 8424.20

This subheading covers the appliances described in Part (B) of the Explanatory Note to heading 84.24.

Subheading 8424.41

The term “portable sprayers” refers to those sprayers which are designed to be pulled or carried by the operator either by a handle, or one or two shoulder straps.

This subheading includes pressure sprayers (which may be marketed as “spray guns”), consisting of a pressure tank incorporating a funnel and integrated pressure pump, a carrying strap, flexible tubing and a hand-held spray arm with a brass lance and an adjustable nozzle, all of which exhibit physical characteristics which clearly render them most suitable for agricultural or horticultural use (for example, operating pressure of 3 bars, 5 litre capacity, adjustable nozzle orifice).

Manual compression and lever operated knapsack sprayers, motorized knapsack sprayers, motorized knapsack mistblowers, operator carried rotary nozzle applicators and manually pulled or pushed boom sprayers are further examples of the portable sprayers of this subheading. This subheading does not include hot and cold foggers.

84.25 - Pulley tackle and hoists other than skip hoists; winches and capstans; jacks.

- Pulley tackle and hoists other than skip hoists or hoists of a kind used for raising vehicles :

8425.11 -- Powered by electric motor

8425.19 -- Other

- Winches; capstans :

8425.31 -- Powered by electric motor

8425.39 -- Other

- Jacks; hoists of a kind used for raising vehicles :

8425.41 -- Built-in jacking systems of a type used in garages

8425.42 -- Other jacks and hoists, hydraulic

8425.49 -- Other

This heading covers simple lifting or handling equipment. The provisions of Explanatory Note to heading 84.26 apply, *mutatis mutandis*, to the equipment of this heading insofar as they concern self-propelled and other "mobile" machines, multi-function machines and lifting, loading, handling, etc., machines intended for incorporation in other machines or for mounting on transport vehicles or vessels of Section XVII. However, if a winch is the normal working tool of a tractor, the complete machine (tractor and winch) is classifiable in **heading 87.01**.

The heading covers :

(I) PULLEY TACKLE AND HOISTS OTHER THAN SKIP HOISTS

The **pulley tackle and hoists** classified in this heading consist of more or less complex systems of pulleys and cables, chains, ropework, etc., designed to give a mechanical advantage to facilitate lifting (e.g., by use of pulleys of different diameter, toothed wheels, gearing systems).

This group includes, *inter alia* :

- (1) Tackle and hoists in which the chain engages in specially designed projections on the pulley rims.
- (2) Drum type pulley hoists in which the cable is wound on a drum enclosing the pulley mechanism. This self-contained type of hoist, usually pneumatic or electric, is often mounted on a trolley or crab running on an overhead rail.
- (3) Hoists consisting of a roller chain running over a geared system of sprocket wheels operated by a crank handle or lever, somewhat as in a jacking system.

Separately presented pulleys and pulley blocks are **excluded (heading 84.83)**.

Davits, also included in this heading, consist of twin tipping or swivelling supports from which ships' boats, etc., may be raised or lowered by means of pulley tackle type hoisting gear.

(II) WINCHES AND CAPSTANS

Winches consist of hand-operated or power-driven horizontal ratchet drums around which the cable is wound. **Capstans** are similar, but the drum is vertical.

This group includes :

- (1) Marine winches and capstans for operating cargo lifting gear, raising anchor, manoeuvring the steering gear, hauling in tow lines, fishing nets, dredging cables, etc. The power unit is often built into those machines as an integral whole.
- (2) Winches for tractors, etc.
- (3) Pit-head winding gear, consisting essentially of a large power-driven winch.
- (4) Capstans for operating turn-tables, or for shunting railway wagons, etc. For shunting, the cable is usually passed along a number of bollards each freely turning on bearings to facilitate haulage. These bollards are classified in **heading 73.25** or **73.26**.
- (5) Drawing blocks for wire-drawing benches.

(III) JACKS

Jacks are designed to raise heavy loads through short distances. The heading includes **rack and pawl jacks**, **screw jacks** in which the screw is raised by rotation or by rotating a nut fixed in the jack base, and **telescopic screw jacks** operated by the action of two or more concentric screws, the outer screw turning in the nut in the jack base.

In **hydraulic or pneumatic jacks**, the lifting piston is forced along a cylinder by pressure generated in a pump or compressor which may be separate or built-in.

Special types of jacks include :

- (1) Portable jacks for cars, etc.
- (2) Trolley mounted garage jacks, crate-lifting jacks, etc.
- (3) Garage type built-in jacking systems, usually hydraulic.
- (4) Jacks used in tipping mechanisms for lorries.
- (5) Jacks for firmly anchoring cranes, heavy lorries, mobile workshops, guns, etc.
- (6) Jacks for lifting railway track.
- (7) Jacks for lifting railway rolling-stock.
- (8) Horizontal action jacks for moving girders, sections of building structures, etc.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the equipment of this heading are classified in **heading 84.31**.

*
* *

The heading also **excludes** :

- (a) Hydraulic or pneumatic cylinders of **heading 84.12**.
- (b) Level crossing control gear and railway signalling equipment of **heading 86.08**.

84.26 - Ships' derricks; cranes, including cable cranes; mobile lifting frames, straddle carriers and works trucks fitted with a crane.

- Overhead travelling cranes, transporter cranes, gantry cranes, bridge cranes, mobile lifting frames and straddle carriers :

- 8426.11 -- Overhead travelling cranes on fixed support
- 8426.12 -- Mobile lifting frames on tyres and straddle carriers
- 8426.19 -- Other
- 8426.20 - Tower cranes
- 8426.30 - Portal or pedestal jib cranes

- Other machinery, self-propelled :

- 8426.41 -- On tyres

- 8426.49 -- Other

- Other machinery :

- 8426.91 -- Designed for mounting on road vehicles

- 8426.99 -- Other

The heading covers a number of intermittent-action lifting or handling machines.

SELF-PROPELLED AND OTHER " MOBILE " MACHINES

In general, the heading covers not only fixed or stationary machines, but (with certain **exceptions** referred to below concerning machines mounted on transport equipment of the type falling in Section XVII) also mobile machines, whether or not self-propelled.

The **exceptions** are :

(a) Machines mounted on vehicles proper to Chapter 86.

Lifting or handling machines are classified in **heading 86.04** if they are mounted on wagons or trucks, of a kind suitable for coupling to a train designed to run on a railway network of any gauge. Railway breakdown cranes or crane wagons or trucks for servicing the permanent way or rolling-stock, and crane wagons or trucks for use in railroad goods loading depots, usually comply with this condition. Self-propelled vehicles for the servicing and maintenance of railway tracks fall also in **heading 86.04**. On the other hand, lifting or handling machines mounted on trucks or platforms **not** meeting the specifications of true railway rolling-stock remain classified in this heading. This is usually the case, for example, with contractors' cranes mounted to run on rails in servicing building sites, quarries, etc.

(b) **Machines mounted on tractors or motor vehicles proper to Chapter 87.**

(1) **Machines mounted on tractor type bases.**

Certain working parts of the machines of this heading may be mounted on tractors which are constructed essentially for hauling or pushing another vehicle, appliance or load but, like agricultural tractors, are fitted with simple devices for operating the working tools. Such working tools are subsidiary equipment for occasional work. In general, they are **relatively light** and can be mounted or changed at the working site by the user himself. In such cases, the working tools remain in this heading **provided** they constitute machines of this heading, or in **heading 84.31** if they are parts of those machines, even if presented with the tractor (whether or not mounted thereon), while the tractor with its operating equipment is classified **separately in heading 87.01**.

On the other hand, this heading covers self-propelled machines in which the propelling base, the operating controls, the working tools and their actuating equipment are specially designed for fitting together to form an integral mechanical unit. This applies, for example, to a propelling base resembling a tractor, but specially designed, constructed or reinforced to form an integral part of a machine performing one or more of the functions mentioned in this heading (lifting, handling, etc.). Presented separately, such propelling bases also fall in this heading, as incomplete machines having the essential features of complete machines of the same kind. Propelling bases potentially classifiable in several of the headings 84.25 to 84.30 because they can be equipped with several different working parts, are classified in accordance with Note 3 to Section XVI or by application of Interpretative Rule 3 (c).

For more detailed criteria for distinguishing between the tractors of heading 87.01 and the propelling bases of this Chapter, see Explanatory Note to heading 87.01.

(2) **Machines mounted on automobile chassis or lorries.**

Certain lifting or handling machines (e.g., ordinary cranes, light breakdown cranes) are often mounted on what is in fact an essentially complete automobile chassis or lorry in that it comprises at least the following mechanical features : propelling engine, gear-box and controls for gear-changing, and steering and braking facilities. Such assemblies fall to be classified in **heading 87.05** as special purpose motor vehicles, whether the lifting or handling machine is simply mounted on the vehicle or forms an integral mechanical unit with it, unless they are vehicles designed essentially for transport purposes falling in **heading 87.04**.

On the other hand, this heading includes self-propelled machines in which one or more of the propelling or control elements referred to above are located in the cab of a lifting or handling machine (generally a crane) mounted on a wheeled chassis, whether or not the whole can be driven on the road under its own power.

The cranes of this heading do not generally move under load or, if they do, the movement is limited and subsidiary to their main function of lifting.

(c) **Machines on floating structures proper to Chapter 89.**

All lifting or handling machines (e.g. derricks and cranes) mounted on pontoons or other floating structures, whether or not self-propelled, are classified in **Chapter 89**.

MULTI-FUNCTION MACHINES

Many machines, in addition to carrying out the functions described in this heading or heading 84.25, 84.27 or 84.28 (lifting, loading, etc.) can also perform the functions described in heading 84.29 or 84.30 (excavating, levelling, boring, etc.). These machines are classified in accordance with Note 3 to Section XVI or by application of Interpretative Rule 3 (c). Examples are mechanical shovels, draglines, etc., which by interchanging jibs or end attachments can be used as cranes, combined coal-cutting and loading machines, combined trenching and pipe lifting and lowering machines, etc.

*
* *

Lifting, loading, handling, etc., machines presented separately are, however, classified in this heading even if intended for incorporation in other machines or for mounting on transport vehicles or vessels of Section XVII.

*
* *

The heading covers lifting or handling machines usually based on pulley, winch or jacking systems, and often including large proportions of static structural steelwork, etc.

These static structural elements (e.g., crane pedestals and gantries) are classified in this heading when they are presented as parts of a more or less complete handling machine.

When presented separately, they are classified in **heading 84.31 provided** they are fitted or designed to be fitted with the mechanical features essential for the operation of the moving parts of the complete installation (wheels, rollers, pulleys, running or guide rails, etc.). Otherwise these structural elements are classified in **heading 73.08**.

The heading covers :

- (1) **Bridge cranes**, which consist of a powerful lifting unit suspended from a heavy cross beam or "bridge", the whole moving on wide gauge rails. Similar bridge cranes used in nuclear reactors for changing or extracting the fuel elements are also classified here.
- (2) **Gantry cranes and overhead travelling cranes** in which the beam itself runs on rails fixed on walls or on suitable supporting metal structures.
- (3) **Transporter cranes**, fixed or running on rails. These are sometimes very long and normally have a cantilever extension (which may or may not be articulated) over berths or unloading areas and are equipped with a hoisting trolley or crab running along the whole length of the beam. Special types are used for handling blocks of building stone or containers and in shipbuilding.
- (4) **Mobile lifting frames** on tyred wheels, particularly for container handling. These machines may be self-propelled, **provided** they are designed to operate when stationary or, if they are able to move with their load over short distances, that they are simple portals which in most cases consist of a horizontal beam supported by two vertical members (sometimes of the telescopic type), each resting on a set of wheels.

- (5) **Straddle carriers**, which consist of a chassis of the "straddle" type, generally with vertical telescopic members for adjusting the height. This chassis is normally mounted on four or more tyred wheels which usually serve both as driving and steering wheels so as to permit manoeuvres within a very small radius.

Owing to their special design they are able to position themselves over a load, lift it by means of special gripping devices, transport it over short distances and then lower it again. Some of these carriers are sufficiently wide and high to be positioned directly over transport vehicles for lifting or lowering the load.

Straddle carriers are used in factories, warehouses, dock areas, airports, etc., for handling long loads (profile shapes, tree trunks, timber, etc.) or for stacking containers.

- (6) **Tower cranes**. These cranes comprise essentially a tower, usually composed of individual sections, of considerable height, fixed or running on rail, a main horizontal jib, fitted with trolleys, winches, service platforms and a cab for the operator, a counterweight jib with counterweights, tie bars to support the jibs, and a slewing device, either at the top or at the bottom, to enable the crane to rotate. The tower may contain hydraulic cylinders or jacks and a climbing frame which raise the jib so that additional tower sections can be attached to increase the working height of the crane.
- (7) **Portal or pedestal cranes**, as used in harbours, which are jib cranes supported on tall four legged pedestals which run on rails of such wide gauge as to span one or more normal railway tracks.
- (8) **Jib or derrick cranes** (but see the introduction to this Explanatory Note regarding railway breakdown cranes, crane lorries, floating cranes, etc.). Jib or derrick cranes are used for lifting loads and sometimes also moving them laterally. They consist essentially of a boom or jib which may be jointed to provide adjustable reach and to facilitate working. The hoisting cable passes over pulleys at the top of the boom and is driven by a winch. The jib or boom may be supported by a vertical support, sometimes of considerable height.
- (9) **Cableways and cable cranes**, which are installations for transporting suspended loads. They consist of one or more bearer cables supported on fixed or movable towers, and a trolley running on the cables and fitted with a mechanism for hoisting and lowering the loads. They are used for handling materials on large construction sites, dams, bridges, quarries, etc.
- (10) **Ships' derricks**, which consist of a fixed upright arm, to the base of which is pivoted a load-carrying arm which can be raised by a pulley system. (See the introduction to this Explanatory Note regarding similar machines mounted on floating pontoons, etc.)
- (11) **Works trucks fitted with a crane**, which are designed for moving loads over short distances in factories, warehouses, dock areas or airports by means of a light crane mounted on a chassis of the works truck type, usually in the form of a box frame, with a long wheel-base and a wide track to avoid overbalancing.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified in **heading 84.31.**

*
* *

The heading **excludes** crane lorries of **heading 87.05.**

84.27 - Fork-lift trucks; other works trucks fitted with lifting or handling equipment.

8427.10 - Self-propelled trucks powered by an electric motor

8427.20 - Other self-propelled trucks

8427.90 - Other trucks

With the **exception** of straddle carriers and works trucks fitted with a crane of **heading 84.26**, this heading covers works trucks fitted with lifting or handling equipment.

Works trucks of this description include, for example :

(A) FORK-LIFT AND OTHER ELEVATING OR STACKING TRUCKS

- (1) **Mechanically propelled fork-lift trucks**, which are sometimes of large size, carry the load on an elevating carriage sliding on a vertical mast. This lifting mechanism is normally situated in front of the driver's seat; it is designed to support the load during movement and to lift it for stacking or to place it on a vehicle.

This group also includes side-loading stacking trucks, which are designed to handle long loads (girders, planks, pipes, containers, etc.) and are usually equipped with a platform to support the load during transport over short distances.

The lifting device of the above trucks is normally powered by the motive power unit of the vehicle, and is usually designed to be fitted with various special attachments (forks, jibs, buckets, grabs, etc.) according to the type of load to be handled.

- (2) Other **stacking machines**, usually mounted on a truck, are equipped with a platform or fork which can be raised and lowered in a vertical support, by hand or power-operated winch or rack systems. They are used for stacking sacks, crates, casks, etc.

Some stacking machines which work on the same principle as elevators are classified in **heading 84.28**.

(B) OTHER WORKS TRUCKS FITTED WITH LIFTING OR HANDLING EQUIPMENT

This group includes :

- (1) **Trucks with mechanically elevating platforms** for the maintenance of electric cables, public lighting systems, etc. (See the introduction to Explanatory Note to heading 84.26 regarding elevating platforms of this type mounted on lorries.)
- (2) **Other trucks** fitted with lifting or handling equipment including those specialised for use in particular industries (e.g., in the textile or ceramic industries, in dairies, etc.).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the trucks of this heading are classified in **heading 84.31**.

84.28 - Other lifting, handling, loading or unloading machinery (for example, lifts, escalators, conveyors, teleferics).

8428.10 - Lifts and skip hoists

8428.20 - Pneumatic elevators and conveyors

- Other continuous-action elevators and conveyors, for goods or materials :

8428.31 -- Specially designed for underground use

8428.32 -- Other, bucket type

8428.33 -- Other, belt type

8428.39 -- Other

8428.40 - Escalators and moving walkways

8428.60 - Teleferics, chair-lifts, ski-draglines; traction mechanisms for funiculars

8428.90 - Other machinery

With the **exception** of the lifting and handling machinery of **headings 84.25 to 84.27**, this heading covers a wide range of machinery for the mechanical handling of materials, goods, etc. (lifting, conveying, loading, unloading, etc.). They remain here even if specialised for a particular industry, for agriculture, metallurgy, etc. This heading is not limited to lifting or handling equipment for solid materials but also includes such machinery for liquids or gases. But the heading **excludes** liquid elevators of the type falling in **heading 84.13**, and floating docks, coffer-dams and similar marine lifting and re-floating appliances operating solely by hydrostatic buoyancy (**heading 89.05 or 89.07**).

The provisions of Explanatory Note to heading 84.26 apply, *mutatis mutandis*, to the equipment of this heading insofar as they concern self-propelled and other "mobile" machines, multi-function machines and lifting, loading, handling, etc., machines intended for incorporation in other machines or for mounting on transport vehicles or vessels of Section XVII.

*
* *

The heading covers lifting or handling machines usually based on pulley, winch or jacking systems, and often including large proportions of static structural steelwork, etc.

These static structural elements (e.g., pylons specialised for teleferics, etc.) are classified in this heading when they are presented as parts of a more or less complete handling machine.

When presented separately, they are classified in **heading 84.31 provided** they are fitted or designed to be fitted with the mechanical features essential for the operation of the moving parts of the complete installation (wheels, rollers, pulleys, running or guide rails, etc.). Otherwise these structural elements are classified in **heading 73.08**.

These more complex machines include :

(I) INTERMITTENT ACTION MACHINES

- (A) **Lifts** are usually operated by winch and cable, or by rams worked by water, air or oil. They are used for raising or lowering a passenger cage or goods platform between vertical guide bars, and are generally fitted with counter-balance weights. The control, stopping, safety, etc., equipment, whether or not electrical, is also classified in this heading **provided** it is presented with the lift itself. The heading also includes manually operated lifts.

Rack and pinion driven lifts or hoists also belong to this category. These lifts and hoists consist of a lift cage, fitted with a motor that drives a pinion, and a mast, equipped with a toothed rack. When the pinion is engaged with the toothed rack, it permits the lift cage to move along the mast, up or down, at a controlled speed.

The group also includes so-called "ship-lifts", i.e., very powerful hydraulic or jack operated installations for lifting a vessel and lock basin complete from one canal level to another, and thus replacing normal locks.

- (B) **Skip hoists** are a type of lift in which bulk material containers are hoisted up a ramp or vertical shaft. They are used for raising coal from mines, for hoisting ores, limestone, fuel, etc., into blast furnaces, lime kilns, etc.

The heading also includes skips for such skip hoists, i.e., large capacity metallic containers or bins often fitted with automatically opening bottoms. Mining skips usually incorporate a cabin for the miners mounted above the load bin.

- (C) **Certain lifting machines** :

(1) **Lifting gins** consist of a winch mounted on a two-legged or tripod support.

(2) **Well drilling derricks** for hoisting the drilling tubes, etc., in petroleum wells, etc. (**other than** those mounted on lorries, etc. - see the introduction to Explanatory Note to heading 84.26).

(3) **Telphers** are similar in operation to overhead travelling or transporter cranes. The hoisting trolleys run (sometimes for considerable distances) on overhead rails supported on pylons.

- (D) **Teleferics** are large winch-operated installations generally for lifting passengers or goods in the mountains. They consist of the bearer and traction cables supported on pylons, and two cabins (or grabs, containers, etc.) which ascend and descend on the bearer cable.

- (E) **Funiculars** operate on the same principle as teleferics but the coaches run on rails. The heading in this case covers only the traction mechanism and winch; it **excludes** the coaches (**heading 86.05**) and the track (**heading 73.02** or **86.08** according to type).

- (F) **Wagon tippers** are platforms with guide rails or grooves, so that the wagon can be run into position, clamped and then emptied by tilting, tipping or rotating the whole machine by a jacking or other lifting system. The heading also includes **wagon shaking machines** used to facilitate the discharge of hopper type wagons.

(II) CONTINUOUS ACTION MACHINES

- (A) **Elevators** used for raising a constant stream of goods or persons vertically or obliquely. They consist essentially of a series of carriers of various types, attached at intervals to a jointed mechanism which turns as a continuous chain. They include bucket lifts for pulverised or granular materials, platform elevators for crates, parcels, etc., finger-tray elevators for sacks, barrels, bales of straw, sheaves, etc., and continuous multiple-cage lifts for passengers, etc.
- (B) **Escalators and moving walkways.**
- (C) **Conveyors** are used for moving goods, usually in a horizontal direction, sometimes over very long distances (in mines, quarries, etc.). They include :
- (1) **Conveyors operated by continuously-moving carrying or pushing elements**, e.g., bucket, tray or pan type conveyors; scraper or screw conveyors (in which the materials are forced along a trough by a push plate or worm respectively); band, belt, apron, slat, chain, etc., conveyors.
 - (2) **Conveyors consisting of a train of motor-driven rollers** (e.g., as used for feeding steel into cogging mills). The heading also covers roller conveyors, not power-driven, usually mounted on bearings (e.g., horizontal roller runways for manoeuvring crates, etc., and gravity roller conveyors), but it **excludes** similar equipment without rollers, e.g., straight, curved or spiral sliding chutes (**heading 73.08, 73.25 or 73.26 according to type**).
 - (3) **Vibrator or shaker conveyors** operated by vibratory or reciprocating movements of the trough supporting the goods.
- (D) **Pneumatic elevators and conveyors** (e.g., pneumatic tube conveyors), in which small containers (for documents, small machined parts, etc.) or bulk materials (grain, straw, hay, sawdust, pulverised coal, etc.) are forced along a tube by an air current (including similar machines for transporting and cleaning grain).
- (E) **Roller supports ("castors")**, similar to roller conveyors, consist of a number of tubular posts fixed in the factory floor. The top of each post consists of a roller running on bearings and pivoting freely in all directions, so that the set of "castors" provides a roller table system (e.g., for handling sheet metal in rolling mills).
- (F) **Cable-operated hauling or towing machines** consist essentially of an endless cable or chain in continuous motion for hauling wagons (e.g., for colliery tubs and tip wagons), for towing barges, sledges, etc., for carrying passengers (ski-lifts), etc.

(III) OTHER SPECIAL LIFTING OR HANDLING MACHINER

- (A) **Locomotive or wagon traversers** for transferring locomotives, trucks, etc., from one track to another.
- (B) **Wagon pushers of various kinds**, e.g. :
 - (1) Appliances fixed between the rails, consisting essentially of two reciprocating power-driven pistons which engage on the axles and thus push the trucks forward.
 - (2) Hydraulic ram or piston type machines for pushing mining trucks into the pithead cages, etc.
 - (3) Self-propelled one-wheel machines running on one rail of the permanent way. They have to be supported by a walking operator in the same way as wheelbarrows, and are powered by small petrol engines. It should, however, be noted that small tractors, also sometimes known as "wagon pushers" and used for that purpose, are **excluded (heading 87.01)**.
- (C) **Mechanical loaders** for picking up coal, ores, excavated earth, pebbles, sand or other bulk materials. These machines are usually combined with a conveyor or an elevator (shaker type conveyor-loader, pick-up conveyor-loader, etc.).
- (D) **Auxiliary mechanical appliances for manipulating pneumatically, hydraulically or electrically operated hand tools** (drills, hammers, etc.). These appliances help to support the tool or push it forward into the work, e.g., pneumatically operated tool supports and pushers; drilling rigs and carriages ("Jumbos"); mechanical "balancers" for suspending tools during working. But the heading **excludes** simple static supports, etc.
- (E) **Industrial robots** specifically designed for lifting, handling, loading or unloading.
- (F) **Mechanical ladders** consisting of sliding sections operated by a mechanism (e.g., pulley tackle or winch).
- (G) **Mechanically adjustable wheeled platforms ("dollies")** for mounting and manipulating cinematographic cameras.
- (H) **Mechanical remote control manipulators**, for radioactive products, fixed or mobile, consisting of an arm outside the shielded cell, which is guided manually, and an arm inside the cell, which reproduces the operator's movements. Transmission of the movements is by means of mechanical, hydraulic or pneumatic appliances or by electric pulses.
Manipulators used independently in the hand (like a hand tool) fall in **heading 82.03, 82.04 or 82.05**.
- (IJ) **Platforms, whether or not self-propelled**, for the handling of containers or palettes used in airports for loading or unloading of aircraft. This equipment consists principally of an elevated platform supported by two diagonal cross-members. It is provided with a moving belt to transport the cargo. This equipment is not intended to transport containers or palettes, even over short distances, but is positioned empty beside the aircraft and operates only from that position.

- (K) **Palletisers**, electrically driven machines designed to align empty bottles automatically in regular rows (using powered or roller conveyors) and then to transfer them perfectly aligned onto a pallet for stacking layer upon layer. These palletisers, which do not fill, close, seal, label or band bottles, can stand alone or be incorporated in a processing line containing other machines which carry out such functions as filling or shrink-wrapping.
- (L) **Patient lifts**. These are devices with a supporting structure and a seat for the raising and lowering of seated persons, e.g., in a bathroom or onto a bed. The mobile seat is fixed to the supporting structure by means of ropes or chains.
- (M) **Stair lifts**. These are lifting devices, fitted with a load platform, which are fixed to banisters, stairway walls or the stairs and are used to move disabled persons or wheelchairs with their occupant up or down stairs.

*
* *

Lifting or handling devices are often used with furnaces, converters, rolling mills, etc., e.g., machines for inserting, handling or withdrawing the pieces being worked; for manipulating doors, covers, hearths, etc.; tipping or tilting machines. When these machines form independent units clearly distinct from the furnaces, etc., they are classified in this heading even if presented with the furnaces, etc. Examples include :

- (1) **Coke oven discharging machines** running to and fro behind the row of ovens, and equipped with a mechanical piston which opens the doors and empties the retorts.
- (2) **Ram or piston operated charging machines for Siemens Martin converters, etc.**
- (3) **Special lifting machines** for raising the covers of metallurgical annealing or "soaking" pits, or for lifting out the ingots.
- (4) **Ingot, forging, etc., manipulators, filters, etc.**
- (5) **Machines** used in certain types of furnaces for inserting or removing, by the action of cylinders fitted with rams or pistons, the objects being treated in the furnace.

It should, however, be noted that the heading **excludes** lifting or handling machines designed to be incorporated in furnaces, converters, etc., or to form a complete unit therewith, **provided** they are presented with the furnaces, etc. (see **headings 84.17, 84.54, 84.55**, etc.). When presented separately they remain in this heading.

It should be noted that mechanical stokers, mechanical grates and similar appliances are also **excluded** (**heading 84.16**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified in **heading 84.31**.

*
* *

The heading also **excludes** :

- (a) Liquid elevators of bucket, chain, screw, band or similar kinds (**heading 84.13**).
- (b) Machinery for sorting, screening, separating or washing earth, stone, ores or other mineral substances in solid form (**heading 84.74**).
- (c) Passenger boarding bridges (**heading 84.79**).
- (d) Machines and apparatus solely or principally of a kind used for lifting, handling, loading or unloading of boules, wafers, semiconductor devices, electronic integrated circuits or flat panel displays (**heading 84.86**).
- (e) Turntables of **heading 86.08**.
- (f) Dumpers (**heading 87.04**).

84.29 - Self-propelled bulldozers, angledozers, graders, levellers, scrapers, mechanical shovels, shovel loaders, tamping machines and road rollers.

- Bulldozers and angledozers :

8429.11 -- Track laying

8429.19 -- Other

8429.20 - Graders and levellers

8429.30 - Scrapers

8429.40 - Tamping machines and road rollers

- Mechanical shovels, excavators and shovel loaders :

8429.51 -- Front-end shovel loaders

8429.52 -- Machinery with a 360° revolving superstructure

8429.59 -- Other

The heading covers a number of earth digging, excavating or compacting machines which are explicitly cited in the heading and which have in common the fact that they are all self-propelled.

The provisions of Explanatory Note to heading 84.30 relating to self-propelled and multi-function machines apply, *mutatis mutandis*, to the self-propelled machinery of this heading, which includes the following :

- (A) **Bulldozers and angledozers.** These consist of a propelling base, often track-laying, with a large blade mounted in front, and forming an integral mechanical unit. They are used, in particular, for removing debris and for rough levelling. Certain types are designed mainly for grubbing or for land clearing.
- (B) **Graders and levellers.** These are machines designed for earth levelling or smoothing (on flat surfaces or banks) by means of an adjustable grading blade, usually mounted within the wheel base.
- (C) **Scrapers.** These incorporate a sharp cutting edge designed to slice off a layer of top soil which is then passed into the scraper body or discharged by a conveyor.

It should be noted that this heading covers only those scrapers in which the motor propulsion unit and the scraper form an integral mechanical unit, for example, track-laying scrapers in which the scraper body incorporating the cutting edge is situated between the two tracks. This heading also includes articulated scrapers which consist of a motor propulsion unit (even with only a single axle) and a scraper proper equipped with a fixed blade or a mobile attachment with several blades.

(D) **Tamping machines** as used in road making, for packing rail-road ballast, etc. (but see paragraph (a) of the introduction to Explanatory Note to heading 84.30 regarding machines mounted on vehicles of Chapter 86).

(E) Self-propelled **road rollers** as used in road building or other public works (e.g., for levelling the ground or rolling the road surface).

These machines are fitted with heavy cast iron or steel cylinders of large diameter, smooth or studded with metal feet which press into the soil ("sheep's-foot" rollers), or with wheels and heavy grade solid or pneumatic tyres.

(F) **Mechanical shovels (boom, jib or cable type)** which dig into the soil, above or below machine level, by means of an excavating bucket, grab, etc., operated either directly from the end of a boom or jib (shovel excavators, drag shovels, etc.) or, to increase the working range, on a cable or by means of a hydraulic jack suspended from the jib (draglines). In long range **excavators** (slackline draglines), the bucket is operated on a cable running between two movable structures set some distance apart.

(G) **Multi-bucket excavators** in which the digging buckets are fitted on endless chains or on rotating wheels. These machines often incorporate conveyors for discharging the excavated soil, and they are mounted on wheeled or track-laying chassis. Special models are designed for digging or cleaning out trenches, drainage channels, ditches for use in open-cast (open-pit) mines, etc.

(H) **Self-propelled shovel loaders.** These are wheeled or crawler machines with a front-mounted bucket which pick up material through motion of the machine, transport and discharge it.

Some "shovel-loaders" are able to dig into the soil. This is achieved as the bucket, when in the horizontal position, is capable of being lowered below the level of the wheels or tracks.

(IJ) **Loader-transporters** used in mines. These machines, the main function of which is handling and not transport, are equipped with a front-mounted bucket which picks up bulk materials and discharges them into the body of the machine.

This heading also covers self-propelled shovel loaders having an articulated arm with a bucket, mounted on the rear.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading, in particular, working tools (blades, buckets, etc.), whether or not fitted with booms and pneumatic or hydraulic cylinders, suitable for mounting directly onto the propelling base, are classified in **heading 84.31**.

84.30 - Other moving, grading, levelling, scraping, excavating, tamping, compacting, extracting or boring machinery, for earth, minerals or ores; pile-drivers and pile-extractors; snow-ploughs and snow-blowers (+).

8430.10 - Pile-drivers and pile-extractors

8430.20 - Snow-ploughs and snow-blowers

- Coal or rock cutters and tunnelling machinery :

8430.31 -- Self-propelled

8430.39 -- Other

- Other boring or sinking machinery :

8430.41 -- Self-propelled

8430.49 -- Other

8430.50 - Other machinery, self-propelled

- Other machinery, not self-propelled :

8430.61 -- Tamping or compacting machinery

8430.69 -- Other

This heading covers machinery, **other than** the self-propelled machines of **heading 84.29** and agricultural, horticultural or forestry machinery (**heading 84.32**), for "attacking" the earth's crust (e.g., for cutting and breaking down rock, earth, coal, etc.; earth excavation, digging, drilling, etc.), or for preparing or compacting the terrain (e.g., scraping, levelling, grading, tamping or rolling). It also includes pile-drivers, pile-extractors, snow-ploughs, and snow-blowers.

SELF-PROPELLED AND OTHER " MOBILE " MACHINES

In general, the heading covers not only fixed or stationary machines, but (with certain **exceptions** referred to below concerning machines mounted on transport equipment of the type falling in Section XVII) also mobile machines, whether or not self-propelled.

The **exceptions** are :

(a) **Machines mounted on vehicles proper to Chapter 86.**

Excavating, etc., machines are classified in **heading 86.04** if they are mounted on wagons or trucks, of a kind suitable for coupling into a train running on a railway network of any gauge. Railroad ballast excavator-screening machines are often mounted on wagons or trucks complying with this condition. On the other hand, excavating, etc., machines mounted on trucks or platforms **not** meeting the specifications of true railway rolling stock remain classified in this heading. Self-propelled vehicles for the servicing and maintenance of railway tracks also fall in **heading 86.04**.

(b) **Machines mounted on tractors or motor vehicles proper to Chapter 87.**

(1) **Machines mounted on tractor type bases.**

Certain working parts (e.g., levelling blades) of the machines of this heading may be mounted on tractors which are constructed essentially for hauling or pushing another vehicle, appliance or load but, like agricultural tractors, are fitted with simple devices for operating the working tools. Such working tools are subsidiary equipment for occasional work. In general, they are **relatively light** and can be mounted or changed at the working site by the user himself. In such cases, the working tools remain in this heading **provided** they constitute machines of this heading, or in **heading 84.31** if they are parts of those machines, even if presented with the tractor (whether or not mounted thereon), while the tractor with its operating equipment is classified **separately in heading 87.01**.

On the other hand, this heading covers self-propelled machines in which the propelling base, the operating controls, the working tools and their actuating equipment are specially designed for fitting together to form an integral mechanical unit. This applies, for example, to a propelling base resembling a tractor, but specially designed, constructed or reinforced to form an integral part of a machine performing one or more of the functions mentioned in this heading (excavating, levelling, etc.). Presented separately, such propelling bases also fall in this heading, as incomplete machines having the essential features of complete machines of the same kind. Propelling bases potentially classifiable in several of the headings 84.25 to 84.30 because they can be equipped with several different working parts, are classified in accordance with Note 3 to Section XVI or by application of Interpretative Rule 3 (c).

For more detailed criteria for distinguishing between the tractors of heading 87.01 and the propelling bases of this Chapter see Explanatory Note to heading 87.01.

(2) **Machines mounted on automobile chassis or lorries.**

Certain machines of this heading (e.g., pile-drivers, oil well drilling machines) are often mounted on what is in fact an essentially complete automobile chassis or lorry in that it comprises at least the following mechanical features : propelling engine, gear-box and controls for gear-changing, and steering and braking facilities. Such assemblies are classified in **heading 87.05** as special purpose motor vehicles.

On the other hand, this heading includes self-propelled machines in which one or more of the propelling or control elements referred to above are located in the cab of a machine mounted on a wheeled chassis, whether or not the whole can be driven on the road under its own power.

The heading further includes self-propelled wheeled machines in which the chassis and the working machine are specially designed for each other and form an integral mechanical unit. In this case, the machine is not simply mounted on an automobile chassis like the machines described in the first paragraph above, but is completely integrated with a chassis that cannot be used for other purposes and may incorporate the essential automobile features referred to above.

(c) **Machines on floating structures proper to Chapter 89.**

All machines (e.g., dredgers) mounted on pontoons or other floating structures, whether or not self-propelled, are classified in **Chapter 89**.

MULTI-FUNCTION MACHINES

Many machines, in addition to carrying out the functions described in heading 84.29 or 84.30 (excavating, levelling, boring, etc.), can also perform the functions described in heading 84.25, 84.26, 84.27 or 84.28 (lifting, loading, etc.). These machines are classified in accordance with Note 3 to Section XVI or by application of Interpretative Rule 3 (c). Examples are combined coal-cutting and loading machines, combined trenching and pipe lifting and lowering machines, etc.

*
* * *

The heading includes :

(I) PILE-DRIVERS AND PILE-EXTRACTORS

Pile-drivers consist of a heavy hammer weight, usually operated in a tall vertical guiding framework. The weight is raised by mechanical power and then allowed to fall on to the head of the pile either under gravity (single-acting machines) or under power (double-acting hammers).

The heading also covers pile-extractors.

(II) SNOW-PLOUGHHS AND SNOW-BLOWERS

Snow-ploughs and snow-blower vehicles of Section XVII with built-in equipment are **excluded**. The heading, however, covers snow-ploughs designed to be pushed or pulled (blade types), e.g., those designed to be attached to lorries or tractors.

(III) EXTRACTING, CUTTING OR DRILLING MACHINERY

This is mainly used in mining, well-drilling, tunnelling, quarrying, clay cutting, etc.

(A) **Coal or rock cutters** for cutting or breaking down coal, ores, etc. They consist of a bar or disc fitted with picks, or, more often, of an endless cutting chain running round a metal jib which may be adjustable for level and angle of cut (universal cutters). They may be mounted on self-propelled wheeled or tracklaying chassis, and some (cutter loaders) may be very large, incorporating a number of cutting chains and a built-in conveyor for loading the cut material on to the face conveyor, tubs, etc.

- (B) **Tunnelling machinery.** Tunnelling shields have smooth outer surfaces and sharp front cutting edges which are pushed forward into the soil by a hydraulic jacking system.
- (C) **Machines for boring drill holes in rock, coal, etc., and percussion type cutters** in which the drill can be swung to make linear cuts. But the heading **excludes** such tools for working in the hand, pneumatic, hydraulic or with self-contained motor (**heading 84.67**).
- (D) **Well sinking or boring machines** for the extraction of petroleum, natural gases, sulphur (Frasch process), etc., for raising strata samples in mining and oil well prospecting, for the sinking of artesian wells, etc. These machines are of two main types :
 - (1) **Rotary well sinking machinery** consisting essentially of a derrick fitted with pulley tackle, a hoist drum with transmission and control gear (draw-work), a swivel and a rotary table or gear-wheel.

The power-driven draw-work imparts a rotary movement to the drill pipes by means of the rotary table or gear-wheel, the drill pipes being suspended from the rotary swivel. The draw-work also raises and lowers the drill pipes, when required, by means of the pulley tackle.

- (2) **Percussion machines** consisting of an eccentric-driven rocker beam, the see-saw action of which causes the bit to strike continually into the well floor.

It should be noted that this heading covers **only** drilling machines as such. Other quite distinct machines normally used therewith are **excluded** even if presented with the drilling machines, e.g., pumps and compressors to force mud, stone, etc., out of the drilling (**heading 84.13 or 84.14**).

Fixed platforms used for the discovery or exploitation of off-shore deposits of oil or natural gas are also classified here. Floating or submersible platforms fall in **heading 89.05**.

- (E) **Augering machines**, hand or power operated, for boring holes in the ground (e.g., for setting trees or fencing posts), but **not including** hand tools of **Chapter 82**.
- (F) **Hydraulic wedges** consist of a long barrel with a number of pistons set laterally at intervals along the length. They are placed in a fissure or drill hole and the pistons are forced out by pumping water into the barrel, thus breaking down the rock or coal.
- (G) **Ploughs, strippers, etc.**, consist of cutter blades, ploughs, picks, wedges, etc., which are forced along the face, slicing off the coal, clay, etc., and loading it directly on to face conveyors, etc.

(IV) TAMPING OR COMPACTING MACHINES

This group includes :

- (A) **Road rollers designed to be pushed or towed.** This group includes "sheep's-foot" tamping rollers studded with metal feet which press into the soil, and tamping rollers made up of a series of lorry type wheels with heavy grade pneumatic tyres mounted on a common axle.

However, the heading **excludes** self-propelled road rollers, whether or not fitted with "sheep's-feet" or with solid or pneumatic tyres (**heading 84.29**) and agricultural rollers (**heading 84.32**).

- (B) **Tamping machines** as used in road making, for packing rail-road ballast, etc., not self-propelled. Tools for working in the hand, pneumatic, hydraulic or with self-contained motor, are, however, **excluded** (**heading 84.67**).
- (C) **Machines, usually pneumatic, for compacting the sides of embankments, etc.**

(V) EARTH EXCAVATING, SCRAPING OR LEVELLING MACHINERY

This group includes :

- (A) **Digging or excavating machines** described in Explanatory Note to heading 84.29, not self-propelled.
- (B) **Dredgers** (bucket or shovel type), similar to the multibucket excavators of heading 84.29.
Floating dredgers are **excluded** (**heading 89.05**).
- (C) **Railroad ballast excavator-screening machines**, consisting essentially of a continuous chain of buckets which dig the ballast from under the railway tracks. They also incorporate mechanisms for screening and discharging the ballast. But see paragraph (a) at the beginning of this Explanatory Note regarding machines mounted on vehicles of Chapter 86.
- (D) **Rippers, rooters and scarifiers** fitted with cutting teeth which loosen the top soil, break up old road surfaces, etc., prior to re-laying.
- (E) **Skimmers**, a type of excavating shovel similar to those of heading 84.29 with a horizontal boom; used for "skimming" off the top soil.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified in **heading 84.31**.

*
* *

The heading also **excludes** :

- (a) Hydraulic guns designed for dislodging minerals (e.g., gold bearing sands) from hill sides, etc., by projecting powerful water jets (**heading 84.24**).
- (b) Agricultural rollers, consisting of a relatively long light land roller of small diameter, in some cases propelled by a small internal combustion engine (**heading 84.32**).
- (c) Power tools (e.g., picks, tampers and drills) for working in the hand, of **heading 84.67**.
- (d) Apparatus for cutting or piercing rock or concrete, using the high temperature produced by burning iron or steel in a jet of oxygen (**heading 84.79**).

◦
◦ ◦

Subheading Explanatory Note.

Subheadings 8430.31 and 8430.39

These subheadings cover the machines described in paragraphs (A), (B) and (G) of Part (III) of the Explanatory Note to heading 84.30.

84.31 - Parts suitable for use solely or principally with the machinery of headings 84.25 to 84.30.

8431.10 - Of machinery of heading 84.25

8431.20 - Of machinery of heading 84.27

- Of machinery of heading 84.28 :

8431.31 -- Of lifts, skip hoists or escalators

8431.39 -- Other

- Of machinery of heading 84.26, 84.29 or 84.30 :

8431.41 -- Buckets, shovels, grabs and grips

8431.42 -- Bulldozer or angledozer blades

8431.43 -- Parts for boring or sinking machinery of subheading 8430.41 or 8430.49

8431.49 -- Other

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts for use **solely or principally** with the machinery of headings 84.25 to 84.30.

It should also be noted that many parts **do not fall** in this heading since they are :

- (a) Specified elsewhere in the Nomenclature, e.g., suspension springs (**heading 73.20**), engines (**heading 84.07** or **84.08**, etc.) and electrical ignition or starting equipment (**heading 85.11**).
- (b) Parts identical with those for motor vehicles and not suitable for use solely or principally with the machinery of headings 84.25 to 84.30, and therefore classified as parts of motor vehicles (**heading 87.08**); this applies in particular to wheels and steering and braking equipment.
- or (c) Parts suitable for use solely or principally with the machinery for lifting, handling, loading or unloading boules, wafers, semiconductor devices, electronic integrated circuits or flat panel displays (**heading 84.86**).

The heading includes :

- (1) Lifting grabs, buckets, grips, etc., i.e., simple lifting buckets fitted with attaching rings, hooks, etc.; hinge-bottomed buckets; grabs consisting of two jointed shells which fit together for lifting powdery materials; grips consisting of two or more jointed blades or claws for handling stone, rocks, etc.

Electro-magnetic lifting heads for handling scrap metal, etc., are also **excluded** (**heading 85.05**).

- (2) Drums for winches or capstans; crane jibs; trolleys, crabs, buckets, skips, etc., for overhead transporters; cabins, cages and platforms for lifts, etc.; escalator steps; buckets and scraper chains for elevators and conveyors; supports, and drums or rollers (whether or not incorporating driving motors) for conveyors; driving and retarding heads for shaker conveyors and tables; safety stopping mechanisms for lifts, skip-hoists, etc.
- (3) Cutter bars, chains and jibs for coal cutters; blades for scrapers, coal ploughs and strippers, etc.

This group also covers bulldozer or angledozer blades intended to be mounted as working tools on vehicles of Chapter 87.

- (4) Rotary tables, swivels, kellies, kelly drive bushings, tool-joints, drill collars, subs, drill pipe guides, stop-collars, spider bowls, split bushing slips, beams, swivel sockets, and drilling jars, for well drilling machines (rotary or percussion).
- (5) Digging buckets and grabs for excavators, bucket ladders for multi-bucket excavators; jibs for mechanical shovels; pile-driver hammers.
- (6) Track-laying or wheeled chassis, not self-propelled, fitted with swivel gear or other rotating devices.

Cables and chains **equipped with their fittings** (e.g., cable clips, rings, hooks and spring hooks) are classified with the machinery for which they are intended, **provided** they are presented therewith. **When presented separately**, however, they are classified in **Section XV** (usually **heading 73.12** or **73.15**). Cables and chains **not equipped with such fittings** and presented in coils are also classified in that Section, even if cut to length and presented with the machines (winches, teleferics, cranes, cable operated hauling machines, draglines, excavators, etc.) for which they are intended.

*
* *

The heading also **excludes** :

- (a) Transmission or conveyor belts or belting, of plastics (**Chapter 39**), of vulcanised rubber (**heading 40.10**), of leather (**heading 42.05**) or of textile materials (**heading 59.10**).
- (b) Slings (**Section XI** or **XV**).
- (c) Hollow drill bars and rods (**heading 72.28**).
- (d) Casing, tubing and drill pipes (**headings 73.04 to 73.06**).
- (e) Adjustable or telescopic pit props (**heading 73.08**).
- (f) Lifting hooks (**heading 73.25** or **73.26**).
- (g) Rock drilling bits and chisels, boring bits, auger bits and similar rock drilling or earth boring tools (**heading 82.07**).
- (h) Locks for passenger and goods lifts, etc. (**heading 83.01**).
- (ij) Pulleys, pulley blocks and bearing housings (**heading 84.83**).

84.32 - Agricultural, horticultural or forestry machinery for soil preparation or cultivation; lawn or sports-ground rollers.

8432.10 - Ploughs

- Harrows, scarifiers, cultivators, weeders and hoes :

8432.21 -- Disc harrows

8432.29 -- Other

- Seeders, planters and transplanters :

8432.31 -- No-till direct seeders, planters and transplanters

8432.39 -- Other

- Manure spreaders and fertiliser distributors :

8432.41 -- Manure spreaders

8432.42 -- Fertiliser distributors

8432.80 - Other machinery

8432.90 - Parts

This heading covers machines, whatever their mode of traction, used in place of hand tools, for one or more of the following classes of agricultural, horticultural or forestry work, viz. :

- (I) Preparing the soil for cultivation (clearing, breaking, tilling, ploughing, loosening, etc.).
- (II) Spreading or distributing fertilisers, including manure, or other products to improve the soil.
- (III) Planting or sowing.
- (IV) The working or maintenance of the soil during the growing period (hoeing, weeding, cleaning etc.).

*
* *

The machines of this heading may be hauled by an animal or by a vehicle (e.g., a tractor), or may be mounted on a vehicle (e.g., on a tractor or a horse-drawn chassis). (In this context, "tractor" includes "pedestrian controlled tractor".)

Machines designed to be hauled by, or mounted as interchangeable equipment on a tractor.

Some agricultural, horticultural or forestry machines (for example, ploughs and harrows) are designed solely to be hauled or pushed by a tractor, to which they are linked by a coupling device (whether or not with a lifting mechanism). Others (e.g., rotating hoes) are operated by a general-purpose power take-off on the tractor. Such machines are mounted and changed in the fields, the forest or the farm yard. All these machines remain in this heading even if they are

presented with (and whether or not mounted on) the tractor. The tractor itself is classified separately in **heading 87.01**.

The same classification principle applies where another type of hauling device is substituted for the tractor (e.g., one classified in heading 87.04), or where a rotary hoe is mounted on the driving axle of a pedestrian controlled tractor in place of the wheels, so that it acts both as an implement and as driving wheels carrying the whole.

Self-propelled agricultural, horticultural or forestry machines.

In these machines the tractive part and the machine make up one integral unit (e.g., motorised ploughs). Such machines are classified in this heading.

However, the heading **excludes** fertiliser, etc., spreading lorries which are classified with other special purpose motor vehicles in **heading 87.05**.

*
* * *

The smaller types of agricultural machines designed to be drawn or rolled by manual power (e.g., ploughs, harrows, cultivators, hoes, rollers and seeders) also fall in this heading.

*
* * *

The numerous machines of this heading include :

- (1) **Ploughs** for all soil working purposes, e.g., mouldboard ploughs (single or multi share or reversible types), sub-soil ploughs (usually without mouldboards) and disc ploughs.
- (2) **Harrows** which are mainly used for breaking up the soil after ploughing. In the **toothed harrow** the teeth are fitted to a rigid, articulated or chain-mesh framework, or sometimes to a drum or rollers. In **disc harrows** the teeth are replaced by one or more rows of concave discs with cutting edges.
- (3) **Scarifiers, cultivators, weeder and hoes** which are used for working, weeding or smoothing the soil after ploughing, or during the growth of the crops. These machines usually consist of a horizontal frame fitted with several rows of various types of tools (shares, discs, teeth, etc.), which may be rigid or springy, fixed or movable, and are sometimes interchangeable.
- (4) **Seeders, planters and transplanters**, for seed, bulbs, tubers, plants, etc., consisting of a box, hopper or other reservoir, sometimes mounted on wheels, and equipped with devices for distribution and for opening and usually re-covering the furrow.

This group includes no-till direct seeders, planters and transplanters for sowing crops without preparing the soil through tillage. They deliver seed in a measured quantity and deposit the seed into the unprepared soil by penetrating through surface mulch and plant residues, opening a narrow slot or punching a hole into soils and releasing the seed at a predetermined position and depth.

- (5) **Fertiliser distributors and manure spreaders.** Distributors for spreading manure or solid fertilisers (chemicals, dung, etc.), sometimes mounted on wheels, usually consist of containers fitted with a distributing mechanism such as sliding floor plates, a worm feed, endless chains or centrifugal discs; portable mechanical apparatus used for the same purposes are also included here.

Fertiliser distributors evenly spread synthetic fertilizer or other synthetic solid inputs over the soil. Manure spreaders distribute manure (dung) or a recycling of plant nutrients from “animal waste” over a field.

Moving-floor trailers with a chopper/distributor attachment enabling them to operate, while unloading, as muck spreaders, and slurry spreaders consisting of a wheeled container, usually equipped with spreading plates or troughs, fall in **heading 87.16**.

Portable injectors for forcing fertilising liquids into the soil, also fall in this heading. They consist of a long hollow rod, through which the fertiliser is pumped into the soil by a pump.

- (6) **Machines for clearing** scrub, undergrowth, stalks of former crops, roots, etc. They generally consist of two large wheels and a drum fitted with cutting blades.
- (7) **Stone-removing machines**, similar to a harrow but fitted with hooked teeth in two rows converging towards an openslatted container, to collect stones.
- (8) **Rollers**, mainly used to pack the soil. These include smooth, corrugated, disc, packer wheel, etc., rollers. The heading also includes rollers for gardens, lawns, sports-grounds, grass tracks, etc.
- (9) **Thinning-out machines** (e.g., beet separators) used for separating young plants. These may be very complex machines controlled by photo-electric devices.
- (10) **Machines for cutting back the tops or stalks of plants** for pruning excess growth.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading covers parts for the above-mentioned machines. Such parts include, *inter alia* :

Plough beams, coulters, shares, mouldboards, plough discs (including diamond-edged shares, discs, etc.); tools and teeth (rigid or springy) for scarifying, cultivating or weeding machines; teeth, drums and discs for harrows; cylinders, segments and parts of rollers; distributing mechanisms for fertiliser distributors, seeding, planting or transplanting machines; shares, teeth, discs and other tools for hoeing machines.

*
* *

The heading **does not include** :

- (a) Dibbers, planters, transplanters and similar hand tools (**heading 82.01**).
- (b) Liquid elevators and pumps for liquids (including hub-pumps for mounting on the wheels of agricultural machines for spraying, etc.) (**heading 84.13**).
- (c) Mechanical agricultural, horticultural or forestry appliances (whether or not hand-operated) for dispersing or spraying liquids or powders (**heading 84.24**).
- (d) Manure lifters and other agricultural, horticultural or forestry lifting machinery of **heading 84.28**.
- (e) Shovel loaders and road rollers, self-propelled (**heading 84.29**).
- (f) Earth excavating, levelling, boring or extracting machinery and non self-propelled road rollers (**heading 84.30**).
- (g) Stump removers and tree transplanters (**heading 84.36**).
- (h) Agricultural carts and vehicles (**Chapter 87**).

84.33 - Harvesting or threshing machinery, including straw or fodder balers; grass or hay mowers; machines for cleaning, sorting or grading eggs, fruit or other agricultural produce, other than machinery of heading 84.37.

- Mowers for lawns, parks or sports-grounds :

8433.11 -- Powered, with the cutting device rotating in a horizontal plane

8433.19 -- Other

8433.20 - Other mowers, including cutter bars for tractor mounting

8433.30 - Other haymaking machinery

8433.40 - Straw or fodder balers, including pick-up balers

- Other harvesting machinery; threshing machinery :

8433.51 -- Combine harvester-threshers

8433.52 -- Other threshing machinery

8433.53 -- Root or tuber harvesting machines

8433.59 -- Other

8433.60 - Machines for cleaning, sorting or grading eggs, fruit or other agricultural produce

8433.90 - Parts

This heading covers machines used in place of hand tools, for the mechanical performance of the following operations :

- (A) Harvesting of agricultural crops (e.g., reaping, croplifting, gathering, picking, threshing, binding or bundling). Hay or grass mowers, and straw or fodder balers are also included in this heading.
- (B) Machines for cleaning, sorting or grading eggs, fruit or other agricultural produce, **other than** machinery of heading 84.37.

The provisions of Explanatory Note to heading 84.32 apply, *mutatis mutandis*, to this heading, e.g., in respect of tractors fitted with harvesting, threshing, mowing or other interchangeable attachments, and in respect of motor rakes.

**(A) HARVESTING OR THRESHING MACHINERY,
INCLUDING STRAW OR FODDER BALERS;
GRASS OR HAY MOWERS**

These include :

- (1) **Lawn mowers**, whether worked by hand or motor driven. They may have a cutter bar like an agricultural mower, rotary blades which cut the grass against a fixed horizontal blade, or a rotating disc with knives on the outer edge.
- (2) **Mowers (including motormowers)** for cutting hay, etc. They usually consist of a horizontal cutter bar and sections which cut by the oscillating action of teeth between the fingers of the cutter bar, or they may consist of rotating discs or drums with knives on the outer edge.
- (3) **Mowers** equipped with a device for depositing the cut crop in rows across the field (mower-windrowers and mower-conditioners).
- (4) **Hay tedders** (e.g., with lifting forks or drums).
- (5) **Hay rakes**, usually consisting of a wheeled row of semi-circular teeth, which can be lifted automatically.
- (6) **Tedder rakes, windrower rakes, bundling rakes.**
- (7) **Pick-up balers and bale rollers**, for picking up and baling hay or straw left on the field.
- (8) **Combine harvesters**, which successively reap, thresh, clean and discharge the grain.
- (9) **Maize (corn) cutters, pickers, harvesters and shellers.**
- (10) **Self-loading trailers permanently mounted with harvesting equipment**, for cutting, chopping and transporting grass, maize (corn), etc.
- (11) **Cotton pickers.**
- (12) **Flax pickers.**
- (13) **Grape harvesters** (trailed or self-propelled).
- (14) **Vegetable harvesters** (for beans, tomatoes, etc.).
- (15) **Potato diggers** (ploughshare, fork and grill types).
- (16) **Root topping machines, root lifters and root harvesters** for beet and similar root crops.

- (17) **Forage harvesters.**
- (18) **Tree shakers.**
- (19) **Harvesting machines for other agricultural produce** (oil seeds, etc.).
- (20) **Grain threshers.** This heading also includes **automatic threshing machine feeders**, whether or not separately presented (i.e., auxiliary machines designed to ensure regular feeding of the thresher by opening and spreading out the sheaves).
- (21) **Machines for removing leaves from the maize (corn) cobs; maize (corn) threshers.**

This heading also covers lawn mowers, known as riding lawn mowers, consisting of three or four wheeled basic machines fitted with a driving seat and having a permanently attached cutter, i.e., one which is removed only for repair or maintenance. Since their principal function is the mowing of lawns, they remain in this heading even if they have a coupling device for hauling or pushing light attachments such as a trailer.

However, the heading **excludes** portable machines for trimming lawns, cutting grass along walls, borders or under bushes, for example. These machines, which are composed of a self-contained internal combustion engine in a light metal frame, or of an electric motor mounted on a metal handle, and a cutting device usually consisting of one or more thin nylon threads, are classified in **heading 84.67**.

(B) MACHINES FOR CLEANING, SORTING OR GRADING EGGS, FRUIT OR OTHER AGRICULTURAL PRODUCE

The heading also covers machines, whether of horticultural, agricultural or industrial types, used for cleaning, sorting or grading produce, such as eggs, fruit, potatoes, onions, bulbs, carrots, asparagus and gherkins, according to size, shape, weight, etc. They remain classified in the heading whether or not they are electrically operated (e.g., photoelectric testers and graders), and they may be equipped with auxiliary devices (e.g., for testing eggs or for marking the produce).

Machines for cleaning, sorting or grading seed, grain or dried leguminous vegetables are **excluded** (**heading 84.37**).

*
* *

Certain machines of the type falling in this heading (e.g., harvesters, combines, threshers, pick-up balers, baling presses, grading machines) often incorporate subsidiary lifting, handling, conveying, etc., apparatus (e.g., conveyor belts, sheaf and straw hoists and bucket-chains); these are classified with the machine, **provided** they are presented therewith; when presented separately they fall in **heading 84.28**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here, e.g., :

Cutter bars, implement lifting mechanisms and fingers for mowers or harvesters; oscillating connecting-rods for transmitting motion to cutter bars of lawn mowers or grass cutters; separators, dividers, rakes, platforms, and binding mechanisms for harvester-binders; windrow attachments; cutter boards; beaters, counter-beaters, shakers, straw ejectors, etc., for combine harvesters or threshing machines; shares, teeth, forks and other tools for potato or other root crop lifting machines; drums and forks for hay tedders; teeth, implement lifting mechanisms for rakes; pick-up rakes for gathering machines or balers.

*
* *

This heading **does not include** :

- (a) Cutting blades and blade sections for mowers (**heading 82.08**).
- (b) Sheaf, straw or bag hoists; "blower type" hay or straw elevators; bucket or pneumatic type grain elevators; agricultural cranes or other loading, lifting, handling or conveying machinery (**heading 84.26** or **84.28**).
- (c) Tree-felling or uprooting machinery and farm type straw cutters, root slicers, grain mills and egg testers (**heading 84.36**).
- (d) Machines for cleaning, sorting or grading seed, grain or dried leguminous vegetables and machinery used in the milling industry, of **heading 84.37**.
- (e) Cotton gins (**heading 84.45**).
- (f) Tobacco leaf stripping or cutting machines (**heading 84.78**).

84.34 - Milking machines and dairy machinery.

8434.10 - Milking machines

8434.20 - Dairy machinery

8434.90 - Parts

This heading covers mechanical milking machines, and other machinery, whether for farm or industrial purposes, used in the treatment of milk or for converting it into other dairy products.

(I) MILKING MACHINES

A milking machine comprises a cluster of teat-cups (each with a rubber liner) which are connected, by means of flexible tubing, on one side to a vacuum pump unit via a pulsator and on the other to a milk pail (usually of stainless metal). The pulsator, which is fixed to the lid of the milk pail, acts on the teat-cups by alternating atmospheric pressure with a comparative vacuum between the cups and the liners. The assembly formed by the teat-cup cluster, the pulsator and the milk pail is described as a “milking pail”.

In certain machines of smaller capacity, the milking pails and the vacuum pump unit may be on a common base (single or twin-pail machines).

In the machines of larger capacity, the various components are usually separate. A variable number of milking pails may be connected to the vacuum pump unit by piping. Certain types have no milk pails, the milk passing directly from the teat-cups to the cooling apparatus or storage tanks along a pipe-line, generally fixed. These types include milking robots, also known as voluntary milking systems. These systems, which incorporate all the equipment necessary for automatic milking, *inter alia*, a nimble robotic arm, electronic devices, a vacuum pump, a compressor, a washing machine, milk meters, etc., are designed for milking cows at their own initiative. Each cow wears a collar carrying a transponder that identifies it, so that the system can decide whether the animal is due to be milked. The milking is performed by a robotic arm fitted with a laser-assisted vision system that permits the milk extraction devices to be guided directly to the teats of the cow.

When presented together, the various components of such machines are classified in this heading as constituting a functional unit within the meaning of Note 4 to Section XVI (see the General Explanatory Note to that Section). **However**, apparatus and appliances which do not contribute directly to the milking function (filters, cooling devices, storage tanks, apparatus for cleaning the teat-cups and pipe-lines, etc.) are **not** classified in this heading but in their appropriate headings.

(II) MACHINES FOR PROCESSING MILK

This group includes **homogenisers**. These break up the fat into fine particles which are more readily digestible, and which also remain longer in a state of emulsion without the formation of cream.

The majority of machines for processing milk depend essentially on the principle of heat exchange and are therefore **excluded (heading 84.19)**, e.g., apparatus for pasteurisation, sterilisation or condensing or drying milk; milk coolers.

The heading further **excludes** :

- (a) Refrigerating appliances (whether or not specially designed for cooling or keeping milk) and milk-cooling vats, incorporating an evaporator of a refrigerating unit (**heading 84.18**).
- (b) Cream separators, filter-presses and other filtering or clarifying machinery or apparatus (**heading 84.21**). (Simple filter funnels and milk strainers are, however, classified according to the constituent material.)
- (c) Machines for washing milk containers, and milk bottling or canning machines (**heading 84.22**).

(III) MACHINERY FOR CONVERTING MILK INTO OTHER DAIRY PRODUCTS

It should be noted that cream separators are **excluded (heading 84.21)**. The heading does, however, cover machines used for the manufacture of butter or cheese. They include :

(A) Butter-making machines.

- (1) **Churns** usually consist of a barrel of stainless steel, inside of which are a number of partitions or blades. The barrel or the blades are rotated by motor power and the resultant beating action hardens the cream to foam and gradually converts it into butter.
- (2) **Combined churns and workers.** These machines, which are used for continuous production of butter, consist essentially of electric motors that drive cylinders with fast rotating elements which transform the cream into butter. The butter is pressed through the working elements of the machine as a continuous length.
- (3) **Machines for moulding butter** into the required commercial shapes, but **not including** machines which also wrap or weigh the product (**headings 84.22 and 84.23**).

(B) Cheese-making machines.

- (1) **Machines for breaking up and homogenising** the mixtures of curd and cream in the manufacture of soft or cream cheeses.
- (2) **Machines for moulding** hard, semi-hard and soft or cream cheeses, but **not including** machines which also wrap or weigh the product (**headings 84.22 and 84.23**).
- (3) **Cheese presses** (e.g., of the mechanical, pneumatic, etc., types) are used, especially in the manufacture of harder cheeses, both to shape the product and to eliminate the superfluous moisture.

*
* *

It should be noted that the heading **excludes** many machines and apparatus used in the dairy industry. For example, storage, maturing, processing, etc., vats and tanks whose operation depends primarily on fitted heating or cooling equipment fall in **heading 84.18 or 84.19**, whether or not they also incorporate mechanical equipment such as agitators. Vats, etc., not fitted with heating or cooling equipment, but incorporating mechanical features such as stirrers, agitators, tipping mechanisms, etc., are classified in this heading **provided** they are identifiable as specialized for dairy use. If they are not identifiable as for any one particular use, they are classified in **heading 84.79**. Vats, etc., not fitted with either thermal or mechanical equipment are classified as articles of the constituent material (e.g., **heading 73.09, 73.10, 74.19, 76.11, or 76.12**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here, e.g. :

Pails, lids, pulsators, teat-cups and fittings (**other than** rubber liners, etc. - **heading 40.16**) for milking machines; butter churn barrels; rollers and tables for butter workers; moulds for butter and cheese moulding machines.

*
* *

The heading **excludes** domestic appliances falling in **heading 82.10 or 85.09**.

84.35 - Presses, crushers and similar machinery used in the manufacture of wine, cider, fruit juices or similar beverages.

8435.10 - Machinery

8435.90 - Parts

The heading covers both agricultural and industrial type machines used for making wine, cider, perry, fruit juices or similar beverages whether or not fermented. This heading also includes machines for commercial use, of a type used in restaurants or similar establishments.

The heading includes, *inter alia* :

- (A) **Juice extracting machines**, hand or power operated, for juices not intended for fermentation (e.g., juices of citrus fruit, peaches, apricots, pineapples, berries or tomatoes).
- (B) **Apple or pear crushers**, hand or power operated. They consist of a hopper which feeds fruit to the grating mechanism or crushing cylinders.
- (C) **Mechanical or hydraulic cider presses**, including "mobile" presses mounted on wheeled trolleys.
- (D) **Grape pressing or crushing machines**, e.g. :
 - (1) **Grape crushing machines**. These usually consist of two grooved cylinders, or of a single cylinder fitted with beaters, which extract the juice from the grapes without crushing the seeds or stems. The heading includes pulping machines incorporating a pump to feed the resultant juices into the fermenting vats.
 - (2) **Machines for separating the juice (must) from the stems of the freshly pressed grapes**. These generally consist of a perforated container fitted with revolving beaters. Some models combine the **operations** of pressing and stemming.
 - (3) **Presses** used to extract the juice remaining in the crushed and strained grape pulp, or from the fermenting vat residues. There are two main types :
 - (i) **Discontinuous mechanical or hydraulic presses** in which the press head crushes the pulp in an interchangeable lattice-work cage (the "claire") supported in a container to collect the juice. The heading includes hydraulic portal presses designed so that a succession of containers ("maies"), usually mounted on trolleys, can be filled with juice.
 - (ii) **Continuous presses** in which an endless screw mechanism feeds the grapes into the machine and presses them.

- (E) **Crumbling or disintegrating machines** fitted with toothed cylinders or revolving blades which break up cakes of compressed marc before further pressing.

Machines used for the processing of juice, must, wine, cider and perry are **excluded**, for example :

- (a) Coolers, sterilisers, pasteurisers and concentrating apparatus (**heading 84.19**).
- (b) Centrifuges, filter presses and other filtering or clarifying machinery or plant (**heading 84.21**).
(Simple filter funnels are, however, classified according to the constituent material.)

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here, e.g., :

Crushing cylinders for juice extractors; toothed cylinders and graters for apple crushers; cylinders for grape pressing or stemming machines; special pulp containers ("claires") and press base plate juice collectors ("maies") for wine presses; screw heads, pressing plates and frames for wine presses, etc.; toothed cylinders and blades for marc crumbling machines, etc.

*
* * *

The heading also **excludes** :

- (a) Fruit juice extractors of the types falling in **heading 44.19, 82.10 or 85.09**.
- (b) Wine, fruit juice, cider, etc., pumps, even if specialized (**heading 84.13**).
- (c) Centrifuges for separating the wine from the marc (**heading 84.21**).
- (d) Bottling, corking or other machinery falling in **heading 84.22**, including steam jet appliances for cleaning barrels, etc.
- (e) Conveyors for fruit (**heading 84.26 or 84.28**).
- (f) Fruit peeling, paring or stoning machines (**heading 84.38**).

84.36 - Other agricultural, horticultural, forestry, poultry-keeping or bee-keeping machinery, including germination plant fitted with mechanical or thermal equipment; poultry incubators and brooders.

8436.10 - Machinery for preparing animal feeding stuffs

- Poultry-keeping machinery; poultry incubators and brooders :

8436.21 -- Poultry incubators and brooders

8436.29 -- Other

8436.80 - Other machinery

- Parts :

8436.91 -- Of poultry-keeping machinery or poultry incubators and brooders

8436.99 -- Other

The heading covers machinery, **not falling in headings 84.32 to 84.35**, which is of the type used on farms (including agricultural schools, co-operatives or testing stations), in forestry, market gardens, or poultry-keeping or bee-keeping farms or the like. However, it **excludes** machines clearly of a kind designed for industrial use.

(I) OTHER AGRICULTURAL, HORTICULTURAL OR FORESTRY MACHINERY; GERMINATION PLANT

These include :

(A) **Seed dusting machines** usually consisting of one or more hoppers feeding a revolving metal drum in which the seeds are coated with insecticidal or fungicidal powders.

However, the heading **excludes** powder spraying machines (**heading 84.24**).

(B) **Fertiliser crushing or mixing mills.**

(C) **Machines for cutting slips** from vines, fruit trees, etc.

(D) **Hedge cutting machines.**

(E) **Machines and appliances for preparing fodder**, etc., such as :

(1) **Oilcake breakers.**

(2) **Cabbage-cutters** and other machines for chopping green-leaf vegetables.

(3) **Root slicers or crushers** for beet, turnips, carrots, fodder, etc.

- (4) **Straw, hay or silage cutters**, whether or not incorporating a conveyor for filling the silo.
 - (5) **Crushing machines** for preparing oats, barley, etc.
 - (6) **Farm type machines for grinding or milling** wheat, maize, barley and other feeding stuffs; **farm type flour-milling machines**.
 - (7) **Fodder mixers**.
 - (F) **Automatic watering-troughs** for cattle, horses, pigs, etc., e.g., those consisting of a metal basin fitted with a hinged plate which, when depressed by the animal's muzzle, permits an inflow of water.
 - (G) **Mechanical clippers** for animals.
Ordinary hand hair clippers are **excluded** (**heading 82.14** or **85.10**).
 - (H) **Forestry machines**, such as :
 - (1) **Tree uprooters**, equipped with jaws which grip the trunk and uproot it by the action of hydraulic jacks.
 - (2) **Tree-felling machines** with hydraulic shears or saws, whether or not equipped with delimiting and bucking devices or with grapples for handling and piling the trunks, and tree-fellers designed for mounting on tractors, operating by means of a plough which cuts the roots and a telescoping boom which amplifies the tractor power.
 - (3) **Tree transplanters**, equipped with root-balling blades and capable, if necessary, of transporting the trees over short distances.
 - (4) **Stump removers** which break up stumps to a certain depth below the surface by means of knived discs.
 - (5) **Machines for chipping branches, twigs, etc.**, following pruning, delimiting, etc., using chipping blades. The chips are discharged by a blower unit.
 - (IJ) **Germination appliances** (e.g. "germinators") provided they are fitted with mechanical features (e.g., pumps, motors or fans) or thermal equipment. Simple chests not so equipped are **excluded** (classified according to the constituent material).
- The heading **does not cover** :
- (a) Cutting blades and knives for root slicers, straw cutters, etc. (**heading 82.08**).
 - (b) Machinery and plant operating by processes involving a change of temperature (**heading 84.19**). For example, **heading 84.19** covers such hay driers, autoclaves for potatoes, fodder, etc., but germination plant, incubators and brooders with thermal equipment remain in this heading.
 - (c) Mechanical appliances for projecting, dispersing or spraying liquids or powders (**heading 84.24**).

- (d) Pneumatic or "blower" type elevators; winches for uprooting, dragging or loading trees, logs, etc.; and other hoisting, handling or conveying equipment (**heading 84.25, 84.26 or 84.28**).
- (e) Machines for boring holes for planting trees; bulldozers and angledozers for felling or clearing (**heading 84.29 or 84.30**).
- (f) Industrial type sugar beet slicing machines (**heading 84.38**).
- (g) Wood chip cutting machines of **heading 84.39**.
- (h) Water-jet bark strippers (**heading 84.24**) and wood de-barking machinery (**heading 84.65 or 84.79**).
- (ij) Machine-tools for working wood (**heading 84.65 or 84.67**).
- (k) Vacuum cleaner type grooming apparatus for horses or cattle (**heading 85.08**).
- (l) Tractors specially designed for hauling logs (log skidders) (**heading 87.01**).
- (m) Mechanical calving aids (**heading 90.18**).
- (n) Anti-hail guns (**heading 93.03**).

(II) POULTRY-KEEPING MACHINES, INCUBATORS AND BROODERS

These include :

- (A) **Incubators.** These machines are fitted with devices permitting eggs, placed in trays, to be automatically turned in an atmosphere where temperature, air flow and air humidity conditions can be exactly controlled. They may work in conjunction with a control system which may be linked to a personal ADP machine in order to optimise the incubation result. Some incubators, known as combi-incubators, incorporate hatcher functions.
- (B) **Hatchers.** In these machines, which incorporate devices for controlled heating and air circulation, the eggs are placed in baskets or special trays for hatching.
- (C) **Brooders**, larger appliances with heating and cooling devices, used for rearing young chicks.
- (D) **Rearing and laying units or "batteries"**, large installations equipped with automatic devices for filling the feeding troughs, cleaning the floors and collecting the eggs.
- (E) **Egg canders (or testers)** with mechanical features (including photo-electric testers), **other than** static testing lamps.

Those fitted with a sorting or grading mechanism are **excluded (heading 84.33)**.

- (F) **Sexing and vaccination equipment**, enabling hatcheries to separate chicks of different sex and to vaccinate them. These machines are not designed to be used by veterinary surgeons.

The heading **does not include** machines, known as chick counting and boxing systems, for automatically counting and placing chicks in boxes (**heading 84.22**); the handling of the chicks is the primary function, the counting being merely a secondary function permitting to place in a box a fixed number of chicks, predetermined in accordance with the size of the box.

(III) BEE-KEEPING MACHINES

These include:

- (A) Honey presses.**
- (B) Machines for forming wax into comb foundations.**

The heading **does not cover** :

- (a) Beehives, classified according to the constituent material (usually **heading 44.21**).
- (b) Hot water baths for re-melting honeycombs, including those with pressing screws (**heading 84.19**).
- (c) Centrifugal type honey extractors (**heading 84.21**).
- (d) Liquid or powder sprayers or smoking-out apparatus of **heading 84.24**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts for the above-mentioned machines.

84.37 - Machines for cleaning, sorting or grading seed, grain or dried leguminous vegetables; machinery used in the milling industry or for the working of cereals or dried leguminous vegetables, other than farm-type machinery.

8437.10 - Machines for cleaning, sorting or grading seed, grain or dried leguminous vegetables

8437.80 - Other machinery

8437.90 - Parts

**(I) MACHINES FOR CLEANING, SORTING OR GRADING SEED,
GRAIN OR DRIED LEGUMINOUS VEGETABLES**

This heading covers machines, whether of horticultural, agricultural or industrial types, of a kind used for cleaning, sorting or grading cereal grains, dried leguminous vegetables, seeds, etc., by winnowing, blowing, sieving, etc. Such machines include :

- (1) **Fanning mills** consisting of a feeding hopper, a blower and sieves (usually vibrating).
- (2) **Grading winnowers, rotating winnowers and seed or grain selectors**, more complex machines which clean by means of air currents, and grade the seed or grain according to weight, size or shape. Some seed selectors, etc., incorporate auxiliary devices for coating the seeds with insecticide powders, etc.
- (3) **Sieving belts**, often used for cleaning beet seed. They consist of a series of rolls operating an endless inclined belt running under a feeding hopper. The seeds roll freely to the bottom of the belt but the light vegetable waste adheres to the plushy surface of the belt fabric.
- (4) **Special machines for selecting and grading seed for planting.**

This heading also covers machinery used in the milling industry for cleaning, sorting or grading grain prior to milling. Some of these machines are based on the same principles as the winnowing, screening and grading machines described above, but are designed for larger output and are specialised for the milling industry, e.g. :

- (1) **Cyclone separators** for cleaning the grain.
- (2) **Machines for cleaning and grading** by the action of revolving pocketed or perforated drums.
- (3) **Aspirator separators** with oscillating sieves.

- (4) **Separators and graders** of the magnetic or electro-magnetic types.
- (5) **Washing, stone-removing and “ whizzing ” machines**, with or without subsidiary drying columns.
- (6) **Grain brushing machines**.
- (7) **Grain dampening machines**, whether or not incorporating heating or weighing apparatus.

The heading also includes combined machines which clean, sort and grade simultaneously, including machines incorporating devices for electro-magnetic separation.

(II) MACHINERY USED IN THE MILLING INDUSTRY

In addition to machinery for cleaning, sorting or grading grain prior to milling (see Part (I) above), the following are included as machinery used in the milling industry :

(A) Certain machines for mixing or preparing grain prior to milling, e.g. :

- (1) **Machines for mixing grain** in pre-determined quantities.
- (2) **Grain scouring machines** consisting of spiked drums turning against rubber cylinders and thus eliminating the softer grains.

However, the heading **does not cover** :

- (a) Plant operating by temperature change (**heading 84.19**). For example, **heading 84.19** covers such drying or cooling columns, but grain dampening machines with thermal equipment remain in this heading.
- (b) Centrifugal dryers (**heading 84.21**).
- (c) Conveyors and elevators (e.g., of the bucket, belt or pneumatic suction types) (**heading 84.28**).

(B) Grinding or crushing machinery, e.g. :

- (1) **Grinding mills**.
- (2) **“ Breaking ” rolls or mills** composed of several sets of grooved rollers, sometimes internally cooled, which crush the grain into middlings, semolina and flour.
- (3) **Reduction rolls or mills** with smoother rollers, specially designed to convert middlings, semolina, etc., into flour.
- (4) **Disintegrators or impact grinders** used to grind down into flour, the meal, etc., which adheres to the mill or converter rollers in the preceding processes.
- (5) **Feeders**, machines designed to ensure a regular and even flow of grain to the crushing rollers.

The heading **does not include** small farm type grinding mills (**heading 84.36**).

(C) Machinery for the sorting or separation of flour from sharps or middlings.

This group includes machines for separating the flour, meal, middlings, sharps, etc., produced by milling.

This separation is effected by a series of operations carried out on the following types of machines which are often used in series :

- (1) **Sifting machines** ("bolters") for separating flour from groats and meal. **Centrifugal sifters** (or "reels") consist of drums fitted internally with beater bars and covered externally with gauze of various mesh sizes. **Oscillating sifters** or **plansifters** consist of nests of free-swinging superimposed sieves and collecting trays.
- (2) **Sieving machines** or "purifiers". These grade the middlings, etc., and also blow off the bran by means of vibrating sieves through which a current of air is drawn.
- (3) **Bran cleaners**.
- (4) **Blending machines** for flour, bran, etc.; also **machines for adding vitamins to flour**.

However, the heading **does not cover** :

- (a) Flour-drying machines (**heading 84.19**).
- (b) Air filters and "cyclones" used to extract the dust from the exhaust air issuing from sorting or bolting machines (**heading 84.21**).
- (c) "Extraction recorders" for recording the flour extraction rate, and other flour testing apparatus of **Chapter 90**.

**(III) MACHINERY USED FOR THE WORKING OF CEREALS
OR DRIED LEGUMINOUS VEGETABLES**

The working referred to is generally preceded by preliminary cleaning, sorting or grading (see Part (I) above).

This group includes :

- (1) **Machines for husking cereals or dried leguminous vegetables**.
- (2) **Rice hulling or polishing machines**.
- (3) **Machines for splitting dried peas, lentils or beans**.
- (4) **Machines for preparing rolled or flaked oats, etc., whether or not incorporating auxiliary heating devices**.
- (5) **Special milling and grinding machines for milling cereals (other than bread grains, see Part (I) (B) above) or dried leguminous vegetables into flour**.
- (6) "**Bearding**" machines and "**clipping**" machines designed to remove the "beards" or "points" from barley or oat grains.

This part of the heading **does not cover** :

- (a) Machinery or plant operating by heat exchange (e.g., steamers, drying apparatus or roasting plant for the manufacture of puffed or toasted grain; plant for malting barley, for roasting flour, etc.) (**heading 84.19**).
- (b) Machines for processes beyond the flour-making stage (e.g., bakery, preserving or macaroni-making) (**heading 84.38**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here, e.g., :

Sieves and sieve frames for the bread grain milling industry (**other than** bolting cloth, whether or not made up – **heading 59.11**); mixing or separating cylinders, rollers for bread grain mills, or converters, etc.

Millstones are, however, **excluded** (**heading 68.04**).

84.38 - Machinery, not specified or included elsewhere in this chapter, for the industrial preparation or manufacture of food or drink, other than machinery for the extraction or preparation of animal or fixed vegetable fats or oils.

- 8438.10 - Bakery machinery and machinery for the manufacture of macaroni, spaghetti or similar products
- 8438.20 - Machinery for the manufacture of confectionery, cocoa or chocolate
- 8438.30 - Machinery for sugar manufacture
- 8438.40 - Brewery machinery
- 8438.50 - Machinery for the preparation of meat or poultry
- 8438.60 - Machinery for the preparation of fruits, nuts or vegetables
- 8438.80 - Other machinery
- 8438.90 - Parts

This heading covers machinery, not specified or included elsewhere in this Chapter, for the industrial preparation or manufacture of food or drink (whether for immediate consumption or preserving, and whether for human or animal consumption), but **not including** machinery for the extraction or preparation of animal or fixed vegetable fats or oils (**heading 84.79**). This heading also includes machines for industrial or commercial use, of a type used in restaurants or similar establishments.

It should, however, be noted that in practice the heading **excludes** many machines used for these purposes, e.g., :

- (a) Domestic appliances (e.g., meat mincing machines and bread cutting machines) falling in **heading 82.10** or **85.09**.
- (b) Industrial or laboratory ovens (**heading 84.17** or **85.14**).
- (c) Cooking, roasting, steaming, etc., machinery and plant (**heading 84.19**).
- (d) Centrifuges and filters (**heading 84.21**).
- (e) Bottling, canning, packing, etc., machinery (**heading 84.22**).
- (f) Machinery for the milling industry (**heading 84.37**).

(I) BAKERY MACHINERY

Such machinery is used for the manufacture of bread, biscuits, pastries, cakes, etc. It includes :

- (1) **Dough or pastry mixers.** These consist essentially of rotating or stationary receptacles equipped with fixed or moving arms or blades for kneading the dough. Certain high speed mixers are often fitted with water-cooled jackets.
- (2) **Dough-dividing machines** consist of receptacles in which the dough, delivered through a hopper, is divided mechanically into portions of equal size. These machines sometimes incorporate devices for weighing or rolling the dough.
- (3) **Moulding machines** for forming the portions of divided dough to the required shapes ready for baking.
- (4) **Slicing machines** for bread, cake, etc.
- (5) **Machines designed for " crumbing " dry bread.**
- (6) **Cutting, shaping, sawing or filling machines** for biscuits, cakes, etc.
- (7) **Cake depositing machines** designed to deliver given quantities of cake batter into cake shapes.

The heading **excludes** :

- (a) Bakery ovens (**heading 84.17 or 85.14**).
- (b) Pastry rolling machines of **heading 84.20**.

(II) MACHINERY FOR THE MANUFACTURE OF MACARONI, SPAGHETTI, OR SIMILAR PRODUCTS

This group includes :

- (1) **Mixing machines** for preparing macaroni paste.
- (2) **Machines for cutting or stamping out** special shapes from the rolled pastry in sheet form. These machines often incorporate devices for rolling the pastry.
- (3) **Continuous extruding presses** for macaroni, spaghetti, etc. Letters, figures and other special shapes can be produced with extruding machines equipped with suitably shaped dies; the dough is then cut off to the desired thickness by a revolving knife fitted on the outside of the dieplate.
- (4) **Machines for filling ravioli, etc.**
- (5) **Machines for twisting** macaroni, vermicelli, etc., in hanks, etc.

The heading **excludes** :

- (a) Macaroni pre-drying or drying machines (**heading 84.19**).
- (b) Machines for rolling macaroni dough, pastry, etc., into sheet form (**heading 84.20**).

(III) MACHINERY FOR THE MANUFACTURE OF CONFECTIONERY

This group includes :

- (1) **Grinding or crushing machines** for the preparation of icing sugar.
- (2) **Confectionery mixing machines.** These usually consist essentially of receptacles fitted with mechanical stirrers or grinders, and are often fitted with heating or cooling coils or jackets.
- (3) **“ Pulling ” machines** used for kneading plastic sugar mixtures by means of crank-shaped revolving arms.
- (4) **Dragee pans.** These consist of hemispherical pans, usually of copper or glass, which rotate on an inclined axis and thus coat hard centres (e.g., almonds) with sugar, chocolate, etc. The heading covers such dragee pans whether they are heated from an external source (hot air blast, independent gas burner, etc.), or whether the pans themselves incorporate heating elements.
- (5) **Machines designed for moulding, cutting or shaping confectionery.**

This heading **does not include** sugar boilers or other heating plant (**heading 84.19**) or cooling plant (**heading 84.18 or 84.19**).

(IV) MACHINERY FOR THE MANUFACTURE OF COCOA OR CHOCOLATE

This group includes :

- (1) **Machines for husking, for removing the germ, or for crushing the roasted beans into “ nibs ”.**
- (2) **Machines for mixing, kneading or grinding** the crushed beans and resultant paste to give the “ cocoa mass ”.
- (3) **Presses for extracting cocoa butter** from the “ cocoa mass ”. These machines always incorporate provision for heating the paste to facilitate the butter extraction.
- (4) **Machines for preparing cocoa powder** by grinding the cakes left after cocoa butter extraction. Normally these machines also sieve and grade the powder, and sometimes mix it with other products to improve the aroma or solubility.
- (5) **Machines for mixing** cocoa butter, cocoa powder, sugar, etc. These machines often incorporate apparatus for measuring the quantities to be mixed.
- (6) **Machines for rolling and refining** the mixture.
- (7) **Conches.** These consist essentially of containers fitted with heating equipment and power driven rollers, grinders, etc., so that the constituents of the mixture are thoroughly intermingled and heat-treated.

- (8) **Machines** which, **prior to moulding, homogenise the chocolate** and deliver it in regular portions by pressure and extrusion.
- (9) **Tabletting and moulding machines**, usually incorporating vibrator devices. These machines also often contain heating elements in the pouring section, and provision for cooling the moulds.
- (10) **Enrobing machines** consist essentially of a conveyor belt on which biscuits, sweets or other centres are coated by passing them through sprays or molten baths of chocolate or confectionery. These machines always incorporate heating elements.

(V) MACHINERY FOR SUGAR MANUFACTURE

The type of machinery used for extracting the sugar juices depends on whether sugar cane or sugar beet is employed. The machines used for extracting the sugar from the juice are, however, much the same in each case.

(A) **Machines for extracting the juice from sugar cane**, e.g. :

- (1) **Cutters or defibrators**, consisting of a series of double-edged knives which revolve at high speed and thus reduce the cane to long fibres.
- (2) **Shredders** in which the cane is passed between toothed rollers revolving at different speeds and is thereby torn to shreds.
- (3) **Crushers**, which consist essentially of adjustable, corrugated metal rollers. Some machines combine the operations of shredding and crushing.
- (4) **Roller mills**, which usually consist of trains of grooved rollers for extracting the juice from the crushed cane. They normally incorporate feeding and conveyor mechanisms, equipment for spraying water on to the cane during rolling, and maceration baths.

(B) **Machines for extracting the juice from sugar beet**, e.g. :

- (1) **Washing machines** consisting of agitators or similar mechanisms operating in large channels, tanks, etc.
- (2) **Slicing machines**. These may be large cylindrical vessels whose bases consist of rotating discs fitted with cutting blades, or of rotating drums whose inner surfaces are fitted with knives against which the beet is projected, by specially designed guide plates or by centrifugal force.

(3) **Diffusing apparatus** for extracting the juice from the sliced beet by osmosis. Each diffusor consists of a "calorisator" in which the water is heated by a steam coil, and a large diffusor vessel in which the sugar is extracted from the beet chips by the hot water. The heading also covers the diffusor vessel presented separately. The "calorisator" presented separately is, however, excluded (**heading 84.19**).

(4) **Pulp presses.**

(C) **Machines for extracting the sugar from the juice, or for refining the sugar, e.g. :**

(1) **Sulphiting vessels, provided** they incorporate mechanical agitators, but **not including** those with thermal equipment (**heading 84.19**)

(2) **Crystallising apparatus** fitted with slow stirring devices. The syrupy mass ("masse cuite") from the concentration plant is here cooled by the surrounding air, and the crystallisation begun in that plant is completed.

(3) **Machines for sawing or breaking sugar** into lumps, etc.

The heading **excludes** :

- (a) Defecation vessels, juice concentration plant, vacuum boiling or crystallising pans and other plant of **heading 84.19**.
- (b) Centrifugal separators and filter presses (**heading 84.21**).

(VI) BREWERY MACHINERY

This group includes :

- (1) **Sprouting or germination machines** fitted with slow stirring devices, rotating drums or similar mechanical features.
- (2) **Rotating cylinders** for removing the shoots from the malt after kilning and **screening machines**.
- (3) **Malt crushing machines.**
- (4) **Mashing vats provided** they contain mechanical agitators, etc., and no heating equipment. In these the crushed malt is mashed with water so that the starch content is converted into sugar (saccharification).
- (5) **Straining vats**, large containers fitted with stirrers or agitators, and with a perforated double bottom to separate the brewers' grains from the wort.

The heading also includes, as functional units within the meaning of Note 4 to Section XVI, brewhouse machinery, comprising, *inter alia*, sprouting or germination machines, malt crushing machines, mashing vats, straining vats. Auxiliary appliances (e.g., bottling machines, label-printing machines) are, however, **not included** and should be classified in their own appropriate heading (see the General Explanatory Note to Section XVI).

The heading **excludes** :

- (a) Fermenting vats without mechanical or cooling equipment; these are classified according to the constituent materials.
- (b) Malt drying plant; macerating vessels and mashing vats with heating equipment; vessels for the decoction of the hops, or for boiling the hop decoction with the wort (**heading 84.19**); fermenting vats with cooling coils and beer coolers (**heading 84.18** or **84.19**).
- (c) Filter presses (**heading 84.21**).

(VII) MACHINERY FOR THE PREPARATION OF MEAT OR POULTRY

This group includes :

- (1) **Machinery for the slaughter and subsequent treatment of animals.**
- (2) **Hog de-hairing machines.** These consist of a revolving cradle which holds the carcass, and of a number of belt scrapers turning in the opposite direction to the cradle.
- (3) **Meat cutting or chopping machines** for cutting up carcasses, etc., by the action of circular saws, rotating knives, etc.
- (4) **Machines for sawing or chopping bones.**
- (5) **Meat beating machines** to make the flesh more tender by the action of pointed or bladed combs which sever the nerve fibres.
- (6) **Meat mincing or dicing machines.**
- (7) **Gut cleaning machines.**
- (8) **Sausage stuffing machines.** These consist essentially of a cylindrical container from which the meat is forced by a piston into the sausage casing.
- (9) **Meat or bacon slicing machines.**
- (10) **Meat or fat moulding presses.**

- (11) **Machines and appliances for killing, plucking or drawing poultry** (electric stunning and bleeding knife, high-output poultry pluckers, eviscerating apparatus, gizzard strippers and lung extractors).
- (12) **Meat pickling machinery** comprising hand-operated brine injection guns connected to a pump, or a fully automatic conveyor device which feeds the meat to a grid consisting of brine injection needles.

The heading **excludes** boilers, autoclaves, heating cupboards and similar plant or machinery of **heading 84.19**.

(VIII) MACHINERY FOR THE PREPARATION OF FRUITS, NUTS OR VEGETABLES

This group includes :

- (A) **Peeling machines**, e.g. :
 - (1) **Abrasive peelers (e.g. for potatoes)**, consisting of a rotating container with abrasive inner walls.
 - (2) **Peelers (e.g., for apples and pears)** in which adjustable knives remove the peel in spirals. These machines often also incorporate devices for coring, removing pips, etc.
 - (3) **Peelers for citrus fruit**. These usually remove the peel in quarters or scoop the fruit from the peel of fruit previously cut into halves.
 - (4) **Chemical peelers**. These usually consist of a conveyor band or rotating drum on which the fruit or vegetables are passed through sprays or baths of hot water, lye, etc. The fruit or vegetables are then vigorously tumbled in a washer vessel to remove the skins. These peelers are classified in this heading whether or not they incorporate provision for heating the water or lye.
- (B) **Machines for shelling peas or similar vegetables**. These usually consist of a revolving perforated drum fitted with beaters.
- (C) **Machines for cutting off the ends of green beans**.
- (D) **Machines for removing the stalks, etc., from currants, gooseberries, cherries, grapes, etc.**
- (E) **Machines for removing the stones, pips, etc., from fruit**.
- (F) **Machines for shelling nuts, etc.**
- (G) **Machines for grating or cutting fresh or dried fruit, vegetables, manioc, etc.**
- (H) **Machines for cutting or salting cabbage for sauerkraut**.
- (IJ) **Machines for pulping fruit or vegetables** for the preparation of jams, sauces, tomato purée, etc., but **not including** presses for fruit juices (e.g., peaches, grapefruit and tomatoes) (**heading 84.35**).

The heading **excludes** :

- (a) Flame or radiant heat peelers (**heading 84.17**).
- (b) Fruit blanching plant, heating plant for the preparation of potato flakes and other plant of **heading 84.19**.
- (c) Fruit or vegetable grading machines (**heading 84.33**).

(IX) MACHINES FOR PREPARING FISH, SHELL FISH, ETC.

This group includes :

- (1) **Machines for scaling, skinning, gutting or for removing heads, tails, bones, etc.**
- (2) **Machines for opening the fish, slicing or cutting it into fillets, etc.**
- (3) **Machines for shelling or cutting up shell fish.**
- (4) **Grinding machines** for preparing fish flour from dried fish.

The heading **does not cover** frying, smoking or curing plant, or other machinery or plant of **heading 84.19**.

(X) OTHER MACHINERY FOR THE INDUSTRIAL PREPARATION OR MANUFACTURE OF FOOD OR DRINK

This group includes :

- (1) **Mechanical appliances for acetification** (used in vinegar-making).
- (2) **Coffee bean husking or hulling machines** (cylinder, disc or blade types).
- (3) **Extracting machines**, of the spiked roller type, for extracting the essential oil from oranges.
- (4) **Tea-leaf cutting or rolling machines.**

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the parts of the machinery of this heading are also classified here (for example, moulds (pans) used in continuous process bread-making, moulds for confectionery moulding machines, moulds for chocolate moulding machines and extrusion dies, of bronze or brass, for use in extruding presses for the manufacture of macaroni, spaghetti, or similar products).

84.39 - Machinery for making pulp of fibrous cellulosic material or for making or finishing paper or paperboard.

8439.10 - Machinery for making pulp of fibrous cellulosic material

8439.20 - Machinery for making paper or paperboard

8439.30 - Machinery for finishing paper or paperboard

- Parts :

8439.91 -- Of machinery for making pulp of fibrous cellulosic material

8439.99 -- Other

This heading covers machinery for making fibrous cellulosic pulp from various cellulosic materials (wood, straw, bagasse, waste paper, etc.) whether the pulp is for paper or paperboard making or for other purposes (e.g., for the manufacture of viscose rayon, certain building boards or explosives). It also covers machinery for making paper or paperboard whether from previously prepared pulp (e.g., mechanical or chemical wood pulp), or directly from the raw materials (wood, straw, bagasse, waste paper, etc.). The heading also covers machines for finishing the paper or paperboard ready for its various uses, **other than** the printing machines of heading 84.43.

(I) MACHINERY FOR MAKING PULP OF FIBROUS CELLULOSIC MATERIAL

This group includes :

(A) **Machines for the preliminary treatment of the raw materials in the process of pulp making**, e.g. :

- (1) **Waste paper or paperboard pulping machines.**
- (2) **Openers or dusters for straw and similar materials.**
- (3) **Bamboo crushers and special straw cutters for the paper-making industry.**
- (4) **Wood chip cutting machines and vibrating graders for grading the wood chips.**
- (5) **Log grinding machines.**
- (6) **“ Masonite ” defibrators** in which wood chips are reduced to fibres by subjection to high pressure followed by a sudden reduction of the pressure.

(B) **Strainers.** In these the dilute pulp passes through screens leaving behind any fibres insufficiently ground and any knots, lumps, dirt, etc. Those operated by centrifugal action, however, are **excluded (heading 84.21)**.

(C) **Wet lappers (presse-pâte machines).** In these the pulpy mass of wood fibres, whether from the mechanical grinders or from the chemical digesters, is concentrated and formed into sheets.

- (D) **Refiners.** These usually comprise a cone shaped case with internal revolving bars which break up any large fibres or lumps and allow the stock that is already sufficiently beaten to pass straight through.
- (E) **Crushers and grinders** which treat previously prepared paper pulp with a view to producing a cellulosic pulp specially constituted for a particular application (for example, preparation of nitrocellulose).

(II) MACHINERY FOR MAKING PAPER OR PAPERBOARD

This group includes :

- (A) **Machines for forming the stock into continuous sheets of paper or paperboard (e.g., Fourdrinier machines or twin wire machines).** These are very complex machines. They consist of regulators for feeding the stock to the head box, a slice at the output end of the head box for distributing the stock onto an endless band, usually a woven fabric of synthetic monofilaments, supported on a breast roll or a forming roll, foils, table rolls, shake mechanism, suction boxes, dandy rolls for watermarking, couch rolls for increasing the dry solids content and consolidating the paper, press rolls forming at least one press nip, one press roll may include a press shoe and a surrounding, rotatable belt loop, in which the paper is pressed against one or between two endless felt belts or other process belts, drying rolls, steam boxes, etc., and usually also calender rolls and reeling devices, etc.
- (B) **Vat machines.** These are similar in principle to those at (A) but, instead of the pulp flowing out on to an endless band of wire cloth, it is picked up from a vat on a revolving cylinder of wire cloth from which it is transferred to a felt band and then on to press rolls (sometimes of the suction type) and finally to a series of drying cylinders. The paper or paperboard is produced either in the form of continuous web or in sheets. In certain of these machines, sheets of paperboard are formed by the layer of pulp winding round and round a cylinder. When a sufficient thickness is built up, it is cut off in the form of sheets, either by hand or mechanically along the length of the cylinder.
- (C) **Machines for the manufacture of multi-layered paper, board or paperboard.** These machines consist of different combinations of Fourdrinier formers or twin wire formers. The different web layers are produced simultaneously and are joined in a humid state in the machine, as a rule without a binder.
- (D) **Sample drawing apparatus for making paper samples intended for testing.** These machines are sometimes called "sample drawing machines" for controlling manufacture.

(III) MACHINERY FOR FINISHING PAPER OR PAPERBOARD

This group includes :

- (A) **Reeling machines.** Some of these at the same time stretch and smooth the paper and discharge any static electricity.

- (B) **Machines (other than calenders) for applying various kinds of surface coatings**, inorganic or organic pigment layers, size, gum, silicon, wax, etc.; for coating carbon papers or photographic papers; for coating paper with textile dust, cork or mica powder, etc., for wallpapers.
- (C) **Machines for impregnating paper or paperboard** with oil, plastics, etc., and machines for making bituminised or tarred roofing papers.
- (D) **Ruling machines** working by means of small discs or steel pens fed from an ink bath, but not printing machines of **heading 84.43**.
- (E) **Crêping machines**. These normally consist of a metal scraper or doctor which scrapes the paper from a **heated** cylinder, so that crinkling of the paper occurs. However, crêping is usually carried out in the papermaking machine.
- (F) **Machines for humidifying paper** (also called “paper conditioners”) in which the entire surface of the paper or paperboard is exposed to humid air.
- (G) **Machines for graining and embossing** (however, calenders used for the same purpose fall in **heading 84.20**).
- (H) **Corrugating machines**, may be combined with a laminating device.

*
* * *

Certain paper-finishing machines (e.g., for coating, laminating or reeling), may also be suitable for use in the working of metal foil, plastic sheets, woven fabric, etc., but they remain in this heading **provided** they are of a type mainly used for paper or paperboard.

Composite machines of this heading sometimes incorporate certain machines falling in other headings of the Chapter (e.g., filters for recovery of fibres and loading material from waste waters (**heading 84.21**), calenders of all kinds (for smoothing, glazing, embossing, etc.) (**heading 84.20**), paper cutting machines (**heading 84.41**)). **Provided** they are presented together, such component machines are classified with the composite machines in this heading, but if presented separately they are classified in their respective headings.

The heading also **excludes** :

- (a) Boilers for rags, straw, etc.; boilers (digesters) for the preparation of chemical wood pulp; steam heated cylinder and other drying machines (**heading 84.19**).
- (b) Water-jet bark strippers (**heading 84.24**) and wood de-barking machinery (**heading 84.65 or 84.79**).
- (c) Printing machines (**heading 84.43**).
- (d) Rag pickers, pulling or garnetting machines (**heading 84.45**).
- (e) Machines for the manufacture of vulcanised fibre (**heading 84.77**).
- (f) Machines for coating abrasives on to paper, cloth, wood, etc. (**heading 84.79**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machinery of this heading are also classified here, e.g.:

Backfalls; bedplates and beater bars for beaters; couch rolls; suction boxes; cylinders for vat machines; dandy rolls.

The following are **not**, however, regarded as parts of this heading :

- (a) Endless belts of textile materials, for Fourdrinier machines and twin wire machines, and felt roller covers (**heading 59.11**).
- (b) Edge-runner stones, grinding stones, bedplates and backfalls and other parts of basalt, lava or natural stone (**heading 68.04** or **68.15**).
- (c) Endless belts of woven copper or bronze wire (e.g., Fourdrinier wire) (**heading 74.19**).
- (d) Machine knives and cutting blades (**heading 82.08**).
- (e) Calender rolls (**heading 84.20**).

84.40 - Book-binding machinery, including book-sewing machines.

8440.10 - Machinery

8440.90 - Parts

This heading covers machines used in the manufacture of books (including booklets, brochures, periodicals, writing-books and the like).

The heading includes :

- (1) **Leaf-folding machines for book-binding.** These fold large sheets of paper a number of times to give a size suitable for pages. They remain here even if they can also be used for other folding operations.
- (2) **Stapling machines and wire-stitching machines,** including those also usable in the manufacture of cardboard boxes or the like.
- (3) **Gathering and stitching machines.** In these the sheets are laid by hand on a conveyor-chain, gathered in sections, headed up and then delivered to the stitching head.
- (4) **Rolling or hammering machines.** These press the folded leaves of unbound volumes before sewing.
- (5) **Machines used to "grecquer" the backs of unsewn books,** i.e., to make shallow cuts in the back of the volume for receiving the cross threads.
- (6) **Book-sewing machines,** including both simple types for sewing only, and very complicated machines which consist of a feeder to place the folded sheets into the machine, a sewing device equipped to sew the sheets together and usually to place a textile reinforcement over the back.
- (7) **Machines for flattening or rounding the backs before covering.**
- (8) **Machines for gluing strips of paper or textile on to loose pages** which are to be incorporated into a book, or on to maps to be assembled into atlases, in order to make binding practicable.
- (9) **Machines for gluing paper covers on to cheap books, brochures, etc.**
- (10) **Machines for the manufacture of book covers.** These usually include feeders to bring in the necessary sheets of paper, cardboard, book cloth, etc., a gluing device and a press, and also sometimes provision for heating and drying.
- (11) **Machines for flattening the finished book covers.** These consist of a roller system and tables.
- (12) **Machines for fixing the stitched volumes of books, etc., into the covers by gluing and pressing.** Some machines are equipped with a device to insert loose pictures, designs, maps or the like.
- (13) **Machines for gilding or colouring the edges of books.**

- (14) **Machines for stamping or gilding letters or designs** on book covers and sometimes also on other goods (e.g., leather goods), but **excluding** general purpose presses (**heading 84.79**) and printing presses using **interchangeable** characters assembled in blocks (**heading 84.43**).
- (15) **Page numbering machines** (e.g., for registers and ledgers).
- (16) **Machines for assembling pages more or less permanently by means of metal or plastic spirals (or rings) passing through perforations in the pages.** They normally consist of a perforating appliance and a spiralling device.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here.

* * *

The heading **excludes** :

- (a) Tables, usually of wood, with a screw device for holding the cross threads, used in the hand sewing of books (**heading 44.21**).
- (b) Knives for cutting machines (**heading 82.08**).
- (c) Machines for folding paper or cardboard (**other than** page-folding for books); machines for cutting or grooving paper or cardboard; machines for trimming bound or stitched books, periodicals, brochures, etc.; machines for trimming edges and corners of books or for making thumb-indexing insets; machines for stacking sheets of paper; stapling machines suitable **only** for cardboard box manufacture (**heading 84.41**).
- (d) Margin setting, folding or page signature marking machines for use with printing machines (**heading 84.43**).
- (e) Textile cutting machines (**heading 84.51**).
- (f) Needles for sewing machines (**heading 84.52**).
- (g) Machines for working leather used in book-binding (**heading 84.53**).
- (h) Stapling machines of a kind used in offices to fix documents together (**heading 84.72**).

84.41 - Other machinery for making up paper pulp, paper or paperboard, including cutting machines of all kinds.

8441.10 - Cutting machines

8441.20 - Machines for making bags, sacks or envelopes

8441.30 - Machines for making cartons, boxes, cases, tubes, drums or similar containers, other than by moulding

8441.40 - Machines for moulding articles in paper pulp, paper or paperboard

8441.80 - Other machinery

8441.90 - Parts

This heading covers all machinery used for cutting, and (**apart from** the book-binding machinery) all machinery for making up paper pulp, paper or paperboard **after** it has been manufactured, ranging from machines for cutting into the widths required or into sheets of commercial sizes to those for the manufacture of various made up articles.

The heading includes :

- (1) **Paper trimming and cutting machines (including multi-blade cutting machines) for cutting out sheets.** These include reel and square cutting machines used with the paper-making machines, trimming machines for books or brochures, machines for rounding the corners of books or making thumb-indexing insets, and paper shears, "guillotines", and apparatus for cutting photographic prints on paper or paperboard mounts for photographs, **but not** film cutting machines and apparatus, of a kind used in photographic or cinematographic laboratories (**heading 90.10**).
- (2) **Machines for die-cutting** (confetti, labels, lace paper, index cards, window envelopes, box shapes, etc.).
- (3) **Machines for cutting, outlining or grooving paperboard** for cartons, boxes, file covers, etc.
- (4) **Machines for making paper bags.**
- (5) **Machines for making envelopes** (cutting, folding, lining, etc.).
- (6) **Machines for making folding cartons and boxes.**
- (7) **Machines for stapling boxes and similar articles, other than** simple wire stapling machines which can be used equally for book-binding or for box-making (**heading 84.40**).
- (8) **Other machines for making cartons and boxes.**
- (9) **Winding machines** for manufacture of paper tubes, spools, sleeves, insulating tubing, cartridge cases, etc.
- (10) **Machines for forming waxed paper cups, containers**, etc., usually with a seam-making and gluing device.

- (11) **Machines for moulding articles in paper pulp, paper or paperboard** (packing for eggs; plates or dishes for confectionery or camping, toys, etc.); although usually fitted with a heating device these machines remain in this heading.
- (12) **Winders** (slitter-winders), for unwinding reels of paper, slitting the paper into bands (slits) of the required width and rewinding it.
- (13) **Stacking machines** for arranging sheets, cards, etc., in orderly piles.
- (14) **Perforating machines, including those for perforating lines** (needle perforations, oblong (or slotted) perforations, etc.) for stamps, toilet paper, etc.
- (15) **Machines for folding, other than page folding machines of heading 84.40.**
- (16) **Composite machines which cut, fold, interleave and pack cigarette papers.**

The heading **does not**, however, **include** simple mechanical or hydraulic presses which are often used for this purpose (**heading 84.79**).

*
* * *

Some of the machines of this heading, in particular the paper-bag or box-folding machines, may be equipped with a printing device. In accordance with Note 3 to Section XVI such machines remain classified in this heading **provided** the printing is not the principal function of the machine.

It should also be noted that some machines described above (such as cutting, folding or bag-making machines) may also be suitable for use in making up certain plastics or thin sheet metal. Such machines remain in this heading **provided** they are of a type normally used for making up paper or paperboard.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here.

*
* * *

The heading also **excludes** :

- (a) Drying stoves for drying made up articles of cardboard (**heading 84.19**).
- (b) Packing machines (e.g., for chocolate) that also make and print paperboard containers (cartons, etc.) (**heading 84.22**).
- (c) Machines for twisting paper strips into yarn (**heading 84.45**).
- (d) Sewing machines for the manufacture of paper bags (**heading 84.52**).
- (e) Punching machines used for punching holes in paper cards or documents and paper shredders of a kind used in offices for destroying confidential documents (**heading 84.72**).
- (f) Eyeletting machines and machines for waxing paper cups and containers, etc., by immersion (**heading 84.79**).

84.42 - Machinery, apparatus and equipment (other than the machines of headings 84.56 to 84.65) for preparing or making plates, cylinders or other printing components; plates, cylinders and other printing components; plates, cylinders and lithographic stones, prepared for printing purposes (for example, planed, grained or polished).

8442.30 - Machinery, apparatus and equipment

8442.40 - Parts of the foregoing machinery, apparatus or equipment

8442.50 - Plates, cylinders and other printing components; plates, cylinders and lithographic stones, prepared for printing purposes (for example, planed, grained or polished)

Apart from certain **exclusions** referred to later, this heading includes :

- (1) The printing parts of printing machinery, for example, plates and cylinders, engraved or otherwise prepared for printing, used to print texts or illustrations (by hand or by the machines of heading 84.43); and prepared lithographic stones, cylinders and plates (i.e., those prepared so as to be suitable for engraving or otherwise receiving an image for subsequent use in printing).
- (2) The machines, apparatus and accessories used to make the printing parts referred to above, or used to assemble (compose) it for use in printing, whether by hand or mechanically.

This heading covers equipment used in the printing of texts, illustrations or repetitive designs, etc., whether on paper, textiles, linoleum, leather or on other materials, by **printing processes**, viz. :

- (I) **Relief printing** : by using relief photo-engraved plates. In this process, the relief parts of the character or image are inked.
- (II) **Planographic printing** : by lithography, photo-lithography or by offset printing. The printing ink is applied only to certain specially prepared parts of the plane surface of the printing plate, etc. This category of printing also includes stencilling.
- (III) **Intaglio printing** : by rotogravure, or by means of etched or engraved metal plates. The printing ink is accumulated in the engraved or etched parts.

**(A) MACHINERY, APPARATUS AND EQUIPMENT (OTHER THAN THE
MACHINES OF HEADINGS 84.56 TO 84.65)
FOR PREPARING OR MAKING PLATES, CYLINDERS OR
OTHER PRINTING COMPONENTS**

This heading includes :

- (1) **Machines for making printing plates by direct reproduction from a document.** In these machines, a photocell scans the document, and the impulses transmitted by an electronic device from that cell activate a tool which engravess a plate of plastics.
- (2) **Machines for acid etching plates or cylinders.** These consist of special vats fitted with stirrers.

- (3) **Machines for sensitising offset zinc plates (horizontal whirlers)**, generally fitted with an electric heating device.

* * *

The heading covers only phototype-setting or composing machines which actually set type, even if the type is photographed after it has been set. However, the heading excludes photographic cameras, photographic enlargers or reducers, photographic contact printers and similar photographic apparatus for preparing printing plates or cylinders (**Chapter 90**), for example :

- (a) vertical or horizontal process cameras mounted on a hanging frame (bed) or a sliding bed, cameras for three colour printing;
- (b) photographic enlargers and reducers, reproduction apparatus and printing frames;
- (c) light tables used for planning layouts or for contact printing.

Some of these apparatus use half-tone or similar finely cross-lined glass or plastics screens, glass or plastics colour filters for colour printing or screen or filter holders.

**(B) PLATES, CYLINDERS AND OTHER PRINTING
COMPONENTS; PLATES, CYLINDERS AND
LITHOGRAPHIC STONES, PREPARED FOR PRINTING PURPOSES
(FOR EXAMPLE, PLANED, GRAINED OR POLISHED)**

This heading includes :

- (1) **Relief or intaglio plates engraved by hand, mechanically or by acid.** These may be of wood, linoleum, copper, steel, etc.
- (2) **Lithographic stones.** The illustration is either hand-drawn or photographically transferred and prepared with acid.
- (3) **Offset printing plates** of zinc or aluminium or similar flexible metal sheets on which the design is reproduced in the flat, i.e., neither in relief nor intaglio.
- (4) **Engraved or etched cylinders.**
- (5) **Plates and dies for relief stamping or printing**, e.g., for machines which emboss, with or without also inking, letter heads, visiting cards, etc.

Provided they have been treated so as to render them suitable for engraving or impressing, **lithographic stones, metal plates and cylinders**, even though not engraved or impressed, are also included in this heading, e.g., :

- (6) **Planed or grained lithographic stones.**
- (7) **Metal plates or sheets** prepared for engraving (by planing, graining or polishing).

- (8) **Perfectly polished or grained surface metal cylinders.** These cylinders, usually of cast iron, are generally electroplated with copper, or else have a copper covering consisting of assembled removable sleeves.
- (9) **Metal or plastic masters for use on office-type offset printing machines.** The top edge of the sheets has usually been processed to permit attachment to the drum of the machine.

Sensitised plates (e.g., consisting of metal or plastics, coated with a sensitised photographic emulsion, or of a sheet of photosensitive plastics, whether or not affixed to a support of metal or other material) are **excluded** (**heading 37.01**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines of this heading.

*
* * *

The heading also **excludes** :

- (a) Stencils of zinc, plastics, cardboard, etc., for use in stencil printing machines (classified according to the constituent material).
- (b) Copying or transfer papers, bearing texts or designs for reproduction (**heading 48.16**).
- (c) Silk screens for silk screen printing, whether or not coated (**heading 59.11**); metal wire cloth, mounted on a frame, whether or not prepared, for use in screen printing (classified according to the constituent material).
- (d) Marking irons for gilding machines (**heading 84.40**).
- (e) Metal, stone or wood working machine-tools and water-jet cutting machines (for example, matrix planing and finishing machines; machines for planing and cutting rules; disc or ball graining machines; engraving machines; milling cutters; routing machines; trim saws) (**headings 84.56 to 84.65**).
- (f) Type and other printing parts of typewriters, calculating or other machines of headings 84.70 to 84.72 (**heading 84.73**).
- (g) Moulds (**heading 84.80**).
- (h) Laser photoplotter for creating latent images, on photosensitive film, generally from digital formats, by means of a laser beam (**heading 90.06**).
- (ij) Measuring or checking instruments (**heading 90.17** or **90.31**).

84.43 - Printing machinery used for printing by means of plates, cylinders and other printing components of heading 84.42; other printers, copying machines and facsimile machines, whether or not combined; parts and accessories thereof (+).

- Printing machinery used for printing by means of plates, cylinders and other printing components of heading 84.42 :

8443.11 -- Offset printing machinery, reel-fed

8443.12 -- Offset printing machinery, sheet-fed, office type (using sheets with one side not exceeding 22 cm and the other side not exceeding 36 cm in the unfolded state)

8443.13 -- Other offset printing machinery

8443.14 -- Letterpress printing machinery, reel fed, excluding flexographic printing

8443.15 -- Letterpress printing machinery, other than reel fed, excluding flexographic printing

8443.16 -- Flexographic printing machinery

8443.17 -- Gravure printing machinery

8443.19 -- Other

- Other printers, copying machines and facsimile machines, whether or not combined :

8443.31 -- Machines which perform two or more of the functions of printing, copying or facsimile transmission, capable of connecting to an automatic data processing machine or to a network

8443.32 -- Other, capable of connecting to an automatic data processing machine or to a network

8443.39 -- Other

- Parts and accessories :

8443.91 -- Parts and accessories of printing machinery used for printing by means of plates, cylinders and other printing components of heading 84.42

8443.99 -- Other

This heading covers (1) all machines used for printing by means of the plates or cylinders of the previous heading, and (2) other printers, copying machines and facsimile machines, whether or not combined.

The heading includes machines for printing a repetitive design, repetitive wording or overall colour on textiles, wallpaper, wrapping paper, rubber, plastics sheeting, linoleum, leather, etc.

(I) PRINTING MACHINERY USED FOR PRINTING BY MEANS OF PLATES, CYLINDERS AND OTHER PRINTING COMPONENTS OF HEADING 84.42

The most common of these machines are rotary presses. In their simplest form, these presses usually consist of a cylinder with two semi-cylindrical plates (letter press), or of cylinders which may be either engraved (gravure printing) or impressed (offset printing); rotary presses for colour-printing are equipped with several printing cylinders, their inking rollers being placed side by side. Since all the printing, pressing and inking mechanisms are rotary, these presses can be used for both continuous printing and sheet by sheet printing, in black or in colour, on single sides or on both sides of the paper. Rotary presses can be divided into two sub-categories :

- (1) **Reel-fed presses**, in which some large rotary presses combine several printing units on a single frame, and which enable all the pages of a newspaper or periodical to be printed in one sequence of operations, so that, in the final result, all the pages are delivered, cut, folded, assembled, stapled and stacked by various ancillary machines working in conjunction with the printing machine.
- (2) **Sheet-fed presses**, in which the sheets are transported through the printing units by grippers. Sheet-fed presses have a feeder, one or more printing units, and a delivery mechanism. In the feeder the sheets are taken from a pile, aligned, and forwarded to the printing unit. In the delivery mechanism the printed sheets are collected in a pile.

This group also includes printing presses using a movable plate (or platen), and cylinder printing machines.

*
* *

The above printing presses (particularly the small or medium-sized rotary presses) can be fitted with a series of making-up units arranged side by side with the printing units, so that, starting from a single reel of paper, complex products (e.g., box shapes, packagings, labels, railway tickets) can be completed in one single and continuous operation.

In addition to the typical types of printing machines, this heading also covers special machines such as :

- (i) Machines for printing tin foil boxes or other containers.
- (ii) Machines for printing clock or watch dials or other articles of special shapes.
- (iii) Machines for printing on corks, tubes, candles, etc.
- (iv) Machines for marking clothing.
- (v) Machines for printing book page signatures.
- (vi) Numbering, dating, etc., machines (**other than** hand-operated date and similar stamps of **heading 96.11**) operating with irons, bands of letters or figures, etc., whether or not inked.
- (vii) Certain small office printing machines which operate by means of printing type or by the offset process, and which are improperly referred to as "duplicating machines" because their operating principles and appearance are similar to those of duplicating machines.

This group also includes **colour printing machines**, used to colour, after they have been first printed in black and white, special art editions, playing cards, children's illustrations, etc., by means of stencils or stencil-plates, the colour being applied by brushes, rollers or by spraying.

Machines for printing a repetitive design, repetitive words or overall colour on textiles, wallpaper, wrapping paper, linoleum, leather, etc., include :

- (1) **Block printing machines** in which blocks engraved with the design, generally in relief, are repeatedly pressed on the cloth, wallpaper, etc., as it passes through the machine, thus producing a continuous design; the same machines are also used for printing separate designs (e.g., on scarves or handkerchiefs).
- (2) **Roller printing machines**, usually consisting of a large central cylinder (pressure bowl) around the periphery of which is placed a series of engraved colour rollers, each with its colour trough, furnisher roller, doctor blades, etc.
- (3) **Screen printing machines**. The material to be printed passes through the machine together with a stencil-screen band, the colour being applied through the stencil.
- (4) **Warp printing machines** which, before weaving, print a design on the sheet of parallel warp yarns unrolled from the warp beam.
- (5) **Yarn printing machines**. These produce colour effects on the yarn (or sometimes on the roving before it is spun into yarn).

(II) OTHER PRINTERS, COPYING MACHINES AND FACSIMILE MACHINES, WHETHER OR NOT COMBINED

This group covers :

(A) Printers.

This group includes apparatus for the printing of text, characters or images on print media, other than those that are described in Part (I) above.

These apparatus accept data from various sources (e.g., automatic data processing machines, flatbed desktop scanners, networks). Most incorporate memory to store that data.

The products of this heading may create the characters or images by means such as laser, ink-jet, dot matrix or thermal print processes. The two most common types of printers are :

- (1) **Electrostatic printers**, which employ a process that involves electrostatic charges, toner and light. A light source (e.g., a laser, a light-emitting diode (LED)) is used to cancel the charge at specific points on a positively charged photoconductive surface (usually a drum) leaving a positively charged replica of the image. The negatively charged toner is electrostatically attracted to the photoconductive surface, reproducing the original image. The toner is electrostatically transferred to the print medium, which has a stronger positive charge than the photoconductive surface, and the image is then fused to the print medium by applying pressure and heat.

- (2) **Inkjet printers.** These machines place drops of ink onto a print medium to create an image.

This heading includes printers presented separately for incorporation in or connection to other products of the nomenclature (e.g., receipt printers of cash registers of heading 84.70).

(B) Copying machines.

This group includes apparatus for the production of copies from original documents, such as :

- (1) **Digital copiers** in which the original document is scanned and a photosensitive surface (e.g., a charge-coupled device (CCD) or photo-diode sensing array) converts the optical image into digitally coded electrical signals that are stored in memory. The print engine, which operates in the same manner as the printers described in Part (II) (A) of this Explanatory Note, then uses that data to produce the required number of copies. Original documents need only be scanned once to produce multiple copies, as the digital representation of the image is stored in memory. Part (D) below describes such apparatus when capable of connecting to an automatic data processing machine or to a network.

- (2) **Photocopiers** in which the optical image of the original document must be projected onto the photosensitive surface for each copy. The most common types are :

- (a) Electrostatic photocopying apparatus which operates either by reproducing the original image directly onto the copy (direct process) or by reproducing the original image via an intermediate onto the copy (indirect process).

In the direct process the optical image is projected onto a substrate (usually of paper) coated with, for example, zinc oxide or anthracene, charged with static electricity. After the latent image has been developed by means of a powdered dye, it is fixed to the substrate by heat treatment.

In the indirect process, the optical image is projected onto a drum (or plate) coated with selenium or other semiconducting substance charged with static electricity. After the latent image has been developed by means of a powdered dye, it is transferred onto ordinary paper by applying an electrostatic field and fixed to the paper by heat treatment.

- (b) Apparatus using chemical emulsion coatings in which the photosensitive surface consists of an emulsion usually containing silver salts or diazo compounds (the latter being designed for exposure to light with a high ultraviolet content). The developing and printing processes vary according to the nature of the emulsion and the type of apparatus (wet or dry developers, heat treatment, ammonia vapour, transfer techniques, etc.).

This group also includes contact type photocopying apparatus and thermo-copying apparatus.

(C) Facsimile machines.

Facsimile (or fax) machines are for the transmission and reception of text or graphics over a network and for the printing of a reproduction of the original text or graphics. Part (D) below describes such apparatus when capable of performing a copying function.

(D) Combinations of printers, copying machines or facsimile machines.

Machines which perform two or more of the functions of printing, copying or facsimile transmission are generally referred to as multi-functional machines. These machines are capable of connecting to an automatic data processing machine or to a network.

The criterion "capable of connecting to an automatic data processing machine or to a network" is described in the Subheading Explanatory Note below.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts and accessories of the machines of this heading.

This would include, for example, machines (whether or not presented separately) for uses ancillary to printing exclusively designed to operate with printing machines and used during or after the printing operation for feeding, handling or further working the sheets or rolls of paper. Such machines, which are usually separate from the printing machine itself, include :

- (1) **Stock or pile elevators and paper trays or drawers**, which hold the blank sheets ready to be printed.
- (2) **Automatic feeders**, used for sheet by sheet printing. Their function is to feed sheets one by one, perfectly centred, into the machine.
- (3) **Sheet delivery mechanisms**, similar in design to feeders, but carrying out the reverse process (i.e., they deliver and pile the printed sheets).
- (4) **Sorters**, which stack and collate printed sheets of multi-page documents.
- (5) **Folders, gummers, perforators and staplers**. These are often used, at the delivery end of the printing machine, to fold and staple or stitch printed pages (of newspapers, folders, periodicals, etc.).

If, however, they are not designed **exclusively** for use in conjunction with a printing machine, they are **excluded** (**heading 84.40 or 84.41**, as the case may be).

- (6) **Serial numbering machines**, small accessory machines operating with rolls of figures.
- (7) **Bronzing machines for the printing industry**. These deposit metal powder on sheets as they emerge from the printing machine in which they have just been mordant-printed.

This heading also includes drums and plates used in electrostatic photocopying apparatus, guide rollers and mounted oil supply pads.

*
* * *

The heading also **excludes** :

- (a) Cylinder blankets and covers of textile fabric, rubberised textile fabric, felt, rubber, etc. (classified according to the constituent material).
- (b) Machinery for labelling bottles, cans, boxes, bags or other containers, and wrapping machinery (**heading 84.22**).
- (c) Machines with an ancillary printing device, e.g., certain bag filling or packing machines (**heading 84.22**); certain machines for making up paper or paperboard (**heading 84.41**). If presented separately, the printing device remains classified in this heading **provided** it prints by one of the processes of the machines of this heading.
- (d) Anti-smudging spraying machines (**heading 84.24**).
- (e) Hectographic and stencil duplicating machines, and addressing machines (**heading 84.72**).
- (f) Pattern generating apparatus (**heading 84.86**).
- (g) Cameras for recording documents on microfilm, microfiche or other microforms (**heading 90.06**).
- (h) Ordinary photographic printing frames (**heading 90.10**).
- (ij) Drawing instruments of **heading 90.17**.
- (k) Hand-operated label embossers of **heading 96.11**.

◦
◦ ◦

Subheading Explanatory Notes.

Subheadings 8443.11, 8443.12 and 8443.13

These subheadings cover printing machinery in which the impression is obtained by means of a printing plate on which the design is reproduced in the flat, i.e., in neither intaglio nor relief (offset printing process). The formation of the image to be printed is based on the principle of the mutual repulsion of water and fatty substances. The printing, always performed on a rotary machine, is not obtained by direct contact of the printing medium on the material to be printed, but by intermediate transfer onto a rubber cylinder called a blanket which, in turn, transfers the image onto the matter to be printed. The machinery of these subheadings is characterised by the presence of the blanket and of a device used to continuously dampen the non-printing parts of the printing plate which is fixed to a metal cylinder. Offset printing machines can be fed by rolls or sheets.

Subheadings 8443.14 and 8443.15

Letterpress printing is a process whereby the ink is transferred under pressure to the printing surface from the raised parts of the type. The type consists of individual characters, lines or image-bearing plates, all of the same height.

These subheadings **do not**, however, **cover** flexographic printing machinery.

Subheading 8443.16

Flexographic printing is a process employing the letterpress principle for simple work (printing of packaging, forms, leaflets, etc.), and in which the printing plate is of rubber or thermoplastic material bonded directly to the impression cylinder. These machines are simpler and lighter than other printing presses; they print continuous webs of paper in one or more colours, using an ink based on alcohol or other volatile solvents.

Subheading 8443.17

In gravure printing, the ink accumulated in different volumes in engraved or etched parts of the printing plate is transferred by pressure onto the surface to be printed. This form of printing has its origins in line engraving and etching, where a graver or an acid is used to incise lines of different depths in a polished copper plate. The surface of the plate remains free of ink, which collects in the lines in sufficient quantity to yield an impression.

The principle of gravure printing is similar to that of line engraving and etching. A rotary cylinder is used instead of the plate. The image or signs are transferred onto a cylindrical plate electroplated with copper by mechanical or photochemical means.

Subheadings 8443.31 and 8443.32

The criterion "capable of connecting to an automatic data processing machine or to a network" denotes that the apparatus comprises all the components necessary for its connection to a network or an automatic data processing machine to be effected simply by attaching a cable. The capability to accept the addition of a component (e.g., a "card") that would then allow the connection of a cable is not sufficient to meet the terms of these subheadings. Conversely, that the component to which a cable would be connected is present but inaccessible or otherwise unable to effect a connection (e.g., switches must first be set) is not sufficient to exclude goods from these subheadings.

84.44 - Machines for extruding, drawing, texturing or cutting man-made textile materials.

This heading covers machines for the manufacture of man-made textile fibres, including machines for cutting the fibres.

These include :

- (1) **Machines for extruding man-made textiles** in the form of monofilaments or of several filaments. These machines are, in practice, made up of a long series of separate identical spinning units placed side by side. Each unit consists essentially of a metering pump and a filter which feed the spinnerets or spinning nozzles. Depending on the process employed, the one or more filaments leaving the nozzles pass either through a bath containing a chemical coagulating agent (e.g., viscose process), or through an airtight chamber fitted with a water spray (e.g., cuprammonium process) or a hot air current (e.g., cellulose acetate process), or through a cooling chamber. The nozzles may be single or contain a great number of holes (sometimes many thousands) according to whether it is desired to obtain a monofil, or a multi-filament yarn, or tow for cutting into staple fibre. In some machines the fibres emerging from the nozzle are brought together and assembled by a slight twist given by a special device, thus forming a yarn. In others, the fibres leaving the various spinning units are combined in a thick rope (tow), sometimes of many hundreds of thousands of fibres, for subsequent cutting into staple fibre.
- (2) **Drawing machines** which stretch the filaments to three or four times their original length, a process which orients the molecules in the direction of the filaments thus considerably increasing its strength.
- (3) **Machines for texturing synthetic textile yarn.** Most texturing processes (traditional discontinuous method, false-twisting, edge crimping, gear-crimping, hot air or steam jets, knit-deknit) modify the physical properties of the yarn to produce crimped yarn, elastic "foam" yarn, etc.
- (4) **Staple fibre cutters** for cutting tow into short lengths.
- (5) "**Tow-to-top**" machines. These also cut the tow into staple fibre lengths, but they do not disturb the parallel arrangements of the fibres in the tow. These machines therefore produce tops which are ready for spinning (requiring neither carding nor combing), and not a loose mass of staple fibres like the cutters of paragraph (4). They sometimes incorporate a spinning machine and are then called "tow-to-yarn" machines (see Explanatory Note to heading 84.45).
- (6) **Rupturing machines** for producing ruptured filament tow. The greater part (but not all) of the filaments are broken at intervals so that, although some filaments remain continuous, the yarn obtained from the tow has the characteristics of a staple fibre yarn.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.48**.

*
* * *

The heading **excludes** :

- (a) Machines for preparing the raw materials intended for later extrusion into man-made textile fibres (generally **heading 84.19** or **84.77**).
- (b) Draw boxes and gill boxes of **heading 84.45**.
- (c) Machines for spinning continuous or discontinuous glass fibres or yarns (**heading 84.75**).

84.45 - Machines for preparing textile fibres; spinning, doubling or twisting machines and other machinery for producing textile yarns; textile reeling or winding (including weft-winding) machines and machines for preparing textile yarns for use on the machines of heading 84.46 or 84.47.

- Machines for preparing textile fibres :

8445.11 -- Carding machines

8445.12 -- Combing machines

8445.13 -- Drawing or roving machines

8445.19 -- Other

8445.20 - Textile spinning machines

8445.30 - Textile doubling or twisting machines

8445.40 - Textile winding (including weft-winding) or reeling machines

8445.90 - Other

Subject to the exclusions mentioned later, this heading covers machines used in the textile industry for the following processes :

- (I) The preparation or preliminary treatment of textile fibres to make them suitable for :
 - i) Spinning into yarns, twine, etc.
 - or ii) Manufacturing into wadding, felt, stuffing material, etc.
- (II) The working up of various textile fibres into yarns by spinning, twisting, doubling, throwing, etc. (including the preparation of paper yarn from strips of paper) but **excluding** specialised processes of rope making (**heading 84.79**).
- (III) Reeling, whether of slivers or rovings, yarns, twine, etc. and preparing textile yarns for use on the machines of **heading 84.46** or **84.47**.

**(A) MACHINERY FOR PREPARING NATURAL TEXTILE FIBRES
OR SHORT MAN-MADE FIBRES UP TO THE SPINNING STAGE,
AND SIMILAR MACHINES WHICH PREPARE THE FIBRES FOR USE
AS STUFFING OR FOR THE MANUFACTURE OF FELT OR WADDING**

This group includes :

- (1) **Blower-grader machines** for sorting animal hair according to length. These consist of a long box divided across its width into compartments into which the hairs are blown by a current of air. The hairs are distributed into the various compartments according to their size.

- (2) **Machines for separating cotton fibres from the seeds, hulls and other impurities (e.g., cotton gins), and similar machines for separating linters from the seed.**
- (3) **Scutching or similar machines** for separating the fibres from vegetable stalks (flax, hemp, etc.) after retting.
- (4) **Machines for tearing rags, old cordage or similar scrap textiles** to reduce them to a fibrous condition suitable for carding (e.g., garnetting machines and rag pickers), but **excluding** rag cutters used in paper-making (**heading 84.39**).
- (5) **Bale breakers**, used for opening out into lumps the cotton from compressed bales.
- (6) **Automatic feeders**, fitted with a spreading device to secure an even flow to the openers.
- (7) **Beaters and spreaders** for further cleaning and opening out the web of cotton fibres; **preparing machines for opening wool.**
- (8) **Wool scouring machines with mechanical arrangements** for feeding in the wool and pumping in hot water; and **raw wool washing machines (e.g., Leviathans) equipped with stirring mechanism** and sometimes means for drying.
- (9) **Raw stock dyeing machines** for dyeing unspun wool fibres in the mass.
- (10) **Machines for impregnating wool, ramie, etc., with oil or chemical products** to facilitate carding and combing.
- (11) **Wool carbonising machines**, equipped with a vat for acid, arrangements for removing excess liquor, for drying and for dusting out the charred impurities.
- (12) **Carding machines** of various types for cotton, wool, short man-made fibres, bast fibres (flax, hemp, etc.), etc. These continue the cleaning begun by the openers and beaters, and separate and straighten the fibres. In principle they consist of large rollers covered with saw-toothed steel wire or with fabric fitted with wire teeth (card clothing); these work against fixed plates or other rollers which are also covered with card clothing. A cleaning device keeps the teeth free from clogging with fibres, and in wool carding machines there is a device for eliminating burrs. Different carding machines are used at different stages for different materials (e.g., breaker cards, intermediate cards, finisher cards, condenser cards). The fibres leave the carding machines in the form of a wide web or lap, or may be condensed into a sliver, and are then wound on spools or bobbins or coiled into rotating bins.

This group also covers carding machines for preparing fibres for felting or for use as wadding or stuffing; these are usually a simpler type consisting of a cylindrical segment covered with card clothing, which oscillates over a flat table also covered with card clothing.

- (13) **Draw boxes, gill boxes, etc.** These draw out the slivers to a smaller cross-section, combine them and re-draw them to produce an even product; these machines are used after carding and, in the case of wool, sometimes also after combing.
- (14) **Combing machines.** The principal function of these machines is to comb out short fibres; the sliver is held between nippers while being acted on by an arrangement of combs or pins. They are used at various stages of manufacture : to treat the material in the raw state (e.g., hackling flax), or after carding or drawing out. The most common types are combing machines for flax, hemp or similar fibres, intermittent (French or rectilinear) combs for cotton, and circular combs for wool.
- (15) **Flax, jute, etc., spreaders.** These combine the bundles of flax or other fibres, and draw them out into a continuous sliver.
- (16) **Backwashing machines** for removing the oil and other impurities from wool after carding or combing. They consist of a number of vats for warm soapy water, equipped with guide and squeeze rollers, drying cylinders and a gill box to open out the wool again.
- (17) **Drawing or roving machines** for finally drawing and slightly twisting the slivers or rovings to make them ready for spinning.
- (18) **Coilers.** These consist of a turntable designed to rotate a can in which the slivers or rovings are collected as they leave the various machines; they usually have a coiling device at the top.

(B) MACHINES FOR PREPARING SILK PRIOR TO THROWING

This group includes :

- (1) **Machines for removing the outer parts of cocoons, and machines for removing, by beating the cocoons, the outer filaments which cannot be reeled.**
- (2) **Vessels for unreeling by hand the silk threads from cocoons**, equipped with a device for assembling and slightly twisting together several filaments and sometimes with the reel on which the raw silk obtained is wound; the reel is sometimes separate from the vessel but **provided** the reel and vessel are presented together the whole unit remains classified here.
- (3) **Machines for removing lumps, thicker parts, etc., from the raw silk yarn.**

(C) SPINNING MACHINES FOR CONVERTING ROVINGS INTO YARN; TWISTING MACHINES AND MACHINES FOR DOUBLING YARNS TO FORM MULTIPLE OR CABLED YARNS

This group includes :

- (1) **Spinning frames** which by a further drawing out and twisting convert the roving into a yarn. The essential feature of a spinning frame is the spinning mechanism (flyer ring and traveller, etc.) associated with a revolving vertical or oblique spindle; a complete spinning frame consists of a number of these elements mounted side by side. The heading includes flax, hemp, jute, etc., spinning machines, intermittent spinning frames (mules, etc.) and continuous spinning frames (flyer spinning, ring spinning, cap spinning, etc.). It also covers hand spinning wheels.
- (2) "**Tow-to-yarn**" **machines**. These complete the whole process of breaking the filaments of the tow, drawing out into a roving and spinning into yarn.
- (3) **Twisting or doubling machines** for giving a supplementary torsion to yarns, or for twisting together two or more yarns to form a multiple or cabled yarn or to form twine; special machines for rope-making are, however, **excluded (heading 84.79)**. Certain machines of this group may include devices for producing fancy yarns (e.g., looped yarns).

This group also includes **throwing machines** for twisting together continuous filaments of silk or of man-made textiles.

- (4) **Machines for knotting together, end to end, lengths of horsehair.**

(D) WINDING OR REELING MACHINES

These are used for putting up yarns (or rovings), twine or string, on bobbins, spools, cops, cones, cheeses, cards, etc., or in balls, hanks or skeins, etc., whether for manufacturing or trade purposes, or for retail sale. For the classification of warping machines, see Part (E) below. Machines for coiling ropes or cables are classified in **heading 84.79**.

The heading also includes machines for recovering and re-reeling yarn from faulty knitted or crocheted goods. It also covers **weft winders** specially designed to wind the weft yarns on to bobbins ready for use in weaving.

(E) MACHINES FOR PREPARING TEXTILE YARNS FOR USE ON THE MACHINES OF HEADING 84.46 OR 84.47

This group includes :

- (1) **Warpers** for preparing a series of yarns parallel, under the same tension, and in the right order (as regards colour and type of yarn) for weaving. The complete number of yarns required for the warp may be prepared as a whole, or they may be prepared in sections (sectional warping); they may be wound directly on the warp beam ready for use on the loom, or provisionally on the roller of the warping machine or on other supports (e.g., bobbins).

The machine consists of a creel for holding a large number of bobbins of yarn, a series of combs and thread guides and a powerful drum winding mechanism; the various parts of this machine are usually quite separate, but when presented together they remain classified here.

- (2) **Warp sizing machines** (e.g., slashing machines). In these the warp yarns, either in sections or as a sheet of parallel yarns, are given a temporary dressing to protect them from fraying on the loom and to make them smooth, thus facilitating weaving. These machines consist generally of a size bath, a system of roller guides, a heated cylinder or hot air dryer and a reeling device, and sometimes also a device for cut-marking (i.e., the application of dye marks at regular intervals on the selvedge yarns).

The heading **does not cover** other sizing machines, e.g., for sizing other yarns (including weft yarns) in hanks or as separate yarns (**heading 84.51**).

- (3) **Drawing-in and reeding machines** for drawing the warp yarns through the respective healds (heddles) of the loom, and through the reed or comb.
- (4) **Warp tying-in or twisting-in machines** for uniting the threads of a new warp with those remaining from the former warp.

This heading **does not cover** warp tyers used to join warp threads which have broken during weaving (**heading 84.48**).

- (5) **Machines for assembling warp yarn** on the beam from warper drums.
- (6) **Machines for interlacing and supplying the thread during weaving**.
- (7) **Threading machines** for embroidery.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.48**.

*
* * *

The heading **excludes** :

- (a) Machines for the heat-treatment of cocoons to kill the silkworms (**heading 84.19**).
- (b) Machines for the drying of textile materials (**heading 84.19** or **84.51**, as the case may be).
- (c) Centrifugal hydro-extractors (**heading 84.21**).
- (d) Machines of **heading 84.44**.
- (e) Machinery for the manufacture or finishing of felts or nonwovens (**heading 84.49**).
- (f) Polishing, glazing, gassing or other finishing machines, and fabric winding machines (**heading 84.51**).
- (g) Hair cutting machines for cutting animal hair from hides (**heading 84.53**).
- (h) Card grinding and comb teeth sharpening machines (**heading 84.60**).
- (ij) Machines for setting the teeth in card clothing (**heading 84.63**).
- (k) Machines for mounting card clothing on card cylinders, etc. (**heading 84.79**).

84.46 - Weaving machines (looms).

8446.10 - For weaving fabrics of a width not exceeding 30 cm

- For weaving fabrics of a width exceeding 30 cm, shuttle type :

8446.21 -- Power looms

8446.29 -- Other

8446.30 - For weaving fabrics of a width exceeding 30 cm, shuttleless type

This heading covers weaving machines for the production of fabrics by weaving, using textile (including peat fibre) yarns or other yarns (e.g., of metal, glass or asbestos).

In these machines the warp and weft yarns are interlaced at right angles to form a fabric.

In the simplest weave, the sheet of warp yarns from the warp beam divides into two groups of alternate yarns, each group being controlled by a harness; these harnesses alternately raise and lower their warp yarns to form an angle (known as the shed) between the two groups of yarns through which passes the weft yarn (in conventional looms carried by a shuttle) which is immediately beaten up against the preceding weft by the reed; the raising or lowering of the groups of warp yarn is then reversed by the harnesses, entrapping the weft and forming a new shed for the next line of weft. On ordinary looms up to eight harnesses can be used to vary the order in which the warp yarns are raised and so produce a certain variation in the weave.

More complex looms can execute more complicated weaves. For example, some looms have a special system for controlling the raising of the warp (dobbies, Jacquards, etc.) so as to control a greater number of groups of warp threads or even single warp threads; or special devices can be used to produce certain special fabrics (leno mechanisms, warp pile (or Terry) attachments, swivel shuttle attachments for broché work). Other looms have devices for changing the shuttles (or the bobbins in the shuttles), thus introducing wefts of different colours or different yarns; Looms often include certain other mechanical or electrical devices (e.g., for replenishing the bobbins in the shuttles when necessary, or for stopping the loom if a warp or weft thread breaks).

Most of these special devices may either form an integral part of the loom, or be mounted on an ordinary loom as auxiliary **removable** attachments; the latter type of attachment is classified here **provided** it is presented with the loom for which it is intended, but if presented separately it is **excluded** (generally **heading 84.48**).

Looms usually produce a flat fabric but there are circular looms which produce a tubular fabric; in these one or more shuttles, moved either mechanically or by electro-magnets, interlace a weft with a vertical series of warp threads arranged in a circle.

Different types of looms may be named according to their type of mechanism or according to the type of fabric they produce, for example, dobby looms, Jacquard looms, automatic box motion looms, shuttleless looms in which the weft is inserted either by compressed air or a water jet or by a long needle, or drawn across from a fixed bobbin by a series of projectiles, ribbon looms (e.g., bar looms, Zurich looms and drum looms), pile fabric looms, carpet looms including knotted pile carpet looms.

The heading also includes :

- (1) Hand looms.
- (2) Looms for weaving cloth of wire or metallised yarn **provided** they are of the same type as textile weaving looms. Such looms must have all the essential mechanical parts characteristic of textile weaving looms, i.e., a warp beam, frame harnesses for forming the shed, the mechanism which passes the weft wire or yarn through the shed at right angles and entraps it in the warp yarns and a cloth beam for winding the cloth as it is produced.

However, the heading **excludes** machines designed for interlacing wire, by various processes, to form heavy wire grill or netting (see Explanatory Note to **heading 84.63**).

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of weaving machines of this heading are classified in **heading 84.48**.

84.47 - Knitting machines, stitch-bonding machines and machines for making gimped yarn, tulle, lace, embroidery, trimmings, braid or net and machines for tufting.

- Circular knitting machines :

8447.11 -- With cylinder diameter not exceeding 165 mm

8447.12 -- With cylinder diameter exceeding 165 mm

8447.20 - Flat knitting machines; stitch-bonding machines

8447.90 - Other

This heading covers all machinery for the production of fabrics or trimmings by knitting, stitch-bonding, gimping, braiding, netting, tufting, etc., or for embroidery work on any ground, whether using unspun rovings, textile (including peat fibre) yarns, other yarns (e.g., of metal, glass or asbestos) or wire.

(A) KNITTING MACHINES

These consist of two main groups :

- (1) **Circular machines** which produce either a straight tubular fabric or, by varying the size of the stitches in the rows, a shaped tubular piece (for stockings, socks, sleeves of garments, berets, fezes or similar knitted headgear, etc.).
- (2) **Flat machines** for producing flat fabric of even width or, by increasing or decreasing the number of stitches in the rows, flat but shaped pieces of fabric to be subsequently made up by sewing (e.g., into stockings or socks). Flat machines include machines for ordinary knitting (e.g., Cotton's frames) and warp knitting (Raschel, milanese, locknit, etc., looms). These machines range from the very simple type to large machines with many rows of needles, in some cases equipped with Jacquard or similar mechanisms to produce various designs.

This heading also covers small domestic knitting machines, and machines designed to knit just the few stitches necessary for repairing stockings. Machines for joining two pieces of knitted fabric by simply **sewing together** the loops forming the knitted edges are classified in **heading 84.52**.

(B) STITCH-BONDING MACHINES

This group includes all kinds of stitch-bonding machines which produce fabrics by a chain-stitching process. The following are included :

- (1) **Machines** incorporating a needle mechanism for attaching the "warp" yarns and the "weft" yarns by chain-stitching.
- (2) **Machines** for inserting loops of yarn in a fabric backing previously produced on a conventional weaving loom, and attaching them to the backing with knitting stitches.
- (3) **Knitting-sewing machines** operate by stitching seams in loose-fibre fabric already made by other machines (for example, cards and garnetting machines) and so produce a consolidated sheet of textile material used as filtering material, carpet underlay, insulating material, etc.

**(C) MACHINES FOR MAKING KNOTTED NET, TULLE,
LACE, BRAID, OR TRIMMINGS, FOR GIMPING YARNS,
FOR EMBROIDERY, FOR TUFTING, ETC.**

These include :

- (1) **Machines for making nets or netting** for any purpose, either in the piece or to the shape of finished articles (e.g., fishing nets).
- (2) **Machines for making plain tulle.**
- (3) **Machines for making figured tulle, lace, etc.**
- (4) **Machines for making bobinot tulle, bobinot curtains and bobinot mechanical lace**, which manufacture flat netting or flat net curtains, as well as mechanical (woven) lace from warp and weft strands. However, the warp and weft strands are not interlaced at right angles as in weaving, but are surrounded and tied, by the to and fro movement of a shuttle, by a large number of warp strands (bobbin threads) arranged on small bobbins.
- (5) **Embroidery machines**, including hand embroidery machines (embroidery machines with pantograph shuttles), which, by means of needles, embroider various designs with one or more threads on an existing ground of woven fabric or other material. Embroidery machines, other than manually operated, may be equipped with Jacquard or similar mechanisms. The heading also covers thread drawing machines which withdraw, and bind the remaining threads into open-work embroidery.

The heading **does not cover** chain or blanket stitch machines (mainly used to edge certain textile articles, but which can also do simple embroidery), nor sewing machines which can do simple embroidery work in addition to ordinary sewing (**heading 84.52**).

- (6) **Gimping machines.** These wrap one yarn in close spirals round a generally thicker core (e.g., of metal wire, rubber thread, unspun fibres, or of one or more coarser yarns). These machines can also be used to gimp fine electrical wiring.
- (7) **Machines for making various trimmings by interlacing**, in various complex ways, yarns or unspun rovings (sometimes gimped) of various textiles (braiding looms, hook looms, etc.).

The heading also covers machines for braiding a wire sheath on hose of rubber, plastics, etc., or for braiding tubular plaits from wire, **provided** they have the essential mechanical parts characteristic of the textile machines referred to in the preceding paragraph.

- (8) **Machines for covering buttons, tassel cores, etc., with textile threads.**
- (9) **Tufting machines**, for inserting loops or tufts of textile yarn in a fabric backing in order to produce carpets, mats or lightweight articles (bedspreads, bath robes, etc.).

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.48**.

84.48 - Auxiliary machinery for use with machines of heading 84.44, 84.45, 84.46 or 84.47 (for example, dobbies, jacquards, automatic stop motions, shuttle changing mechanisms); parts and accessories suitable for use solely or principally with the machines of this heading or of heading 84.44, 84.45, 84.46 or 84.47 (for example, spindles and spindle flyers, card clothing, combs, extruding nipples, shuttles, healds and heald-frames, hosiery needles).

- Auxiliary machinery for machines of heading 84.44, 84.45, 84.46 or 84.47 :

8448.11 -- Dobbies and Jacquards; card reducing, copying, punching or assembling machines for use therewith

8448.19 -- Other

8448.20 - Parts and accessories of machines of heading 84.44 or of their auxiliary machinery

- Parts and accessories of machines of heading 84.45 or of their auxiliary machinery :

8448.31 -- Card clothing

8448.32 -- Of machines for preparing textile fibres, other than card clothing

8448.33 -- Spindles, spindle flyers, spinning rings and ring travellers

8448.39 -- Other

- Parts and accessories of weaving machines (looms) or of their auxiliary machinery :

8448.42 -- Reeds for looms, healds and heald-frames

8448.49 -- Other

- Parts and accessories of machines of heading 84.47 or of their auxiliary machinery :

8448.51 -- Sinkers, needles and other articles used in forming stitches

8448.59 -- Other

This heading covers :

- (I) All auxiliary machines and apparatus which exercise, either separately or concurrently, a function complementary to those of the machines of heading 84.44, 84.45, 84.46 or 84.47 (in particular spinning, weaving, knitting or embroidery machines). These auxiliary machines may either extend the possibilities of the main machines (as in the case of dobbies and jacquards), or may perform mechanically a particular job necessary for the proper working of the main machine (as is the case with warp stop motions, weft stop motions, warp knotting machines).

- (II) Parts of the machines of this heading and also parts of the machines of heading 84.44, 84.45, 84.46 or 84.47 (see the General Explanatory Note to Section XVI).
- (III) Various accessories used with the machines of heading 84.44, 84.45, 84.46 or 84.47 or of this heading; in general, the term "accessories" refers to articles of equipment, not forming an integral part of the machines, which are interchangeable and must be frequently replaced (for example, because they are rapidly worn out, or because different types are necessary for different types of work).

(A) AUXILIARY MACHINERY

This group includes :

- (1) **Auxiliary machines for use with textile spinning machines**, for example, automatic devices which remove fully wound reels and replace them with empty ones, and mobile appliances for setting up rows of empty reels.
 - (2) **Warp beam stands or creels**. These hold the warp beams during the sizing process, or during the winding of the warp beam; in certain cases, they hold the warp beam, in the course of weaving.
 - (3) **Dobbies and Jacquards**, used to adapt a loom for producing weaves more complicated than it could otherwise execute. Dobbies control the separate lifting of a large number of harnesses, and Jacquards the lifting of individual warp threads. They operate by a number of lags with projecting pegs which form a chain, or in many cases (particularly Jacquards) by a series of suitably perforated cards loosely laced together edge to edge to form a continuous chain. These pegs or a number of needles, certain of which come into play according to the different perforations of the cards, actuate the mechanisms for lifting the warp threads. Similar mechanisms (Verdol machines) are operated with continuous strips of perforated paper.
 - (4) **Machines for mounting on Jacquards** to enable certain of the cards to remain in position while more than one weft is inserted. This reduces the number of cards required and increases the speed of weaving.
 - (5) **Card lacing machines** for assembling the cards in a loose chain ready for use on the Jacquard machines.
 - (6) **Warp stop motions and weft stop motions**. These cause the immediate stopping of the loom in the event of a warp or weft thread breaking; also **bobbin control mechanisms** for ensuring a continuous supply of weft yarn by replenishing the bobbin when necessary. The heading includes apparatus of this kind whether or not operated electrically.
 - (7) **Warp tyers**; small machines placed on a loom above the sheet of warp yarns, and used to join them if they break during weaving.
- This heading **does not cover** warp tying-in or twisting-in machines of **heading 84.45**.
- (8) **Leno attachments** which, during weaving, cross over certain of the warp threads to form loops through which weft threads pass. They are used in the manufacture of gauze and other leno fabrics.

- (9) **Swivel shuttle attachments**; these enable a swivel shuttle to be passed between certain warps to produce broché designs.
- (10) **Warp pile motions** which, by a variable motion of the comb, form loops on one or both surfaces of the fabric (Terry fabrics, etc.).
- (11) **Split selvedge machines**. When a wide loom is used to produce simultaneously a number of narrow fabrics, these machines produce a leno weave or insert a form of oversewing where the weft threads are to be cut to separate the narrow fabrics.
- (12) **Apparatus incorporating photoelectric cells, which detect faults in fabrics being knitted, yarns being wound on a warping frame, etc.**, and stop the motion of the machine with which they are used as soon as they detect a fault.
- (13) **Automatic spool changers for weaving machines**.
- (14) **Machines for placing thin plates in automatic stop motions**.
- (15) **Warp-protectors** for warpers, warp sizing machines and knitting machines.
- (16) **Bobbin holders**.
- (17) **Screens and beaters (beating wings) for openers and beaters for mechanical stitchers**.
- (18) **Cylinders and drums for mechanical stitchers, cards or combing machines**.
- (19) **Agitators, drums and cylinders for wool degreasing machines or for greasing machines**.
- (20) **Stretching devices** for drawing bench, roving benches or continuous ring threading machines, and cylinders thereof.
- (21) **Mechanical yarn separators** of simple design, for bobbin machines, intended to remove knots and other faults from the yarns.

Certain of the items listed above may be designed to form integral parts of particular looms (Jacquard looms, automatic looms, etc.). When presented separately these are classified in this heading, not as auxiliary machinery, but as parts of the machines of **heading 84.44, 84.45, 84.46 or 84.47**.

(B) PARTS AND ACCESSORIES

This group includes :

- (1) **Creels** for holding bobbins during warping.
- (2) **Spindles and spindle flyers** for spinning frames.
- (3) **Centrifugal pots** (Topham boxes) (often of plastics) inside which man-made textile yarns are coiled in the form of cakes as they are produced.
- (4) **Combs** for combing machines; **fallers or gills**, i.e., toothed bars used in gill boxes.

- (5) **Card clothing** (including narrow strips known as card fillets), set with their wire teeth, and all-steel card clothing in the form of saw-toothed wire.
- (6) **Ring travellers**, open rings placed on the spinning ring of a spinning frame to provide the twist necessary in forming the yarn.
- (7) **Extruding nipples**, spinnerets, etc., used in extruding man-made filaments, including those of precious metal but **excluding** those of ceramics (**heading 69.09**) or of glass (**heading 70.20**).
- (8) **Thread guides** (but not those of glass or ceramics, see **headings 70.20 and 69.09**, nor those wholly of agate or other precious or semi-precious stones, see **heading 71.16**).
- (9) **Warp beams**, from which the warp yarns are unrolled during weaving.
- (10) **Reeds for looms** (including adjustable expansion combs). These beat up each line of weft against the preceding one as the weaving proceeds.
- (11) **Frames** in which the healds for looms are mounted.
- (12) **Shuttles**, but **excluding** the bobbins on which the yarn is wound.
- (13) **Metallic healds**, either flat or as lengths of two twisted wires, with a control eye through which the warp yarn passes, and **metallic harness cords** which connect heald frames to the lifting mechanism.

The heading **excludes** healds and harness cords of textile yarn or textile cord (**heading 59.11**).

- (14) **Lingoes**, thin metal weights with eyes at their upper ends to be attached to each cord of a loom harness.
- (15) **Needle boards and bottom boards**, i.e., perforated boards (usually of wood or vulcanised fibre) used with Jacquard or similar machines.
- (16) **Jacquard hooks**. Large numbers of these specialised latched hooks are used on Jacquard machines to attach the neck cords of the Jacquard to the harness cords.
- (17) **Needles for knitting machines**, for example, **bearded needles, including stilettos and needles for remeshing machines, hinged needles** (also called valve or blade needles), equipped with one or more tongues, **grooved needles** the tongue of which is replaced by a mobile slot, **tubular needles, crochet needles** for crochet machines.
- (18) **Slides, combs, slide bars, etc.**, for tulle, lace-making and embroidery machines.
- (19) **Sliders** for knitting machines.
- (20) **Drawing sleeves** of plastics.
- (21) **Shuttles for weaving machines (weaving shuttles), embroidery machines and net-making machines**.
- (22) **Plates for knitting machines**, for example, braking plates, forming, lowering, chasing plates, double-edge plates, thread guiding plates, transfer plates, plates for Jacquard stitches. These are articles made of thin plates of steel about 0.1 to 2 mm in thickness with very variable profiles, which assist the needles (generally bearded or hinged needles) to form stitches.

- (23) **Accessories to form stitches**, for example, waves, wave guides, design griffs, stretchers, grooves, pins and push rods.
- (24) **Warping beams, divided beams and beam trays, brakes and regulators of automatic roll beams.**
- (25) **Plates and suspension hooks of blades and teeth for combs.**
- (26) **Tamplets for weaving machines.**
- (27) **Shuttle boxes.**
- (28) **Iron parts used in weaving machines**, for forming a loop, including those with a cutting section.
- (29) **Hooks for crochet machines** (without shuttle).
- (30) **Needle bars for hosiery machines, sliding plates, cams and plates for needles for rectilinear knitting machines, needle cams and needle cylinders for circular knitting machines.**
- (31) **Needles for bobinot tulle machines and hooks for net-making machines.**
- (32) **Embroidery needles and frames for embroidery machines.**
- (33) **Spindles for braiding machines and bobbin machines.**
- (34) **Thread brakes (tensioners) and combs for warpers and mechanical warp sizing machines.**
- (35) **Needles, plates, "knives" and griffs for dobbies or Jacquards.**
- (36) **Magazines (lifting, turning boxes, etc.) for automatic shuttle changers.**
- (37) **Magazines for automatic changers of woof bobbins.**
- (38) **Lamellae (thin plates) for automatic warp-protectors.**

*
* *

The heading also **excludes**, *inter alia* :

- (a) Pumps used in the extrusion of man-made fibres (**heading 84.13**).
- (b) Filters used in the extrusion of man-made fibres (**heading 84.21**).
- (c) Needles of a type used on sewing machines (**heading 84.52**).
- (d) Recorded media for controlling Jacquard or similar machines (**heading 85.23**).
- (e) Roving or sliver cans (classified according to their constituent materials).
- (f) Lease rods (simple lengths of wood or metal, used on the loom to limit the beginning of the shed) (classified according to their constituent materials).
- (g) Bobbins, pirns, cops, cones, spools and similar supports (classified according to their constituent materials).

84.49 - Machinery for the manufacture or finishing of felt or nonwovens in the piece or in shapes, including machinery for making felt hats; blocks for making hats.

The heading covers machinery for the manufacture or finishing of all kinds of felt or nonwovens or of articles of felt or nonwovens, but **excluding** those for the manufacture of felted woven fabrics. The heading also covers blocks for making hats.

Machines used in the preliminary operations before felting (e.g., blower grading machines for sorting hair, textile openers, beaters and cards) are the same as those used in the preliminary operations for preparing fibres for spinning, and remain classified in **heading 84.45**.

**(A) MACHINES FOR THE MANUFACTURE OR FINISHING
OF FELT OR NONWOVENS IN GENERAL**

This group includes :

- (1) **Felters**, generally composed of two heavy grooved plates, one fixed and the other capable of reciprocating movement, between which the web of carded fibres is submitted to friction and high pressure and becomes felted. These machines also include devices for moistening the web and heating the plates.

In certain types of these machines the plates are replaced by fluted rollers.

- (2) **Soaping machines** to soap the partially formed felt.
- (3) **Fulling mills**. In these the felt pieces, previously soaped, are pounded with hammers to complete the felting. Such mills remain here even though, exceptionally, they can be used for fulling small woven or knitted textile articles; on the other hand, rotary milling machines which are mainly used for fulling or felting woven fabrics are **excluded** (**heading 84.51**).
- (4) **Machines for the manufacture of reinforced felts**. The felt and a support of woollen fabric may be felted together by the action of a heated roller; or a series of barbed needles may be used to punch some of the fibres into a non-woollen base fabric prior to felting.
- (5) **Finishing machines for felts**, such as smoothing and polishing, shaving, etc.
- (6) **Machines for the manufacture of nonwovens** (such as those employing the dry process, wet process or direct spinning).

(B) MACHINERY FOR MAKING FELT HATS

This group includes :

- (1) **Machines for felting animal hair into hat-shapes.** They consist of a roller system feeding the hair to rotating brushes or revolving belts of card clothing, and these throw the hair on to revolving perforated metal cones (or gauze cones). A strong current of air sucks the hair to the surface of the cone forming a layer on its surface.
- (2) **Felting presses**, with grooved faces usually of wood, one or both of which are capable of reciprocating motion, between which the pre-formed hat-shape is felted.
- (3) **Roller presses** to complete the felting of the hat-shapes.
- (4) **Stretching machines** on which the conical hat-shape is further formed and the conical end rounded.
- (5) **Machines in which the brim is formed** by passing the edges through conical rollers.
- (6) **Polishing machines**, which remove outstanding hairs from the surface by means of pumice stone or abrasive cloth.
- (7) **Singeing machines** for burning off hairs from the surface of the hat-shape.
- (8) **Proofing machines** in which certain hat-shapes are soaked or sprayed with shellac or gelatin, and pressed between rollers.
- (9) **Blocking machines** in which the turning of the brim is completed, and the hat-shape is given its final form.
- (10) **Sand presses**; these press bags of hot sand against the inside of the hat-shape placed on a hollow former, thus restoring the surface of the felt disturbed by previous operations.
- (11) **Machines with revolving pads to give the felt a smooth shiny surface.**

Machines for making woollen felt hats are the same as those described above for making hats from other animal hair felts, except for the first hat-shape forming operation. In the case of wool, the layer of fibres from the carding machine is formed into a hat-shape by a device consisting of a revolving double conical block.

(C) BLOCKS FOR MAKING HATS

These may be of wood or metal (usually aluminium), and are used with certain of the above machines.

Hat-stretching blocks used in hat fitting are also classified here. Machines for tracing head contours used in hat fitting are **excluded (heading 90.31)**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines of this heading.

*
* *

The heading **does not cover** :

- (a) Calenders for compressing the bats of fibre before felting (**heading 84.20**).
- (b) Knitting machines used in the production of knitted headgear (berets, fezes, etc.) (**heading 84.47**).

84.50 - Household or laundry-type washing machines, including machines which both wash and dry (+).

- Machines, each of a dry linen capacity not exceeding 10 kg :

8450.11 -- Fully-automatic machines

8450.12 -- Other machines, with built-in centrifugal drier

8450.19 -- Other

8450.20 - Machines, each of a dry linen capacity exceeding 10 kg

8450.90 - Parts

The heading covers **household or laundry-type washing machines** (whether or not electric and whatever the weight), which are normally used in the household, commercial laundries, hospitals, etc., to clean linens, finished goods, etc. They usually include paddles or rotating cylinders for keeping the liquid circulating through the contents, or sometimes a device to give high frequency vibrations to the liquid.

The heading also covers machines which both wash and dry.

However, dry-cleaning machinery falls in **heading 84.51**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines of this heading.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 8450.11

This subheading covers washing machines which, once the programme has been selected, wash, rinse and spin without the intervention of the user.

84.51 - Machinery (other than machines of heading 84.50) for washing, cleaning, wringing, drying, ironing, pressing (including fusing presses), bleaching, dyeing, dressing, finishing, coating or impregnating textile yarns, fabrics or made up textile articles and machines for applying the paste to the base fabric or other support used in the manufacture of floor coverings such as linoleum; machines for reeling, unreeling, folding, cutting or pinking textile fabrics.

8451.10 - Dry cleaning machines

- Drying machines :

8451.21 -- Each of a dry linen capacity not exceeding 10 kg

8451.29 -- Other

8451.30 - Ironing machines and presses (including fusing presses)

8451.40 - Washing, bleaching or dyeing machines

8451.50 - Machines for reeling, unreeling, folding, cutting or pinking textile fabrics

8451.80 - Other machinery

8451.90 - Parts

This heading covers a wide variety of machines which are used :

- (I) For the washing, bleaching, wringing, cleaning, ironing, dyeing, drying or the like of textile yarns, fabrics or made up textile articles, but **excluding** household or laundry-type washing machines (**heading 84.50**).
- (II) For the dressing or finishing of yarns or fabrics, after spinning or weaving respectively, to bring out certain qualities or improve their appearance (e.g., shearing, fulling, lustring), or to give them special new qualities (e.g., by impregnating or coating), but **excluding** machines for the finishing of felt (**heading 84.49**).
- (III) For the reeling, unreeling, folding, cutting or pinking of textile fabrics.

Many of the machines of this heading are nothing more than vats, tanks, troughs or other containers, fitted with simple mechanical features such as rollers for leading in the yarn or fabric or for squeezing out excess liquid, stirring paddles, etc. Such machines are used for a variety of washing, bleaching, dyeing, cleaning, etc., operations, or for finishing operations involving coating or impregnating (e.g., with size or with waterproofing, crease-resisting, fireproofing, moth-proofing, rot-proofing, etc., compounds). To fall in the heading, the apparatus **must have such mechanical features and must be clearly intended for treating textiles**.

(A) MACHINERY FOR WASHING, WRINGING, IRONING OR PRESSING WHETHER OR NOT FITTED WITH HEATING DEVICES

This group includes :

- (1) **Industrial washing machines, excluding** washing machines of **heading 84.50**, for yarns or woven fabrics or textile articles. This heading includes, for example, tunnel washers through which hanks of yarn are drawn, successively sprayed to wash them and dried, as well as festoon loop washers for piece goods.

This heading covers industrial washing machines used during the manufacturing process of fabrics and textiles, in which the equipment is used in finishing or to remove sizing from the manufactured goods.

- (2) **Wringers and mangles.**
- (3) **Shaker-tumblers** used in laundries to untangle the damp pieces and open them out ready for ironing.
- (4) **Ironing machines and steam presses** for pressing garments (including fusing presses) but **excluding** smoothing or ironing machines of the calender type, whether or not for domestic use, of **heading 84.20**.

(B) BLEACHING OR DYEING MACHINERY

These include **J-boxes** used in bleaching or other wet finishing operations; they consist essentially of a vertical two-armed container, shaped like a letter J, fitted with internal steam jets and with rollers to guide the cloth. The fabric, previously impregnated by passing through a bath of bleaching liquor, enters the longer arm where it remains for the time required for the bleaching to take effect, and in due course emerges from the smaller arm.

Other machines of this group are mainly vat-type machines already referred to, adapted for dealing with particular types of textile goods (e.g., yarns in hanks or skeins or in balls, on bobbins, etc., piece goods or made up articles). The group also includes machines for dyeing or dressing textile piece goods in open width; the essential feature of these machines is that they incorporate a set of rollers for squeezing out excess liquid.

(C) DRY CLEANING MACHINERY

These clean with liquids such as petrol, carbon tetrachloride, etc., instead of water. They are usually complex machines incorporating, for example, washers for circulating the liquid through the goods being cleaned, centrifugal extractors, filters, clarifiers and storage tanks. In view of the inflammable nature of many of the liquids used, they usually have an explosion-proof motor drive for the washer and circulating pump.

(D) DRYING MACHINES

These machines are classified here **only** if they are clearly designed and specialised for the drying of textile yarns, fabrics or made up articles. They are of two main types : those consisting essentially of a closed chamber in which the goods to be dried are subjected to the action of hot air, and those in which fabrics are passed over heated rollers.

The heading **excludes** dryers not specialised for the treatment of textile goods (**heading 84.19**), and centrifugal dryers (**heading 84.21**).

(E) DRESSING OR FINISHING MACHINES

This group includes :

- (1) **Mercerising machines** in which yarns or fabric are treated with caustic soda.
- (2) **Beetling machines** in which rows of wooden headed or cast-steel hammers, mounted spirally on a roller, consolidate the cloth by beating; they close up the interstices of the weave and improve the lustre of the fabric.
- (3) **Rotary milling machines**. These machines close up the warp and weft threads and effect a partial felting on the surface.
Stock or hammer mills, mainly used in the manufacture of felt, are **excluded** (**heading 84.49**).
- (4) **Picking or burling machines**, used in the removal of imperfections or pieces of burr still remaining in the fabrics.
- (5) **Raising machines**, used to raise the surface fibres of a cloth. They consist essentially of a large cylinder, mounted either with slats or frames into which teasels can be set, or with smaller cylinders fitted with fine wire points.
- (6) **Machines for beating the backs of fabrics** to make the surface hairs stand up.
- (7) **Cropping machines** to shear the surface of the fabric level after teaseling; similar machines are used in the finishing of velvets. By using indented bed-plates or rollers, patterned effects can be obtained.
- (8) **Ratine or rippling machines** used to form wave or bead effects on raised fabrics, by rolling and curling together bunches of fibres. They consist of a plush covered table over which another table (covered with rubber, felt or emery) swings with a short oscillating and circular motion.
- (9) **Brushing machines**; these comprise revolving cylindrical brushes for brushing the fabric after raising or cropping.
- (10) **Singeing machines** for removing the hairiness of yarn or cloth. These work by rapidly passing the cloth over heated cylinders or curved plates, or over gas flames.
- (11) **Machines for polishing or glazing string, for polishing silk yarn in hanks, or for polishing silk fabrics.**

- (12) **Emery machines** for producing a smooth, even surface on fabrics.
- (13) **Cylindrical presses** operating on a flat or semi-circular bed-plate to produce a surface lustre. Calendering machines (**heading 84.20**) and general purpose hydraulic presses (**heading 84.79**) are also used for this purpose.
- (14) **Decatising machines** in which the fabric is steam-treated to fix the final finish and set of the cloth; also similar machines for conditioning yarns or fabrics by steam-treatment.
- (15) **Stentering (tentering) machines** for restoring the fabric to its proper width.
- (16) **Shrinking machines**, which close up the weft threads to produce a close fabric less likely to shrink subsequently.
- (17) **Coating or impregnating machines** for applying special surface coatings to yarns or fabrics, or for impregnating them with special preparations (e.g., gum, starch, size, wax, plastics, rubber or water-proofing compounds). The heading includes machines for coating fabric, paperboard, etc., in the manufacture of floor coverings such as linoleum, and also the dressing machines described in the last sentence of Part (B) above.
- (18) **Fancy yarn manufacturing machines** in which the special effect is produced after the spinning and doubling of the yarn (e.g., machines for ornamenting yarn with small drops of gelatin or wax).

(F) MACHINES FOR REELING, UNREELING, FOLDING, CUTTING OR PINKING TEXTILE FABRICS

This group includes :

- (1) **Cloth folding or reeling machines**, which fold the cloth lengthwise or across the width, or roll it on to a support; also **inspection machines incorporating folding or reeling devices**, for inspecting fabrics for defects. Any of these machines may be combined with measuring apparatus.
- (2) **Cloth cutting or pinking machines**, including machines for cutting out patterns or parts of garments, etc.

*
* *

The following are also classified here :

- (1) **Steaming apparatus** (steam dummies, busts for steam ironing) **for outer garments**.
- (2) **Machinery and apparatus (tables, etc.) for folding linen already ironed** (for example, handkerchiefs, sheets, tablecloths).
- (3) **Machinery and apparatus for boiling and washing wool fabric** in order to scour it before bleaching or dyeing.
- (4) **Machines for removing gum from fabrics** before bleaching or dyeing.

- (5) **Machines for treating fabrics** with a lye of soda or potassium before bleaching or dyeing.
- (6) **Steam machines for humidifying** yarns, fabrics and other textile products.
- (7) **Form setting and fixing machines** (thermosetting), including **machines for preforming or forming stockings or socks**.
- (8) **Machines for the impregnation and drawing of fabrics for pneumatic tyres**.
- (9) **Machines for inking textile ribbons for typewriters and the like**.
- (10) **Machines for breaking up the finish of fabrics**.
- (11) **Machines for flocking fabrics**, for example, electrostatic flocking machines.
- (12) **Fabric-pleating machines**.
- (13) **Appliances for cleaning carpets in situ** by injecting a liquid cleaning solution into the carpet, the solution then being extracted by suction, designed for use in establishments (other than domestic premises) such as hotels, motels, hospitals, offices, restaurants and schools.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines of this heading.

*
* * *

The heading also **excludes** :

- (a) Autoclaves, steam-jacketed vats and other heating apparatus not identifiable as being for the heat-treatment of textiles (**heading 84.19**).
- (b) Calendering machines (for glossing, glazing, smoothing, embossing, moireing, etc.) and their cylinders (**heading 84.20**).
- (c) Centrifugal dryers and other centrifuges of **heading 84.21**.

84.52 - Sewing machines, other than book-sewing machines of heading 84.40; furniture, bases and covers specially designed for sewing machines; sewing machine needles (+).

8452.10 - Sewing machines of the household type

- Other sewing machines :

8452.21 -- Automatic units

8452.29 -- Other

8452.30 - Sewing machine needles

8452.90 - Furniture, bases and covers for sewing machines and parts thereof; other parts of sewing machines

(A) SEWING MACHINES

The **sewing machines** and **sewing machine heads** of this heading are intended for sewing together two or more pieces of textile material, leather, etc. The heading includes sewing machines which, in addition to ordinary sewing, can produce purely decorative work (e.g., embroidery effects); however, machines designed to do embroidery work **only** (including drawn thread machines) fall in **heading 84.47**. Book-sewing machines are classified in **heading 84.40** and knitting-sewing machines and other stitch-bonding machines in **heading 84.47**.

Except when performing certain embroidery work, these machines generally operate with two threads, one inserted by the needle and one carried underneath by a shuttle. They generally have one needle and one shuttle, but may be fitted with several needles and shuttles (e.g., to produce a double or triple seam).

Electric sewing machines with a built-in electric motor, whether domestic or otherwise, remain classified in this heading.

In addition to the ordinary sewing machines used in the home or by tailors, dress-makers, etc., the heading also covers special machines which can be used only for certain other kinds of sewing, such as :

- (1) Sewing machines used in the manufacture or mending of boots or shoes or for other leather sewing.
- (2) Machines for button-hole sewing; these may include a device for cutting the button-hole.
- (3) Machines for sewing on buttons.

- (4) Machines for sewing up straw hats.
- (5) Machines for sewing furs.
- (6) Machines for sewing up sacks after filling (flour or cement sacks, etc.); these machines may be suspended and generally have no shuttles.
- (7) Machines for sewing up tears in sacks.
- (8) Over-sewing machines for the manufacture of sacks, for working the edges of blankets, carpets, etc.
- (9) Hem-stitching or blanket-stitching machines.
- (10) Machines for sewing together, edge to edge, parts of knitted garments.

In addition to sewing, certain of the machines of this heading may also perform other operations, e.g., cutting, pinking, perforating or pleating fabrics, leather, paper, etc.

(B) FURNITURE, BASES AND COVERS SPECIALLY DESIGNED FOR SEWING MACHINES

For example, stands which can be used as tables or cabinets, and parts of such furniture (drawers, extension boards, etc.), bases and covers are classified in this heading, even if presented separately. Separate cases mainly for protection or carrying purposes, if presented separately, are classified in their respective headings.

(C) SEWING MACHINE NEEDLES

The heading covers not only the needles for the types of sewing machines described above, but also, **provided** they are of the sewing machine type (usually with an eye near the point), those for the book-sewing machines of heading 84.40 or for the embroidery machines of heading 84.47.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts (e.g., stands and shuttles) for machines of this heading. Bobbins are, however, classified according to their constituent material.

*
* *

The heading **excludes** toy sewing machines (**heading 95.03**).

○
○ ○

Subheading Explanatory Note.

Subheading 8452.10

Subheading 8452.10 applies to the following sewing machines and sewing machine heads, all of which are capable of at least lock stitch operation :

- (a) foot or hand powered machines;
- (b) machines incorporating an electric motor of an output not exceeding 120 watts;
- (c) machines for powered operation, presented without a motor, the weight of the machine head not exceeding 16 kg.

This subheading also applies to the sewing machines called "overlock" or "serger" with built-in electric motor of an output not exceeding 120 watts, which operate with three, four or five thread leads, and sewing machine heads similar to those mentioned above, by virtue of their construction and performance, which operate with stitches other than lock stitches but are nevertheless designed for household use in that their operating speed generally does not exceed 1,500 stitches per minute.

This subheading also covers hand-held, battery-operated sewing machines which sew by means of chain stitch with a single thread.

The subheading **does not**, however, **include** sewing machines dedicated to a specific function such as button holing or filled bag closing.

84.53 - Machinery for preparing, tanning or working hides, skins or leather or for making or repairing footwear or other articles of hides, skins or leather, other than sewing machines.

8453.10 - Machinery for preparing, tanning or working hides, skins or leather

8453.20 - Machinery for making or repairing footwear

8453.80 - Other machinery

8453.90 - Parts

This heading covers machinery for preparing hides or skins (including furskins) ready for tanning, machinery for effecting the tanning (including parchmenting) processes, and machinery for the subsequent finishing operations. It also covers machinery used for making or repairing articles of hide, skins or leather (e.g., for making leather footwear, gloves or travel goods). But the heading excludes sewing machines (heading 84.52).

(I) MACHINERY FOR PREPARING, TANNING OR WORKING HIDES, SKINS OR LEATHER

Many machines of this group are, in practice, used at several stages in the processing of hides or skins (e.g., in the washing, pre-tanning, dyeing or other finishing processes). Such machines include special vats, drums, washers, etc., incorporating mechanical features such as stirrers, rotating mechanisms or devices for manipulating the skins.

This group also includes, *inter alia* :

- (1) **De-hairing machines**, which remove from the raw skins the hairs previously loosened by chemical action.
- (2) **Fleshing machines**, for removing flesh, fat, etc., from the raw skin.
- (3) **Hammer mills (faller stocks) and cylinder beater mills**. The hammers or the grooved rotating cylinder of these machines work the skins or leather during the washing, tanning, oiling or impregnation processes.
- (4) **Machines for stretching skins or leather** to open the pores, eliminate creases or other surface flaws; **scraping machines**, used to smooth out the flesh side and to remove foreign matter; **softening machines**, in which the leather is treated by the action of cylinders covered with cork or rubber.
- (5) **Hammering machines** which beat the surface of the leather with small hammers to remove dirt and excess moisture, and to restore the grain.
- (6) **Hammer machines used for compacting**, hardening or smoothing leather (e.g., for shoe soles or machinery belting).
- (7) **Shaving or splitting machines** which, by means of knives, equalise the thickness over the whole skin, or split skins into layers.

- (8) **Emery machines**, e.g., for roughening the surface of the skin to produce a velvety effect.
- (9) **Brushing machines**, e.g., to clean the skin and increase the velvety effect after roughening.
- (10) **Machines for glazing leather** by working it with agate polishing stones, or with small rollers of agate or glass.
- (11) **Graining machines**.

This group further includes **machines for processing furskins**. In general these skins receive pre-tanning and tanning treatment on similar machines to those described above, but the heading also includes those for treating the fur itself (e.g., for trimming the hair to an even length, for removing long hairs, for curling, combing, brushing or dyeing the fur).

The heading also **excludes** :

- (a) Drying machines of **heading 84.19**.
- (b) Calenders (e.g., for smoothing, glazing or graining leather) (**heading 84.20**).
- (c) Centrifugal dryers (**heading 84.21**).
- (d) Machines for spraying dyes, varnish, etc. (**heading 84.24**).
- (e) Hog de-hairing machines of the type used in butchery (**heading 84.38**).
- (f) General purpose presses (**heading 84.79**).
- (g) Machines for measuring hides or skins (**heading 90.31**).

(II) MACHINERY FOR MAKING OR REPAIRING FOOTWEAR OR OTHER ARTICLES OF HIDES, SKINS OR LEATHER

This group covers machinery for making or repairing articles made from hides, skins (including furskins) or leather (e.g., footwear, gloves, jackets and other articles of apparel, saddlery, book-covers, handbags, travel goods).

The group includes, *inter alia* :

- (A) **Skiving or paring machines** for thinning the edges or certain other parts of pieces of leather before sewing or gluing them together.
- (B) **Machines for cutting out leather in particular shapes** (e.g., shoe uppers, glove blanks, straps, etc.). The two most common types are the band-knife machine and the clicking press (which cuts out by the use of dies).
- (C) **Perforating machines**, for ornamenting toe caps, glove backs, etc.

(D) **Boot or shoe machinery**, e.g., :

- (1) **Channel cutting machines**, used to cut grooves or channels into which the stitches can be inserted (e.g., round the edge of the sole); and **machines for opening or closing the channels** before or after sewing.
- (2) “**Pulling-over**” or **lasting machines**, for drawing the upper on to the last, and tacking or sticking it onto the in-sole.
- (3) **Machines for pounding and hammering** the edges of the uppers and the bottoms of the in-soles after they have been put together on the last.
- (4) **Machines for glueing** the outer sole onto the in-sole and upper, e.g., glueing machines, sole laying machines.
- (5) **Machines for fastening** the heel onto the sole.
- (6) **Machines for trimming, smoothing or finishing** the edges of the sole or heel.
- (7) **Roughening machines** which by means of a wire brush or an abrasive belt remove the finish from the upper in order to make it adhere better when being glued to the sole.
- (8) **Polishing and finishing machines**, consisting of a series of grinding stones, polishing brushes and felts used to give a good surface to the uppers; the heading includes similar machines used by boot or shoe repairers.
- (9) **Boot or shoe stretching machines**.

It should be noted that some of the machines of this heading such as graining, cutting out, perforating, pricking, and even certain boot or shoe making machines, can be used for materials other than leather (e.g., cardboard, imitation leather or plastics); they remain, however, in this heading **provided** they are clearly designed to be used mainly for hides, skins or leather.

The heading **does not**, however, **include** :

- (a) Boot or shoe lasts (classified according to the constituent material, generally **heading 44.17**).
- (b) Wood-working machines for making clogs, wooden soles, heels, etc. (**heading 84.65**).
- (c) Automatic shoe brushing machines and eyeletting machines (**heading 84.79**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading, and dies and other interchangeable tools for these machines are also classified here.

84.54 - Converters, ladles, ingot moulds and casting machines, of a kind used in metallurgy or in metal foundries.

8454.10 - Converters

8454.20 - Ingot moulds and ladles

8454.30 - Casting machines

8454.90 - Parts

(A) CONVERTERS

These are used for converting or refining metals (e.g., for converting iron into steel, or smelting copper or nickel mattes, galena, etc.) by subjecting the materials, previously melted or brought to a high temperature in a furnace, to a strong current of oxygen; by this action most of the carbon and dissolved elements such as manganese, silicon and phosphorus are oxidised and eliminated in the form of gas or molten slag. The oxidation increases the temperature of the metal further.

The most common types of converters are pear-shaped or cylindrical vessels consisting of an outer shell of heavy steel plates with an internal lining of refractory material. The oxygen is brought in either by a lance from above (LD-converters (Linz-Donawitz)) or through nozzles in the converter bottom (OBM-converters (Oxygen Bodenblasende Maximilianhütte)). Combinations of the two exist.

Other types include converters with the tuyères incorporated in the sides, rotating cylindrical converters, conical converters (for treating copper matte) with an internal metal grille for supporting the charge.

(B) LADLES

These are used to receive the molten metal from a furnace and pour it into converters or moulds; they are simple open containers generally lined with refractory material, usually fitted with devices to facilitate tipping or pouring and in some cases fitted with wheels. They are usually handled mechanically (e.g., by cranes), but the heading also covers foundry-type casting ladles manipulated by hand. Small hand ladles of the type used by tinsmiths, goldsmiths, etc., are **excluded (heading 73.25 or 73.26)**.

(C) INGOT MOULDS

These may be of various shapes, in one piece or two halves, in which the molten metal is provisionally cast into, e.g., ingots, pigs, slabs.

Other moulds (e.g., for casting articles) are generally classified in **heading 84.80**.

The moulds of this group are of metal, usually iron or steel. Ingot moulds of graphite or other carbon or of ceramic material are, however, excluded (headings 68.15 and 69.03, respectively).

(D) CASTING MACHINES OF A KIND USED IN METALLURGY OR IN METAL FOUNDRIES

This group includes :

- (1) **Machines (generally incorporating a conveyor belt or chain) for the successive filling, cooling and emptying of the moulds.** These sometimes incorporate devices for shaking or tapping the moulds to facilitate the even setting of the molten metal.
- (2) **Machines for casting under pressure.** These consist essentially of two adjustable plates to which are fixed the two halves of the mould. The liquid metal from a reservoir is forced into the mould, either by the direct action of compressed air on the free surface of liquid metal in the reservoir, or by the insertion of a piston into a closed reservoir full of the liquid metal. In some cases these machines incorporate cooling devices, to accelerate solidification of the metal, and arrangements for separating the cast article from the mould. They are mainly used for casting small non-ferrous metal articles.

However, the heading **does not cover** machines for moulding metal powders under pressure, by sintering, (heading 84.62).

- (3) **Centrifugal casting machines** in which the molten metal is led into a cylindrical mould rotating at high speed; the metal is thrown on to the sides of the mould and solidifies in the form of a pipe.
- (4) **Continuous casting machines.** In these, steel is conveyed from the ladle in a distributor which feeds the different casting flow lines. These flow lines include :
 - (a) an ingot mould, without bottom, with its cooling devices;
 - (b) outside the ingot mould a system for atomising water in order to cool the cast metal;
 - (c) a group of conveyor rollers allowing the regular extraction of the solidified metal; and
 - (d) a system of cutting-off machines, followed by an evacuation device.

The moulds to be used with the machines of this group fall usually in **heading 68.15, 69.03 or 84.80**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines of this heading.

84.55 - Metal-rolling mills and rolls therefor.

8455.10 - Tube mills

- Other rolling mills :

8455.21 -- Hot or combination hot and cold

8455.22 -- Cold

8455.30 - Rolls for rolling mills

8455.90 - Other parts

(I) ROLLING MILLS

Rolling mills are metal working machines consisting essentially of a system of rollers between which the metal is passed; the metal is rolled out or shaped by the pressure exerted by the rollers, and at the same time the rolling modifies the structure of the metal and improves its quality. In some cases, in addition to their normal functions, rolling mills may be used to produce a pattern on the metal surface, or to roll together two or more sheets of different metals to produce a laminated product.

Similar machines for rolling materials **other than** metal, e.g., calenders, are **excluded** (**heading 84.20**). Other roller machines (e.g., for gumming metal foil on to a paper support) (**heading 84.20**), bending, folding, straightening or flattening machines (**heading 84.62**) are not regarded as rolling mills in the sense described above and are therefore also **excluded** from this heading.

Rolling mills are of various types according to the particular rolling operations for which they are designed, viz. :

- (A) Rolling out to reduce the thickness with a corresponding increase in length (e.g., in the rolling of ingots into blooms, billets or slabs; rolling of slabs into sheet, strip, etc.).
- (B) Rolling of blooms, billets, etc., to form a particular cross-section (e.g., in the production of bars, rods, angles, shapes, sections, girders, railway rails).
- (C) Rolling tubes.
- (D) Rolling of wheel blanks or wheel rim blanks (e.g., to shape the flanges of railway wheels).

Most rolling mills are designed for the operations indicated at (A) or (B) above. The essential element of these is known as a "stand", and consists of two, three or four rolls mounted horizontally one above the other in heavy metal housings, the metal being passed through an adjustable gap between the rollers. In three high and double two high stands, the metal, after being passed between two of the rollers, is then passed through two others; some stands have two or more additional rolls which act as support to give additional power and steadiness to the working rollers.

Most mills consist of a number of such stands arranged either side by side, or slightly staggered, or tandem fashion (for example, continuous rolling mills for sheets); the speeds and gaps of the rollers are adjusted to produce a progressive and gradual rolling down of the metal.

Certain rolling mills may have side rollers for working on the edges of the material, or for producing particular sections (e.g., girders).

For flat products (slabs, sheet, strip, etc.) the rollers are plain (except that certain finishing rollers may produce a simple ridged pattern). In many cases (e.g., for the operations under (B) above) the rolling is not done over the full width of the rolls, but the working rollers have channels cut in their surface so that a gap (or pass) of a particular shape is formed between the two rollers. The metal as it passes through is formed to the shape of the gap, and passing through a succession of such gaps, gradually varying in shape, the metal is thus worked to the desired cross-section.

Rolling mills of the kinds referred to above vary considerably in size, from small machines for rolling precious metals up to very heavy rolling mills for steel.

Most of the rolling mills referred to above are for hot rolling, but certain finishing mills (particularly for sheet or strip) roll the metal cold.

Among the rolling mills of the type referred to at (C) and (D) above are :

- (1) Mannesmann or similar machines for piercing billets; these have large inclined rollers which rotate the heated billet and force it over a piercing mandrel, thus forming the rough tube.
- (2) Mills for rolling out the pierced billets to reduce the thickness of the walls, increase the length and produce a satisfactory surface to the walls. The walls of the tube are worked between a mandrel or plug on the inside, and either rollers with a circular pass or conical rollers on the outside. In certain cases rollers with eccentrically cut channels to give a variable pass are used (step rolling).
- (3) Finishing mills for tubes, to finish or reduce the thickness of the walls, or to reduce the diameter, or produce a perfect circular cross-section. These may operate with or without an internal mandrel.
- (4) Radial mills for rolling the walls of large diameter cast steel tubes. The tube rotates between a number of rollers operating on the outside and corresponding rollers on the inside.
- (5) Wheel or disc rolling mills. These usually consist of sets of conical or cylindrical rollers variously arranged, between which the roughly formed wheel revolves; the various parts of the wheel (e.g., flanges of railway wheels) are worked to the required shape by the pressure of the rollers. Similar machines are used for shaping flanged tyres for railway wheels, and for certain railway rails.

In general, the operation of rolling mills requires a large amount of **auxiliary equipment** such as guides, roller tables, handling equipment, re-heating furnaces, pickling tanks, strip coilers, shears and saws, cooling beds, weighing or marking machines, straightening or flattening machines, control apparatus (mechanical, electric or electronic), etc.

(II) ROLLS AND OTHER PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading covers parts of rolling mills. Among the parts covered by this heading are the **rolls of rolling mills**. These vary considerably in length and diameter, those for steel ranging approximately from 30 to 520 cm in length and from 18 to 137 cm in diameter. They are made of cast iron, or of cast or forged steel, usually specially hardened on the surface and carefully machined to exact dimensions; they may be plain, or with grooves of various shapes to form the necessary passes. Each roll ends in necks, often specially shaped for mounting in the housings of the rolling mill. Outside the roll necks, wobbler-ends are cut to which the driving force is applied.

84.56 - Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc processes; water-jet cutting machines.

- Operated by laser or other light or photon beam processes :

8456.11 - - Operated by laser

8456.12 - - Operated by other light or photon beam processes

8456.20 - Operated by ultrasonic processes

8456.30 - Operated by electro-discharge processes

8456.40 - Operated by plasma arc processes

8456.50 - Water-jet cutting machines

8456.90 - Other

The machine-tools of this heading are machines used for the shaping or surface-working of any material. They must meet three essential requirements :

- (i) They must work by removing material;
- (ii) They must carry out operations of the kind performed by machine-tools equipped with conventional tools;
- (iii) They must use one of the following seven processes : laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc.

This heading also covers water-jet cutting machines described in Part (H) below.

This heading, however, **excludes** the following kinds of machines, which are provided for in **heading 84.86** :

- (i) Machines for working any material by removal of material, of a kind used solely or principally for the manufacture of semiconductor boules or wafers, semiconductor devices, electronic integrated circuits or flat panel displays.
- (ii) Machines for working any material by removal of material, of a kind used solely or principally for the manufacture or repair of masks and reticles.
- (iii) Machines for dry-etching patterns on semiconductor materials.

Examples of the foregoing products are (1) laser-beam machine tools which drill semiconductor crystals and (2) ultrasonic process machine-tools which cut semiconductor chips or which cut or drill ceramic substrates for integrated circuits.

(A) MACHINE-TOOLS FOR WORKING BY LASER OR OTHER LIGHT OR PHOTON BEAM PROCESSES

Laser-beam machining (photonic machining) consists of bombarding a target with photons. This group covers, in particular, machines for drilling (metals, rubies for watches, etc.), machines for cutting metals or other hard materials and machines for engraving (figures, letters, lines, etc.) on various highly resistant materials.

The principle of the machine-tools operated by laser processes is the removal of material by melting, burning or vaporization (also referred to as "ablation"), which are caused by a focused intense laser beam directed at the workpiece. In certain machinetools of this type, the laser beam may be coupled into a low-pressure water jet, which is used to guide the laser beam, and to remove debris and cool the material.

The other machine-tools of this group differ from the machine-tools operated by laser beam processes by the type of beam used for the removal of material.

(B) MACHINE-TOOLS FOR WORKING BY ULTRASONIC PROCESSES

Ultrasonic machine-tools consist of a punch subjected to ultrasonic vibrations and an abrasive in suspension in a liquid. These machines may incorporate an abrasive recycling system.

This group includes machine-tools which are used, in particular :

- (1) For working diamond or metal carbide dies;
- (2) For drilling or shaping minerals;
- (3) For engraving glass;
- (4) For milling, broaching or polishing.

(C) MACHINE-TOOLS FOR WORKING BY ELECTRO-DISCHARGE PROCESSES

The principle of this type of machining is the removal of metal between two metallic electrodes (the workpiece and the tool) by sudden electrical discharges of very short duration at the rate of several hundred thousand cycles per second. This group covers, for example, **high-frequency electric-spark cutting machines**.

(D) MACHINE-TOOLS FOR WORKING BY ELECTRO-CHEMICAL PROCESSES

The principle of this type of machining is the removal of metal by electrolysis. The workpiece (anode) is a conductor of electricity as is the tool (cathode). Both are submerged in a selected electrolyte which makes cathodic deposition impossible, and all that occurs is anodic dissolution.

This group includes :

- (1) **Electrolytic polishing apparatus**, used for polishing specimens for microscopic or metallurgical examination.
- (2) **Electrolytic sharpeners** for sharpening cutting tools, cutting chip-breaker grooves or cutting metal carbide plates; these machines utilise a diamond wheel.
- (3) **Machines for deburring** various kinds of gear-wheel by anodic dissolution.
- (4) **Machines for precision** finishing flat surfaces, etc.

(E) MACHINE TOOLS FOR WORKING BY ELECTRON BEAM PROCESSES

Electron beam machining consists of bombarding the workpiece on a very small surface with electrons emitted by a cathode, accelerated by an intense electrical field, and focussed by a system of magnetic or electrostatic lenses.

(F) MACHINE-TOOLS FOR WORKING BY IONIC-BEAM PROCESSES

The beam of these machine-tools works by continuous action, not by impulses as in the case of the laser beam.

(G) MACHINE-TOOLS FOR WORKING BY PLASMA ARC PROCESSES

Plasma arc machining involves intense ionisation of a gas by means of an electric current produced by a magnetic impulse generator under high tension. It permits cutting plates at a very high speed and rough-cutting and machining coarse-feeding threads.

(H) WATER-JET CUTTING MACHINES

This group includes water-jet and water-abrasive jet cutting machines. These are machines designed to cut materials by a process using streams of water or of water mixed with very fine abrasives, typically at a velocity of 2 to 3 times the speed of sound. They operate under pressures of 3,000 to 4,000 bars and are capable of making multiple types of precision cuts in a variety of materials. Water-jet cutting machines are typically used for softer materials (foam, soft rubber, gasket material, foils, etc.). Water-abrasive jet cutting machines are typically used for harder materials (tool steel, hard rubber, composites, stone, glass, aluminium, stainless steel, etc.).

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.66**.

*
* * *

The heading also **excludes** :

- (a) Ultrasonic apparatus for cleaning (**heading 84.79**).
- (b) Soldering, brazing or welding machines and apparatus, whether or not capable of cutting (**heading 85.15**).
- (c) Testing machines (**heading 90.24**).

84.57 - Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal.

8457.10 - Machining centres

8457.20 - Unit construction machines (single station)

8457.30 - Multi-station transfer machines

This heading applies (see Note 4 to this Chapter) only to machine-tools for working metal (other than lathes (including turning centres)) which can carry out different types of machining operations on a single workpiece either :

- (a) by automatic tool change from a magazine or the like in conformity with a machining programme (machining centres);
- (b) by the automatic use, simultaneously or sequentially, of different unit heads working on a fixed position workpiece (unit construction machines, single station); or
- (c) by the automatic transfer of the workpiece to different unit heads (multi-station transfer machines).

(A) MACHINING CENTRES

Machining centres are individual machines, i.e., all the machining operations are performed on a single (multi-function) machine. These centres must satisfy two conditions : they must carry out several machining operations and they must have automatic tool change, from a magazine or the like in conformity with a machining programme.

Consequently, this group covers machine-tools which carry out **two** or more machining operations by automatic tool change from a magazine or the like, whereas machine-tools which carry out **one** machining operation using a single tool or several tools working simultaneously or sequentially (for example, multiple-spindle drills or multiple-cutter milling machines) are classified in **headings 84.59 to 84.61**.

The automatic tool change requirement excludes from the heading multi-function machines (for example, machines which drill, bore, tap and mill) in which the various tools are not changed automatically. Such machines are to be classified in **headings 84.59 to 84.61** in accordance with Note 3 to Section XVI or by application of Interpretative Rule 3 (c) unless, of course, they can be regarded as **multi-station transfer machines**, in which the workpiece is automatically transferred to the different unit heads (see Part (C) below).

Machining centres may also include auxiliary devices such as pallet changers, systems of pallet magazines or tool magazine changers.

(B) UNIT CONSTRUCTION MACHINES (SINGLE STATION)

Unit construction (single station) machines are multi-function machines in which the workpiece is held in a fixed position while the unit heads move relative to the workpiece to carry out the operation or the machine operations.

The unit heads are parts of the machines on which they are mounted and are used to hold, guide and actuate (rotate, advance, retract) the interchangeable tool. Rotating heads usually incorporate an electric motor, while translation heads usually incorporate a hydraulic cylinder : these two types of head may be combined.

This group covers unit construction machines (single station) carrying out two or more machining operations with the use of two or more unit heads.

However, machines carrying out one machining operation with the use of several unit heads or those carrying out several machining operations with the use of a single unit head are **excluded**.

(C) MULTI-STATION TRANSFER MACHINES

The machines of this group must satisfy three conditions : they must carry out several machining operations, they must work by the automatic transfer of the workpiece to the tool and they must be equipped with various unit heads.

A distinction is generally made between rotary transfer machines and linear transfer machines. In the former, the unit heads which perform the various operations are arranged in a circle on a common base. The workpiece travels around the circle in such a way that, at each stop (station), it is worked on by the tools of the corresponding unit head (for example, drilling, boring, tapping). In linear transfer machines, the unit heads are arranged in a line on a common base and work successively on the workpiece as it travels from one head to another, along the line.

In accordance with Chapter Note 4 (c) this heading **does not cover** transfer lines consisting of various machines linked by a conveyor carrying the workpieces.

Under the terms of the above-mentioned Chapter Note, this heading **also excludes** "flexible manufacturing systems" (FMS) which consist of several machines, generally numerically controlled, or several groups of machines, together with automatic handling facilities such as lifting frames, conveyors, unmanned trolleys, manipulators and industrial robots, for conveying the workpieces to the machines or removing them after machining. The various groups of machines and the handling facilities which constitute the flexible manufacturing system are controlled by automatic data processing machines.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* * *

The heading also **excludes** :

- (a) Machine-tools for working any material, by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic beam or plasma arc processes; water-jet cutting machines (**heading 84.56**).
- (b) Lathes (including turning centres) for removing metal (**heading 84.58**).
- (c) Way-type unit head machines (**heading 84.59**).
- (d) Soldering, brazing or welding machines and apparatus of **headings 84.68** and **85.15**.

84.58 - Lathes (including turning centres) for removing metal (+).

- Horizontal lathes :

8458.11 -- Numerically controlled

8458.19 -- Other

- Other lathes :

8458.91 -- Numerically controlled

8458.99 -- Other

The lathes (including turning centres) of this heading are machines used for surface-working metal by cutting away or otherwise removing metal.

These machines can be distinguished from tools (pneumatic, hydraulic or with motor) for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, or on a bench, or on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

The heading includes :

- (1) **Lathes**, whether or not automatic, including slide lathes, vertical lathes, capstan or turret lathes, production (or copying) lathes. However, spinning lathes which function by deforming the metal are classified in **heading 84.63**.
- (2) **Spindle or axle turning machines**, for turning simultaneously and symmetrically the two ends of the spindles or axles of large wheels, etc.
- (3) **Turning centres**, for removing metal.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the lathes of this heading are classified in **heading 84.66**.

*
* * *

The heading also **excludes** :

- (a) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc processes; water-jet cutting machines (**heading 84.56**).
- (b) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (c) Cutting-off machines (**heading 84.61**).
- (d) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (e) Machines and appliances for testing, of **heading 90.24**.

Subheading Explanatory Note.

Subheadings 8458.11 and 8458.91

Numerically controlled machine-tools are, as a group, known by their abbreviations CNC (Computer Numerical Control) or NC (Numerical Control). The terms “Computer Numerical Control” and “Numerical Control” can be regarded as synonymous. To qualify as a numerically controlled machine-tool, the functions and movements of the machine-tool, tool or workpiece must be performed according to pre-programmed instructions. The programming is normally executed in an NC-specific language, for example, ISO-code. Programs and other data are stored in order to be accessible directly or subsequently. Numerically controlled machine-tools always integrate a control unit (separate “stand alone” unit or built in), incorporating an automatic data processing machine or a microprocessor, as well as servo systems, in order to achieve the desired motions of the machine-tool, tool or workpiece. CNC-machines, CNC-lathes and NC-milling machines are examples of numerically controlled machine-tools.

If the control unit is not presented with the machine-tool, the latter is nevertheless to be considered as a numerically controlled machine-tool **provided** it has the specific characteristics of this type of machine.

84.59 - Machine-tools (including way-type unit head machines) for drilling, boring, milling, threading or tapping by removing metal, other than lathes (including turning centres) of heading 84.58 (+).

8459.10 - Way-type unit head machines

- Other drilling machines :

8459.21 -- Numerically controlled

8459.29 -- Other

- Other boring-milling machines :

8459.31 -- Numerically controlled

8459.39 -- Other

- Other boring machines :

8459.41 -- Numerically controlled

8459.49 -- Other

- Milling machines, knee-type :

8459.51 -- Numerically controlled

8459.59 -- Other

- Other milling machines :

8459.61 -- Numerically controlled

8459.69 -- Other

8459.70 - Other threading or tapping machines

This heading covers machine-tools for drilling, boring, milling, threading or tapping by removing metal, **other than** lathes (including turning centres) of **heading 84.58**.

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

This heading covers :

- (1) **Way-type unit head machines.** These machines, which are designed to perform drilling, boring, milling, threading or tapping operations, have no attached base. They consist only of a "frame" holding a motor and a tool holder and are equipped with guides (ways) and can therefore move back and forth repetitively when placed on a suitable base. The workpiece is inserted in a work holder independent of the way-type unit head machine which moves back and forth horizontally for drilling, boring, etc.

- (2) **Drilling machines.** These are used for cutting cylindrical holes, including recessed holes, in articles by means of a rotating tool called a drill or bit. The article remains immobile during the working of the tool which is rotated (cutting action) or fed into the work (feed action). This heading also covers drilling machines which employ a fixed tool to work a rotating article, or like machines using both processes.

Drilling machines include single spindle machines, radial or otherwise, and machines with several spindles (multi-spindle drilling machines).

- (3) **Boring machines.** These further work the internal surface of an existing hole to exact dimensions. Boring may be cylindrical, conical or spherical. Boring machines are used, for example, for working to exact dimensions the cylinder bores of piston engines or pumps.

The operation of boring involves the use of free standing facing tools with fixed dimensions (borer drills, straight or helically-fluted finishing borers) or variable dimensions (expanding-end borers, inset-strip borers, micrometrically adjustable boring heads, boring heads with inset cutters) or with tools working on a guideway (adjustable, expanding or non-adjustable cutters and hollow one-piece sleeves or sleeves with inset parts).

This heading includes, *inter alia*, vertical boring machines, horizontal boring machines (with fixed or moveable mounting), multiple boring machines, boring machines for duplicating the interiors of hollow-bored shafts as well as machines commonly called miller-borers fitted with a composite spindle made up of two concentric spindles which may function independently; the interior spindle consists of a long sleeve allowing the attachment of a boring bar (spindle borer), while the external spindle, generally coupled to a plate in a rigid manner, is adapted for fitting with a milling cutter (milling spindle).

This heading also covers those machines designed and built essentially for boring, even if they are adapted for carrying out other additional operations (for example, drilling, surfacing, milling, turning and sometimes even screw cutting). On the other hand, lathes (including turning centres) which carry out boring as an auxiliary or additional operation are classified in **heading 84.58**.

- (4) **Milling machines.** These work a plane or profile surface by means of rotating tools (known as milling cutters), the circular cutting movement is combined with a traversing movement of the article fixed on the machine table. Milling machines include, *inter alia*, horizontal milling machines, vertical milling machines, horizontal-vertical milling machines, milling machines with adjustable heads, plane-milling machines, universal milling machines which, in addition to the normal milling work, can by means of a dividing head mounted on the machine, mill splines in a shaft, or spur or helical gears, repetitive milling machines, milling machines for grooving or chamfering, engraving millers.
- (5) **Tapping machines** (i.e., machines to produce a screw thread in an existing hole) and **threading machines** for threading bolts, screws, etc. It should be noted that **thread milling machines** are regarded as milling machines.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* *

The heading also **excludes** :

- (a) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc processes; water-jet cutting machines (**heading 84.56**).
- (b) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (c) Lathes (including turning centres) for removing metal (**heading 84.58**).
- (d) Machine-tools for planing and other machine-tools working by removing metal, of **heading 84.61**.
- (e) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (f) Machines and appliances for testing, of **heading 90.24**.

○

Subheading Explanatory Notes.

Subheadings 8459.21, 8459.31, 8459.41, 8459.51 and 8459.61

See the Explanatory Note to subheadings 8458.11 and 8458.91.

Subheadings 8459.51 and 8459.59

The machines of these subheadings can be identified by the presence of a console which consists of a horizontal element which moves vertically on a stand by means of guideways. This stand supports the worktable which is operated in a transverse direction. The console usually contains the devices necessary to drive the machines.

84.60 - Machine-tools for deburring, sharpening, grinding, honing, lapping, polishing or otherwise finishing metal or cermets by means of grinding stones, abrasives or polishing products, other than gear cutting, gear grinding or gear finishing machines of heading 84.61 (+).

- Flat-surface grinding machines :

8460.12 -- Numerically controlled

8460.19 -- Other

- Other grinding machines :

8460.22 -- Centreless grinding machines, numerically controlled

8460.23 -- Other cylindrical grinding machines, numerically controlled

8460.24 -- Other, numerically controlled

8460.29 -- Other

- Sharpening (tool or cutter grinding) machines :

8460.31 -- Numerically controlled

8460.39 -- Other

8460.40 - Honing or lapping machines

8460.90 - Other

This heading covers certain surface-finishing machines for metal or cermets, but **excludes** gear cutting, gear grinding or gear finishing machines (**heading 84.61**). These machines work by removing material by means of grinding stones, abrasives or polishing products. For the purposes of this heading the expression "polishing products" means the following :

- (1) polishing discs made from metal carbides, steel, soft metal, wood, felt, textile material or leather;
- (2) wire brushes;
- (3) polishing pads.

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

The heading includes :

- (1) **Deburring machines with metal brushes or abrasives**, for trimming rough castings or the rough edges of cut metal.
- (2) **Sharpening machines** (tool and cutter grinding machines) including machines for grinding cermets or hard metal tool tips as well as card sharpening machines.

- (3) **Grinding machines**, of different types (e.g., internal surface grinders, centreless surface grinders, surface grinding machines, thread grinding machines, machines for grinding valves and valve seats) whose function is to perfect, to the desired degree of precision, the work of other machines.

This group includes, for example :

- (i) **Centreless grinding machines**. These machines are characterised by the absence of a spindle and the presence of two grinding wheels (an abrasive wheel and a regulating wheel) and of a support blade holding the workpiece.
- (ii) **Cylindrical grinding machines**. These machines are characterised by the presence of a spindle and a support, that holds and moves the workpiece, and one or more abrasive wheels. They can work the external surface of the workpiece, the internal surface or both (universal cylindrical grinding machines).
- (4) **Honing and lapping machines** for producing a precision-fit surface.
- (5) **Polishing machines** for finishing the surface of the workpiece.
- (6) **Engraving machines excluding those of heading 84.59 or 84.61.**

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the general Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* *

The heading also **excludes** :

- (a) Hand tools or hand or pedal operated grinding wheels (**heading 82.05**).
- (b) Sand blasting machines (**heading 84.24**).
- (c) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc processes; water-jet cutting machines (**heading 84.56**).
- (d) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (e) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (f) Rotating drums for de-sanding, de-scaling or polishing metal goods (**heading 84.79**).
- (g) Testing machines and apparatus (**heading 90.24**).

○
○ ○

Subheading Explanatory Note.

Subheadings 8460.12, 8460.22, 8460.23, 8460.24 and 8460.31

See the Explanatory Note to subheadings 8458.11 and 8458.91 regarding the term “numerically controlled”.

84.61 - Machine-tools for planing, shaping, slotting, broaching, gear cutting, gear grinding or gear finishing, sawing, cutting-off and other machine-tools working by removing metal or cermets, not elsewhere specified or included.

8461.20 - Shaping or slotting machines

8461.30 - Broaching machines

8461.40 - Gear cutting, gear grinding or gear finishing machines

8461.50 - Sawing or cutting-off machines

8461.90 - Other

The heading covers machine-tools working by removing metal or cermets, not elsewhere specified or included.

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

The heading includes :

- (1) **Planing machines** which are for working the external plane or sectional surfaces of an article with the help of tools with a single cutting edge. These are machine-tools in which the tool is fixed while the table holding the article to be planed moves with a reciprocating planar motion. However, certain large planing machines such as pit planing machines or plate edge planers have a fixed table and are used for working articles of a great length (e.g., rails).

Some planing machines are fitted with one or two auxiliary or additional milling machine carriages, which replace an equal number of planing carriages. These machine-tools called "planing and milling machines" are considered as planing machines, even though it is possible by reducing the speed of the table to use them for milling work. They must not be confused with some milling machines called "plano-milling machines" of **heading 84.59**, the appearance of which is similar to that of a planing machine, but which are equipped only with milling carriages.

Planing machines may also possess one or two grinding slides in addition to planing carriages. The addition of these grinding heads allows these planing machines to be used as table surface trueing machines. Some models are fitted at one and the same time with planing carriages, milling carriages and grinding slides, while others are fitted with devices to allow them to carry out slotting work.

- (2) **Shaping machines** which are machine-tools operating on the planing principle and which can be differentiated from planing machines by the fact that the article to be worked is fixed during the cut, while the tool moves with a reciprocating linear movement. Because of the overhang of the tool holder, its maximum run is limited and for this reason the shaping machine is usually restricted to working articles of small dimensions.

- (3) **Slotting machines** which are machine-tools operating by the planing method in which the article to be worked is immobile during the cut, while the tool is moved with a reciprocating linear movement in vertical or sometimes inclined direction. These machines, by reference to use, are slotting tools which are machines characterised by their short slide stroke; slotting-punching machines for carrying out the work necessary for the rapid removal of considerable quantities of material from an extra thick article. These machines use either slide tools (with a single cutting edge), or a punching tool (with four cutting edges); vertical slotting machines; slotting with transverse displacement slide; machines called "grooving machines" (by pulling or pushing), the working process of which resembles that of broaching machines the difference being the tool used.
- (4) **Broaching machines.** The tool (the broach) is pulled or pushed across the work or through a hole, for surface working or shaping. Among the different types of broaching machines are horizontal or vertical machines with simple slide; double machines ("duplex") which consist of two slides each working on one broach or broaching presses which are vertical machines working on the broach by pressure.
- (5) **Gear-cutting, gear-grinding and gear-finishing machines.** This heading covers gear-cutting machines designed exclusively for making gears by removing metal from cylindrical or conical blanks.

Gear-cutting machines work principally according to the following processes :

- module-controlled milling-cutting in which a milling disc or conical cutter is used as a tool. This process is currently used for cutting spur gearing;
- reproduction cutting in which the teeth are produced by a planing tool (straight cutting tool). This process is for bevel gear-cutting and cylindrical gear-cutting;
- cutting by meshing, using a tool such as a worm hob, a rack cutting tool (or chasing tool) or a pinion tool (for circular cutter). This process allows internal or external straight or helical and conical gears to be worked;
- abrasive cutting.

- (6) **Sawing machines.** Depending on the form of tool used, the following machines on this type can be distinguished :
- reciprocating sawing machines or oscillating sawing machines in which the tool consists of a straight toothed blade which moves with a reciprocating linear movement;
 - circular saws, which employ a circular tool, toothed on its outer edge and turning at great speed. This tool is commonly called a "slitting saw blade" or "slotting saw blade";
 - bandsaw sawing machines, which use a very long blade, one side of which is toothed and the ends of the blade are joined to form a band.

- (7) **Cutting-off machines.** These machine-tools differ from sawing machines by virtue of the tools they use. The latter can be either cutting tools analogous to lathe tools, or abrasive or metal discs.
- cutting-off machines with cutting tools employ either of two methods.

One type works in the same way as slide lathes but is distinguishable from them by the fact that the tool holders cannot be moved lengthwise, unlike the saddles of slide lathes.

The other type works like a spindle or axle turning machine in which the tool itself is fixed while the article to be worked moves on a carriage. It is distinguishable from the latter, however, by the fact that the article to be worked can only be moved in one direction.

Both the above types can only carry out one cutting-off operation.

Those which work like slide lathes consist of a hollow spindle of large diameter which works on the rotating articles. A very short bed supports one or two tool holders which can be moved transversely. In those which work like a spindle or axle turning machine, the article to be cut is fixed on a carriage which enables it to be moved. The tool itself is fixed on the machine and consists of a crown turning at high speed on which cutting tools are arranged in rings;

- cutting-off machines with abrasive discs have a construction similar to those of circular saws, but the slitting saw blade is replaced by a double-edged abrasive wheel;
- cutting-off machines with metal discs, also known as friction sawing machines, are characterised by the fact that they operate by means of a mild steel disc with a toothless periphery. This disc, which may be fluted, is rotated in such a way as to give it a peripheral speed such that if the periphery of the disc is gradually brought in close proximity to a piece of metal, the latter immediately melts without having close contact with the disc. This phenomenon is the result of friction combined with the oxidising action of the air trapped between the disc and the metal to be cut.

- (8) **Filing machines**, which are of similar design to reciprocating sawing machines but which use a file rather than a blade.
- (9) **Engraving machines, other than those of heading 84.59 or 84.60.**

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* *

The heading also **excludes** :

- (a) Hand tools (**heading 82.05**).
- (b) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic, electro-discharge, electro-chemical, electron beam, ionic-beam or plasma arc processes; water-jet cutting machines (**heading 84.56**).
- (c) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (d) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (e) Machines and appliances for testing, of **heading 90.24**.

84.62 - Machine-tools (including presses) for working metal by forging, hammering or die-stamping; machine-tools (including presses) for working metal by bending, folding, straightening, flattening, shearing, punching or notching; presses for working metal or metal carbides, not specified above (+).

8462.10 - Forging or die-stamping machines (including presses) and hammers

- Bending, folding, straightening or flattening machines (including presses) :

8462.21 -- Numerically controlled

8462.29 -- Other

- Shearing machines (including presses), other than combined punching and shearing machines :

8462.31 -- Numerically controlled

8462.39 -- Other

- Punching or notching machines (including presses), including combined punching and shearing machines :

8462.41 -- Numerically controlled

8462.49 -- Other

- Other :

8462.91 -- Hydraulic presses

8462.99 -- Other

The heading covers certain machine-tools, listed in the heading text, which work by changing the shape or form of metal or metal carbides.

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

The heading includes :

(1) **Forging and stamping machines.** Broadly speaking forging includes all processes for working heated metal by impact or by pressure, either to eliminate puddling slag (shingling) or to shape the metal. Except in the case of shingling where the metal is worked in the form of balls, the metal to be shaped is either in the form of semi-finished products such as blooms, billets or sheet bars, or in the form of bars and rods, usually of circular section. Forging can be described more precisely as an operation which uses heat but no dies.

Stamping (or cutting out) is a process for forcing metal, by impact or pressure to fill the hollows of metal moulds called dies. This operation is carried out hot for hard metals (notably steel) or cold for soft metals. Generally a press is used.

In the process of stamping or cutting out, the dies completely enclose the workpiece. In certain cases, however, a single metal die operating on only one part of the unworked piece is used. This die is then called a stamp and the operation is termed stamping.

Stamping machines can eliminate the "flash" produced during stamping or cutting out. This trimming operation is carried out with the aid of special cutting dies. The finishing operation carried out by a precision die-stamper is, in fact, described as sizing. This sizing produces the necessary precise dimensions.

The following are examples of machine-tools specially designed and built for carrying out the operations described above :

- Hammers, drop forges and drop hammers (mechanical, hydraulic or pneumatic hammers and steam hammers) which operate by a series of short, sharp shocks.
- Metal working presses, which operate by continuous pressure. However, general purpose presses not specially designed for metal working are **excluded** (**heading 84.79**).

(2) **Bending machines.** These include machines for working flat products (sheets, plates and strips) which, by passing the products through three or four sets of rollers, give them a cylindrical curve (for this the rollers are parallel as with tube forming machines) or else a conical shape (in which the rollers are not parallel); machines for working non-flat products (bars, rods, angles, shapes, sections, tubes). These machines work either by means of forming rollers, by press bending, or, for tubes (and, in particular, oil pipes), by drawing their ends while the main section is held by a fixed cylinder.

(3) **Folding machines.** These machines include the following :

- (a) machines for working flat products. The folding of a flat product consists of giving a sheet (or strip) in a straight line a permanent deformation of small radius, without rupturing the metal. This operation is carried out, either on a universal folding machine, or on a folding press;
- (b) machines for working non-flat products. The folding of bars, rods, tubes, angles, shapes and sections is akin to forming (see paragraph (2) above); wire bending involves giving it a curvature within a single plane. Wire bending machines carrying out more complex operations (for example, spring manufacturing machines) do not constitute simple folding machines and fall in **heading 84.63**.

(4) **Straightening machines and flattening machines.** These machines are for remedying imperfections in non-flat products, such as wire, bars, rods, tubes, angles, shapes and sections, or flat products, such as sheets or strip, arising during their manipulation after manufacture.

Flattening machines include the following, for example :

- (a) Flattening machines of the roller type which consist of a series of parallel rollers (or cylinders), either small in number (5 to 11) but of relatively large diameter and great rigidity, or large in number (generally 15 to 23) but of small diameter, great flexibility, and supported by an equal number of counter rollers;
- (b) Tables for flattening by drawing in which imperfections are eliminated by slight permanent stretching.

- (5) **Shearing machines.** The shearing process involves two cutting tools with faces in the same plane applied vertically to the metal to be cut. These tools penetrate the metal which is subjected to plastic deformation and the fibres of which, under progressively more and more pressure and penetration, rupture along the line of the blades.

Machines of this type include : balance shears, lever shears and guillotine shears which use blades; rotary shearing machines which, instead of blades, use tools in the form of discs or frustums of cones.

- (6) **Punching machines** used for perforating, notching or cutting metal by means of two tools adjusted one inside the other. The punching tool is called the punch while the other is called the die. Rupture of the metal is effected as in shearing and the shape of the hole obtained depends on the shape of the tools.

The different machines of this type include machines for making gears by punching.

- (7) **Notching machines** are small machines used for working various sections (L, T, I or U sections) and half-rounds, either to prepare them for assembly (for example, grooves, slots, tenons and dovetails), or simply to cut or pierce them.

- (8) **Extruding presses** for extruding bars, rods, wire, angles, shapes, sections, tubes, etc. These presses are designed to force a mass of metal through an extrusion die with the help of a punch. Depending on the malleability of the metal, this operation is carried out hot or cold.

- (9) **Presses for moulding metallic powders** by sintering.

- (10) **Presses for compressing metal scrap** into bales.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* * *

The heading also **excludes** :

- (a) Hand tools (**heading 82.05**).
- (b) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (c) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (d) Machines for stamping address plates (**heading 84.72**).
- (e) Pig iron breakers and special stamping mills for breaking up cast iron scrap (**heading 84.79**).

- (f) Machine-tools for bending, folding and straightening semiconductor leads (**heading 84.86**).
- (g) Testing machines and apparatus (**heading 90.24**).

Subheading Explanatory Note.

Subheadings 8462.21, 8462.31 and 8462.41

See the Explanatory Note to subheadings 8458.11 and 8458.91.

84.63 - Other machine-tools for working metal or cermets, without removing material.

8463.10 - Draw-benches for bars, tubes, profiles, wire or the like

8463.20 - Thread rolling machines

8463.30 - Machines for working wire

8463.90 - Other

With the **exception** of the machine-tools of **heading 84.62**, this heading covers machine-tools which work metal or cermets, without removing material.

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

The heading includes :

- (1) **Drawing machines** (draw benches), for the bright-drawing of bars, tubes, shapes, sections, wire or similar products.
- (2) **Thread rolling machines** in which the threads on bolts or screws are obtained by rolling and pressing and not by cutting.
- (3) **Machines for working wire** e.g., for manufacturing wire goods such as springs, barbed wire, chains, pins, wire nails or staples, and hooks. The heading also covers machines which, being of a kind specially designed for making wire grill or netting, differ from the ordinary textile weaving loom both as regards their method of operation and their constituent parts. Assembly looms using precrimped wire are **excluded** (**heading 84.79**, etc.).

Machinery for making ropes or stranded cables of metal wire or of mixed textile and wire is also **excluded** (**heading 84.79**).

- (4) **Machines for spiralling fine metal wire** in the manufacture of electric lamp filaments.
- (5) **Riveting machines** apart from presses of **heading 84.62**.
- (6) **Swaging machines**, in which tubes or bars are forced through rotating dies to reduce the diameter.
- (7) **Spinning lathes**. These machines differ from those of **heading 84.58** by the fact that they operate by deforming the metal.
- (8) **Machines for manufacturing flexible tubes of spiral metal strip**.
- (9) **Electro-magnetic-pulse metal-forming machines** (or **magneto-forming machines**), using the force of a magnetic flux to shape, without removing any material, a metal workpiece, usually tubular, with the aid of a die.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* *

The heading also **excludes** :

- (a) Hand tools (**heading 82.05**).
- (b) Banding machines for banding bales, machines for closing cans or other containers (**heading 84.22**).
- (c) Machining centres, unit construction machines (single station) and multi-station transfer machines, for working metal (**heading 84.57**).
- (d) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (e) Testing machines and apparatus (**heading 90.24**).

84.64 - Machine-tools for working stone, ceramics, concrete, asbestos-cement or like mineral materials or for cold-working glass (+).

8464.10 - Sawing machines

8464.20 - Grinding or polishing machines

8464.90 - Other

In general machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

**(I) MACHINES FOR WORKING STONE, CERAMICS, CONCRETE,
ASBESTOS-CEMENT OR LIKE MINERAL MATERIALS**

This group covers not only machines for working natural stone, but also those for working similar hard materials (ceramics, concrete, artificial stone, asbestos-cement, etc.). Although most machines for working precious or semi-precious stones have special features (higher precision, etc.), they are nevertheless classified in this heading.

The heading includes :

(A) **Sawing or cutting machines**, such as :

- (1) **Sawing machines proper** (circular saws, band saws and reciprocating saws, including those using toothless blades, etc.).
- (2) **Disc (e.g., abrasive) cutting machines**, including machines for grooving or cutting false joints on concrete surfaces or on the face of building stone.
- (3) **Helical-wire cutting machines**. These operate by means of an endless steel wire consisting of several spirally twisted strands, and guided by a system of grooved pulleys. The wire, assisted by an abrasive mixture of powdered sandstone and water, cuts into the stone by friction.

(B) **Machines for splitting or cleaving**.

(C) **Machines for grinding, smoothing, polishing, graining, etc.**

(D) **Machines for drilling or milling**.

(E) **Machines for turning, engraving, carving, cutting mouldings, etc.**

(F) **Machines for cutting or dressing grinding wheels**.

(G) **Machine-tools for working ceramic products** (drilling, cutting, milling, polishing, etc.), **except** machines for working ceramic paste or unfired articles of ceramic materials (e.g., machines for moulding or shaping ceramic paste, **heading 84.74**).

(II) MACHINE-TOOLS FOR COLD WORKING GLASS

This category covers machine-tools used for cold-working glass, but it **excludes** machines used for hot-working glass (i.e., glass heated until it becomes fluid or plastic) (**heading 84.75**). Nevertheless, the fact that in some cases the glass is slightly heated to facilitate certain processes does not exclude the machines from this heading, since they are working on glass which still retains the consistency of a hard material.

Many of these machines carry out operations similar to those mentioned in paragraph (I) above in connection with stone or the like.

Others, on the other hand, are employed for more specific work, e.g., decorative finishing, or for certain specialised uses (e.g., optical or watch-making). The following, in particular, fall in this latter category :

- (1) **Glass cutting machines**, of the wheel or diamond type.
- (2) **Glass cutting (shaping) machines**, for facetting, or for cut-glass articles.
- (3) **Trueing, grinding, etc., machines**, used mainly for smoothing edges, levelling bases or trimming moulded objects.
- (4) **Polishing machines**. Polishing is sometimes followed by a still more specialised finishing process, known as smoothing, executed by **felt disc machines**; such machines also fall in this heading.
- (5) **Engraving machines** of the grinding wheel or diamond type; sand jet engraving machines are, however, **excluded** (**heading 84.24**).
- (6) **Machine-tools used for finishing or polishing optical, spectacle or clock or watch glass**. These include the special circular glass-cutter which is used to cut out eye-pieces for spectacles, and also machines for shaping or polishing optical glass by wearing down the surface of lenses, prisms, spectacle lenses (spherical, ring-shaped, cylindrical, multi-focus, etc.), etc.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading fall in **heading 84.66**.

*
* *

This heading also **excludes** :

- (a) Hand tools or hand or pedal operated grinding wheels (**heading 82.05**).
- (b) Machines for twisting glass fibres into yarns, weaving machines, and other machines of **heading 84.45** or **84.46**.
- (c) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic or plasma arc processes and other machines of **heading 84.56**.
- (d) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (e) Crushing, grinding, mixing, moulding, agglomerating, casting, brick-making, etc., machines (**heading 84.74**).
- (f) Machine-tools for sawing, scribing or scoring semiconductor boules or wafers (e.g., "wafer dicers"), and machine-tools for grinding, polishing or lapping semiconductor boules or wafers or flat panel displays (**heading 84.86**).

○
○ ○

Subheading Explanatory Note.

Subheading 8464.10

This subheading covers the sawing or cutting machines described in paragraph (A) of Part (I) of the Explanatory Note to heading 84.64.

84.65 - Machine-tools (including machines for nailing, stapling, glueing or otherwise assembling) for working wood, cork, bone, hard rubber, hard plastics or similar hard materials.

8465.10 - Machines which can carry out different types of machining operations without tool change between such operations

8465.20 - Machining centres

- Other :

8465.91 -- Sawing machines

8465.92 -- Planing, milling or moulding (by cutting) machines

8465.93 -- Grinding, sanding or polishing machines

8465.94 -- Bending or assembling machines

8465.95 -- Drilling or morticing machines

8465.96 -- Splitting, slicing or paring machines

8465.99 -- Other

This heading covers machine-tools for the shaping or surface-working (including cutting, forming and assembling) of wood (and materials derived from wood), cork, bone, hardened rubber, hard plastics and similar hard materials (horn, corozo, mother of pearl, ivory, etc.).

The heading **excludes** machines for working materials which although referred to in the heading do not possess the characteristics of hard materials at the time work commences on them. For this reason, machines for cutting or slicing supple plastics or unhardened rubber are **excluded** (**heading 84.77**). Furthermore, the heading **does not cover** machines for making articles from granules or powder, such as machines for moulding plastic materials (**heading 84.77**), machines for agglomerating or moulding particles or fibres of wood or other ligneous matter (**heading 84.79**) or other similar machines. Although they might be considered to be for the treatment of the materials mentioned in the heading, the heading also **excludes**, in general, machines and apparatus whose function is not to work the material or its surface, e.g., those for the drying of wood or the ageing of it by desiccation (**heading 84.19**), machines for the expansion of cork (**heading 84.19**) or machines for compressing, agglomerating or impregnating wood (**heading 84.79**).

In general, machine-tools are power-driven but similar machines, worked by hand or pedal, are also covered by this heading. These latter types can be distinguished from the hand tools of **heading 82.05** and from the tools for working in the hand of **heading 84.67**, by the fact that they are usually designed to be mounted on the floor, on a bench, on a wall or on another machine, and are thus usually provided with a base plate, mounting frame, stand, etc.

**(A) MACHINES NOT NORMALLY SPECIALISED FOR
A PARTICULAR INDUSTRY**

This group includes :

- (1) **Sawing machines** of all types. They operate by means of blades or chains generally provided with teeth. They include :

- (a) Sawing machines with reciprocating tools, e.g., log cross-cut sawing machines with right-toothed blades, fret saws and vertical or horizontal frame saws for cutting rough timber into planks.
 - (b) Sawing machines whose tool revolves. These include chain saws and band saws such as vertical and horizontal band saws, quartering and halving band saws, chariot or table band saws and various specialised machines such as multiple band saws for making blocks, strips, friezes, etc., for wood flooring and band saws for the paper industry.
 - (c) Sawing machines whose tool has a rotating motion. This large group includes all machines which cut by means of one or more toothed blades moving in a circular movement. It includes, for example, pendulum saws, cut-off saws with a straight line tool stroke, radial saws, block stroke saws with longitudinal cut, circular log-cutting saws, edging circular saws, bench saws, sliding table saws, circular panel-cutting saws.
- (2) **Moulding and planing machines**, which prepare the surface of the workpiece using blades which remove chips of the material. These include machines which work on one or two surfaces and planing machines which can work on up to all four surfaces.
- (3) **Machines for moulding and milling**, which shape the workpiece using profiled rotating tools which remove chips of the material. These include, for example, spindle moulding machines, single-end tenoning machines, dovetailing machines, grooving machines, countersinking machines, pattern milling and recessing machines, copying machines (other than lathes), 1, 2, 3 or 4-side moulding machines, profile forming machines, with rotating workpiece, slotting machines and log-milling machines (canters). This group also includes CNC milling machines.
- (4) **Machining centres** (see Subheading Note 1 to this Chapter), also known as **CNC work centres**. These machines carry out several machining operations and have automatic tool change, from a magazine or the like in conformity with a machining programme. Consequently, this group covers machine-tools which carry out **two or more** machining operations by automatic tool change from a magazine or the like, whereas machine-tools which carry out **one** machining operation using a single tool or several tools working simultaneously or sequentially (for example, multiple-spindle drills or multiple-cutter milling machines) remain classified in their respective subheadings as drilling or milling machines.
- (5) **Grinding, sanding and polishing machines**. Grinding machines which use grindstones are principally used for hard products such as corozo, hard rubber, horn and ivory.
- Sanding machines use abrasives to improve the surface finish as well as the dimensional accuracy of the workpiece. This group includes those with an oscillating action, belt sanders, disc sanders, bobbin and drum sanders. Machines known as smoothing machines are also in this group.
- Polishing machines impart a lustre, by means of bands, drums or flexible rollers, to a workpiece previously given a smooth finish.
- (6) **Bending machines** which mechanically change the form or physical characteristics of the workpiece by action on its structure.

(7) Assembling machines.

These include :

- (a) Machines which assemble two or more parts by means of binding agents, adhesives or gummed paper. This group includes veneer splicing machines, plank glueing machines, panel forming machines, frame clamps, carcase clamps, plywood and laminating wood presses, veneering presses. These machines may incorporate devices for spreading glue on the surface of the wood.
 - (b) Machines which join, using nails, staples, wire, etc.
 - (c) Machines for joining without binding agents or fasteners, e.g., squeeze presses.
- (8) **Drilling machines.** These are used solely to drill a circular hole using a rotating tool (spindle or bit). The centre of the tool and of the hole to be drilled are along a common axis. This group includes single and multiple drilling spindle machines, knot hole drilling machines and dowel hole drilling machines. CNC drilling machines also belong to this group.
- (9) **Morticing machines.** These cut non-cylindrical holes using a chisel, a mortice chain or routing bit, e.g., slot, chisel or chain morticing machines.
- (10) **Splitting, stamping, fragmenting, paring and slicing machines.** All these machines transform a workpiece mechanically without removing chips of wood.

These include :

- (a) Splitting machines which split the fibre bond by wedge action. These include log splitting machines, firewood splitting machines, root splitting machines and willow, bamboo and rattan splitting machines.
- (b) Stamping machines which shape by impact cutting, e.g., veneer stamping machines.
- (c) Fragmenting machines which produce small pieces of wood of similar size and shape. These include sliver cutting machines, particle producing machines, wood-wool making machines and chopping and chipping machines.

However, defibrators for producing wood pulp are **excluded** and fall in **heading 84.39**.

- (d) Paring or slicing machines which use a straight cutting edge to produce thin sheets either by slicing (machines for making thin boards) or by paring (machines for producing veneers or thin sheets for plywood production).

This group also includes veneer shearing machines which use rectilinear blades, mitre trimming machines and mullion cutting machines.

(11) **Lathes**, which are used to fashion a workpiece by a motion about its own axis, the tool not turning. This group includes lathes of all kinds, including copying lathes.

(12) **Tree delimiting or bucking machines.**

(13) **Wood de-barking machinery** (log decorticators, post peeling machines, etc.), **other than** water-jet bark strippers of **heading 84.24** and barking drums of **heading 84.79**.

(14) **Knot-boring machines** for preparing logs (e.g., for use in making paper pulp).

The heading also includes machines which can carry out different types of machining operations without tool change between such operations.

Examples are :

(1) **Combined joinery machines** having in a single unit several machines with different functions, used independently of each other. With this type of machine it is necessary to give manual assistance to the workpiece between each operation. These include machines for surface planing combined with one or more other operations and sawing-moulding-morticing machines.

(2) **Multi-purpose machines** in which, unlike the previous group, no further manual assistance is required after the insertion of the workpiece. These include single-end tenoning machines with several spindles, double-end tenoning machines, machines for positioning hardware, dowel holes, etc., machines for assembling, using adhesives and finishing (for the production of veneer strips or making panels from laths).

(B) MACHINE-TOOLS SPECIALISED FOR A PARTICULAR INDUSTRY

This group includes :

(1) **Cooperage machinery** (e.g., stave-jointing, stave-planing, stave-bending, stave croze cutting or cask crozing machines; cask assembly machines; machines for driving the hoops over a cask). But the heading **excludes** cask or stave steaming apparatus (**heading 84.19**).

(2) **Machinery used in the pencil-making industry.**

(3) **Machines for the morticing or boring of railway sleepers.**

(4) **Wood-sculpturing machines, engraving machines, including copying machines.**

(5) **Wood flour grinding machines.** But the heading **excludes** defibrators used in the paper pulp industry (**heading 84.39**).

(6) **Machines for nailing, stapling, glueing or otherwise assembling boxes, crates, cases, casks, etc.**

(7) **Wooden button-making machines.**

(8) **Machines for making clogs, wooden soles or heels for shoes, or shoe-trees.**

- (9) **Machinery for working osier, cane, etc.** (peeling, splitting, rounding, etc.), **other than** machines for the manufacture of basketwork or wickerwork (**heading 84.79**).

The heading includes **machine-tools used for working cork** (e.g., by sawing, cutting-out, cutting, polishing), **bone, hard rubber, hard plastics and similar hard materials**. These machines are, in general, designed on the same principles as machine-tools for wood-working.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories (**other than** the tools of **Chapter 82**) of the machine-tools of this heading are classified in **heading 84.66**.

*
* * *

The heading also **excludes** :

- (a) Bamboo crushers, wood chip cutting machines and log grinding machines used in pulp manufacture (**heading 84.39**).
- (b) Machine-tools for working any material by removal of material, by laser or other light or photon beam, ultrasonic or plasma arc processes and other machines of **heading 84.56**.
- (c) Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (d) Deflash machines for cleaning and removing contaminants from the metal leads of semiconductor packages (**heading 84.86**).

84.66 - Parts and accessories suitable for use solely or principally with the machines of headings 84.56 to 84.65, including work or tool holders, self-opening dieheads, dividing heads and other special attachments for the machines; tool holders for any type of tool for working in the hand.

8466.10 - Tool holders and self-opening dieheads

8466.20 - Work holders

8466.30 - Dividing heads and other special attachments for machines

- Other :

8466.91 -- For machines of heading 84.64

8466.92 -- For machines of heading 84.65

8466.93 -- For machines of headings 84.56 to 84.61

8466.94 -- For machines of heading 84.62 or 84.63

With the **exception** of the tools of **Chapter 82** and **subject** to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers :

(A) **Parts** of the machines of **headings 84.56 to 84.65**.

(B) **Accessories** for these machines, that is, subsidiary devices used in connection with the machines, such as interchangeable devices which modify the machine so that it can perform a wider range of operations; devices to increase precision; devices which perform a particular service relative to the main function of the machine.

(C) **Tool holders** for any type of tool for working in the hand.

The very wide range of parts and accessories classified here includes :

(1) **Tool holders** which hold, guide or operate the working tool and which **permit the interchange of such tool-pieces**. They are of very varied types, e.g. :

Chucks; tap and drill collets; lathe tool posts; self-opening dieheads; grinding wheel holders; honing bodies for use in honing machines; boring bars; turrets for turret lathes, etc.

This heading also includes tool holders for any type of tool designed for operation in the hand. Such holders are usually designed for the tools of **heading 82.05** or **84.67**, but this heading also includes tool holders for flexible shaft outfits. (See also the provisions of the Explanatory Notes to **headings 84.67 and 85.01**).

- (2) **Work holders** designed to hold and sometimes manipulate (as required for a particular operation) the part being worked by the machine. These include :

Lathe centres; mechanical or pneumatic lathe chucks of all kinds and their clamping jaws; work holding plates and tables (whether or not with a micrometer adjusting or setting device); clamps and angle plates; chocks and wedges; fixed, revolving or adjustable machine vices; steady rests (ring-shaped devices designed to support long parts during turning, in order to prevent buckling and overcome vibrations set up by the pressure of the tool).

- (3) **Auxiliary attachments for notching, for spherical turning, etc.**
- (4) **Copying attachments** (including those which are electrically or electronically operated) for the automatic reproduction of work according to a pattern.
- (5) **Surface-finishing attachments** for lathes, planing, shaping, etc., machines.
- (6) **Mechanical or pneumatic attachments used to automatically control** the progress of the work or the tool in the course of working.
- (7) **Other special auxiliary attachments**, designed to increase the precision of the machine without actually entering into its operation. They include centring or levelling attachments; dividing heads; indexing tables; micrometer carriage stops; carriage spacing attachments, etc. Such attachments remain in the heading even if incorporating an optical device to assist in reading the scale or in carrying out adjustments (e.g., "optical" dividing heads). However the heading **excludes** apparatus which are in themselves essentially optical apparatus, e.g., centring microscopes (**heading 90.11**), alignment or levelling telescopes and image projecting test apparatus (**heading 90.31**), etc.

The heading also **excludes** :

- (a) Grinding wheels and similar abrasive tools of **heading 68.04**.
- (b) Magnetic or electro-magnetic oil filters (**heading 84.21**).
- (c) Auxiliary devices for lifting or handling (e.g., levelling jacks sometimes used to support very large or heavy work during machining) (**heading 84.25**, etc.).
- (d) Gear-boxes and other speed changers, clutches and similar transmission equipment (**heading 84.83**).
- (e) Parts and accessories, including work or tool holders and other special attachments for machine-tools or water-jet cutting machines, suitable for use solely or principally with the machines and apparatus of heading 84.86 (**heading 84.86**).
- (f) Electric (including electronic) parts and accessories (e.g., magnetic chucks and numerical control panels) (**Chapter 85**).
- (g) Measuring or checking apparatus (**heading 90.31**).
- (h) Revolution counters and production counters (**heading 90.29**).
- (ij) Brushes for mounting on machines (**heading 96.03**).

84.67 - Tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor.

- Pneumatic :

8467.11 -- Rotary type (including combined rotary percussion)

8467.19 -- Other

- With self-contained electric motor

8467.21 -- Drills of all kinds

8467.22 -- Saws

8467.29 -- Other

- Other tools :

8467.81 -- Chain saws

8467.89 -- Other

- Parts :

8467.91 -- Of chain saws

8467.92 -- Of pneumatic tools

8467.99 -- Other

This heading covers tools which incorporate an electric motor, a compressed air motor (or compressed air operated piston), an internal combustion motor or any other motor (e.g., small hydraulic turbine); the compressed air motor is generally operated by an external source of compressed air, and in the case of the internal combustion motor the ignition batteries are sometimes separate. In pneumatic tools the action of the compressed air is sometimes supplemented by hydraulic connections.

The heading covers such tools **only** if for working in the hand. The expression "tools for working in the hand" means tools designed to be held in the hand during use, and also heavier tools (such as earth rammers) which are portable, that is, which can be lifted and moved by hand by the user, in particular while work is in progress, and which are also designed to be controlled and directed by hand during operation. To obviate the fatigue of taking their full weight during operation they may be used with auxiliary supporting devices (e.g., tripods, jacklegs, overhead lifting tackle).

However, certain tools for working in the hand of this heading have fittings permitting them to be **temporarily** fixed to a support. They remain classified here, together with the support if it is presented therewith, **provided** the tools are essentially "for working in the hand" as defined above.

Some of the tools covered by this heading may be fitted with auxiliary devices (e.g., a fanwheel and its dust-bag to remove and collect dust during working).

The heading **excludes** tools which, because of their weight, size, etc., obviously cannot be used in the hand as described above. It also **excludes** tools (whether or not portable) fitted with a base plate or other device for fixing to the wall, bench, floor, etc., those with provisions for running on rails (e.g., machines for slotting or drilling railway sleepers) and walk-behind or similar hand-directed machines on wheels, e.g., floor grinding machines, for concrete, marble, or wood, etc.

The heading further **excludes** combinations consisting of a tool holder with one or more tools, and a separate spark-ignition internal combustion piston engine or a separate electric motor with a flexible shaft; the tool holder is classified in **heading 84.66**, the motor with its flexible shaft in **heading 84.07** or **85.01**, as the case may be, and the tools in their own appropriate headings.

The tools of this heading include tools for working various materials and are used in various industries.

Subject to the conditions above, the tools of this heading include, *inter alia* :

- (1) Drilling, tapping or reaming machines.
- (2) Boring machines, rock drills and the like.
- (3) Wrenches, screwdrivers, nut setters.
- (4) Planing, gauging, surfacing or similar appliances.
- (5) Filing machines, grinders, sanders, polishers and the like.
- (6) Wire brush machines.
- (7) Circular saws, chain saws and the like.
- (8) Hammers of various types, such as chipping hammers, de-scaling hammers, caulking hammers, riveting hammers, concrete breakers.
- (9) Squeeze-type riveters; rivet busters and other chisel-operated appliances.
- (10) Sheet metal cutters (shear type or nibbler type).
- (11) Sand rammers, de-coring tools for removing cores from castings, mould vibrators for foundries.
- (12) Earth compacting rammers for road building or maintenance.
- (13) Automatic spades.
- (14) Concrete vibrators to facilitate the flow and setting of concrete.
- (15) Hedge trimmers.
- (16) Hydraulically driven boiler type de-scalers.
- (17) Compressed air type greasing pistols for garages, etc.
- (18) Portable machines for trimming lawns, cutting grass in corners, along walls, borders or under bushes, for example. Such machines have a self-contained motor in a light metal frame and a cutting device usually consisting of a thin nylon thread.

- (19) Portable brush-cutters with a self-contained motor, a drive shaft (rigid or flexible) and a tool holder, presented together with various interchangeable cutting tools for mounting in the tool holder.
- (20) Cutters for cutting textiles in the ready-made clothing industry.
- (21) Engraving tools.
- (22) Electric hand scissors, comprising a fixed cutter blade and a mobile cutter blade operated by a built-in electrical motor, for use in dressmakers' and milliners' workrooms, households, etc.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts (**other than** tool holders of **heading 84.66**) of the tools of this heading.

*
* * *

The heading also **excludes** :

- (a) Grinding, sharpening, polishing, cutting wheels and the like, of stone, ceramics or agglomerated abrasives (**heading 68.04**).
- (b) Tools of **Chapter 82**.
- (c) Air compressors (**heading 84.14**).
- (d) Liquid or powder sprayers, hand controlled spray guns, sand blasting apparatus and the like (**heading 84.24**).
- (e) Electric lawn mowers (**heading 84.33**).
- (f) Electro-mechanical domestic appliances (**heading 85.09**).
- (g) Electric shavers, hair clippers and hair-removing appliances of **heading 85.10**.
- (h) Electro-mechanical hand tools for medical or dental purposes (**heading 90.18**).

84.68 - Machinery and apparatus for soldering, brazing or welding, whether or not capable of cutting, other than those of heading 85.15; gas-operated surface tempering machines and appliances.

8468.10 - Hand-held blow pipes

8468.20 - Other gas-operated machinery and apparatus

8468.80 - Other machinery and apparatus

8468.90 - Parts

The heading covers :

- (A) Soldering, brazing or welding machinery and apparatus, whether or not capable of cutting, gas-operated or using processes other than those referred to in the text of **heading 85.15**. Machines designed exclusively for cutting are classified in their own appropriate headings.
- (B) Gas-operated surface tempering machines and appliances.

(I) GAS-OPERATED APPLIANCES FOR WORKING METAL, ETC.

The appliances of this group are operated by means of a very hot flame produced by the combustion of an inflammable gas in a jet of oxygen or air.

In general, these appliances can be used not only for the operations referred to in the heading, but also for other operations requiring a similar high temperature (e.g., preliminary heating for certain operations, or refilling worn parts or cavities with metal); in practice certain appliances are specialised for these other operations, but they remain in this heading **provided** they operate in the same manner and on the same principle as the other appliances of the heading.

All the appliances of this group have an arrangement for bringing two gases to the nozzle which has two outlets, either concentric or side by side; one of the gases is inflammable (acetylene, butane, propane, coal gas, hydrogen, etc.) and the other compressed air or oxygen.

The heading covers hand-operated appliances and also machines.

**(A) HAND-OPERATED GAS WELDING, ETC.,
APPLIANCES (BLOWPIPES)**

Blowpipes are said to be of high-pressure or low-pressure type depending on whether they are designed to be connected to a high or low-pressure source of inflammable gas. In the high-pressure type, the compression gives the gas the velocity required to produce the flame jet; with the low-pressure type a compressor is necessary.

Both types of blowpipes are otherwise of more or less similar construction. In design, they consist of a handle or body fitted with the supply pipes, at the exit of which (the nozzle) the gas is ignited; they generally also include regulating valves, etc. The apparatus is connected to an external gas supply by flexible tubing.

To enable the appliances to be adapted to the type of work concerned (e.g., to blast-furnace tapping, rivet removing, grooving or simple heating) the tubes and nozzles are usually interchangeable (variable aperture nozzles, multiple nozzle orifices, flame-separating nozzles, etc.). Some blowpipes are specially designed for particular operations, e.g., welding blowpipes equipped with a water-cooling system, for heavy work.

(B) MACHINES FOR WELDING, ETC.

These are based on the same principles as the hand-operated appliances in Part (A) above, and consist essentially of fixed or adjustable blowpipes. Other parts of the machine (e.g., feed-tables, jaws, slide-rests and jointed arms) either enable the part being worked to be fixed, guided or moved forward, or allow the nozzles to be moved or adjusted according to the progress of the work.

(C) SURFACE TEMPERING MACHINES

These consist of a number of nozzles arranged according to the shape of the object to be treated; the flames from these nozzles project on to the surface to be tempered a heat of such intensity that it is rapidly brought to the temperature required, but this heat does not penetrate far below the surface. Once the surface has been brought to the required tempering temperature, sprays of cooling liquid are directed on the article or it is immersed in a bath of the liquid.

(II) GAS-OPERATED APPLIANCES FOR WELDING THERMOPLASTICS

This heading also includes certain appliances for welding or sealing thermoplastic materials or articles thereof. The appliances of this heading operate by means of a flame or a jet of hot air, nitrogen or inert gas from a welding torch. The air or other gases may be heated by passage through a gas-heated tube.

(III) MACHINERY AND APPARATUS FOR WELDING, OTHER THAN GAS-OPERATED APPLIANCE

This group includes :

- (1) Machinery and mechanical appliances for welding by means of grooved wheels or heated irons, **other than** hand soldering irons (**heading 82.05**) and **other than** electrical apparatus of **heading 85.15**.
- (2) Friction welding machines.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machines and apparatus of this heading.

The heading also includes accessory attachments such as supports (ball, roller, etc.).

*
* *

The heading also **excludes** :

- (a) Blow lamps and brazing lamps of **heading 82.05**.
- (b) Machinery and apparatus for spraying molten metal (**heading 84.24**).
- (c) Apparatus for cutting or piercing rock or concrete, using the high temperature produced by burning iron or steel in a jet of oxygen (**heading 84.79**).
- (d) Welding, brazing or soldering machines and apparatus, using both gas and electricity (**heading 85.15**).

[84.69]

84.70 - Calculating machines and pocket-size data recording, reproducing and displaying machines with calculating functions; accounting machines, postage-franking machines, ticket-issuing machines and similar machines, incorporating a calculating device; cash registers.

8470.10 - Electronic calculators capable of operation without an external source of electric power and pocket-size data recording, reproducing and displaying machines with calculating functions

- Other electronic calculating machines :

8470.21 -- Incorporating a printing device

8470.29 -- Other

8470.30 - Other calculating machines

8470.50 - Cash registers

8470.90 - Other

All machines of this heading, **except** for certain cash registers, have one common characteristic in that they include a calculating device enabling them to add together at least two figures each comprising several digits. It should be noted that devices which merely count or add one by one are **not** regarded as calculating devices (e.g., devices incorporated in certain stamp affixing machines, revolution counters, production counters). The machines of this heading may be manually or electrically operated. The calculation operations are performed mechanically or by electro-magnetic, electronic or fluidic devices.

(A) CALCULATING MACHINES AND POCKET-SIZE DATA RECORDING, REPRODUCING AND DISPLAYING MACHINES WITH CALCULATING FUNCTIONS

This group comprises a wide range of calculating machines varying from the simplest types which can only add and subtract to more complex machines which can perform the four arithmetic operations and several other types of calculations (e.g., extract square roots, raise a number to a given power and carry out trigonometric calculations). It includes, in particular, pocket electronic calculators and office electronic calculators, whether or not programmable. This group also includes pocket-size data recording, reproducing and displaying machines with calculating functions (see Note 8 to this Chapter).

Electronic programmable calculators differ from automatic data processing machines, in particular, by the fact that they cannot execute, without human intervention, a processing program which requires them to modify their execution, by logical decision during the processing run. These calculators incorporate a microprocessor designed to carry out complex mathematical operations.

Calculating machines comprise the following main parts :

- (1) **Manual arrangements for data input** (stops or cursors, keyboard, etc.). However, they may have ancillary facilities for the automatic input of recurrent or preset data (readers for punched cards or tape, magnetic tape, etc.).

- (2) **A calculating device** operated by a series of keys or by a program which may be fixed or may be modified by replacing the programming element or changing the program instructions.
- (3) **An output device** presenting the results in the form of a visual display or a print-out. "Printer" machines incorporate a device for printing the result and sometimes also the preliminary data. However, calculating machines remain classified here whether or not comprising such a device.

Calculating machines with a printing facility use numbers and a limited range of symbols. However, they differ from accounting machines in that they print vertically only, on paper bands or rolls. Some have ancillary facilities for recording the results in code on data media.

Some of the components of these machines (calculating device, ancillary devices, etc.) may be built-in or be separate units connected by electric cable.

(B) ACCOUNTING MACHINES

These machines are designed to keep accounting books, accounting documents, etc. They combine the function of accounting (i.e., totalling a series of items) with that of printing letters or symbols in addition to figures in order to provide an adequate description of the accounting operation performed.

The structure of accounting machines is appreciably the same as that of calculating machines. In addition to manual input arrangements for variable data (e.g., debit-credit operations), like calculating machines they may be fitted with devices for reading punched cards or tape, magnetic tape or cards, etc., to introduce recurrent data (account No., customer's name and address, etc.) or pre-set data (e.g., balance of account).

Accounting machines have numeric or alpha-numeric printing devices which can print both vertically and horizontally; this is one of the features which distinguishes them from calculating machines.

In most cases, these machines are designed to be used with specially printed forms such as pay slips, invoices, loose-leaf pages of day books, journals, ledgers, etc., or filing cards. Some of them can type simultaneously on two or more forms (e.g., on the invoices and corresponding day book and ledger entries).

They are often equipped with apparatus for transcribing data onto data media in coded form. Some print in clear on a card and simultaneously transcribe the results in code on a magnetic track on the side of the card. These results can then serve as basic data for further processing in the machine.

Like calculating machines, these machines may be in the form of a self-contained unit or consist of separate units to be electrically interconnected.

(C) CASH REGISTERS

This group comprises cash registers whether or not incorporating a calculating device.

These machines are used in shops, offices, etc., to provide a record of all transactions (sales, services rendered, etc.) as they occur, of the amounts involved, the total of the amounts recorded and, in some cases, the code number of the article sold, quantity sold, time of transaction, etc.

Data may be introduced either manually by means of a keyboard and a stop, lever or handle, or automatically, e.g., by means of a bar-code reader. Like calculating and accounting machines, some cash registers also have ancillary facilities for the automatic input of recurrent or pre-set data (e.g., card or tape readers).

Usually, the result is visually displayed and printed, at the same time, on a ticket for the customer and on a tallyroll which is periodically removed from the machine for checking purposes.

These machines are often combined with a till or drawer in which the cash is kept.

They may also incorporate or work in conjunction with devices such as multipliers for increasing their calculating capacity, calculators of change due, automatic change dispensers, trading stamp dispensers, credit card readers, check digit verifiers, or appliances for transcribing all or part of the data on transactions onto data media in coded form. If presented separately, these devices are classified in their respective headings.

This heading also covers cash registers working in conjunction, on-line or off-line, with an automatic data processing machine and cash registers which use, for example, the memory and microprocessor of another cash register (to which they are linked by cable) to perform the same functions.

This group also includes terminals for electronic payment by credit or debit card. These terminals use the telephone network to connect to the financial institution for authorisation and completion of the transaction, and to record and issue receipts indicating the amounts debited and credited.

(D) OTHER MACHINES INCORPORATING A CALCULATING DEVICE

These include :

- (1) **Postage-franking machines**; these print on the envelope a design in place of the postage stamp. The machine has a non-reversible totalling device which adds up the total value of the postages printed. In addition the machine can often be used for other printing on the envelope (e.g., advertising slogans).
- (2) **Ticket-issuing** machines used to issue tickets (e.g., cinema or railway tickets) at the same time recording and totalling the amounts involved; certain of these also print the ticket.
- (3) **Totalisator** machines for racecourses. These issue the tickets, record and total the amounts staked, and in certain complex machines also calculate the odds.

Machines which only count the tickets, etc., issued, without totalising the amounts, are **excluded (heading 84.72 or, if coin-operated, heading 84.76)**.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of machines of this heading are classified in **heading 84.73**.

*
* *

The heading **does not cover** :

- (a) Data processing machines of **heading 84.71**.
- (b) Weighing machines which total the weights (**heading 84.23 or 90.16**).
- (c) Slide rules, disc calculators, cylindrical calculators and other calculating instruments based on the slide rule or other mathematical calculating principle including, for instance, pocket-type adding and subtracting devices operated by the selection of numbers with a stylus according to a given procedure (**heading 90.17**).
- (d) Instruments which count unit by unit, such as revolution counters, production counters, etc., of **heading 90.29**.

84.71 - Automatic data processing machines and units thereof; magnetic or optical readers, machines for transcribing data onto data media in coded form and machines for processing such data, not elsewhere specified or included (+).

8471.30 - Portable automatic data processing machines, weighing not more than 10 kg, consisting of at least a central processing unit, a keyboard and a display

- Other automatic data processing machines :

8471.41 -- Comprising in the same housing at least a central processing unit and an input and output unit, whether or not combined

8471.49 -- Other, presented in the form of systems

8471.50 - Processing units other than those of subheading 8471.41 or 8471.49, whether or not containing in the same housing one or two of the following types of unit : storage units, input units, output units

8471.60 - Input or output units, whether or not containing storage units in the same housing

8471.70 - Storage units

8471.80 - Other units of automatic data processing machines

8471.90 - Other

(I) AUTOMATIC DATA PROCESSING MACHINES AND UNITS THEREOF

Data processing is the handling of information of all kinds, in pre-established logical sequences and for a specific purpose or purposes.

Automatic data processing machines are machines which, by logically interrelated operations performed in accordance with pre-established instructions (program), furnish data which can be used as such or, in some cases, serve in turn as data for other data processing operations.

This heading covers data processing machines in which the logical sequences of the operations can be changed from one job to another, and in which the operation can be automatic, that is to say with no manual intervention for the duration of the task. These machines mostly use electronic signals but may also use other technologies. They may be self-contained, all the elements required for data processing being combined in the same housing, or they may be in the form of systems consisting of a variable number of separate units.

This heading also covers separately presented constituent units of automatic data processing systems described above.

However, the heading **excludes** machines, instruments or apparatus incorporating or working in conjunction with an automatic data processing machine and performing a specific function. Such machines, instruments or apparatus are classified in the headings appropriate to their respective functions or, failing that, in residual headings (See Part (E) of the General Explanatory Note to this Chapter).

(A) AUTOMATIC DATA PROCESSING MACHINES

The automatic data processing machines of this heading must be capable of fulfilling **simultaneously** the conditions laid down in Note 5 (A) to this Chapter. That is to say, they must be capable of:

- (1) Storing the processing program or programs and at least the data immediately necessary for the execution of the program;
- (2) Being freely programmed in accordance with the requirements of the user;
- (3) Performing arithmetical computations specified by the user; and
- (4) Executing, without human intervention, a processing program which requires them to modify their execution, by logical decision during the processing run.

Thus, machines which operate only on fixed programs, i.e., programs which cannot be modified by the user, are **excluded** even though the user may be able to choose between a number of such fixed programs.

These machines have storage capability and also stored programs which can be changed from job to job.

Automatic data processing machines process data in coded form. A code consists of a finite set of characters (binary code, standard six bit ISO code, etc.).

The data input is usually automatic, by the use of data media such as magnetic tapes, or by direct reading of original documents, etc. There may also be arrangements for manual input by means of keyboards or the input may be furnished directly by certain instruments (e.g., measuring instruments).

The input data are converted by the input units into signals which can be used by the machine, and stored in the storage units.

Part of the data and program or programs may be temporarily stored in auxiliary storage units such as those using magnetic discs, magnetic tapes, etc. But these automatic data processing machines must have a main storage capability which is directly accessible for the execution of a particular program and which has a capacity at least sufficient to store those parts of the processing and translating programs and the data immediately necessary for the current processing run.

Automatic data processing machines may comprise in the same housing, the central processing unit, an input unit (e.g., a keyboard or a scanner) and an output unit (e.g., a visual display unit), or may consist of a number of interconnected separate units. In the latter case, the units form a "system" when it comprises at least the central processing unit, an input unit and an output unit (see Subheading Note 2 to this Chapter). The interconnections may be made by wired or wireless means.

A complete automatic data processing system must comprise, at least :

- (1) A **central processing unit** which generally incorporates the main storage, the arithmetical and logical elements and the control elements; in some cases, however, these elements may be in the form of separate units.
- (2) An **input unit** which receives input data and converts them into signals which can be processed by the machine.
- (3) An **output unit** which converts the signals provided by the machine into an intelligible form (printed text, graphs, displays, etc.) or into coded data for further use (processing, control, etc.).

Two of these units (input and output units, for example) may be combined in one single unit.

A complete automatic data processing system is classified in this heading, even though one or more units may be classified elsewhere when presented separately (see part (B) **Separately presented units**, below).

These systems may include remote input or output units in the form of data terminals.

Such systems may also include units, apart from the input or output units, designed to increase the capacity of the system for instance, by expanding one or more of the functions of the central unit (see Part (B) below). Such units are inserted between the input or output units (start and end of the system), although adapting and converting units (channel adaptors and signal converters) may occasionally be connected before the input unit or after the output unit.

Automatic data processing machines and systems are put to many uses, for example, in industry, in trade, in scientific research and in public or private administrations. (See Part (E) of the General Explanatory Note to Chapter 84 with respect to the classification of machines incorporating or working in conjunction with an automatic data processing machine and performing a specific function (Note 5 (E) to this Chapter)).

(B) SEPARATELY PRESENTED UNITS

Subject to the provisions of Notes 5 (D) and (E) to this Chapter, this heading also covers separately presented constituent units of automatic data processing systems. These may be in the form of units having a separate housing or in the form of units not having a separate housing and designed to be inserted into a machine (e.g., insertion onto the main board of a central processing unit). Constituent units are those defined in Part (A) above and in the following paragraphs, as being parts of a complete system.

An apparatus can only be classified in this heading as a unit of an automatic data processing system if it :

- (a) Performs a data processing function;
- (b) Meets the following criteria set out in Note 5 (C) to this Chapter :
 - (i) It is of a kind solely or principally used in an automatic data processing system;

- (ii) It is connectable to the central processing unit either directly or through one or more other units; and
 - (iii) It is able to accept or deliver data in a form (codes or signals) which can be used by the system.
- (c) Is not excluded by the provisions of Notes 5 (D) and (E) to this Chapter.

In accordance with the last paragraph of Note 5 (C) to this Chapter, keyboards, X-Y co-ordinate input devices and disc storage units which satisfy the conditions of items (b) (ii) and (iii) above, are in all cases to be classified as constituent units of data processing systems.

If the unit performs a specific function other than data processing, it is to be classified in the heading appropriate to that function or, failing that, in a residual heading (see Note 5 (E) to this Chapter). If an apparatus does not meet the criteria set out in Note 5 (C) to this Chapter, or is not performing a data processing function, it is to be classified according to its characteristics by application of General Interpretative Rule 1, if necessary in combination with General Interpretative Rule 3 (a).

Separately presented appliances such as measuring or checking instruments adapted by the addition of devices (signal converters, for example), which enable them to be connected directly to a data processing machine, are, in particular, **not** to be regarded as units of an automatic data processing system. Such appliances fall to be classified in their own appropriate heading.

Apart from central processing units and input and output units, examples of other units include :

- (1) **Additional storage** external to the central processing unit (magnetic card transports, magnetic or optical disc storages, tape autoloaders and libraries, optical disc drive libraries (sometimes referred to as "optical disc jukeboxes"), etc.). This group also includes additional data storage devices known as "proprietary storage formats", whether for internal installation in an automatic data processing machine or for external use with such machines. The devices may be in the form of drives for discs or tapes.
- (2) **Additions which enhance the processing power of the central processing unit** (e.g. floating point processing units).
- (3) **Control and adaptor units** such as those to effect interconnection of the central processing unit to input or output units (e.g., USB hubs). However, control and adaptor units for communication in a wired or wireless network (such as a local or wide area network) are **excluded (heading 85.17)**.
- (4) **Signal converting units**. At input, these enable an external signal to be understood by the machine, while at output, they convert the output signals that result from the processing carried out by the machine into signals which can be used externally.
- (5) **X-Y co-ordinate input devices**, which are units for inputting position data into automatic data processing machines. These devices include the mouse, the light pen, the joystick, the track ball and the touch-sensitive screen. Their common attribute is that their input consists of, or is interpreted as, data indicating position relative to some fixed point. Their common usage is to control the position of the cursor on the display unit, as a replacement for or a complement to the cursor keys on the keyboard.

This category also covers graphic tablets, which are X-Y co-ordinate input devices making it possible to capture and trace the co-ordinates of a curve or any other geometrical form. This apparatus is generally composed of a rectangular board with an active sensing surface, a pointer or pen used to create drawings, and a zoom linked to a cross-piece, making it possible to input data.

This category further covers digitizers, which have similar functions to graphic tablets. However, while graphic tablets are used for creating original art and drawings, as well as for application menu selection and on-screen object control, digitizers are generally used for the capture of existing drawings that exist only in hard-copy form. Digitizer pointing devices may assume any shape, but must be small enough to be hand-held and moved around the (active) sensing region of the digitizer. Cross-hair cursors are the most common shape.

**(II) MAGNETIC OR OPTICAL READERS, MACHINES FOR
TRANSCRIBING DATA ONTO DATA MEDIA IN CODED FORM
AND MACHINES FOR PROCESSING SUCH DATA,
NOT ELSEWHERE SPECIFIED OR INCLUDED**

This group comprises a wide range of machines, many being electro-magnetic or electronic, which usually complement each other and are generally used in systems for compiling statistics or for accounting or other operations. The group includes magnetic or optical readers, machines for transcribing data onto data media in coded form and machines which process data and which decode the result.

The group includes machines only if they are not elsewhere specified or included. It thus **excludes**, for example :

- (a) The automatic data processing machines and units thereof described in Part (I) above, other than bar code readers.
- (b) Calculating machines, accounting machines and cash registers of **heading 84.70**, from which they differ in that they have no manual input arrangements but receive data solely in coded form (magnetic tape, discs, CD-ROMs, etc.).
- (c) Automatic typewriters and word-processing machines (**heading 84.72**).

(A) MAGNETIC OR OPTICAL READERS

Magnetic or optical readers read characters, generally in a special form, and convert them into electric signals (impulses) which can be directly used by machines for transcribing or processing coded information.

- (1) **Magnetic readers.** In this type of appliance, the characters, printed with a special magnetic ink, are magnetised and then converted into electric impulses by a magnetic reader head. They are subsequently identified either by comparison with data registered in the storage units of the machine or by means of a numeric code, usually binary.

- (2) **Optical readers.** These do not require the use of special ink. The characters are read directly by a series of photoelectric cells and translated on the binary code principle. This group also includes bar code readers. These machines generally use photosensitive semiconductor devices, e.g., laser diodes, and are used as input units in conjunction with an automatic data processing machine, or with other machines, e.g., cash registers. They are designed for working in the hand, for placing on a table or for fixing to a machine.

The readers described above are classified in this heading only if presented separately. When combined with other machines (e.g., machines for transcribing data onto data media in coded form and machines for processing such data in coded form) they are classified with those machines **provided** they are presented with them.

(B) MACHINES FOR TRANSCRIBING DATA ONTO DATA MEDIA IN CODED FORM

This group includes :

- (1) **Machines for transferring coded information from one medium to another.** These machines can be used either to transfer coded information from one type of data medium to a different type or to transfer it to another medium of the same type. The latter category includes **reproducing machines** which are used to reproduce all or part of the data on a master tape, magnetic or optical discs (e.g., DVD, CD-ROM) by making a new tape or disc.
- (2) **Machines for introducing fixed programs into integrated circuits** (programmers). These machines are designed to transfer, in coded form, the data contained in the internal memory of the programmers onto integrated circuits. The programmers “burn” the information onto one or more integrated circuits following various techniques suitable for the type of programmable integrated circuit used.

Some programmers have an additional feature (emulator) which allows the user to picture or emulate the result of the programming before actually committing the program to the integrated circuit.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.73**.

*
* * *

This heading also **excludes** :

- (a) Power supply units (**heading 85.04**).
 - (b) Modulator-demodulator apparatus (modems), which modulate, in transmittable form over a telephone network, information obtained from an automatic data processing machine, and reconvert it into digital form (**heading 85.17**).
 - (c) Electronic integrated circuits (**heading 85.42**).
 - (d) Flight simulators (e.g., **heading 88.05**).
- ◦ ◦

Subheading Explanatory Notes.

Subheading 8471.30

This subheading covers portable automatic data processing machines weighing not more than 10 kg. These machines, which are equipped with a flat screen, may be capable of operating without an external source of electric power and often have a modem or other means for establishing a link with a network.

Subheading 8471.90

This subheading covers, *inter alia*, optical disc filing systems which usually include keyboards, displays, optical disc drive units, scanners and printers. These systems may include an automatic data processing machine as the controller or they may be configured such that they are accessible or controllable by an automatic data processing machine. These systems generally perform the following functions :

- recording the image by electronic scanning
- filing
- retrieval
- display
- printing on ordinary paper.

84.72 - Other office machines (for example, hectograph or stencil duplicating machines, addressing machines, automatic banknote dispensers, coin-sorting machines, coin-counting or wrapping machines, pencil-sharpening machines, perforating or stapling machines).

8472.10 - Duplicating machines

8472.30 - Machines for sorting or folding mail or for inserting mail in envelopes or bands, machines for opening, closing or sealing mail and machines for affixing or cancelling postage stamps

8472.90 - Other

This heading covers all office machines **not covered** by the preceding three headings or more specifically by any other heading of the Nomenclature.

The term " office machines " is to be taken in a wide general sense to include all machines used in offices, shops, factories, workshops, schools, railway stations, hotels, etc., for doing " office work " (i.e., work concerning the writing, recording, sorting, filing, etc., of correspondence, documents, forms, records, accounts, etc.).

Office machines are classified here **only** if they have a base for fixing or for placing on a table, desk, etc. The heading **does not cover** the hand tools, not having such a base, of **Chapter 82**.

The machines of this heading may be hand-operated, mechanically operated or electrically operated (including electro-magnetic relay or electronic operated machines).

The heading includes, *inter alia* :

- (1) **Duplicating machines** of the hectograph type (e.g., gelatin or spirit duplicators), and **stencil duplicating machines** which operate with waxed paper stencils previously cut by a stylus or on a typewriter. The heading includes small presses designed for use with hectographic apparatus.

But it **excludes** small printing machines (e.g., letterpress, lithographic or offset printing machines) even if intended for office use, and duplicators using embossed plastic or metal sheets (including such machines which can also operate with stencils), and photocopying or thermocopying apparatus (**heading 84.43**), and microfilm apparatus (**Chapter 90**).

- (2) **Addressing machines.** These rapidly print addresses on invoices, letters, envelopes, etc.; they usually operate by means of a series of small card or metal stencils or embossed metal plates. The heading also covers special machines used for cutting the stencils or embossing the metal plates, and machines for selecting certain out of a number of address plates or stencils.
- (3) **Ticket-issuing machines (other than** those incorporating a calculating device (**heading 84.70**) and coin-operated machines (**heading 84.76**)). This heading includes small portable machines for punched tickets, or which issue and print the ticket from a roll of paper (e.g., as used by bus or tram conductors); it also covers machines for date stamping tickets.

- (4) **Coin-sorting or coin-counting machines** (including banknote counting and paying-out machines). This heading covers such machines whether or not they are fitted with a device for wrapping the coins or banknotes, or in some cases for printing the amount on the wrapping.

Coin-counting machines operating by weighing fall in **heading 84.23** or **heading 90.16**.

- (5) **Automatic banknote dispensers**, operating in conjunction with an automatic data processing machine, whether on-line or off-line.

- (6) **Automatic teller machines**, with which customers deposit, draw and transfer money and see the balances of their accounts without direct contact with bank personnel.

- (7) **Pencil-sharpening machines** including hand-operated machines.

The heading **excludes** non-mechanical pencil sharpeners; these fall in **heading 82.14** or, if they have the character of toys, in **Chapter 95**.

- (8) **Punching machines** used for punching holes in paper cards or documents (e.g., for loose leaf filing purposes or for simple indexing or sorting).

The heading **excludes** machines for perforating lines of small holes (as in sheets of postage stamps) (**heading 84.41**).

- (9) **Machines for perforating paper bands so that they can be used in automatic typewriting machines.**

- (10) **Perforated band operated machines** which do not themselves contain any typewriting mechanism, but constitute separate units used in conjunction with ordinary typewriters for automatic typing. Certain of these machines can select parts from the perforated band as required for a particular letter or document.

- (11) **Stapling machines** (used to fix documents together with a staple) **and de-stapling machines.**

But the heading **excludes** :

(a) Stapling pistols (**heading 82.05**).

(b) Stapling machines of a kind used in bookbinding (**heading 84.40**).

(c) Stapling machines of a kind used in cardboard box manufacture (**heading 84.41**).

- (12) **Letter folding machines**, sometimes combined with a device for inserting the letter in an envelope or wrapping it with a paper band.

- (13) **Letter opening machines and letter closing or sealing machines.**

- (14) **Stamp cancelling machines.**

- (15) **Letter sorting machines** used in post offices, including those consisting essentially of groups of coding desks, pre-sorting channel systems, intermediate sorters and final sorters, the whole being controlled by an automatic data processing machine and constituting a functional unit within the meaning of Note 4 to Section XVI (see also the General Explanatory Note to Section XVI).

- (16) **Machines for delivering wrapping paper or gummed paper.**
- (17) **Machines for moistening gummed paper or stamps** (including the simple roller type).
- (18) **Paper shredders of a kind used in offices for destroying confidential documents.**
- (19) **Cheque-writing machines;** these are usually small machines specially designed for the purpose. In addition to typing letter by letter, they can often type a whole word or group of words simultaneously (e.g., when inserting, in words, a sum of money). They usually employ special indelible and penetrating inks, and sometimes also perforations or embossing.
- (20) **Cheque-signing machines;** these automatically write in the signature on cheques in an indelible fashion, and usually also reproduce an elaborate background difficult to copy.
- (21) **Automatic change dispensers** used in conjunction with cash registers for automatic dispensing of change to the customer.
- (22) **Stand-alone machines of a kind used in offices for sorting and collating documents** and printed matter.
- (23) **Typewriters (other than printers of heading 84.43).** They are, in general, characterised by a hand-operated keyboard, the keys of which when depressed cause the corresponding characters to be printed directly onto the paper. In some cases they operate by a series of levers and hammers, the character being engraved in relief on the faces of the hammers; in other cases the characters are carried on a ball, a cylinder, a daisy wheel or on cylindrical elements (shuttles) which present the required character to the paper on which it then prints. The text is produced letter by letter, though in exceptional cases combinations of letters (e.g., standards, words or abbreviations) may be used.

Typewriters are classified here whatever the characters used (e.g., normal letters and figures, stenotype symbols, music symbols or Braille characters). Machines for writing in code or for de-coding, operating in the same manner as normal typewriters, are also covered by the heading.

Electric typewriters, whether operated by electric motors, by electro-magnetic relays or, in the case of certain automatic typewriters, with electronic devices, are also classified in this heading.

The heading also covers :

- (i) **Automatic typewriters.** These include :
 - (a) Machines in which a previously perforated paper band is run through the machines, thus causing it to type a stock paragraph or a complete stock letter.
 - (b) Machines with a memory of limited capacity which are able, using additional functional keys, to memorise, correct and retype texts automatically.
 - (c) Keyboardless machines (printers) which print character by character using interchangeable typewheels. These machines are designed to be connected, by means of an appropriate interface, to other typewriters, word-processing machines, automatic data processing machines, etc. Subject to Note 5 (B) to this Chapter, the printers which satisfy the conditions of Note 5 (D) (i) to this Chapter are to be classified as printers of **heading 84.43.**

- (ii) Machines for typing identifying characters (and sometimes also branding with heated characters) on to insulated tubing for electrical wiring.
 - (iii) Typewriters, **not incorporating any calculating device** but specially designed for accounting purposes (e.g., for typing on specially prepared forms such as invoices, loose leaf ledgers, day books or filing cards).
 - (iv) Typewriters incorporating a device for transmitting the figures being typed to a separate calculating machine, or incorporating a counting device for use in speed tests.
- (24) **Word-processing machines.** These comprise, in addition to a keyboard, one or more large-capacity memories (e.g., disc, minidisc or cassette), a visual display unit and a printer. The various components may be housed in a single unit or be in separate units connected by cables. Word-processing machines may be fitted with interfaces permitting, for example, relay to other word-processing machines, to phototype-setting equipment, to automatic data processing machines, or to telecommunications systems. Their ability to correct or compose text is greater than that of automatic typewriters. Their ability to perform arithmetical operations does not compare with that of automatic data processing machines (as defined in Note 5 to this Chapter) and thus they do not lose the character of word-processing machines. They are different from automatic data processing machines of **heading 84.71** in that, in particular, they cannot take a logical decision during processing to modify the execution of a program (see Note 5 to this Chapter).

The machines referred to in Items (19) and (20) above can be also used for filling in and signing other documents.

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the machines of this heading are classified in **heading 84.73**.

*
* *

This heading also **excludes** :

- (a) Sorters which are parts or accessories of the machines of **heading 84.43**.
- (b) Accounting machines (**heading 84.70**).
- (c) Automatic data processing machines (**heading 84.71**).
- (d) Teleprinters (**heading 85.17**).
- (e) Dictating machines and other sound recording or sound reproducing apparatus (**heading 85.19**).
- (f) X-ray apparatus for the examination of banknotes or other documents (**heading 90.22**).
- (g) Time recorders (**heading 91.06**).
- (h) Toy typewriters (**heading 95.03**).
- (ij) Hand-operated date, sealing or similar stamps (**heading 96.11**).

84.73 - Parts and accessories (other than covers, carrying cases and the like) suitable for use solely or principally with the machines of headings 84.70 to 84.72.

- Parts and accessories of the machines of heading 84.70 :

8473.21 -- Of the electronic calculating machines of subheading 8470.10, 8470.21 or 8470.29

8473.29 -- Other

8473.30 - Parts and accessories of the machines of heading 84.71

8473.40 - Parts and accessories of the machines of heading 84.72

8473.50 - Parts and accessories equally suitable for use with the machines of two or more of the headings 84.70 to 84.72

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts and accessories suitable for use solely or principally with the machines of **headings 84.70 to 84.72**.

The accessories covered by this heading are interchangeable parts or devices designed to adapt a machine for a particular operation, or to perform a particular service relative to the main function of the machine, or to increase its range of operations.

The heading includes :

- (1) Form feed devices for the continuous feeding of stationery into typewriters, accounting machines, etc.
- (2) Automatic spacing devices for typewriters, accounting machines, etc.
- (3) Listing devices for attachment to addressing machines.
- (4) Auxiliary printing devices for tabulating machines.
- (5) Copy holders for attachment to typewriters.
- (6) Metal address plates, whether or not cut or embossed, identifiable as for use in addressing machines.
- (7) Calculating devices for incorporation in typewriters, accounting machines, calculating machines, etc.
- (8) Diskettes for cleaning disk drives in ADP machines, etc.
- (9) Electronic memory modules (e.g., SIMMs (Single In-line Memory Modules) and DIMMs (Dual In-line Memory Modules)) suitable for use solely or principally with automatic data processing machines, not consisting of discrete components as required by Note 9 (b) (ii) to Chapter 85, not conforming to the definition of multi-component integrated circuits (MCOs) (see Note 9 (b) (iv) to Chapter 85), and not having an individual function.

But the heading **excludes** covers, carrying cases and felt pads; these are classified in their appropriate headings. It also **excludes** articles of furniture (e.g., cupboards and tables) whether or not specially designed for office use (**heading 94.03**). However, stands for machines of **headings 84.70 to 84.72** not normally usable except with the machines in question, remain in this heading.

The heading also **excludes** :

- (a) Spools or similar supports, suitable for use with machines of a kind falling in **heading 84.70, 84.71 or 84.72** (classified according to their constituent material, for example, in **heading 39.23** or **Section XV**).
- (b) Mouse pads (classified according to their constituent material);
- (c) Duplicator stencils of paper (**heading 48.16**) or of other materials (classified according to constituent material).
- (d) Printed statistical cards (**heading 48.23**).
- (e) Magnetic disc packs and other media prepared for magnetic recording (**heading 85.23**).
- (f) Electronic integrated circuits (**heading 85.42**).
- (g) Revolution counters (e.g., for attachment to typewriters to check speed) (**heading 90.29**).
- (h) Typewriter or similar ribbons, whether or not on spools or in cartridges (classified according to their constituent material, or in **heading 96.12** if inked or otherwise prepared for giving impressions).
- (ij) Monopods, bipods, tripods and similar articles (**heading 96.20**).

84.74 - Machinery for sorting, screening, separating, washing, crushing, grinding, mixing or kneading earth, stone, ores or other mineral substances, in solid (including powder or paste) form; machinery for agglomerating, shaping or moulding solid mineral fuels, ceramic paste, unhardened cements, plastering materials or other mineral products in powder or paste form; machines for forming foundry moulds of sand.

8474.10 - Sorting, screening, separating or washing machines

8474.20 - Crushing or grinding machines

- Mixing or kneading machines :

8474.31 -- Concrete or mortar mixers

8474.32 -- Machines for mixing mineral substances with bitumen

8474.39 -- Other

8474.80 - Other machinery

8474.90 - Parts

This heading covers :

- (I) Machinery of a kind used, mainly in the extractive industries, for the treatment (sorting, screening, separating, washing, crushing, grinding, mixing or kneading) of solid mineral products (in general the products of Section V of the Nomenclature) such as earth (including earth colours), clay, stone, ores, mineral fuels, mineral fertilisers, slag cement or concrete.
- (II) Machinery for agglomerating, shaping or moulding solid mineral products in powder or paste form (e.g., agglomerating solid mineral fuels; moulding to shape ceramic pastes, unhardened cements, plastering materials, etc., whether or not with an added binder or filler).
- (III) Machines for forming foundry moulds of sand.

Many machines of this heading combine two or more of the functions in question (e.g., hydraulic sorting and washing, grinding and sorting, grinding and mixing, mixing and moulding machines).

Certain machines of the kind **normally** used for the treatment of mineral products can, as a secondary use, also treat non-mineral products (e.g., wood or bone); such machines remain in this heading. However, the heading **does not extend** to machinery specially designed for carrying out similar operations on non-mineral materials (e.g., for sorting or screening wood chips; for grinding wood flour; for grinding or mixing chemicals or organic colouring materials; for grinding bone, ivory, etc.; for agglomerating or moulding cork powder).

(I) MACHINES REFERRED TO IN CATEGORY (I) ABOVE (MACHINES MAINLY FOR THE EXTRACTIVE INDUSTRIES)

This group includes :

- (A) **Sorting, screening, separating or washing machines** for separating the materials, usually according to the size or weight of the lumps or particles, or for washing the materials free of impurities. These machines include :
- (1) **Roller sorters.** These consist of a number of parallel rollers revolving in the same direction in more or less close contact with each other. Each roller has a number of grooves so that, with the adjacent roller, it forms a channel through which the material passing over the rollers can fall if small enough. These channels increase in size along the machine, so that the material falls through the channels and is collected in receptacles below according to the size of the particles.
 - (2) **Screening machines using wire mesh or perforated sheet.** The material passes over an inclined screen whose meshes or perforations increase in size towards the lower end. These machines are of two types : in the first type, the wire mesh or perforated sheet is formed into a revolving inclined drum, usually cylindrical or hexagonal (trommels); in the other type, a flat inclined mesh or perforated screen is vibrated or oscillated by the machine.
 - (3) **Rake type sorting machines.** The material is sorted by a series of rakes whose teeth are spaced at appropriate distances.
 - (4) **Specialised machines** of various types for removing stones, etc., from coal.
 - (5) **Hydraulic washing, separating or concentrating machines.** Some simply wash away impurities; others separate out or concentrate the heavier part not held in suspension by the water.
 - (6) **Flotation separating machines,** mainly for ore concentration. The crushed ore is mixed with water and certain surface active agents (oil or various chemicals). A film forms on certain of the mineral particles which are then carried to the surface and are removed; in certain cases, the action is accelerated by blowing air into the mixture.

The heading also covers sorting or separating machines incorporating magnetic or electrical devices (e.g., electrostatic separating machines), and machines using electronic or photoelectric detecting devices, for example, sorting equipment for uranium or thorium ore, operating by radioactivity measurement.

The heading **does not cover** centrifugal sorting machines, i.e., machines in which separation depends entirely on the centrifugal principle that particles of differing specific gravities can be collected at differing distances from the quickly rotating centre (**heading 84.21**). However, machines in which centrifugal force is used to throw the material against a wire screen remain in this heading.

Conveyor bands used in conjunction with sorting or screening apparatus remain in their own appropriate headings unless forming an integral part of a sorting or screening machine, or **unless** the conveyor band itself acts as a screening or sorting device (e.g., has perforations for sorting or screening).

(B) **Crushing or grinding machines.** These include :

- (1) **Vertical rotary crushers.** Essentially, they comprise a vessel in which a cone revolves, sometimes with an eccentric motion; the material is crushed between the cone and the walls of the vessel.
- (2) **Jaw crushers of various types.** The material to be crushed falls between two vertical grooved jaws, one of which is fixed and the other movable.
- (3) **Drum crushers.** The material is lifted to the top of a drum and is broken by falling on to the bottom.
- (4) **Roller crushers or grinders.** The material is crushed between parallel rollers revolving in opposite directions - the distance between the rollers varying according to the fineness required. In many cases the machine consists of a number of pairs of such rollers.
- (5) **Percussion grinders.** The material is thrown violently (e.g., by rapidly rotating arms) against the walls of the machine.
- (6) **Hammer type crushers.**
- (7) **Ball or rod mills.** These consist essentially of a rotating drum containing a number of balls or short rods (e.g., of steel or porcelain). The material is placed in the rotating drum and is crushed or ground by the action of the balls or rods.
- (8) **Millstone type grinders.**
- (9) **Drop hammer crushers** (known as stamp mills); mainly used for crushing ores. A series of cam-operated drop hammers, often arranged in graduated stages, break up the material to the required fineness.
- (10) **Machines for breaking up and kneading** lumps of clay prior to further working in the ceramics industry.

(C) **Mixing or kneading machines.** These consist essentially of a container, equipped with paddles or other stirring devices, in which two or more materials are mixed or kneaded by stirring or agitation. They include :

- (1) **Concrete or mortar mixers.** Concrete mixers permanently mounted on a railway wagon or on a lorry chassis are, however, excluded (heading 86.04 or 87.05).
- (2) **Machinery for mixing mineral substances** (crushed or broken stone, gravel, limestone, etc.) **with bitumen**, for the preparation of bituminous road-surfacing materials. These may take the form, for example, of installations consisting of a group of separate components (feed hopper, dryer, dust extractor, mixer, elevator, etc.) mounted on a common chassis, or of functional units in which the components are simply placed side by side (fixed or transportable asphalt plant).
- (3) **Ore mixers.**

- (4) **Machines for mixing coal dust, etc., with binding substances** in the production of agglomerated fuels.
- (5) **Machines used in the ceramics industry** (e.g., for mixing the clay with colouring materials, or for kneading the ceramic paste).
- (6) **Mixing machines used in the preparation of foundry sand.**

(II) AGGLOMERATING, MOULDING OR SHAPING MACHINERY

In general these machines are of one of the three following types :

- (i) Various types of presses operating with moulds in which the material previously prepared is agglomerated and pressed into the required shape.
- (ii) Large cylinders whose surfaces are fitted with a series of hollows or moulds where the material is pressed into the required shape.
- or (iii) Extruding machines.

This group includes :

- (A) **Machines for agglomerating solid mineral fuel** (coal dust, peat fibres, etc.) into brick, ball, egg, etc., shapes.
- (B) **Machines for agglomerating or shaping ceramic pastes.** These include :
 - (1) **Brick making machines of the press or extrusion types**, including machines for cutting the extruded bars into bricks.
 - (2) **Tile moulding machines**, including machines for trimming the edges.
 - (3) **Machines for moulding or extruding earthenware pipes.**
 - (4) **Bricanion lath making machines**. In these, wire mesh is passed through rollers and covered at the intersections with clay.
 - (5) **Potters' wheels and similar machines** on which the ceramic paste is rotated and moulded to shape by hand, or with the aid of tools.
 - (6) **Machinery for moulding porcelain artificial teeth.**
- (C) **Machinery for agglomerating abrasives**, in the manufacture of grinding wheels.
- (D) **Machinery for making various prefabricated concrete articles** (e.g., paving stones, posts, balustrades, pylons), including **centrifugal moulding machines for tubes**.
- (E) **Machinery for moulding various plaster, staff, stucco, etc., articles** (e.g., toys, statuettes and ceiling decorations).
- (F) **Machinery for moulding articles of asbestos-cement** (e.g., vats, drinking troughs, chimneys), and **machines for making tubes or pipes of asbestos-cement** by rolling on a mandrel.

- (G) **Machinery for moulding graphite electrodes.**
- (H) **Machinery for extruding graphite pencil leads.**
- (IJ) **Machinery for moulding blackboard chalks.**

(III) MACHINES FOR FORMING FOUNDRY MOULDS OF SAND

These machines, which may be of various types, are designed to press previously prepared foundry sand either into a mould to form a foundry core, or round a pattern in a moulding box to form a mould. They often incorporate a jolting mechanism to settle the sand firmly in the mould.

This heading covers the many types in which compressed air acts either on a piston or directly on to the surface of the sand; but machines in which sand is sprayed in a jet of compressed air are **excluded (heading 84.24)**. Core or mould drying stoves are also **excluded (heading 84.19)**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are also classified here. However, balls for ball mills are classified according to their constituent material.

*
* *

The heading also **excludes** :

- (a) Pulverised fuel burners; mechanical stokers, incorporating pulverising or grinding equipment (**heading 84.16**).
- (b) Calendering or rolling machines (**heading 84.20**).
- (c) Filter presses (**heading 84.21**).
- (d) Machine-tools for working stone or other mineral materials, or for cold working glass (**heading 84.64**).
- (e) Concrete vibrators (**headings 84.67 or 84.79**, as the case may be).
- (f) Machinery for moulding or pressing glass (**heading 84.75**).
- (g) Machinery for moulding plastics (**heading 84.77**).
- (h) General purpose presses (**heading 84.79**).
- (ij) Concrete spreaders (**heading 84.79 or Chapter 87**).
- (k) Moulding boxes for metal foundry; moulds for use in the machines of this heading (**heading 84.80**).

84.75 - Machines for assembling electric or electronic lamps, tubes or valves or flash-bulbs, in glass envelopes; machines for manufacturing or hot working glass or glassware.

8475.10 - Machines for assembling electric or electronic lamps, tubes or valves or flash-bulbs, in glass envelopes

- Machines for manufacturing or hot working glass or glassware :

8475.21 -- Machines for making optical fibres and preforms thereof

8475.29 -- Other

8475.90 - Parts

The heading covers machines for assembling electric or electronic lamps, tubes or valves or flash-bulbs, in glass envelopes. It also includes machines for manufacturing or hot working glass or glassware (**other than** furnaces of **heading 84.17 or 85.14**).

**(I) MACHINES FOR ASSEMBLING ELECTRIC OR
ELECTRONIC LAMPS, TUBES OR VALVES OR
FLASH-BULBS, IN GLASS ENVELOPES**

This group includes :

(A) Machines for the vacuum-sealing of lamp bulbs.

(B) Rotary machines for the automatic assembly of incandescent lamps or wireless valves.

These machines usually include equipment for the heat-treatment of glass (e.g., blowpipes or pressing and closing devices for closing the glass envelope), but remain here even if not including such glass-working devices.

The heading also includes machinery for assembling electric filament lamps of which the component parts are interconnected by conveyors, and which include equipment for the heat-treatment of glass, pumps and lamp-testing units (see Note 4 to Section XVI).

The heading **does not**, however, **include** machines used solely for making metal parts of components of lamps or valves (e.g., machines for cutting out or deep drawing screens, anodes or supports (**heading 84.62**), machines for spiralling fine metal wire in the manufacture of electric lamp filaments (**heading 84.63**), and machines for welding screens or electrodes (**heading 84.68 or 85.15**)).

(II) MACHINES FOR THE MANUFACTURE OR HOT WORKING OF GLASS OR GLASSWARE

The glass-working machines of this heading are those which work glass (including fused quartz and other fused silica) which has been heated until it becomes soft or liquid. These machines operate mainly by casting, drawing, rolling, spinning, blowing, modelling, moulding, etc. Machines for working glass in the hard state (even if slightly heated to facilitate the operation) are excluded (**heading 84.64**).

(A) MACHINES FOR THE MANUFACTURE OF FLAT GLASS SHEETS

This group includes :

- (1) **Machines for making sheet glass by drawing out flat strips.** A roughly formed sheet of glass is picked up by a special device; it is then gripped by rollers and drawn out vertically or horizontally as it passes through an annealing oven. The continuous band thus obtained is cut into sheets (mechanically or by an electrically heated wire).
- (2) **Machines for the manufacture of floatglass.** In the float process, the glass is floating horizontally on a molten media, to manufacture an endless glass ribbon, which later in the process is cut into pieces.

(B) OTHER MACHINES FOR HOT WORKING GLASS

This group includes :

- (1) **Bottle-making machines, etc.** These range from simple mechanical appliances for gathering and blowing (operated by suction or compressed air and using separate moulds), to automatic continuous feeder machines (with two revolving plates, one with rough-casting moulds, the other with finishing moulds).
- (2) **Special machines and presses for moulding** various glass articles (e.g., paving blocks, tiles, insulators, optical glass blanks and hollow glassware), but excluding presses of general use (**heading 84.79**).
- (3) **Machines for drawing, shaping or blowing glass pipes or tubes, and special machinery for drawing fused silica tubes.**
- (4) **Machines for making glass beads,** in particular, machines in which cut pieces of tubing are rounded by being rolled in rotating heated drums.
- (5) **Machines for making glass fibre or filaments.** These fall into three main categories :
 - (i) **Machines for making continuous glass yarn for weaving.** These consist of a small electric furnace which is charged with glass balls. The bottom of the furnace consists of a draw-plate with a hundred or so very fine holes; the filaments are lubricated as they emerge from these holes, and are joined together by a special device to form a single strand. This is wound on a rotating drum which ensures that the filaments are continuously drawn forward.

- (ii) **Machines for making short fibres.** These machines are equipped with an electric furnace and a draw-plate like that mentioned above, but there are also sets of converging compressed air jets on either side. These jets fulfil the dual purpose of drawing out and breaking the filaments. The fibres fall through an oil-spray on to a rotating perforated drum; a suction device inside the drum draws the fibres together to form a roving which is wound on to a spool bobbin.
- (iii) **Special machines for making glass wadding.** The molten glass is poured on to a heated rotating disc; it adheres to the corrugations of the disc and is drawn into fibres by centrifugal action.
- (6) **Machines for bulb-blowing or for making other glass parts of electric light bulbs or tubes, or of electronic valves or tubes, etc.** (e.g., base blocks, filament supports, stems).
- (7) **Machines for making optical fibres and preforms thereof.**

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified here.

*
* * *

The heading also **excludes** :

- (a) Hand type glass blowers (**heading 82.05**).
- (b) Certain machines for the manufacture of toughened glass, in which ordinary glass sheets are placed between heated plates and then suddenly cooled (**heading 84.19**).
- (c) Moulds for manual or mechanical glass-making (**heading 84.80**).

84.76 - Automatic goods-vending machines (for example, postage stamp, cigarette, food or beverage machines), including money-changing machines (+).

- Automatic beverage-vending machines :

8476.21 -- Incorporating heating or refrigerating devices

8476.29 -- Other

- Other machines :

8476.81 -- Incorporating heating or refrigerating devices

8476.89 -- Other

8476.90 - Parts

This heading covers the various kinds of machines which supply some kind of merchandise when one or more coins, tokens or a magnetic card are put in a slot (**other than** those machines covered more specifically by other headings of the Nomenclature or excluded from the Chapter by a Chapter or Section Note). The term "vending" in the context of this heading refers to a "monetary" exchange between the purchaser and the machine in order to acquire a product. This heading **does not cover** machines which dispense a product but do not have a device to accept payment.

Automatic hot or cold beverage-dispensing machines without a device to accept payment are **excluded** (**heading 84.19**).

The heading covers not only machines in which the distribution is automatic, but also those consisting of a number of compartments from which the merchandise can be withdrawn after the coin has been inserted, the machine incorporating a device for releasing the lock of the appropriate compartment (e.g., by pressing on a corresponding button).

Simple cupboards or containers with a coin-operated lock, such as are used in stations for the deposit of baggage or in theatres for supplying opera glasses are **excluded** from this heading, but fall, for example, in **Section XV or Chapter 94**.

The heading includes machines equipped with heating or refrigerating devices, or with devices for preparing the product sold (e.g., fruit juice pressers, coffee and milk mixers, ice cream mixers), **provided** the principal function and purposes of the machines is the automatic sale of the product.

The heading includes coin-operated machines for selling postage stamps, railway tickets, chocolate, sweets, ice cream, cigarettes, cigars, beverages (such as beer, wine, liqueurs, coffee or fruit juices), toilet products (including scent spraying machines), stockings, photographic films, newspapers, etc.; also machines on which name plates can be stamped out on a strip of metal.

The heading also covers money-changing machines.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers **automatic vending mechanisms** of the kind to be built into shop fronts, and parts of the machines of this heading.

*
* *

The following coin-operated machines or appliances **are not covered** by the heading :

- (a) Coin-operated locks (e.g., for cupboards or public lavatories) (**heading 83.01**).
- (b) Pumps for dispensing fuel or lubricants, of the type used in filling-stations or in garages (**heading 84.13**).
- (c) Weighing machines (**heading 84.23**).
- (d) Typewriters (**heading 84.72**).
- (e) Coin-operated shoe brushing machines (**heading 84.79**).
- (f) Electric shavers (**heading 85.10**).
- (g) Telephone apparatus (**heading 85.17**).
- (h) Television receivers (**heading 85.28**).
- (ij) Telescopes, cameras, cinematograph projectors (**Chapter 90**).
- (k) Gas or electricity supply meters (**heading 90.28**).
- (l) Games of skill or chance (**heading 95.04**) and other machines of **Chapter 95**.

○
○ ○

Subheading Explanatory Note.

Subheadings 8476.21 and 8476.29

The expression " automatic beverage-vending machines " refers to all automatic machines for selling beverages (coffee, tea, fruit juices, alcoholic drinks, etc.) dispensed either ready for use in a cup or in any other container (e.g., tin, bottle or carton), or by dispensing separately both instant-mix powders and hot or cold water.

84.77 - Machinery for working rubber or plastics or for the manufacture of products from these materials, not specified or included elsewhere in this Chapter.

8477.10 - Injection-moulding machines

8477.20 - Extruders

8477.30 - Blow moulding machines

8477.40 - Vacuum moulding machines and other thermoforming machines

- Other machinery for moulding or otherwise forming :

8477.51 -- For moulding or retreading pneumatic tyres or for moulding or otherwise forming inner tubes

8477.59 -- Other

8477.80 - Other machinery

8477.90 - Parts

The heading covers machinery for working rubber or plastics or for the manufacture of products from these materials, not specified or included elsewhere in this Chapter.

This heading includes :

- (1) Moulding machines for tyres or other articles of rubber or plastics **excluding** moulds as such (**headings 68.15, 69.03 and 84.80** in particular).
- (2) Inner-tube valve-hole cutting machines.
- (3) Special rubber-thread cutting machines and appliances.
- (4) Forming presses for rubber or plastics.
- (5) Special presses for moulding thermoplastic powders.
- (6) Presses for making gramophone records.
- (7) Machinery for the manufacture of vulcanised fibre.
- (8) Extruders.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machinery of this heading.

*
* *

However, the heading **does not cover** machinery for encapsulation in the assembly of semiconductors (**heading 84.86**).

84.78 - Machinery for preparing or making up tobacco, not specified or included elsewhere in this Chapter.

8478.10 - Machinery

8478.90 - Parts

This heading covers machinery, **not** specified or included elsewhere in this Chapter, for preparing or making up tobacco.

Stripping is carried out in threshing separators. A current of air passes through a system of rotating beating hammers and metallic grills (baskets) of various sizes thus fragmenting the tobacco leaves, the lighter leaf parts being separated from the heavier veins and ribs.

The heading includes :

- (1) Tobacco leaf stripping or cutting machines.
- (2) Cigar or cigarette-making machines, whether or not equipped with an auxiliary packaging device.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machinery of this heading.

84.79 - Machines and mechanical appliances having individual functions, not specified or included elsewhere in this Chapter.

8479.10 - Machinery for public works, building or the like

8479.20 - Machinery for the extraction or preparation of animal or fixed vegetable fats or oils

8479.30 - Presses for the manufacture of particle board or fibre building board of wood or other ligneous materials and other machinery for treating wood or cork

8479.40 - Rope or cable-making machines

8479.50 - Industrial robots, not elsewhere specified or included

8479.60 - Evaporative air coolers

- Passenger boarding bridges :

8479.71 - - Of a kind used in airports

8479.79 - - Other

- Other machines and mechanical appliances :

8479.81 - - For treating metal, including electric wire coil-winders

8479.82 - - Mixing, kneading, crushing, grinding, screening, sifting, homogenising, emulsifying or stirring machines

8479.89 - - Other

8479.90 - Parts

This heading is **restricted to** machinery having individual functions, which :

(a) Is not excluded from this Chapter by the operation of any Section or Chapter Note.

and (b) Is not covered more specifically by a heading in any other Chapter of the Nomenclature.

and (c) Cannot be classified in any other particular heading of this Chapter since :

(i) No other heading covers it by reference to its method of functioning, description or type.

and (ii) No other heading covers it by reference to its use or to the industry in which it is employed.

or (iii) It could fall equally well into two (or more) other such headings (general purpose machines).

The machinery of this heading is distinguished from the parts of machinery, etc., that fall to be classified in accordance with the general provisions concerning parts, by the fact that it has individual functions.

For this purpose the following are to be regarded as having "individual functions" :

(A) Mechanical devices, with or without motors or other driving force, whose function can be performed distinctly from and independently of any other machine or appliance.

Example : Air humidification and dehumidification are individual functions because they can be performed by appliances operating independently of any other machine or appliance.

A separately presented air dehumidifier, even if designed to be mounted on an ozone generator falls, therefore, to be classified in this heading as having an individual function.

(B) Mechanical devices which cannot perform their function unless they are mounted on another machine or appliance, or are incorporated in a more complex entity, **provided** that this function :

- (i) is distinct from that which is performed by the machine or appliance whereon they are to be mounted, or by the entity wherein they are to be incorporated, and
- (ii) does not play an integral and inseparable part in the operation of such machine, appliance or entity.

Example : A chain cutter is a device which is mounted on an industrial sewing machine and which automatically cuts the thread so that the machine can run without interruption. This device performs an individual function because it plays no part in the "sewing" function of the machine; as there is no other more specific heading, the chain cutter falls to be classified here.

On the other hand, the function of a carburettor for an internal combustion engine is distinct from that of the engine but it is not an "individual function" as defined above because the operation of the carburettor is inseparable from that of the engine. Separately presented carburettors are therefore to be classified as parts of engines in **heading 84.09**.

Similarly, mechanical or hydraulic shock absorbers form an integral part of the machine or appliance in which they are to be incorporated. Separately presented shock absorbers therefore fall to be classified as parts of the machines or appliances on which they are to be mounted. (Shock absorbers for vehicles or aircraft fall in **Section XVII**).

The many and varied machines covered by this heading include *inter alia* :

(I) MACHINERY OF GENERAL USE

This group includes, for example :

- (1) Vats or other receptacles (e.g., vats or tanks for electrolysis), fitted with mechanical devices (agitators, etc.), and which are not identifiable as being for any particular industry and are not heating, cooking, etc., apparatus of **heading 84.19**. Vats or other receptacles simply fitted with taps, level or pressure gauges or the like are classified according to their constituent material.
- (2) Presses, crushers, grinders, mixers, etc., not designed for particular goods or industries.
- (3) Volumetric distributing apparatus (e.g., mechanical hopper feeds) and mechanical distributors for continuous presentation of work pieces in the same alignment ready for the working operation, not specialised for any particular industry.

- (4) Eyeletting or tubular riveting machines equally suitable for applying the eyelets or rivets to any material such as textiles, paperboard, plastics or leather; and machines equally suitable for joining by stapling the ends of machinery belting of textiles, rubber or other materials.
- (5) Vibrator motor consisting of an electric motor with eccentric discs fitted to the protruding ends of the shaft, generating radial vibrations which are transmitted to the apparatus or appliance (chutes, bins, hoppers, conveyors, compacting appliance, etc.) to which the vibrator motor is fixed.
- (6) Electro-magnetic vibrator, for attachment to conveying, screening, compacting, etc., appliances, consisting of a base plate carrying an electro-magnet and two metal rods supporting a mass held in position by two sets of springs at a suitable distance from the electro-magnet; the mass is alternatively attracted by the magnet and pulled back by the springs.
- (7) Industrial robots for multiple uses. Industrial robots are automatic machines which can be programmed to carry out repeatedly a cycle of movements. By the use of sensors, industrial robots are able to acquire information about the field in which they operate and to analyse the information thus obtained to be able to adapt their pattern of activity to variations in their field of operation.

Industrial robots may consist of an articulated structure comparable to that of the human arm, mounted on a base in a horizontal or vertical position, and having at its extremity a mobile holder for the toolholder (so-called vertical robots). They may also consist of a rectilinear structure often moving on a vertical axis of which the holder forms the terminal part of the operating mechanism often moving on a horizontal axis (horizontal robots). These robots could equally be placed on a beam (beam robots).

The different parts of the structure are activated by electric motors or by means of a hydraulic or pneumatic system.

Industrial robots have many uses; welding, painting, handling, loading and unloading, cutting, assembling, metal trimming, etc. They are replacing humans in tasks performed in a hostile environment (with toxic products, dust, etc.) or with laborious tasks (moving of heavy loads, repetitive tasks of a boring nature). For these varied applications, robots are equipped with a tool holder and tools specifically designed for the accomplishment of the task (pincers, grippers, welding heads, for example).

The heading covers only industrial robots capable of performing a variety of functions simply by using different tools. However, the heading **excludes** those industrial robots **specifically designed** to perform a specific function; these industrial robots are classified in the heading covering their function (e.g., **heading 84.24, 84.28, 84.86 or 85.15**).

(II) MACHINERY FOR CERTAIN INDUSTRIES

This group includes :

(A) Machinery for public works, building or the like, e.g. :

- (1) Machines for spreading mortar or concrete (**excluding** mixers for preparing concrete or mortar - **heading 84.74** or **87.05**).
- (2) Road making machines which vibrate the concrete to consolidate it and to camber the surface, sometimes also spreading the concrete.
However this heading **does not include** levellers of **heading 84.29**.
- (3) Machines, whether or not self-propelled, for spraying gravel on road or similar surfaces and self-propelled machines for spreading and tamping bituminous road-surfacing materials. Gravel sprayers mounted on a motor vehicle chassis are **excluded (heading 87.05)**.
- (4) Machinery and mechanical appliances for smoothing, grooving, checkering, etc., fresh concrete, bitumen or other similar soft surfaces.

Heating apparatus for bitumen, etc., are **excluded (heading 84.19)**.

- (5) Small pedestrian directed motorised apparatus for the maintenance of roads (e.g., sweepers and white line painters).

Mechanical rotating brooms, which may be mounted with a dirt hopper and a sprinkler system on a wheeled chassis powered by a tractor of **heading 87.01**, are also classified in this heading as interchangeable equipment, even if they are presented with the tractor.

- (6) Salt and sand spreaders for clearing snow, designed to be mounted on a lorry, consisting of a tank for storing sand and salt, equipped with a lump-breaking agitator, a system for crushing/grinding the lumps of salt, and a hydraulic projection system with spreading disk. The machines' various functions are operated from the cab of the lorry, by remote control.

(B) Machinery for the oil, soap or edible fat industries, e.g. :

- (1) Special grinders, crushers, mills or presses for oilseeds or oleaginous fruit.
- (2) Tanks fitted with mechanical agitators, specially designed for purifying oils.
- (3) Tallow-washing equipment.
- (4) Equipment for rolling raw tallow in order to crush the cells before melting down.
- (5) Churns and mixers for mixing together the component parts of margarine.
- (6) Soap cutting or moulding machines.

(C) **Machinery for treating wood or similar materials**, e.g. :

- (1) Barking drums in which logs are stripped of their bark by scraping against each other.
- (2) Special presses for agglomerating wood fibre, wood chips, sawdust or cork dust.
- (3) Wood hardening presses.
- (4) Machines for impregnating wood under pressure.

(D) **Rope or cable-making machines** (stranding, twisting or cabling, etc., machines) working with either textile yarn or metal wire or both, including machinery for twisting flexible electrical conductors, **other than** twisting-frames of a type used in spinning textiles (**heading 84.45**).

The heading **does not cover** :

- (a) Machines for reeling textile yarn, string, etc., into balls (**heading 84.45**).
- (b) Machines for finishing (glazing, polishing) textile yarn, string, etc. (**heading 84.51**).

(E) **Machinery for treating metals, including electric wire coil-winders**, e.g. :

- (1) Crucible vice-presses for alumino-thermic welding of rails, machine parts, etc.
- (2) Machinery for scouring or pickling metals (by acid, trichloroethylene, etc.) including pickling units for sheet-rolling mills, but **excluding** steam or sand blasting appliances of **heading 84.24**.
- (3) Rotating drums for de-sanding, de-scaling or polishing metal goods (e.g., nuts, bolts or ball bearings).
- (4) Machines for tin-plating by dipping.
- (5) Pig iron breakers and special stamping mills for breaking up cast iron scrap.
- (6) Special machines for winding or covering electric cables with layers of textile yarn, impregnated paper strips, asbestos tapes or other insulating or protective material; but **excluding** gimping machines of the kind falling in **heading 84.47**.
- (7) Electric wire coil-winders (e.g., for motors, transformers or inductors).

(F) **Basket-making, wickerwork-making and other machinery for plaiting or interlacing osier, canes, rattans, straw, wood strips, plastics, etc.** e.g. :

- (1) Machines for making baskets, hampers or similar articles.
- (2) Machines for forming wickerwork covers on carboys, bottles, etc.
- (3) Machines for making protective straw envelopes for bottles.
- (4) Machines for plaiting hats or braids and bands for hat-making.

The heading **does not include** machines for splitting wood, peeling osier, rounding rattans, etc. (**heading 84.65**).

(G) **Machinery for making paint brushes or other brushes**, e.g. :

- (1) Machines for preparing (including trimming or shaping) hair, bristles, fibres, etc., for brushes.
- (2) Machines for inserting the hairs, bristles, fibres, etc., into sockets, mounts or handles.

The heading **does not cover** :

- (a) Machines for sterilising bristles or fibres (**heading 84.19**).
- (b) Machines for working brush mounts or brush handles in wood, cork, bone, hard rubber or similar hard materials (**heading 84.65**).

(III) MISCELLANEOUS MACHINERY

This group includes :

- (1) Air humidifiers or dehumidifiers, **other than** the appliances of **heading 84.15, 84.24 or 85.09**.
- (2) Engine starters (mechanical, hydraulic, compressed air, etc.) **but not** electrical equipment of **heading 85.11**.
- (3) Hydraulic accumulators, for keeping in reserve an amount of liquid under pressure in order to give an even rate of flow or feed pressure to hydraulic machinery. Normally, these accumulators consist of a vertical pump-fed cylinder enclosing a weighted piston which is adjusted to a certain pressure.
- (4) Pump-type automatic machine greasers.
- (5) Match-dipping machines.
- (6) Machinery for cask tarring or coating **other than** spraying appliances of **heading 84.24**.
- (7) Machines for coating welding electrodes.
- (8) Machines for cleaning off or re-covering gelatin inking rollers.
- (9) Machines for coating photosensitive emulsions on to a backing **other than** those machines of **heading 84.86**.
- (10) Machines for frosting glass by the acid process.
- (11) Bolting or unbolting machines and metal core extractors, **other than** hand tools of **Chapter 82** and small tools for working in the hand, pneumatic, hydraulic or with self-contained electric or non-electric motor (**heading 84.67**).
- (12) Machines for the maintenance of pipelines or other non-flexible pipes (e.g., small self-propelled machines used on oil pipelines to clean the pipe, coat it with asphalt or other protective covering; machines, carried through the pipes by the flow of the fluid itself, used for cleaning the inside of pipelines).

- (13) Machines for mounting card clothing on carding cylinders.
- (14) Machines for making rope soles for footwear.
- (15) Machines for washing, scouring or removing dust from bed feathers.
- (16) Machines for filling eiderdowns or stuffing mattresses.
- (17) Machines for applying abrasives to any backing (fabrics, paper, etc.).
- (18) Coiling machines for flexible cables or tubes (e.g., for textile or metal cables or ropes, electric cables, lead pipes).
- (19) Mechanical appliances for cutting water-weeds. These consist of a horizontal scythe, below water-level, rotating on a vertical axis which is supported by a frame for fitting to a boat. They may be hand or power-driven.
- (20) Diving bells or metal diving suits, etc., mechanically equipped.
- (21) Gyroscopic stabilisers for ships or for similar uses; but **excluding** the gyroscopic devices for instruments of **Chapter 90** (gyro-compasses, etc.) and torpedoes (**heading 93.06**).
- (22) Steering and rudder equipment for ships, **other than** the rudders themselves (usually **heading 73.25** or **73.26**), and automatic pilots (Gyro pilots) of **heading 90.14**.
- (23) Electrical, hydraulic, pneumatic, etc., windscreen wiping mechanisms for aircraft, ships and all vehicles **except** those for cycles or motor vehicles (**heading 85.12**). The heading also includes wiper-blade mountings and mounted wiper-blades, **provided** they are identifiable as for the wiping mechanisms described above; those for use with motor vehicle windscreen wiping mechanisms are **excluded** (**heading 85.12**).
- (24) Ultrasonic apparatus for cleaning metal parts and miscellaneous other articles; consisting when complete (whether mounted in a common housing or as separate units) of a high frequency generator, one or several transducers and a tank for the articles to be cleaned, presented either complete or without the tank. The heading also covers ultrasonic transducers for such apparatus. Ultrasonic apparatus and transducers of a kind used solely or principally for cleaning semiconductor wafers or flat panel displays are **excluded** (**heading 84.86**).
- (25) Underwater blowpipes, usually fitted with a special ignition device, and with provision for bringing an additional supply of compressed air or oxygen through a ring-shaped outlet round the nozzle, in order to create a cavity in the water so that the flame can burn.
- (26) Apparatus for cutting or piercing rock or concrete, using the high temperature produced by burning iron or steel in a jet of oxygen. The apparatus used is usually quite simple, consisting of a heat-resisting handle or grip which incorporates a valve and has provision for connecting both to a source of oxygen and to a length of iron or steel tubing. In operation, the oxygen passes through the iron or steel tubing, the end of which, previously brought to red heat, is thus burned away producing a very high temperature sufficient to melt the rock or concrete.
- (27) Automatic shoe brushing machines.

- (28) Machines for waxing paper cups and containers, etc., by immersion.
- (29) Industrial floor polishers.
- (30) Evaporative air coolers.
- (31) Passenger boarding bridges. These bridges permit passengers and personnel to walk between a terminal building and a parked aircraft, a cruise ship or ferry-boat, without having to go outside. The bridges generally consist of a rotunda assembly, two or more rectangular telescopic tunnels, vertical lift columns with wheel bogies, and a cabin located in the front part of the bridges. They include electromechanical or hydraulic devices that are designed for moving the bridges horizontally, vertically and radially (i.e., their telescopic sections, cabin, vertical lift columns, etc.), in order to adjust the bridges to the appropriate position to the particular aircraft's door, or to the port (entrance) of the cruise ship or ferry-boat. The passenger boarding bridges of the type used at seaports can be, furthermore, equipped with a transitional device installed on their foreshore which can be extended into the port (entrance) of the cruise ship or ferry-boat. These bridges themselves do not lift, handle, load or unload anything.

Appliances for cleaning carpets in situ by injecting a liquid cleaning solution into the carpet, the solution then being extracted by suction, and designed for use in establishments (other than domestic premises) such as hotels, motels, hospitals, offices, restaurants and schools are classified in **heading 84.51**.

The heading also **excludes** machinery for encapsulation in the assembly of semiconductors (**heading 84.86**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the machinery of this heading, including moulds **other than** those covered elsewhere (in particular, **heading 84.80**).

84.80 - Moulding boxes for metal foundry; mould bases; moulding patterns; moulds for metal (other than ingot moulds), metal carbides, glass, mineral materials, rubber or plastics.

8480.10 - Moulding boxes for metal foundry

8480.20 - Mould bases

8480.30 - Moulding patterns

- Moulds for metal or metal carbides :

8480.41 -- Injection or compression types

8480.49 -- Other

8480.50 - Moulds for glass

8480.60 - Moulds for mineral materials

- Moulds for rubber or plastics :

8480.71 -- Injection or compression types

8480.79 -- Other

This heading covers the moulding boxes used in metal foundry, mould bases and moulding patterns, with certain **exceptions** referred to later, it also covers all moulds (whether or not hinged, and whether used by hand or in presses or moulding machines) which are of a kind used for moulding the following materials into blanks or finished articles :

- (I) Metals and metal carbides.
- (II) Glass (including fused quartz or other fused silica) or mineral materials such as ceramic pastes, cement, plaster or concrete.
- (III) Rubber or plastics.

In general, the essential function of a mould is to retain the material in a predetermined shape while it sets; some moulds also exert a certain pressure on the material. But the heading **excludes** stamping dies of **heading 82.07** since these shape the material solely by means of a powerful blow or compression (e.g., dies for stamping out sheet-metal goods).

(A) MOULDING BOXES FOR METAL FOUNDRY

These are frames usually of cast iron or steel and usually rectangular or round. They hold the sand mould formed by pressing the sand around a pattern.

(B) MOULD BASES

These are plates placed on the bottom of the moulds.

(C) MOULDING PATTERNS

These include foundry patterns, foundry cores, core boxes, moulding boards, pattern plates etc., used in the preparation of sand moulds (generally of wood).

(D) MOULDS FOR METAL (OTHER THAN INGOT MOULDS) OR FOR METAL CARBIDES

This group includes :

- (1) **Chill-moulds (die-casts).** These take the form of a metallic casing consisting of two or more adjustable parts which reproduce, in hollow form, the shape of the required articles.
- (2) **Pressure-casting moulds,** into which the molten metal is forced under pressure. They normally consist of two complementary metallic chill-moulds, with hollows corresponding to the shape of the required articles in their opposing faces; in some cases the halves of the mould compress the molten metal to a certain degree.
- (3) **Moulds for sintering metal powders.** These moulds are heated. They are sometimes also used for sintering metal carbides or ceramic powders.
- (4) **Cylindrical moulds** for centrifugal moulding machines (e.g., for casting iron pipes, gun barrels).

(E) MOULDS FOR GLASS

This group includes :

- (1) **Moulds for glass paving stones, bricks or flags, and compression moulds for glass tiles.**
- (2) **Bottle moulds** for hand or machine working, including pedal operated moulds (e.g., blank or finishing moulds, ring moulds).
- (3) **Moulds for hollow glassware, for insulators, etc.**
- (4) **Shaping moulds for glassmakers' lathes.**
- (5) **Moulds made of steel or cast iron, used to make lens or spectacle blanks, etc.**

(F) MOULDS FOR MINERAL MATERIALS

This group includes :

- (1) **Moulds for ceramic pastes** (e.g., brick moulds, moulds for pipes or for other articles of ceramics, including moulds for artificial teeth).
- (2) **Moulds for moulding concrete, cement or asbestos-cement goods** (tubes, vats, paving stones, flags, chimney-pots, bannisters, architectural ornaments, wall, floor or roof slabs, etc.). Also moulds for making prefabricated construction elements of reinforced or prestressed concrete (window frames, parts of vaulting beams, railway sleepers, etc.).

- (3) **Moulds for agglomerating abrasives into grinding wheels.**
- (4) **Moulds for plaster, staff or stucco articles** (e.g., toys, statuettes and ceiling decorations).

(G) MOULDS FOR RUBBER OR PLASTICS

This group includes :

- (1) **“Bladder” moulds for vulcanising tyres.** These consist of two adjustable metal chill-moulds, steam or electrically heated, enclosing a kind of air-inflated ring-shaped bag (the air-bag) or hot water-inflated bag (the water-bag), which presses the tyre firmly against the mould surfaces.
- (2) **Moulds for moulding or vulcanising miscellaneous rubber articles.**
- (3) **Moulds for making plastic articles**, whether or not electrically or otherwise heated; they may operate by gravity, or by injection or compression.

The heading also includes **preliminary tabletting moulds**. These employ a cold process to consolidate the moulding powders into tablets, each of which contains the appropriate quantity of material (and are of a suitable shape and volume) ready for final moulding into the desired article.

The heading also **excludes** :

- (a) Forms used in the manufacture of articles (e.g., gloves) by dipping the form into liquid rubber, plastics, etc. (classified according to their constituent material).
- (b) Moulds made of graphite or other carbon (**heading 68.15**).
- (c) Moulds of any kind made of ceramics (**heading 69.03** or **69.09**, as the case may be).
- (d) Moulds made of glass (**heading 70.20**).
- (e) Ingot moulds (**heading 84.54**).
- (f) Moulds for the manufacture of semiconductor devices (**heading 84.86**).
- (g) Matrices and masters for the production of records (**heading 85.23**).
- (h) Subject to the above exclusions, moulds used on presses and other machines, for the moulding of materials other than those cited in the text of this heading (classified as parts of the machines for which they are designed).

84.81 - Taps, cocks, valves and similar appliances for pipes, boiler shells, tanks, vats or the like, including pressure-reducing valves and thermostatically controlled valves.

8481.10 - Pressure-reducing valves

8481.20 - Valves for oleohydraulic or pneumatic transmissions

8481.30 - Check (nonreturn) valves

8481.40 - Safety or relief valves

8481.80 - Other appliances

8481.90 - Parts

This heading covers taps, cocks, valves and similar appliances, used on or in pipes, tanks, vats or the like to regulate the flow (for supply, discharge, etc.), of fluids (liquid, viscous or gaseous), or, in certain cases, of solids (e.g., sand). The heading includes such devices designed to regulate the pressure or the flow velocity of a liquid or a gas.

The appliances regulate the flow by opening or closing an aperture (e.g., gate, disc, ball, plug, needle or diaphragm). They may be operated by hand (by means of a key, wheel, press button, etc.), or by a motor, solenoid, clock movement, etc., or by an automatic device such as a spring, counterweight, float lever, thermostatic element or pressure capsule.

Taps, valves, etc., incorporating such mechanisms or devices remain classified in this heading. This applies, for example, to a valve equipped with a thermostatic element (double-leaf, capsule, bulb, etc.). The heading also covers valves, etc., connected to a thermostatic element by means of, for instance, a capillary tube.

Combinations consisting of a tap, valve, etc. and a thermostat, manostat or any other measuring, checking or automatically controlling instrument or apparatus of heading 90.26 or 90.32 remain in this heading if the instrument or apparatus is mounted or is designed to be mounted directly on the tap, valve, etc., and **provided** the combined apparatus has the essential character of an article of this heading. If **not** satisfying these conditions, they are classified in **heading 90.26** (e.g., liquid-type pressure gauge fitted with a drain cock) or in **heading 90.32**.

In the case of remote-control systems, only the tap, valve, etc., is classified in this heading.

In general, taps, valves, etc., are of base metal or plastics, but those of other materials (**other than** unhardened vulcanised rubber, ceramics or glass) are also covered by the heading.

Taps, valves, etc., remain classified here even if incorporating other accessory features (e.g., double walls for heating or cooling purposes; short lengths of tubing; short lengths of tube ending in a shower rose; small drinking fountain bowls; locking devices).

Taps, cocks, valves, etc., remain in this heading even if specialized for use on a particular machine or apparatus, or on a vehicle or aircraft. However, certain machinery parts which incorporate a complete valve, or which regulate the flow of a fluid inside a machine although not forming a complete valve in themselves, **are classified as parts of the relative machines**, for example, inlet or exhaust valves for internal combustion engines (**heading 84.09**), slide valves for steam engines (**heading 84.12**), suction or pressure valves for air or other gas compressors (**heading 84.14**), pulsators for milking machines (**heading 84.34**) and non-automatic greasing nipples (**heading 84.87**).

*
* * *

The heading includes *inter alia* :

- (1) Pressure-reducing valves for reducing the pressure of gases and maintaining that reduced pressure at a fairly constant level by means of a plug or stopper which is generally controlled by a pressure device (diaphragm, bellows, capsule, etc.) damped by an adjustable tension spring. These appliances directly regulate the pressure of gases passing through them; they are mounted, for example, on compressed gas cylinders, on pressure containers, or on feed pipe systems of the appliances which they serve.

The heading also includes pressure-reducing valves (sometimes called pressure regulators, pressure reducers or pressure regulator-reducers), also mounted at the outlets of pressure containers, of boilers, on connecting feed pipe systems or near the appliances which they serve, to perform the same function on compressed air, steam, water, hydrocarbons or other fluids.

If combined with a pressure gauge, pressure-reducing valves fall either in this heading or in **heading 90.26** depending on whether or not the combined apparatus retains the essential character of a tap, valve, etc. (see the fourth paragraph of this Explanatory Note).

- (2) Valves for oleohydraulic or pneumatic transmissions (see Subheading Note 3 to this Chapter). These valves, which may be of any type (pressure-reducing type, check type, etc.), are used specifically in the transmission of "fluid power" in a hydraulic or pneumatic system, where the energy source is supplied in the form of pressurised fluids (liquid or gas).
- (3) Nonreturn valves (e.g., swing check valves and ball valves).
- (4) Safety valves, relief valves, etc., whether or not incorporating a warning whistle.

Bursting discs (thin discs of plastics or metal) are used in certain cases as safety devices instead of valves; they are mounted by means of a special carrier on pipe systems or pressure vessels and burst at a specific pressure. They are classified according to the constituent material (**headings 39.26, 71.15, 73.26, 74.19, 75.08, 76.16**, etc.).

- (5) Manifold valves (e.g., three way valves and "Christmas tree" valves).
- (6) Control cocks, blow-off cocks and shut off valves, etc., for level gauges.
- (7) Radiator drainage taps.
- (8) Inner-tube valves.
- (9) Float controlled valves.
- (10) Steam traps in which the water of condensation from a steam conduit collects and which are automatically emptied (e.g., by the operation of a float). The heading also covers steam traps in which the plug or stopper is actuated by a thermostatic element (double-leaf or capsule) mounted inside the trap (thermostatically controlled steam traps).

- (11) Fire-hydrants (stand pipes), fire cocks, hosepipe nozzles and the like, fitted with cocks or with valves for forming a jet or a spray.
- Mechanical sprinkler heads for anti-fire installations, mechanical garden sprinkler heads and the like are excluded (**heading 84.24**).
- (12) Mixing taps and valves, with two or more inlets and a mixing chamber. The heading also covers thermostatically controlled mixing valves incorporating an adjustable tension thermostatic element, which actuates the plugs or stoppers regulating the admission of fluids at different temperatures into the mixing chamber.
- (13) Waste holes with plugs (**other than** simple waste holes with plugs to be inserted by hand, classified according to their constituent material).
- (14) Sea cocks and other underwater valves, cocks, etc., for ships.
- (15) Lubricating taps with flexible or telescopic tubes for lubricating shafts of steamships, etc.
- (16) Soda-water bottle valves.
- (17) Pressure spray-can lids for cans to be filled with liquid or gaseous insecticides, disinfectants, etc., under pressure, comprising a metal head fitted with a press-button displacing a needle which opens or closes the ejection orifice.
- (18) Taps and cocks for fitting in the bung holes of casks, barrels, etc.
- (19) Taps for bottle filling machines, designed to close automatically when the level of the liquid reaches the top of the bottle.
- (20) Gas operated beer dispensing units for bar counters, consisting essentially of one or more hand-operated cocks fed by the pressure of carbon dioxide piped into the casks of beer.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the appliances of this heading are also classified here.

*
* *

The heading also excludes :

- (a) Taps, cocks, valves and similar appliances made of unhardened vulcanised rubber (**heading 40.16**), ceramics (**heading 69.03** or **69.09**), or of glass (**heading 70.17** or **70.20**).
- (b) U-bends for waste water in sinks, lavatories, bathrooms or the like, and also flushing cisterns whether or not equipped with their mechanism, which are classified according to their constituent material (e.g., **heading 39.22**, **69.10**, **73.24**).
- (c) Centrifugal governors for steam engines (**heading 84.12**).
- (d) Steam injector or ejector pumps (**heading 84.13**).
- (e) Air spraying equipment, etc. (**heading 84.24**).
- (f) Pneumatic grease guns (**heading 84.67**).
- (g) Blowpipes for gas welding (**heading 84.68**).
- (h) Taps combined with a measuring-out device for dispensing ice cream, spirits, milk, etc. (**heading 84.79**).

84.82 - Ball or roller bearings.

8482.10 - Ball bearings

8482.20 - Tapered roller bearings, including cone and tapered roller assemblies

8482.30 - Spherical roller bearings

8482.40 - Needle roller bearings

8482.50 - Other cylindrical roller bearings

8482.80 - Other, including combined ball/roller bearings

- Parts :

8482.91 -- Balls, needles and rollers

8482.99 -- Other

This heading covers all ball, roller or needle roller type bearings. They are used in place of smooth metal bearings and enable friction to be considerably reduced. They are generally fitted between the bearing housing and the shaft or axle, and may be designed to give radial support (radial bearings) or to resist thrust (thrust bearings). Certain bearings may be designed for both radial and thrust support.

Normally, bearings consist of two concentric rings (races) enclosing the balls or rollers, and a cage which keeps them in place and ensures that their spacing remains constant.

The bearings classified in this heading include :

(A) **Ball bearings**, with single or double rows of balls. This group also includes **slide mechanisms with bearing balls**, for example :

- (1) Those consisting of a steel outer ring rigidly locked with a brass inner ring which has six slots arranged lengthwise and in the shape of elongated ellipses enclosing small steel balls.
- (2) The restricted-travel type, of steel, comprising a grooved cylinder, a ball cage and a housing.
- (3) The free-travelling type, of steel, comprising a segment, a casing enclosing the bearing balls, and a guide rail with a groove of triangular section.

(B) **Roller bearings**, with single or double rows of rollers of any shape (cylindrical, conical, barrel-shaped, etc.).

(C) **Needle roller bearings**. These differ from ordinary roller bearings in that they are bearings with cylindrical rollers of a uniform diameter not exceeding 5 mm and having a length which is at least three times the diameter. The ends of the rollers may be rounded (see Subheading Note 4 to the Chapter). These rollers are fitted between the two rings of the bearing and in most cases no cage is used.

Owing to the high pressure to which they are exposed, bearings are normally of steel (especially chromium steel), though some for particular uses are of bronze, copper or plastics.

PARTS

The heading also covers parts of ball, roller or needle roller bearings, e.g. :

- (1) **Polished steel balls** (whether for bearings of this heading or not), the maximum and minimum diameters of which do not differ from the nominal diameter by more than 1 % or by more than 0.05 mm whichever is less; balls **not conforming** to this definition are classified in **heading 73.26** (see Chapter Note 6).
- (2) **Bearing balls** of copper, bronze, plastics, etc.
- (3) **Needles or rollers for bearings**, of any shape.
- (4) **Rings, cages, fixing sleeves, etc.**

*
* *

The heading **does not cover** machinery parts incorporating ball, roller or needle roller bearings; these are classified in their own appropriate headings, e.g. :

- (a) Bearing housings and bearing brackets (**heading 84.83**).
- (b) Bicycle hubs (**heading 87.14**).

84.83 - Transmission shafts (including cam shafts and crank shafts) and cranks; bearing housings and plain shaft bearings; gears and gearing; ball or roller screws; gear boxes and other speed changers, including torque converters; flywheels and pulleys, including pulley blocks; clutches and shaft couplings (including universal joints).

- 8483.10 - Transmission shafts (including cam shafts and crank shafts) and cranks
- 8483.20 - Bearing housings, incorporating ball or roller bearings
- 8483.30 - Bearing housings, not incorporating ball or roller bearings; plain shaft bearings
- 8483.40 - Gears and gearing, other than toothed wheels, chain sprockets and other transmission elements presented separately; ball or roller screws; gear boxes and other speed changers, including torque converters
- 8483.50 - Flywheels and pulleys, including pulley blocks
- 8483.60 - Clutches and shaft couplings (including universal joints)
- 8483.90 - Toothed wheels, chain sprockets and other transmission elements presented separately; parts.

The goods covered by this heading are mainly :

- (i) Certain mechanical parts which are used in the transmission of power from an **external** power unit to one or more machines.
- (ii) Certain **internal** parts of a machine, used to transmit power to the various parts of the same machine.

**(A) TRANSMISSION SHAFTS
(INCLUDING CAM SHAFTS AND CRANK SHAFTS)
AND CRANKS**

These usually transmit a rotary motive power. They include :

- (1) **Main shafts or driving shafts** driven directly by the motor.
- (2) **Counter shafts**, for coupling to the main shaft by belts and pulleys or by cogs, etc.; they are used to take the drive from the main shaft to a number of machines, or to different parts of a machine.
- (3) **Articulated shafts**, consisting of two or more shafts connected by ball and socket joints, etc.
- (4) **Flexible shafts** which transmit the motion of a driving unit to, e.g., hand tools, measuring instruments (revolution counters, speedometers, etc.).
- (5) **Crankshafts and crank shafts**. These may be either made in one piece or assembled from several parts. They receive a reciprocating motion (e.g., from a piston engine) and convert it into rotary movement, or vice versa.
- (6) **Cam shafts and eccentric shafts**.

The heading **does not cover** simple axles which do not transmit power but merely support a wheel or other revolving part.

It also **excludes** :

- (a) Bars of iron or steel of uniform cross-section (**heading 72.14 or 72.15**).
- (b) Simple lengths of twisted wire for the manufacture of flexible drives, not fitted with coupling attachments (**heading 73.12**).
- (c) Oscillating connecting-rods for transmitting motion to cutter bars of lawn mowers or grass cutters (**heading 84.33**).

(B) BEARING HOUSINGS AND PLAIN SHAFT BEARINGS

Bearing housings consist of a frame or block designed to house the plain, ball, roller, etc., bearing in which (or, in the case of a thrust bearing, against which) the ends of a shaft or axle turn. They usually consist of two parts which, when fitted together, form a ring to hold the bearing. They may incorporate means of lubricating the bearing.

They also often incorporate a chair, plate, bracket, etc., by which they can be fixed to the machine, or to a wall or other part of a building; but chairs, plates, brackets, etc., not incorporating a bearing housing (nor themselves designed to house a bearing) **are classified according to the constituent material** (usually **heading 73.25 or 73.26**).

Bearing housings incorporating ball, roller or needle roller bearings remain classified in this heading; but ball, roller or needle roller bearings presented separately fall in **heading 84.82**.

On the other hand **plain shaft bearings** are classified in this heading even if they are presented without housings. They consist of rings of anti-friction metal or other material (e.g., sintered metal or plastics). They may be in one piece or in several pieces clamped together, and form a smooth bearing in which a shaft or axle turns.

The heading **does not include** graphite or other carbon bearings (**heading 68.15**).

(C) GEARS AND GEARING INCLUDING FRICTION GEARS AND CHAIN SPROCKETS

The **basic gear** is the toothed wheel, cylinder, cone, rack or worm, etc. In an assembly of such gears, the teeth of one engage with the teeth of another so that the rotary movement of the first is transmitted to the next, and so on. According to the relative number of teeth in the separate units, the rotary movement may be transmitted at the same rate, or at a faster or slower rate; according to the type of gear and the angle at which it meshes with the next, the direction of transmission may be changed, or a rotary movement converted into a linear movement or vice versa (as with a rack and pinion).

The group covers all types of gears including simple cog wheels, bevel gears, conical gears, helical gears, worms, rack and pinion gears, differential gears, etc., and assemblies of such gears. It also covers toothed and similar wheels for use with transmission chains.

The group also covers **friction gears**. These are wheels, discs or cylinders, which, when mounted one on the driving shaft and one on the driven shaft, transmit the movement by friction between them. They are usually of cast iron, in certain cases being covered with leather, wood, bonded fibres or other material to increase the friction.

(D) BALL OR ROLLER SCREWS

Ball or roller screws consist of a threaded shaft and a nut with bearing balls or rollers distributed along the path between the threads on its inner surface; these devices enable rotary motion to be converted into linear motion, and vice versa.

(E) GEAR BOXES AND OTHER SPEED CHANGERS, INCLUDING TORQUE CONVERTERS

These provide a range of speeds which can be varied, either by hand or automatically, according to the requirements of the machine. They include, *inter alia* :

- (1) **Gear-boxes** consisting of assemblies of gears which can be selected in alternative arrangements; the speed of transmission can thus be varied according to the arrangement of gears set.
- (2) **Friction disc or friction cone couplings and couplings with chains or driving belts**, in which a disc, a cone, a chain or a belt is in contact with a friction wheel whose position, relative to the centre of the disc or the ends of the cone, can be varied automatically (or as required), and so controls the speed of rotation transmitted.
- (3) **Variable speed fluid couplings, including hydraulic torque converters**. Variations are obtained by the rotation of vanes of the driving element in a fluid (generally oil) against fixed or movable vanes of the driven element. Power is transmitted either by pressure (hydrostatic changers) or by flux (hydrodynamic changers or torque converters).

The heading **does not cover** gear boxes or other variable speed changers combined with a motor; these are classified in the same heading as the motor.

(F) FLYWHEELS

These are relatively large, heavy wheels, usually constructed so that the weight is concentrated near the rim. The inertia of the wheel as it turns tends to resist any change in speed of the motor and so keeps the speed constant. Flywheels may in some cases have a grooved or cogged rim, or be fitted with connecting-rods, so that in certain circumstances they can act for the transmission of power (e.g., as a driving pulley or cog wheel).

(G) PULLEYS, INCLUDING PULLEY BLOCKS

Pulleys consist of wheels, sometimes with a grooved rim, which transmit rotary movement from one to another by means of an endless belt or rope revolving in contact between them. The heading covers simple pulleys, drums (wide pulleys), conical pulleys, stepped pulleys, etc.

The group also covers **pulley blocks** for hoists, etc., and free pulleys which do not transmit any power themselves but simply act as a guide or turning post for a transmission rope or cable (e.g., idlers and jockey wheels used to regulate the tension of driving belts).

An assembly of two or more pulley blocks (i.e., a hoist) is, however, **excluded (heading 84.25)**.

(H) CLUTCHES

These are used to connect or disconnect the drive at will. They include :

Friction clutches in which rotating discs, rings, cones, etc. with friction surfaces, can be engaged or disengaged; dog (or claw) clutches in which the opposing members have projections and corresponding slots; automatic centrifugal clutches which engage or disengage according to the speed of rotation; compressed air clutches; hydraulic clutches, etc.

Electro-magnetic clutches, however, are **excluded (heading 85.05)**.

(IJ) SHAFT COUPLINGS (INCLUDING UNIVERSAL JOINTS)

These include sleeve couplings, flange couplings, flexible couplings, hydraulic couplings, etc., and universal couplings (such as Cardan joints and Oldham couplings).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of the goods covered by this heading.

*
* * *

The heading also **excludes** :

- (a) Pieces roughly shaped by forging, of **heading 72.07**.
- (b) Transmission equipment of the kinds described above (gear boxes, transmission shafts, clutches, differentials, etc.), but which are designed for use solely or principally with vehicles or aircraft (**Section XVII**); it should, however, be noted that this exclusion does not apply to internal parts of vehicle or aircraft engines - these parts remain classified in this heading.

Thus a crank shaft or a cam shaft remains in this heading even if it is specialised for a motor car engine; but motor car transmission (propeller) shafts, gear boxes and differentials fall in **heading 87.08**.

It should further be noted that transmission equipment of the type described in this heading remains classified here even if it is specially designed for ships.

- (c) Parts of clocks or watches (**heading 91.14**).

84.84 - Gaskets and similar joints of metal sheeting combined with other material or of two or more layers of metal; sets or assortments of gaskets and similar joints, dissimilar in composition, put up in pouches, envelopes or similar packings; mechanical seals.

8484.10 - Gaskets and similar joints of metal sheeting combined with other material or of two or more layers of metal

8484.20 - Mechanical seals

8484.90 - Other

**(A) GASKETS AND SIMILAR JOINTS OF METAL SHEETING
COMBINED WITH OTHER MATERIAL
OR OF TWO OR MORE LAYERS OF METAL**

These are composed of :

- (i) A core of asbestos (or sometimes felt, cardboard or other non-metallic material) sandwiched between two metal sheets.
- or (ii) Asbestos or other non-metallic materials cut to shape, and with metal sheeting folded along the outer edges and around the edges of any holes punched in the gasket or joint.
- or (iii) Layers or metal foil (of the same metal or of dissimilar metals) pressed together.

They are mainly used in certain motors or pumps, or for certain pipe joints.

But the heading **excludes** gaskets and joints of asbestos board reinforced with metal wire or metal gauze (**heading 68.12**), **unless** forming part of a set or assortment covered by the second part of this heading.

(B) SETS OR ASSORTMENTS OF GASKETS AND SIMILAR JOINTS

Such sets or assortments of any material (agglomerated cork, leather, rubber, textiles, paperboard, asbestos, etc.) are classified here when put up in pouches, envelopes, boxes, etc., **provided** that the gaskets or joints are **not** all of the same material.

To be classified here, the sets and assortments **must** contain at least two gaskets or joints of different material. Therefore a pouch, envelope, box, etc., containing, for example, five gaskets all made of paperboard, is **not covered by the heading** but is classified in **heading 48.23**; but if the set also included a rubber gasket it would fall in this heading.

(C) MECHANICAL SEALS

Mechanical seals (e.g., sliding-ring seals and spring-ring seals) constitute mechanical assemblies which form a leakproof joint between flat, rotating surfaces to prevent high-pressure leakage in the machine or apparatus on which they are mounted, resisting the pressure and stress exerted on them by moving components or due to vibrations, etc.

The structure of these seals is generally fairly complex. They comprise :

- (i) fixed parts which, when the seal is placed, become integral with the machine or apparatus; and
- (ii) movable parts : rotating elements, spring elements, etc.

It is specifically on account of these movable parts that the articles are called "mechanical seals".

These seals act as anti-vibration devices, bearings, actual seals and, in some cases, as unions. These seals have numerous applications, including in pumps, compressors, mixers, agitators and turbines; they are produced from a variety of materials and in various configurations.

*
* *

The heading **does not cover** :

- (a) Gaskets or joints, other than the composite types incorporating metal sheeting or foil, which do not comply with the conditions set out in (B) above; these are generally classified according to their constituent material.
- (b) Machinery packing (e.g., of asbestos cord **heading 68.12**).
- (c) Oil seal rings of **heading 84.87**.

[84.85]

84.86 - Machines and apparatus of a kind used solely or principally for the manufacture of semiconductor boules or wafers, semiconductor devices, electronic integrated circuits or flat panel displays; machines and apparatus specified in note 9 (C) to this Chapter; parts and accessories.

- 8486.10 - Machines and apparatus for the manufacture of boules or wafers
- 8486.20 - Machines and apparatus for the manufacture of semiconductor devices or of electronic integrated circuits
- 8486.30 - Machines and apparatus for the manufacture of flat panel displays
- 8486.40 - Machines and apparatus specified in Note 9 (C) to this Chapter
- 8486.90 - Parts and accessories

This heading covers machines and apparatus of a kind used solely or principally for the manufacture of semiconductor boules or wafers, semiconductor devices, electronic integrated circuits or flat panel displays. However, this heading **excludes** machines and apparatus for measuring, checking, inspecting, chemical analysis, etc. (**Chapter 90**).

(A) MACHINES AND APPARATUS FOR THE MANUFACTURE OF BOULES OR WAFERS

This group covers machines and apparatus for the manufacture of boules or wafers such as :

- (1) **One-melt furnaces** for zone melting and refining of silicon rods, oxidation furnaces for oxidizing the surface of wafers and diffusion furnaces for doping the wafers with impurities.
- (2) **Crystal growers and pullers** for the production of extremely pure monocrystalline semiconductor boules from which wafers can be sliced.
- (3) **Crystal grinders**, which grind the crystal boule to precise diameter required for wafers and to grind the flats on the boule to indicate the conductivity type and resistivity of the crystal.
- (4) **Wafer slicing saws**, which slice wafers from a boule of monocrystalline semiconductor material.
- (5) **Wafer grinders, lappers and polishers**, which prepare the semiconductor wafer for the fabrication process. This involves bringing the wafer within dimensional tolerances. Especially critical is the flatness of its surface.
- (6) **Chemical mechanical polishers (CMP)**, which flatten and polish a wafer by combining chemical removal with mechanical buffing.

(B) MACHINES AND APPARATUS FOR THE MANUFACTURE OF SEMICONDUCTOR DEVICES OR OF ELECTRONIC INTEGRATED CIRCUITS

This group covers machines and apparatus for the manufacture of semiconductor devices or of electronic integrated circuits such as :

- (1) **Film formation equipment**, which apply or produce various films on the surface of the wafer during the fabrication process. These films serve as conductors, insulators and semiconductors on the finished device. They may include oxides and nitrides of the substrate surface, metals, and epitaxial layers. The processes and equipments listed below are not necessarily limited to the generation of a particular type of film.
 - (a) **Oxidation furnaces**, which form a "film" of oxide on the wafer. The oxide is formed by the chemical reaction of the top molecular layers of the wafer with the applied oxygen or steam under heat.
 - (b) **Chemical Vapour Deposition (CVD) equipment**, which deposit various types of films which are obtained by combining the appropriate gases in a reactant chamber at elevated temperatures. This constitutes a thermochemical vapor-phase reaction. Operations may take place at atmospheric or low pressure (LPCVD) and may use plasma enhancement (PECVD).
 - (c) **Physical Vapour Deposition (PVD) equipment**, which deposit various types of films which are obtained by vaporizing a solid. For example :
 - (1) **Evaporation equipment**, in which the film is generated by heating the source material.
 - (2) **Sputtering equipment**, in which the film is generated by bombarding the source material (target) with ions.
 - (d) **Molecular Beam Epitaxy (MBE) equipment**, which grow epitaxial layers on a heated monocrystalline substrate in an ultrahigh vacuum using beams of molecules. The process is similar to PVD.
- (2) **Doping equipment**, which introduce dopants into the wafer surface in order to modify the conductivity or other characteristics of a semiconductor layer such as :
 - (a) **Thermal diffusion equipment**, in which the dopants are introduced into the surface of the wafer by the application of gases under high temperatures.
 - (b) **Ion Implantation**, in which the dopants are "driven" into the crystal lattice structure of the surface of the wafer in the form of a beam of accelerated ions.
 - (c) **Annealing furnaces**, which repair the crystal lattice structures of the wafer damaged by ion implantation.

- (3) **Etching and stripping equipment** for etching or cleaning surfaces of the wafers such as :
- (a) **Wet etching equipment**, in which chemical etching materials are applied by spraying or immersion. Spray etchers provide more uniform results than bath etchers, since they perform the operation on one wafer at a time.
 - (b) **Dry plasma etching**, in which etching materials are presented as gases within a plasma energy field, providing an anisotropic etch profile. Dry-etchers use several different methods for creating gaseous plasma which removes thin film materials from semiconductor wafers.
 - (c) **Ion beam milling equipment**, in which ionized gas atoms are accelerated toward the wafer surface. The impact results in the top layer being physically removed from the surface.
 - (d) **Strippers or ashers**, using techniques similar to etching this apparatus removes the spent photoresist from the surface of the wafer after it has served its purpose as a "stencil". This equipment may also remove nitrides, oxides, and polysilicon, with an isotropic etch profile.
- (4) **Lithography equipment**, which transfer the circuit designs to the photoresist-coated surface of the semiconductor wafer such as :
- (a) **Equipment for coating wafers with photoresist**. These include the photoresist spinners which apply liquid photoresist evenly over the surface of the wafer.
 - (b) **Equipment for exposing the photoresist coated wafer with the circuit design** (or a part thereof) :
 - (i) **Using a mask or reticle and exposing the photoresist to light** (generally ultraviolet) or, in some instances, X-rays :
 - (a) **Contact printers**, where the mask or reticle is in contact with the wafer during exposure.
 - (b) **Proximity aligners**, which are similar to contact aligners except actual contact does not take place between the mask or reticle and the wafer.
 - (c) **Scanning aligners**, which use projection techniques to expose a continuously moving slit across the mask and wafer.
 - (d) **Step and repeat aligners**, which use projection techniques to expose the wafer a portion at a time. Exposure can be by reduction from the mask to the wafer or 1:1. Enhancements include the use of an excimer laser.
 - (ii) **Direct write on wafer equipment**. These apparatus operate with no mask or reticle. They use an automatic data processing machine-controlled "writing beam" (such as an electron beam (E-beam), ion beam or laser) to "draw" the circuit design directly on the photoresist coated wafer.

- (5) **Equipment for developing exposed wafers.** These include chemical baths similar to those used in photographic laboratory applications.

This heading also covers :

- (i) **Centrifuges** for spin-coating insulating substrate or wafers with photoresist.
- (ii) **Screen printers** for printing insulating substrate with etch-resisting ink.
- (iii) **Laser scribing machines** for dividing wafers into chips (dicing).
- (iv) **Wafer dicing saws.**

(C) MACHINES AND APPARATUS FOR THE MANUFACTURE OF FLAT PANEL DISPLAYS

This group covers the fabrication of substrates into a flat panel. However, it does not cover the manufacture of glass or the assembly of printed circuit boards or other electronic components onto the flat panel.

This heading covers machines and apparatus for the manufacture of flat panel displays such as :

- (1) **Apparatus for etching, developing, stripping or cleaning.**
- (2) **Apparatus for projection, drawing or plating circuit patterns.**
- (3) **Centrifugal spin dryers and other drying appliances.**
- (4) **Machines (spinners) designed to coat photographic emulsions.**
- (5) **Ion implanters for doping.**
- (6) **Furnaces, ovens and other equipment for diffusion, oxidation, annealing or rapid heating.**
- (7) **Chemical Vapour Deposition and Physical Vapour Deposition apparatus.**
- (8) **Machines for grinding and polishing.**
- (9) **Machines for sawing, scribing or scoring.**

(D) MACHINES AND APPARATUS SPECIFIED IN NOTE 9 (C) TO THIS CHAPTER

This group covers machines and apparatus solely or principally of a kind used for :

- (1) **the manufacture or repair of masks and reticles** (e.g., appliances (photoplotters) for the photographic production of photomasks and ion milling machines for the repair of masks and reticles);
- (2) **assembling semiconductor devices or electronic integrated circuits**, e.g. :
 - (a) **Laser engraving machines** for engraving the plastic casing of completed monolithic integrated circuits or discrete semiconductor components.
 - (b) **Encapsulation equipment such as presses** for making the plastic casings for chips by pressing plastic material around the chips.
 - (c) **Wire bonders** for welding gold wires to the contact points of monolithic integrated circuits by ultrasonic or electrical compression welding.
 - (d) **Wafer bumping** which is a process where connections are formed on an entire wafer before dicing.
- (3) **lifting, handling, loading or unloading of boules, wafers, semiconductor devices, electronic integrated circuits and flat panel displays** (e.g., automated material handling machines for transport, handling and storage of semiconductor wafers, wafer cassettes, wafer boxes and other material for semiconductor devices).

(E) PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading includes parts and accessories for the machines and apparatus of this heading. Parts and accessories falling in this heading thus include, *inter alia*, work or tool holders and other special attachments which are solely or principally used for the machines and apparatus of this heading.

84.87 - Machinery parts, not containing electrical connectors, insulators, coils, contacts or other electrical features, not specified or included elsewhere in this Chapter.

8487.10 - Ships' or boats' propellers and blades therefor

8487.90 - Other

This heading covers all **non-electrical** parts of machinery, **other than** :

- (a) Those specially designed for use **solely or principally** with a **particular** machine (including a machine of **heading 84.79** or **85.43**, of **Section XVII, Chapter 90**, etc.) and therefore classified in the same heading as that particular machine (or, where a separate heading is provided, in that separate heading).
- (b) Parts covered by **heading 84.81** to **84.84**.
- (c) Parts covered more specifically by other headings of the Nomenclature or excluded by Note 1 to Section XVI or Note 1 to Chapter 84, for example, transmission or conveyor belts or belting, of plastics (**Chapter 39**); transmission or conveyor belts or belting, of vulcanised rubber (**heading 40.10**), and other parts made of unhardened vulcanised rubber (**heading 40.16**); parts made of leather or of composition leather (**heading 42.05**); transmission or conveyor belts or belting, of textile material (**heading 59.10**), and other machinery parts made of textile material (**heading 59.11**); parts made of ceramics or of glass (**Chapter 69** or **70**); machinery parts made wholly of precious or semi-precious stones (natural, synthetic or reconstructed) (**Chapter 71**); screws, chains, springs and other parts of general use as defined in Note 2 to **Section XV**; brushes (**heading 96.03**).

In general, therefore, the goods of this heading are such as can be recognised as being parts of machines, but not as parts of any **particular** machine. **Subject** to these conditions, the heading includes non-automatic lubricating pots; greasing nipples; hand wheels, levers and hand grips; safety guards and baseplates; and oil seal rings. These rings, which are generally of circular cross-section, have a fairly simple structure (a flexible rubber ring and a metal reinforcement assembled by vulcanisation, for example), characterised by the absence of movable parts. They are used in a large number of machines or apparatus to prevent leaks of oil or gas or to prevent dust, etc., from entering, by sealing the surfaces to be joined.

The heading also covers propellers and paddle-wheels for ships or boats.

Chapter 85

Electrical machinery and equipment and parts thereof; sound recorders and reproducers, television image and sound recorders and reproducers, and parts and accessories of such articles

Notes.

1.- This Chapter does not cover :

- (a) Electrically warmed blankets, bed pads, foot-muffs or the like; electrically warmed clothing, footwear or ear pads or other electrically warmed articles worn on or about the person;
- (b) Articles of glass of heading 70.11;
- (c) Machines and apparatus of heading 84.86;
- (d) Vacuum apparatus of a kind used in medical, surgical, dental or veterinary sciences (heading 90.18); or
- (e) Electrically heated furniture of Chapter 94.

2.- Headings 85.01 to 85.04 do not apply to goods described in heading 85.11, 85.12, 85.40, 85.41 or 85.42.

However, metal tank mercury arc rectifiers remain classified in heading 85.04.

3.- For the purposes of heading 85.07, the expression "electric accumulators" includes those presented with ancillary components which contribute to the accumulator's function of storing and supplying energy or protect it from damage, such as electrical connectors, temperature control devices (for example, thermistors) and circuit protection devices. They may also include a portion of the protective housing of the goods in which they are to be used.

4.- Heading 85.09 covers only the following electro-mechanical machines of the kind commonly used for domestic purposes :

- (a) Floor polishers, food grinders and mixers, and fruit or vegetable juice extractors, of any weight;
- (b) Other machines provided the weight of such machines does not exceed 20 kg.

The heading does not, however, apply to fans or ventilating or recycling hoods incorporating a fan, whether or not fitted with filters (heading 84.14), centrifugal clothes-dryers (heading 84.21), dish washing machines (heading 84.22), household washing machines (heading 84.50), roller or other ironing machines (heading 84.20 or 84.51), sewing machines (heading 84.52), electric scissors (heading 84.67) or to electrothermic appliances (heading 85.16).

5.- For the purposes of heading 85.23 :

- (a) "Solid-state non-volatile storage devices" (for example, "flash memory cards" or "flash electronic storage cards") are storage devices with a connecting socket, comprising in the same housing one or more flash memories (for example, "FLASH E2PROM") in the form of integrated circuits mounted on a printed circuit board. They may include a controller in the form of an integrated circuit and discrete passive components, such as capacitors and resistors;
- (b) The term "smart cards" means cards which have embedded in them one or more electronic integrated circuits (a microprocessor, random access memory (RAM) or read-only memory (ROM)) in the form of chips. These cards may contain contacts, a magnetic stripe or an embedded antenna but do not contain any other active or passive circuit elements.

6.- For the purposes of heading 85.34 "printed circuits" are circuits obtained by forming on an insulating base, by any printing process (for example, embossing, plating-up, etching) or by the "film circuit" technique, conductor elements, contacts or other printed components (for example, inductances, resistors, capacitors) alone or interconnected according to a pre-established pattern, other than elements which can produce, rectify, modulate or amplify an electrical signal (for example, semiconductor elements).

The expression "printed circuits" does not cover circuits combined with elements other than those obtained during the printing process, nor does it cover individual, discrete resistors, capacitors or inductances. Printed circuits may, however, be fitted with non-printed connecting elements.

Thin- or thick-film circuits comprising passive and active elements obtained during the same technological process are to be classified in heading 85.42.

7.- For the purpose of heading 85.36, "connectors for optical fibres, optical fibre bundles or cables" means connectors that simply mechanically align optical fibres end to end in a digital line system. They perform no other function, such as the amplification, regeneration or modification of a signal.

8.- Heading 85.37 does not include cordless infrared devices for the remote control of television receivers or other electrical equipment (heading 85.43).

9.- For the purposes of headings 85.41 and 85.42 :

(a) "Diodes, transistors and similar semiconductor devices" are semiconductor devices the operation of which depends on variations in resistivity on the application of an electric field;

(b) "Electronic integrated circuits" are :

- (i) Monolithic integrated circuits in which the circuit elements (diodes, transistors, resistors, capacitors, inductances, etc.) are created in the mass (essentially) and on the surface of a semiconductor or compound semiconductor material (for example, doped silicon, gallium arsenide, silicon germanium, indium phosphide) and are inseparably associated;
- (ii) Hybrid integrated circuits in which passive elements (resistors, capacitors, inductances, etc.), obtained by thin- or thick-film technology, and active elements (diodes, transistors, monolithic integrated circuits, etc.), obtained by semiconductor technology, are combined to all intents and purposes indivisibly, by interconnections or interconnecting cables, on a single insulating substrate (glass, ceramic, etc.). These circuits may also include discrete components;
- (iii) Multichip integrated circuits consisting of two or more interconnected monolithic integrated circuits combined to all intents and purposes indivisibly, whether or not on one or more insulating substrates, with or without leadframes, but with no other active or passive circuit elements.
- (iv) Multi-component integrated circuits (MCOs) : a combination of one or more monolithic, hybrid, or multi-chip integrated circuits with at least one of the following components : silicon-based sensors, actuators, oscillators, resonators or combinations thereof, or components performing the functions of articles classifiable under heading 85.32, 85.33, 85.41, or inductors classifiable under heading 85.04, formed to all intents and purposes indivisibly into a single body like an integrated circuit, as a component of a kind used for assembly onto a printed circuit board (PCB) or other carrier, through the connecting of pins, leads, balls, lands, bumps, or pads.

For the purpose of this definition :

1. "Components" may be discrete, manufactured independently then assembled onto the rest of the MCO, or integrated into other components.
2. "Silicon based" means built on a silicon substrate, or made of silicon materials, or manufactured onto integrated circuit die.
3. (a) "Silicon based sensors" consist of microelectronic or mechanical structures that are created in the mass or on the surface of a semiconductor and that have the function of

detecting physical or chemical quantities and transducing these into electric signals, caused by resulting variations in electric properties or displacement of a mechanical structure. "Physical or chemical quantities" relates to real world phenomena, such as pressure, acoustic waves, acceleration, vibration, movement, orientation, strain, magnetic field strength, electric field strength, light, radioactivity, humidity, flow, chemicals concentration, etc.

- (b) "Silicon based actuators" consist of microelectronic and mechanical structures that are created in the mass or on the surface of a semiconductor and that have the function of converting electrical signals into physical movement.
- (c) "Silicon based resonators" are components that consist of microelectronic or mechanical structures that are created in the mass or on the surface of a semiconductor and have the function of generating a mechanical or electrical oscillation of a predefined frequency that depends on the physical geometry of these structures in response to an external input.
- (d) "Silicon based oscillators" are active components that consist of microelectronic or mechanical structures that are created in the mass or on the surface of a semiconductor and that have the function of generating a mechanical or electrical oscillation of a predefined frequency that depends on the physical geometry of these structures.".

For the classification of the articles defined in this Note, headings 85.41 and 85.42 shall take precedence over any other heading in the Nomenclature, except in the case of heading 85.23, which might cover them by reference to, in particular, their function.

- 10.- For the purposes of heading 85.48, "spent primary cells, spent primary batteries and spent electric accumulators" are those which are neither usable as such because of breakage, cutting-up, wear or other reasons, nor capable of being recharged.

○
○ ○

Subheading Note.

- 1.- Subheading 8527.12 covers only cassette-players with built-in amplifier, without built-in loudspeaker, capable of operating without an external source of electric power and the dimensions of which do not exceed 170 mm x 100 mm x 45 mm.

GENERAL

(A) SCOPE AND STRUCTURE OF THE CHAPTER

This Chapter covers all electrical machinery and equipment, **other than** :

- (a) Machinery and apparatus of a kind covered by **Chapter 84**, which remains classified there even if electric (see the General Explanatory Note to that Chapter).
- and (b) Certain goods excluded from the Section as a whole (see the General Explanatory Note to Section XVI).

Contrary to the rules in Chapter 84, the goods of this Chapter remain classified here, even if they are of ceramic materials or glass, with the **exception** of glass envelopes (including bulbs and tubes) of **heading 70.11**.

This Chapter covers :

- (1) Machines and apparatus for the production, transformation or storage of electricity, e.g., generators, transformers, etc. (headings 85.01 to 85.04) and primary cells (heading 85.06) and accumulators (heading 85.07).
- (2) Certain domestic appliances (heading 85.09), and shavers, hair clippers and hair-removing appliances (heading 85.10).
- (3) Certain machines and appliances which depend for their operation on the properties or effects of electricity, such as its electro-magnetic effects, heating properties, etc. (headings 85.05, 85.11 to 85.18, 85.25 to 85.31 and 85.43).
- (4) Instruments and appliances for recording or reproducing sound; video recorders or reproducers; parts and accessories for such instruments and appliances (headings 85.19 to 85.22).
- (5) Recording media for sound or similar recording of other phenomena (including video recording media, but **excluding** photographic or cinematographic films of **Chapter 37**) (heading 85.23).
- (6) Certain electrical goods not generally used independently, but designed to play a particular role as components, in electrical equipment, e.g., capacitors (heading 85.32), switches, fuses, junction boxes, etc. (heading 85.35 or 85.36), lamps (heading 85.39), thermionic, etc., valves and tubes (heading 85.40), diodes, transistors and similar semiconductor devices (heading 85.41), electrical carbons (heading 85.45).
- (7) Certain articles and materials which are used in electrical apparatus and equipment because of their conducting or insulating properties, such as insulated electric wire and assemblies thereof (heading 85.44), insulators (heading 85.46), insulating fittings and metal conduit tubing with an interior insulating lining (heading 85.47).

In addition to the electrical goods indicated above, the Chapter also covers permanent magnets, including those not yet magnetised, and permanent magnet work holders (heading 85.05).

It should, however, be noted that this Chapter covers **only certain types of electro-thermic apparatus**, e.g., furnaces, etc. (heading 85.14) and space heating equipment, domestic appliances, etc. (heading 85.16).

It should be further noted that certain electronic memory modules (e.g., SIMMs (Single In-line Memory Modules) and DIMMs (Dual In-line Memory Modules)) **which cannot be regarded as products of heading 85.23 or as multi-component integrated circuits (MCUs) of heading 85.42** (see Note 9 (b) (iv) to this Chapter), and **do not have another individual function** are to be classified by application of Note 2 to Section XVI as follows :

- (a) modules suitable for use solely or principally with automatic data processing machines are to be classified in **heading 84.73** as parts of those machines,
- (b) modules suitable for use solely or principally with other specific machines or with a number of machines of the same heading are to be classified **as parts of those machines or groups of machines**, and
- (c) where it is not possible to determine principal use, the modules are to be classified in **heading 85.48**.

In general, however, electrically heated apparatus falls in other Chapters (mainly in **Chapter 84**), for example : steam generating boilers and super-heated water boilers (**heading 84.02**), air conditioning machines (**heading 84.15**), roasting, distilling or other apparatus of **heading 84.19**, calendering or other rolling machines and cylinders therefor (**heading 84.20**), poultry incubators and brooders (**heading 84.36**), general purpose branding machines for wood, cork, leather, etc. (**heading 84.79**), medical apparatus (**heading 90.18**).

(B) PARTS

As regards parts in general, see the General Explanatory Note to Section XVI.

Non-electrical parts of the machines or apparatus of this Chapter are classified as follows :

- (i) Many are in fact articles falling in other Chapters (especially **Chapter 84**), for example, pumps and fans (**heading 84.13** or **84.14**), taps, cocks, etc. (**heading 84.81**), ball bearings (**heading 84.82**), transmission shafts, gearing, etc. (**heading 84.83**).
- (ii) Other non-electrical parts suitable for use solely or principally with a particular kind of electrical machine of this Chapter (or with a number of machines falling in the same heading) are to be classified with that machine (or those machines) or, if appropriate, in **heading 85.03, 85.22, 85.29** or **85.38**.
- (iii) Other non-electrical parts fall in **heading 84.87**.

85.01 - Electric motors and generators (excluding generating sets).

- 8501.10 - Motors of an output not exceeding 37.5 W
- 8501.20 - Universal AC/DC motors of an output exceeding 37.5 W
 - Other DC motors; DC generators :
- 8501.31 -- Of an output not exceeding 750 W
- 8501.32 -- Of an output exceeding 750 W but not exceeding 75 kW
- 8501.33 -- Of an output exceeding 75 kW but not exceeding 375 kW
- 8501.34 -- Of an output exceeding 375 kW
- 8501.40 - Other AC motors, single-phase
 - Other AC motors, multi-phase :
- 8501.51 -- Of an output not exceeding 750 W
- 8501.52 -- Of an output exceeding 750 W but not exceeding 75 kW
- 8501.53 -- Of an output exceeding 75 kW
 - AC generators (alternators) :
- 8501.61 -- Of an output not exceeding 75 kVA
- 8501.62 -- Of an output exceeding 75 kVA but not exceeding 375 kVA
- 8501.63 -- Of an output exceeding 375 kVA but not exceeding 750 kVA
- 8501.64 -- Of an output exceeding 750 kVA

(I) ELECTRIC MOTORS

Electric motors are machines for transforming electrical energy into mechanical power. This group includes rotary motors and linear motors.

- (A) **Rotary motors** produce mechanical power in the form of a rotary motion. They are of many types and sizes according to whether they operate on DC or AC, and according to the use or purpose for which they are designed. The motor housing may be adapted to the circumstances in which the motor will operate (e.g., dust proof, drip proof or flame proof motors; non-rigid mountings for belt driven motors, or for motors which will be subject to much vibration).

Many motors may incorporate a fan or other device for keeping the motor cool during running.

With the **exception** of starter motors for internal combustion engines (**heading 85.11**), the heading covers electric motors of all types from low power motors for use in instruments, clocks, time switches, sewing machines, toys, etc., up to large powerful motors for rolling mills, etc.

Motors remain classified here even when they are equipped with pulleys, with gears or gear boxes, or with a flexible shaft for operating hand tools.

The heading includes "outboard motors", for the propulsion of boats, in the form of a unit comprising an electric motor, shaft, propeller and a rudder.

Synchronous motors for clock movements are classified here even if equipped with gears; however such synchronous motors also associated with a clock train are **excluded** (**heading 91.09**).

(B) **Linear motors** produce mechanical power in the form of a linear motion.

Linear induction motors consist essentially of one or more primary members composed of magnetic circuits, generally laminated (stack of magnetic laminations), on which coils are arranged and of a secondary member, usually in the form of a plate or profile of copper or aluminium.

These motors generate a propulsive force when the primary member is energised by applying an alternating current in the presence of the secondary. The two members are separated by an airgap, and the translational motion (one member remaining stationary while the other moves) is produced without mechanical contact.

The characteristic features of linear induction motors vary according to the purpose for which they are designed : driving hovertrains (the primary members are carried in the vehicles and straddle a rail (secondary member) secured to the track); powering bulk-handling equipment (a secondary plate mounted underneath a wheeled trolley travels over a series of primary coils located between the rails); operating overhead conveyors (bogies fitted with primary members travel underneath a secondary profile); positioning vehicles in car parks or stores (secondary pallets are displaced by primary members set into the floor); controlling, e.g., piston pumps and valves (this function may be performed by "polysolenoid" linear motors in which the shaft (secondary member) moves to and fro inside an annular primary member); positioning on machine-tools; etc.

DC linear motors, whose operation uses the interaction of electro-magnets or of electro-magnets and permanent magnets, can be used as alternating or oscillating motors (e.g., for reciprocating pumps, weaving shuttle drives), stepper motors (e.g., small conveyors), etc.

This group also includes :

- (1) **Servomotors**, presented separately, consisting essentially of an electric motor with speed-reducing gears and equipped with a power transmission device (e.g., lever, pulley) designed to adjust the variable position of a regulating control in a boiler, in a furnace or in other plant (and possibly provided with an emergency hand-wheel).
- (2) **Self-synchronising units**, with a stator carrying three windings angled at 120° and a rotor carrying a single winding connected to two slip rings, for use in pairs (synchrotransmitter and synchroreceiver), e.g., in telemetering or remote control systems.
- (3) **Valve actuators, electrical**, consisting of an electric motor with reducing gear and drive shaft and, in some cases, with various devices (electric starter, transformer, hand-wheel, etc.) to operate the valve plug.

(II) ELECTRIC GENERATORS

Machines that produce electrical power from various energy sources (mechanical, solar, etc.) are classified here, **provided** they are not more specifically covered by any other heading of the Nomenclature.

There are two main classes, direct current (DC) generators (**dynamos**), and alternating current (AC) generators (**alternators**). In general, both consist essentially of a stator mounted in a housing, and a rotating member (the rotor) mounted inside the stator on a shaft driven by the prime mover. In the case of DC generators a commutator with segments is mounted on the rotorshaft. The current produced is collected by a system of carbon brushes which rub the commutator segments, and is transferred to the external circuit. AC generators are in most cases brushless and the current which they produce is led off directly to the external circuit. In other AC generators the current is collected by slip rings mounted on a rotorshaft and is transferred by a system of carbon brushes which rub the slip rings.

The stator usually consists of a system of electromagnets, but for certain DC generators (magneto-electric generators) a system of permanent magnets is used. The rotor usually consists of a system of coils of wire mounted on a laminated iron core; this system is known as the armature. In some AC generators the revolving portion is the field system.

Electric generators may be hand- or pedal-operated, but usually they have prime movers (e.g., hydraulic turbines, steam turbines, wind engines, reciprocating steam engines, internal combustion piston engines). However, this heading only covers generators when presented without prime movers.

The heading also covers photovoltaic generators consisting of panels of photocells combined with other apparatus, e.g., storage batteries and electronic controls (voltage regulator, inverter, etc.) and panels or modules equipped with elements, however simple (for example, diodes to control the direction of the current), which supply the power directly to, for example, a motor, an electrolyser.

In these devices, electricity is produced by means of solar cells which convert solar energy directly into electricity (photovoltaic conversion).

The heading covers all electric generators including large generators for power stations; small auxiliary generators used for exciting the windings of other generators; generators of various sizes and types used for supplying current for a variety of purposes (e.g., on ships, on farms not connected to an external supply, in chemical industries for electrolysis, and in diesel-electric trains).

The heading also **excludes** :

- (a) Drums or rollers incorporating an electric motor for belt or roller conveyors (**heading 84.31**).
- (b) Vibrator motors and electro-magnetic vibrators of **heading 84.79** (see the Explanatory Note to that heading).
- (c) Electric generators combined with prime movers (**heading 85.02**).
- (d) High tension generators (**heading 85.04**).

- (e) Primary cells and primary batteries (**heading 85.06**).
- (f) Generators (dynamos and alternators) used in conjunction with internal combustion engines, or for electrical lighting or signalling equipment of a kind used for cycles or motor vehicles (**headings 85.11** and **85.12**, respectively).
- (g) Solar cells whether or not assembled in modules or made up into panels but not equipped with elements, however simple, which supply the power directly to, for example, a motor, an electrolyser (**heading 85.41**).
- (h) Certain electrical apparatus sometimes known as generators which do not in fact produce electric energy, e.g., signal generators (**heading 85.43**).
- (ij) The generators of Chapter 90, for example, X-ray generators (**heading 90.22**); generators designed for demonstrational purposes and unsuitable for other uses (**heading 90.23**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified in **heading 85.03**.

85.02 - Electric generating sets and rotary converters.

- Generating sets with compression-ignition internal combustion piston engines (diesel or semi-diesel engines) :

8502.11 -- Of an output not exceeding 75 kVA

8502.12 -- Of an output exceeding 75 kVA but not exceeding 375 kVA

8502.13 -- Of an output exceeding 375 kVA

8502.20 - Generating sets with spark-ignition internal combustion piston engines

- Other generating sets :

8502.31 -- Wind-powered

8502.39 -- Other

8502.40 - Electric rotary converters

(I) ELECTRIC GENERATING SETS

The expression " generating sets " applies to the combination of an electric generator and any prime mover **other than an electric motor** (e.g., hydraulic turbines, steam turbines, wind engines, reciprocating steam engines, internal combustion engines). Generating sets consisting of the generator and its prime mover which are mounted (or designed to be mounted) together as one unit or on a common base (see the General Explanatory Note to Section XVI), are classified here **provided** they are presented together (even if packed separately for convenience of transport).

Electric generating sets for welding equipment are classified in this heading when presented separately, without their welding heads or welding appliances. However, they are **excluded (heading 85.15)** when presented together with their welding heads or welding appliances.

(II) ELECTRIC ROTARY CONVERTERS

These consist essentially of a combination of an electric generator and a prime mover consisting of an electric motor permanently mounted on a common base, though in certain cases the two functions are combined in one unit with certain windings in common. They are used to transform the nature of the current (to convert from AC to DC or vice versa) or to change certain characteristics such as the voltage, frequency or phase of alternating current (to convert, for example, the frequency of 50 to 200 cycles or to transform single phase to three phase current). Another type of rotary converter (sometimes known as a rotary transformer) is used to convert DC from one voltage to another.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the machines of this heading are classified in **heading 85.03**.

85.03 - Parts suitable for use solely or principally with the machines of heading 85.01 or 85.02.

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI) this heading covers parts of the machines of the two preceding headings. The very wide range of parts classified here includes :

- (1) **Shells and cases, stators, rotors, collector rings, collectors, brush-holders, excitation coils.**
- (2) **Electrical sheets** and plates in shapes other than square or rectangular.

85.04 - Electrical transformers, static converters (for example, rectifiers) and inductors.

8504.10 - Ballasts for discharge lamps or tubes

- Liquid dielectric transformers :

8504.21 -- Having a power handling capacity not exceeding 650 kVA

8504.22 -- Having a power handling capacity exceeding 650 kVA but not exceeding 10,000 kVA

8504.23 -- Having a power handling capacity exceeding 10,000 kVA

- Other transformers :

8504.31 -- Having a power handling capacity not exceeding 1 kVA

8504.32 -- Having a power handling capacity exceeding 1 kVA but not exceeding 16 kVA

8504.33 -- Having a power handling capacity exceeding 16 kVA but not exceeding 500 kVA

8504.34 -- Having a power handling capacity exceeding 500 kVA

8504.40 - Static converters

8504.50 - Other inductors

8504.90 - Parts

(I) ELECTRICAL TRANSFORMERS

Electrical transformers are apparatus which, without having any moving parts, transform, by means of induction and using a preset or adjustable system, an alternating current into another alternating current of different voltage, impedance, etc. These usually consist of two or more coils of insulated wire wound in various configurations on laminated iron cores, although in some cases (e.g., radio-frequency transformers) there may be no magnetic core, or the core may be of agglomerated iron dust, ferrite, etc. An AC in one coil (the primary circuit) induces an AC usually at different values of current and voltage in the others (the secondary circuit). In certain cases (auto transformers) there is only a single coil, part of the winding of which is common to the primary and secondary circuits. In shell type transformers, there is a shell of laminated iron round the transformer.

Certain transformers are designed for particular purposes, e.g., matching transformers for matching the impedance of one circuit with that of another, and instrument transformers (current or voltage transformers, combined instrument transformers) used to step down or step up voltages or currents to the level of the connected equipment, e.g., measuring instruments, electricity meters or protective relays.

The heading covers all transformers. They vary from ballasts for the control of the amount of current that flows through discharge lamps or tubes, small types used in wireless sets, instruments, toys, etc., to large types enclosed in oil tanks or equipped with radiators, fans, etc., for cooling purposes. The large types are used in electricity stations, stations for interconnecting mains, distributing stations or sub-stations. The frequency may vary from mains frequencies up to very high radio frequencies. The heading includes baluns (balancing units) which reduce electro-magnetic interference by balancing the impedance in paired lines.

The power-handling capacity of a transformer is the kilovolt-ampere (kVA) output based on continual use at the rated secondary voltage (or amperage, when applicable) and at the rated frequency without exceeding the rated temperature limitations.

Transformers for electric welding equipment presented separately without their welding heads or welding appliances are classified in this heading. However, they are **excluded** (**heading 85.15**) when presented together with their welding heads or welding appliances.

The heading also covers **induction coils**, a kind of transformer in which an intermittent or fluctuating direct current in the primary induces a corresponding current in the secondary. They can be used either to step up the voltage to a higher value or, in the case of telephony, to reproduce in the secondary circuits a small fluctuating current corresponding to the fluctuation imposed on a steady DC in the primary. The heading covers induction coils of all kinds, **other than** ignition equipment for internal combustion engines (**heading 85.11**).

(II) ELECTRICAL STATIC CONVERTERS

The apparatus of this group are used to convert electrical energy in order to adapt it for further use. They incorporate converting elements (e.g., valves) of different types. They may also incorporate various auxiliary devices (e.g., transformers, induction coils, resistors, command regulators, etc.). Their operation is based on the principle that the converting elements act alternately as conductors and non-conductors.

The fact that these apparatus often incorporate auxiliary circuits to regulate the voltage of the emerging current does not affect their classification in this group, nor does the fact that they are sometimes referred to as voltage or current regulators.

This group includes :

- (A) **Rectifiers** by which alternating current (single or polyphase) is converted to direct current, generally accompanied by a voltage change.
- (B) **Inverters** by which direct current is converted to alternating current.
- (C) **Alternating current converters and cycle converters** by which alternating current (single or polyphase) is converted to a different frequency or voltage.
- (D) **Direct current converters** by which direct current is converted to a different voltage.

Electrical static converters may be divided into the following principal categories according to the type of converting element with which they are equipped :

- (1) **Semiconductor converters** based on the one-way conductivity between certain crystals. Such converters consist of a semiconductor as the converting element and various other devices (e.g., coolers, tape conductors, drives, regulators, control circuits).

These include :

- (a) Monocrystalline semiconductor rectifiers using, as a converting element, a device containing silicon or germanium crystals (diode, thyristor, transistor).
- (b) Polycrystalline semiconductor rectifiers using a selenium disc.

(2) **Gas discharge converters**, such as :

- (a) Mercury arc rectifiers. Their converting element consists of a glass envelope or a metal tank having a vacuum and containing a mercury cathode and one or more anodes through which the current to be rectified passes. They are equipped with auxiliary devices, e.g., for priming, charging, cooling, and sometimes to maintain the vacuum.

There are two categories of gas discharge rectifiers identifiable according to the mechanism of the primer, viz., "excitrons" (with charging anodes) and "ignitrons" (with igniters).

- (b) Thermo-ionic rectifiers with incandescent cathodes. Their converting element (e.g., a thyratron) is similar to that of mercury arc rectifiers except that it contains an incandescent cathode in place of the mercury cathode.

(3) **Converters with a mechanical converting element** based on the one-way conductivity of various contacts, such as :

- (a) Contact rectifiers (e.g., those using camshafts) with a device whose metal contacts open and close in synchronisation with the frequency of the alternating current to be rectified.

- (b) Mercury-jet turbine rectifiers with a rotating jet of mercury, synchronised with the frequency of the alternating current, which strikes a fixed contact.

- (c) Vibrator rectifiers with a thin metal tongue, oscillating at the frequency of the alternating current, which touches a contact so placed that the current is drawn from the source.

(4) **Electrolytic rectifiers** based on the principle that the combination of certain products used as electrodes in combination with certain liquids used as electrolytes will only allow current to flow in a single direction.

Electrical static converters may be used for different purposes, e.g. :

- (1) Converters to supply electricity to drive stationary machines or electric traction vehicles (e.g., locomotives).
- (2) Supply converters, such as accumulator chargers (which consist essentially of rectifiers with associated transformer and current control apparatus), converters for galvanising and electrolysis, emergency power packs, converters for installations which supply high-tension direct current, converters for heating purposes and for the current supply to electro-magnets.

Also classified here are converters known as high-tension generators (used particularly with radio apparatus, emission tubes, microwave tubes, ion-beam tubes) which convert the current from any source, usually the mains, into the direct high-tension current necessary for feeding the equipment concerned by means of rectifiers, transformers, etc.

This heading also includes stabilised suppliers (rectifiers combined with a regulator), e.g., uninterruptible power supply units for a range of electronic equipment.

However, high-tension generators (or transformers) specifically designed for supplying radiological apparatus fall in **heading 90.22**. Automatic voltage regulators are classified in **heading 90.32**.

(III) INDUCTORS

These consist essentially of a single coil of wire which, inserted in an AC circuit, limits or prevents by its self-induction the flow of the AC. They vary from small chokes used in wireless circuits, instruments, etc., to large coils often mounted in concrete, used in power circuits (e.g., for limiting the flow of current in the event of a short circuit).

Inductors or inductances obtained in the form of individual components by a printing process remain classifiable in this heading.

Deflection coils for cathode-ray tubes are classified in **heading 85.40**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here. In particular, metal tank mercury arc rectifiers, with or without a pump, are always classified as parts.

However, most of the electric components of the devices of this heading are to be found in other headings of the Chapter, for example :

- (a) Various switches of **heading 85.36** (for example, those used with multiple contact transformers).
- (b) Vacuum or mercury vapour rectifying tubes and valves (**other than** the metal tank type) and thyratrons (**heading 85.40**).
- (c) Semiconductor diodes, transistors, and thyristors (**heading 85.41**).
- (d) Articles of **heading 85.42**.

85.05 - Electro-magnets; permanent magnets and articles intended to become permanent magnets after magnetisation; electro-magnetic or permanent magnet chucks, clamps and similar holding devices; electro-magnetic couplings, clutches and brakes; electro-magnetic lifting heads.

- Permanent magnets and articles intended to become permanent magnets after magnetisation :

8505.11 -- Of metal

8505.19 -- Other

8505.20 - Electro-magnetic couplings, clutches and brakes

8505.90 - Other, including parts

This heading covers electro-magnets, those electro-magnet operated appliances specially listed in the heading, permanent magnets and permanent magnet work holders.

(1) **Electro-magnets.**

These are of various sizes and shapes according to the use for which they are intended. They consist essentially of a coil of wire wound around a core of soft iron, this core being either in one piece or laminated. The passing of electric current in the coil confers magnetic properties on the core, which can then be used either for attraction or repulsion.

(2) **Permanent magnets and articles intended to become permanent magnets after magnetisation.**

Permanent magnets consist of pieces of hard steel, special alloys or other materials (e.g., barium ferrite agglomerated with plastics or synthetic rubber) which have been rendered permanently magnetic. Their shape varies according to the use for which they are designed. To reduce the tendency to de-magnetise, horseshoe-shaped magnets are often furnished with a bar of iron (the keeper) adhering to the two poles. Permanent magnets remain classified here whatever their use, including small magnets used, *inter alia*, as toys.

Articles intended to become permanent magnets after magnetisation are recognisable as such by their shape and composition, generally being cubes or discs (tags) of metal or of agglomerated ferrite (e.g., barium ferrite).

(3) **Electro-magnetic or permanent magnet chucks, clamps and similar holding devices.**

These are mainly devices of various types in which magnets are used to hold work pieces in place while they are being worked. This group also covers holding devices for machines other than machine-tools (for example, magnetic devices for holding printing plates in printing machinery).

(4) Electro-magnetic clutches and couplings.

These may be of various types. Certain types consist of a fixed coil around a movable armature, the latter being pulled into the coil when current passes and pulled out again by a spring when the current is cut off. The heading also covers variable speed couplings, some of which are based on the principle of an asynchronous motor.

(5) Electro-magnetic brakes.

These generally consist of shoes which, under the influence of electro-magnets, act on the rim of a wheel or on the rail. Others are based on the principle of electro-magnetic induction, a soft steel disc mounted on the shaft being braked by the action of eddy currents induced in it by electro-magnets. The heading **does not**, however, **cover** mechanical hydraulic or pneumatic brakes controlled by electro-magnetic devices.

(6) Electro-magnetic lifting heads.

These consist essentially of electro-magnets, generally circular, and are usually used in conjunction with cranes (e.g., for the lifting of scrap iron). Certain types are designed for special purposes (e.g., on salvage vessels for the recovery of metal objects from wrecks).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* *

The heading **does not cover** :

- (a) Magnetic ferrite with a binder, in the form of powder or pellets (**heading 38.24**).
- (b) Electro-magnets, permanent magnets or magnetic devices of this heading, when presented with machines, apparatus, toys, games, etc., of which they are designed to form part (classified with those machines, apparatus, etc.).
- (c) Media for magnetic recording such as cards composed of unmagnetised magnetic material laminated between two plastic sheets and used, in particular, for opening magnetic locks (**heading 85.23**).
- (d) Electro-magnets designed for use by oculists or surgeons (**heading 90.18**).

85.06 - Primary cells and primary batteries (+).

- 8506.10 - Manganese dioxide
- 8506.30 - Mercuric oxide
- 8506.40 - Silver oxide
- 8506.50 - Lithium
- 8506.60 - Air-zinc
- 8506.80 - Other primary cells and primary batteries
- 8506.90 - Parts

These generate electrical energy by means of chemical reactions.

A primary cell consists basically of a container holding an alkaline or a non-alkaline electrolyte (e.g., potassium or sodium hydroxide, ammonium chloride or a mixture of lithium chloride, ammonium chloride, zinc chloride and water) in which two electrodes are immersed. The anode is generally of zinc, magnesium or of lithium and the cathode (depolarising electrode) is, for example, of manganese dioxide (mixed with carbon powder), of mercuric oxide or of silver oxide. In lithium primary cells, the anode is of lithium and the cathode is, for example, of thionyl chloride, of sulphur dioxide, manganese dioxide or of iron sulphide. A nonaqueous electrolyte is used because of the solubility and reactivity of lithium in aqueous solutions. In air-zinc primary cells, an alkaline or neutral electrolyte is generally used. The zinc is used as the anode, oxygen diffuses into the cell and is used as the cathode. Each electrode is provided with a terminal or other arrangement for connection to an external circuit. The principal characteristic of a primary cell is that it is not readily or efficiently recharged.

Primary cells are used for supplying current for a number of purposes (for bells, telephones, hearing aids, cameras, watches, calculators, heart pacemakers, radios, toys, portable lamps, electric prods for cattle, etc.). Cells may be grouped together in batteries, either in series or in parallel or a combination of both. Cells and batteries remain classified here irrespective of the use for which they are intended (e.g., standard cells for laboratory work producing a constant known voltage fall in the heading).

The various types of cells include :

- (1) **Wet cells**, in which the electrolyte is a liquid, and is not restrained from flowing. Wet cells are therefore sensitive to orientation.
- (2) **Dry cells**, in which the electrolyte is immobilised in absorbent materials or gels (e.g., mixed with a thickener such as agar-agar or flour to form a paste). The electrolyte used may be liquid but it is restrained from flowing. Dry cells are used mainly for portable devices.
- (3) **Inert cells**, or reserve cells or batteries to which water or all or part of the electrolyte must be added before they can be used, or in which the electrolyte must be heated to become ionically conductive.
- (4) **Concentration cells**, the electrolyte being at a different degree of concentration at each electrode.

Primary cells and batteries may be manufactured to various shapes and sizes. Common types are those having a cylindrical or button shape.

Certain cells (e.g., wet cells and some inert cells) are usually presented without their electrolyte, but remain classified here.

This heading **does not cover** rechargeable cells and batteries, as these are classified in **heading 85.07** as electric accumulators.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading covers parts of primary cells or batteries, including containers.

*
* *

The heading **does not cover** :

- (a) Terminals (**heading 85.36**).
- (b) Solar cells (**heading 85.41**).
- (c) Carbon electrodes (**heading 85.45**).
- (d) Spent primary cells and spent primary batteries and waste and scrap thereof (**heading 85.48**).
- (e) Thermocouples (e.g., **headings 85.03, 85.48, 90.33**).

○
○ ○

Subheading Explanatory Notes.

Subheadings 8506.10, 8506.30 and 8506.40

Classification in these subheadings is determined by the composition of the cathode (depolarising electrode). **However**, primary cells with cathode of manganese dioxide and anode of lithium are classified in **subheading 8506.50** as lithium primary cells (see the Explanatory Note to that subheading below).

Subheading 8506.50

Classification in this subheading is determined by the composition of the anode.

85.07 Electric accumulators, including separators therefor, whether or not rectangular (including square).

8507.10 - Lead-acid, of a kind used for starting piston engines

8507.20 - Other lead-acid accumulators

8507.30 - Nickel-cadmium

8507.40 - Nickel-iron

8507.50 - Nickel-metal hydride

8507.60 - Lithium-ion

8507.80 - Other accumulators

8507.90 - Parts

Electric accumulators (storage batteries or secondary batteries) are characterised by the fact that the electrochemical action is reversible so that the accumulator may be recharged. They are used to store electricity and supply it when required. A direct current is passed through the accumulator producing certain chemical changes (charging); when the terminals of the accumulator are subsequently connected to an external circuit these chemical changes reverse and produce a direct current in the external circuit (discharging). This cycle of operations, charging and discharging, can be repeated for the life of the accumulator.

Accumulators consist essentially of a container holding the electrolyte in which are immersed two electrodes fitted with terminals for connection to an external circuit. In many cases the container may be subdivided, each subdivision (cell) being an accumulator in itself; these cells are usually connected together in series to produce a higher voltage. A number of cells so connected is called a battery. A number of accumulators may also be assembled in a larger container. Accumulators may be of the wet or dry cell type.

The main types of accumulators are :

- (1) **Lead-acid accumulators**, in which the electrolyte is sulphuric acid and the electrodes lead plates or lead grids supporting active material.
- (2) **Alkaline accumulators**, in which the electrolyte is usually potassium, or lithium hydroxide or thionyl chloride and the electrodes are, for example :
 - (i) Positive electrodes of nickel or nickel compounds and negative electrodes of iron, cadmium or metal hydride;
 - (ii) Positive electrodes of lithiated cobalt oxide and negative electrodes of a blend of graphite;
 - (iii) Positive electrodes of carbon and negative electrodes of metallic lithium or lithium alloy;
 - (iv) Positive electrodes of silver oxide and negative electrodes of zinc.

The electrodes may consist of simple plates, grids, rods, etc., or of grids or tubes covered or filled with a special paste of the active material. The containers for lead-acid accumulators are usually made of glass or, in the case of car batteries, are moulded from plastic, hard rubber or composition material. In big stationary accumulators, glass or lead lined, plastic or wood boxes are used, while containers for alkaline accumulators are usually of steel or plastics. Alkaline accumulators may be of a specific size and shape, so designed to fit the device for which they are the source of electricity. They may be within waterproof containers. Many alkaline accumulators may have the external appearance of primary cells or batteries of heading 85.06.

Accumulators are used for supplying current for a number of purposes, e.g., motor vehicles, golf carts, fork-lift trucks, power hand-tools, cellular telephones, portable automatic data processing machines, portable lamps.

Some lead-acid accumulators are fitted with a hydrometer, which measures the specific gravity of the electrolyte and so indicates roughly the degree of charge of the accumulator.

Electric accumulators remain classified here even if presented without their electrolyte.

Accumulators containing one or more cells and the circuitry to interconnect the cells amongst themselves, often referred to as "battery packs", are covered by this heading, whether or not they include any ancillary components which contribute to the accumulator's function of storing and supplying energy, or protect it from damage, such as electrical connectors, temperature control devices (e.g., thermistors), circuit protection devices, and protective housings. They are classified in this heading even if they are designed for use with a specific device.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), the heading also covers parts of accumulators, e.g., containers and covers; lead plates and grids, whether or not coated with paste; separators of any material (except of unhardened vulcanised rubber or of textile material), including those in the form of flat plates merely cut into rectangles (including squares), meeting very precise technical specifications (porosity, dimensions, etc.) and hence ready for use.

The heading **does not cover** :

- (a) Terminals (**heading 85.36**).
- (b) Spent electric accumulators and waste and scrap thereof (**heading 85.48**).

85.08 - Vacuum cleaners.

- With self-contained electric motor :

8508.11 -- Of a power not exceeding 1,500 W and having a dust bag or other receptacle capacity not exceeding 20 l

8508.19 -- Other

8508.60 - Other vacuum cleaners

8508.70 - Parts

Subject to Note 1 (d) to Chapter 85, this heading covers vacuum cleaners of all kinds, whether or not hand-held, including dry and wet vacuum cleaners, whether or not presented with accessories such as rotary brushes, carpet beating devices, multiple-function suction heads, etc.

Vacuum cleaners perform two functions : the suction of material, including dust, and the filtering of the air stream. Suction is effected by means of a turbine fixed directly onto the shaft of the motor, turning at high velocity. The dust and other material are collected in an internal or external dust bag or other receptacle, whereas the air sucked in and filtered is also used to cool the motor.

The heading includes, *inter alia*, vacuum cleaner type grooming apparatus for horses or cattle.

Excluded from this heading are appliances for cleaning carpets in situ by injecting a liquid cleaning solution into the carpet, the solution then being extracted by suction, which are not combination dry and wet vacuum cleaners (**heading 84.51** or **85.09**).

This heading also **excludes** vacuum apparatus of a kind used in medical, surgical, dental or veterinary sciences (**heading 90.18**).

EQUIPMENT PRESENTED WITH THE APPLIANCES OF THIS HEADING

Vacuum cleaners of this heading may be presented with auxiliary devices (accessories) (for brushing, polishing, insecticide spraying, etc.) or interchangeable parts (carpet devices, rotary brushes, multiple-function suction heads, etc.). Such an appliance is classified here together with the parts and accessories presented with it, **provided** they are of a kind and number commonly used with the appliance. When presented separately, they are classified by reference to their nature.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Notes to Section XVI), parts of appliances of this heading are also classified here.

85.09 - Electro-mechanical domestic appliances, with self-contained electric motor, other than vacuum cleaners of heading 85.08.

8509.40 - Food grinders and mixers; fruit or vegetable juice extractors

8509.80 - Other appliances

8509.90 - Parts

This heading covers a number of domestic appliances in which an electric motor is **incorporated**. The term "domestic appliances" in this heading means appliances normally used in the household. These appliances are identifiable, according to type, by one or more characteristic features such as overall dimensions, design, capacity, volume. The yardstick for judging these characteristics is that the appliances in question must not operate at a level in excess of household requirements.

Subject to the exclusions and in appropriate cases the limitations of weight given in Chapter Note 4, the heading covers apparatus which fulfil the above criteria. The heading **does not cover** appliances driven by a **separate** electric motor (whether by means of a flexible shaft, transmission belts or other transmission equipment), nor appliances which, though similar in construction and use, are clearly intended solely for industrial use (e.g., in the food industries, in chimney sweeping, machine cleaning or road cleaning); these are classified, in general, in **heading 82.10** or in **Chapter 84**.

The appliances of this heading are of two groups (see Chapter Note 4) :

(A) A limited class of articles are classified here irrespective of their weight.

This group consists of the following only :

- (1) **Floor polishers** (whether or not with a waxing attachment, and whether or not with a heating element for liquefying the wax).
- (2) **Food grinders and mixers**, e.g., grinders for meat, fish, vegetables or fruit; multi-purpose grinders (for coffee, rice, barley, split peas, etc.); milk shakers; ice cream mixers; sorbet mixers; dough kneaders; mayonnaise beaters; other similar grinders and mixers (including those which, by means of interchangeable parts, can also be used for cutting or other manipulations).
- (3) **Fruit or vegetable juice extractors.**

(B) A non-limited class of articles are classified in this heading provided their weight is 20 kg or less.

This group includes, *inter alia* :

- (1) **Floor scrubbing, scraping or scouring appliances, and appliances for sucking up dirty water or soap suds after scrubbing.**
- (2) **Appliances for spraying polish on to floors** before polishing. These are usually fitted with heating elements to liquefy the wax.
- (3) **Kitchen waste disposers.** These devices are designed to be attached to the kitchen sink and are used to grind kitchen waste.
- (4) **Peelers, chippers, cutters, etc., for potatoes or other vegetables.**

- (5) **Slicers of all kinds** (e.g., for meat, sausages, bacon, cheese, bread, fruit or vegetables).
- (6) **Knife sharpeners and cleaners.**
- (7) **Electric tooth brushes.**
- (8) **Air humidifiers and dehumidifiers.**

EQUIPMENT PRESENTED WITH THE APPLIANCES OF THIS HEADING

Many of the appliances listed above may be presented with interchangeable parts or auxiliary devices to make them suitable for various purposes. For example, food mixers which can be used for cutting, grinding, whipping, mincing, etc.; slicers with honing and sharpening devices; floor scrubbers with a polishing brush set; scrubbers with a soap feeder and suction device for removing dirty water or soap suds. Such an appliance is classified here together with the parts and accessories presented with it, **provided** they are of a kind and number commonly used with the appliance. The weight of the extra interchangeable parts or detachable auxiliary devices is to be ignored in determining whether the appliance falls in the heading under the terms of paragraph (B) above.

The appliances of this heading may be mounted on runners, castors or similar devices to facilitate use.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the appliances of this heading are also classified here.

*
* * *

The heading **does not cover** :

- (a) Fans or ventilating or recycling hoods incorporating a fan, whether or not fitted with filters (**heading 84.14**).
- (b) Refrigerators (**heading 84.18**).
- (c) Roller or other ironing machines (**heading 84.20** or **84.51**).
- (d) Centrifugal clothes-dryers (**heading 84.21**) and household washing machines (**heading 84.50**).
- (e) Dish washing machines (**heading 84.22**).
- (f) Grass mowers (**heading 84.33**).
- (g) Dairy type butter churns (**heading 84.34**).

- (h) fruit or vegetable juice extractors, food grinders and mixers, or the like, for industrial or commercial use, of the type used in restaurants or similar establishments (**heading 84.35** or **84.38**, respectively).
- (ij) Appliances for cleaning carpets in situ by injecting a liquid cleaning solution into the carpet, the solution then being extracted by suction, designed for use in establishments (other than domestic premises) such as hotels, motels, hospitals, offices, restaurants and schools (**heading 84.51**).
- (k) Sewing machines (**heading 84.52**).
- (l) Hair-removing appliances (**heading 85.10**).
- (m) Electro-thermic domestic appliances (**heading 85.16**).
- (n) Massage appliances (**heading 90.19**).

85.10 - Shavers, hair clippers and hair-removing appliances, with self-contained electric motor.

8510.10 - Shavers

8510.20 - Hair clippers

8510.30 - Hair-removing appliances

8510.90 - Parts

This heading covers electric shavers and hair clippers which have a built-in electric motor or vibrator, whether for use on human beings, or for shearing sheep or for grooming horses, clipping cattle, etc.

In electric shavers (dry shavers) rotating or reciprocating cutters or knife blades slide along the inside of a perforated or slotted plate, thus cutting those hairs which protrude through the perforations or slots. In the case of hair clippers, a comb-like cutter blade slides to and fro over a fixed metal comb thus cutting the hair or wool which is caught between the teeth of the combs. Hair clippers for barbers' use operate on a similar principle to those for sheep shearers, grooms, etc., but differ in size.

This heading also covers electro-mechanical hair-removing appliances with self-contained electric motor; these appliances, which grip the hair and pluck it out at the root, may operate with either a micro-roller, or a metal spiral which rotates around its own axis, or a guard, a depilating head and a set of depilating wheels.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of electric shavers, hair clippers or hair-removing appliances are also classified here. These include, *inter alia*, cutter heads, cutter blades, knife blades and comb blades.

*
* * *

Hair clippers operated by a flexible shaft driven by a separate electric motor are classified in **heading 82.14**, the electric motor (whether or not equipped with the flexible shaft) being classified in **heading 85.01**.

85.11 - Electrical ignition or starting equipment of a kind used for spark-ignition or compression-ignition internal combustion engines (for example, ignition magnetos, magneto-dynamos, ignition coils, sparking plugs and glow plugs, starter motors); generators (for example, dynamos, alternators) and cut-outs of a kind used in conjunction with such engines.

8511.10 - Sparking plugs

8511.20 - Ignition magnetos; magneto-dynamos; magnetic flywheels

8511.30 - Distributors; ignition coils

8511.40 - Starter motors and dual purpose starter-generators

8511.50 - Other generators

8511.80 - Other equipment

8511.90 - Parts

This heading covers electrical starting or ignition equipment and appliances for internal combustion engines of any kind (piston or other types), whether for use in motor cars, aircraft, boats or the like, or for stationary engines. It also covers generators and cut-outs for use in conjunction with such internal combustion engines.

The heading includes :

(A) **Sparkling plugs.**

These consist of a central insulated electrode and a point (or points) attached to the casing. The casing is partly threaded at its base for screwing it into the cylinder-head, and there is a terminal at the top of the central electrode for connection to the source of current. When a high voltage is applied to the central electrode a spark jumps between that electrode and the point or points and is used for igniting the explosive mixture in the cylinder.

(B) **Ignition magnetos (including magneto-dynamos).**

These are used to provide the necessary high tension voltage to be applied to the sparkling plugs of an internal combustion engine; they are used mainly for racing cars, tractors, aircraft, motor-boat or motor-cycle engines. They are of the following main types :

(1) **Revolving armature magnetos.** These incorporate a form of AC generator in which an armature, wound with a primary low tension coil, rotates between the poles of a permanent magnet. This primary coil is connected to a contact breaker and capacitor, and the sudden making and breaking of the current in this coil induces very high voltage in a secondary winding. The whole is usually built in one housing, on the top of which a distributor arm is mounted to distribute the voltage to the sparkling plugs in turn.

(2) **Stationary armature magnetos.** These are of two types. In both the armature winding, contact breaker and capacitor are stationary; but in one type the magnets revolve, whereas in the other type, the magnets are also stationary and soft iron inductors revolve between the magneto and the armature winding.

(3) **Magneto-dynamos.** These comprise a magneto and a dynamo combined into a single unit with a common drive; they are normally used on motor-cycles.

(C) Magnetic flywheels.

These consist of a magnetic device fitted to a flywheel to produce a low tension current for ignition purposes.

(D) Distributors.

These distribute the ignition current to the sparking plugs in turn, and also incorporate an interrupter to make and break the circuit in the primary winding of the ignition coil; both functions are synchronised with the strokes of the pistons in the cylinders by means of a cam driven by the engine.

(E) Ignition coils.

These consist of specially modified induction coils, usually in a cylindrical container. By connecting the primary via an interrupter to the battery, a high voltage is produced in the secondary and is led to the sparking plugs via a distributor.

In some ignition systems a double-spark ignition coil is connected directly to two sparking plugs and the coil generates an ignition spark in each plug simultaneously, with the spark from one plug producing its cylinder power stroke and the spark from the other plug having no effect on its cylinder because it is on the exhaust stroke. Such systems do not require a distributor as the ignition coil is connected directly to the sparking plugs. In these systems the coils are energised by an electronic (semiconductor) coil module.

(F) Starter motors.

These are small electric motors, usually of the DC series wound type. They are fitted with a small pinion capable of travelling up and down a screwed shaft, or with some other mechanical device for coupling them temporarily to the internal combustion engine to be started.

(G) Generators (dynamos and alternators).

These are driven by the engine, and serve to charge the batteries and to supply current to the lighting, signalling, heating and other electrical equipment of motor vehicles, aircraft, etc. Alternators are used with a rectifier.

(H) Booster coils.

These are small induction coils used, mainly on aircraft, when the turning speed at starting is too low for the engine magnetos to function.

(IJ) Glow plugs.

These are similar to sparking plugs, but in place of the electrode and points for producing a spark, they have a small resistor which, when current is passed, becomes heated. They are used to heat the air in the cylinders of diesel engines before and during starting.

(K) Heating coils.

These are intended for mounting in the air intake of diesel engines for starting purposes.

(L) Dynamo cut-out apparatus.

These prevent the dynamo from being driven as a motor, at the expense of the battery, when the engine is stationary or turning at low speed.

Cut-outs combined, in a single housing, with a voltage regulator or a current regulator are also classified here. In addition to protecting the battery and the dynamo, these devices ensure a constant flow of charge current or limit the intensity of this current.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* * *

The heading **excludes** :

- (a) Engine starters as used on airfields, bus stations, etc., for starting internal combustion engines and consisting essentially of a transformer and rectifier (**heading 85.04**).
- (b) Electric accumulators (**heading 85.07**).
- (c) Dynamos for use on bicycles for lighting purposes only (**heading 85.12**).

85.12 - Electrical lighting or signalling equipment (excluding articles of heading 85.39), windscreens wipers, defrosters and demisters, of a kind used for cycles or motor vehicles.

- 8512.10 - Lighting or visual signalling equipment of a kind used on bicycles
- 8512.20 - Other lighting or visual signalling equipment
- 8512.30 - Sound signalling equipment
- 8512.40 - Windscreens wipers, defrosters and demisters
- 8512.90 - Parts

This heading covers electrical apparatus and appliances specialised for use on cycles or motor vehicles for lighting or signalling purposes. It **does not**, however, **cover**, dry batteries (**heading 85.06**), electric accumulators (**heading 85.07**) or dynamos and magneto-dynamos of **heading 85.11**. The heading also includes electrical windscreens wipers, defrosters and demisters for motor vehicles.

The heading includes, *inter alia* :

- (1) **Dynamos** for generating electric current by means of a friction wheel running on one of the tyres or wheel rims of a bicycle or, in some rare cases, of a motor-cycle.
- (2) **Battery holders**, equipped with a switch, terminals, contacts, etc., for cycle lighting equipment; **battery-operated lamps**, designed for mounting on cycles.
- (3) **Headlamps of all kinds** including lamps fitted with dimming or dipping attachments; diffused driving lamps; anti-fog lamps; spot-lights; search-lamps of a kind used on police cars or the like (including those which, attached to a length of cable, can be used as hand lamps or can be placed on the road).
- (4) **Side lamps; tail lamps; parking lamps; licence plate lamps.**
- (5) **Braking lights, direction indication lights, reversing lamps and the like.**
- (6) **Combinations of some of the above-mentioned lamps, assembled in one casing.**
- (7) **Interior lighting lamps**, such as dome lamps, wall lamps, step indicating lamps, door frame lamps and instrument panel lamps.
- (8) **Luminous overtaking signals**, transmitting to the driver automatically (sometimes by means of a photoelectric cell) a signal indicating the presence of an overtaking vehicle.
- (9) Other **electrical visual signalling apparatus**, e.g., illuminated triangles for vehicles with trailers, illuminated indicators (of the revolving dome type or the "lightbar" type) for taxis, police vehicles, fire engines, etc.

- (10) **Parking equipment** operated by means of external feelers, which, when they touch the curb or other object, cause a light or other signal to warn the driver.
- (11) **Anti-theft alarms** which emit visual or audio signals to warn of attempts to break in to a vehicle.
- (12) **Horns, sirens and other electrical sound signalling appliances.**
- (13) **Electrical apparatus which emit audio signals** to warn the driver of the proximity of vehicles or other objects behind the vehicle when reversing. These apparatus usually comprise ultrasonic sensors, an electronic control unit, a buzzer or beeper and associated wiring.
- (14) **Electrical apparatus of a kind used in a motor vehicle** to warn the driver, by visual or audio signals, that a speed detection device, such as a radar gun or a laser gun, is operating in the vicinity.
- (15) **Windscreen wipers**, including dual windscreen wipers, driven by an electric motor.
- (16) **Defrosters and demisters**. These consist of a resistance wire mounted in a frame for fitting to the windscreen.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* * *

The heading also **excludes** :

- (a) Glass lenses (**heading 70.14**).
- (b) Air conditioning machinery or apparatus (**heading 84.15**).
- (c) Electric sound amplifier sets, consisting of a microphone, audio-frequency amplifier and loudspeaker, used for transmitting to the driver of a towing vehicle the warning hoot or other road sounds behind his trailer (**heading 85.18**).
- (d) Boards, panels and other bases, equipped with two or more apparatus of heading 85.36 (e.g., an assembly of switches for mounting on the steering column) (**heading 85.37**).
- (e) Electric lamps, including sealed beam lamp units, of **heading 85.39**.
- (f) Insulated electric wire and cable, whether or not cut to length or fitted with connectors or made up in sets (e.g., ignition wiring sets) (**heading 85.44**).
- (g) Non-electric car heating apparatus which also acts as defroster or demister (**heading 73.22** or **87.08**).

85.13 - Portable electric lamps designed to function by their own source of energy (for example, dry batteries, accumulators, magnetos), other than lighting equipment of heading 85.12.

8513.10 - Lamps

8513.90 - Parts

This heading covers portable electric lamps designed to function by means of a self-contained source of electricity (e.g., dry cell, accumulator or magneto).

They comprise two elements (i.e., the lamp proper and the source of electricity) which are usually mounted and directly connected together, often in a single case. In some types, however, these elements are separate and are connected by wires.

The term "portable lamps" refers **only** to those lamps (i.e., both the lamp and its electricity supply) which are designed for use when carried in the hand or on the person, or are designed to be attached to a portable article or object. They usually have a handle or a fastening device and may be recognised by their particular shapes and their light weight. The term therefore **excludes** lighting equipment for motor vehicles or cycles (**heading 85.12**), and lamps which are connected to a fixed installation (**heading 94.05**).

The lamps of this heading include :

- (1) **Pocket lamps.** Some ("dynamo lamps") are operated by a magneto, hand driven by means of a spring-loaded lever.
- (2) **Other hand lamps** (including those with an adjustable beam). Hand lamps are often fitted with a simple device for hanging them temporarily on a wall, etc., while others are designed so that they can be placed on the ground.
- (3) **Lamps, torches or flashlights** in the shape of pens, often fitted with a clip for securing the lamp to the user's pocket when not in use.
- (4) **Morse signalling lamps.**
- (5) **Miners' safety lamps;** the lighting device is usually designed for fitting to the miners' helmet, while the source of electricity (accumulator) is usually hooked on to the belt.
- (6) **Examination lamps for general use,** fixed to a headband (which usually consists of a curved strip of metal). Such lamps are classified here **only** if they have their own source of current (dry battery in user's pocket, for example). The lamps of this heading are used by doctors, watchmakers, jewellers, etc. Specialised medical inspection lamps (e.g., for throat or ear inspection) are **excluded** (**heading 90.18**).
- (7) **Fancy torches** in the shape of pistols, lipsticks, etc. Composite articles composed of a lamp or torch and a pen, screwdriver, key ring, etc., remain classified here **only** if the principal function of the whole is the provision of light.
- (8) **Reading lamps** fitted with a clip or the like for attachment to a book or magazine.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the lamps of this heading are also classified here.

*
* *

The heading **excludes** :

- (a) Photographic flash-light apparatus (**heading 90.06**).
- (b) Laser pointers incorporating a laser diode (**heading 90.13**).

85.14 - Industrial or laboratory electric furnaces and ovens (including those functioning by induction or dielectric loss); other industrial or laboratory equipment for the heat treatment of materials by induction or dielectric loss.

8514.10 - Resistance heated furnaces and ovens

8514.20 - Furnaces and ovens functioning by induction or dielectric loss

8514.30 - Other furnaces and ovens

8514.40 - Other equipment for the heat treatment of materials by induction or dielectric loss

8514.90 - Parts

This heading covers a number of industrial or laboratory type electro-thermic machines, apparatus and appliances in which the heat is obtained electrically (e.g., by the heating effect of a current in a conductor; from an electric arc). The heading includes furnaces and ovens functioning by induction or dielectric loss and other industrial or laboratory equipment for the heat treatment of materials by induction or dielectric loss (e.g., industrial microwave furnaces, ovens and equipment). The heading **excludes** electro-thermic appliances of a kind used for domestic purposes (**heading 85.16**).

**(I) INDUSTRIAL OR LABORATORY ELECTRIC FURNACES
AND OVENS (INCLUDING THOSE FUNCTIONING
BY INDUCTION OR DIELECTRIC LOSS)**

Electric furnaces and ovens consist essentially of a more or less closed space or vessel in which a relatively high temperature is obtained. They are used for many purposes (melting, annealing, tempering, enamelling, welding, heat treatment of welds, etc.). The principal types include retort furnaces, bell-type furnaces, trough furnaces, crucible furnaces, tunnel furnaces, etc. Some of these furnaces may have special tilting attachments, or be provided with an inner vessel for the treatment of metals in a particular gas to prevent oxidation.

The furnaces and ovens covered by this group include, *inter alia* :

- (A) **Resistance heated furnaces and ovens** in which the heat is produced by the passage of a current through heating resistors. These heating elements (resistors) transfer heat to the stock or charge by radiation and convection.
- (B) **Resistance furnaces for heating bars of metal or granular materials** where the material to be heated serves as the resistor. These consist of a container in which current is passed through the material itself; the electrical resistance of the material produces the necessary heat.
- (C) **Liquid resistance furnaces** consisting of baths furnished with electrodes. In operation the bath contains molten metal, molten salts or special oil, maintained at the required temperature by the passage of electricity, via the electrodes, through the liquid; the object is heated by being plunged in the bath of liquid.
- (D) **Electrolytic furnaces for smelting or refining metals.** These are also liquid resistance furnaces fitted with electrodes immersed in a molten bath electrolyte. The bath contains the metal bearing constituent of the ore dissolved in a molten salt. Electrolytic dissociation which is caused by the passage of electricity through the electrolyte via the electrodes results in pure molten metal collecting at the cathode while a gas is given off at the anode.

- (E) **Low frequency induction furnaces.** Low frequency AC in a primary coil is linked magnetically by a soft iron core with the charge to be heated, and induces current in that charge thus causing it to be heated. In certain furnaces of this type, the molten charge circulates from the main crucible through vertical looped piping in which the heating currents are induced from the primary circuit.
- (F) **High frequency induction furnaces.** An AC of high frequency (often of radio frequency) in the primary coil induces eddy currents in the charge to be heated. This type of furnace has no iron core.
- (G) **Dielectric capacitance furnaces and ovens.** The charge, which must be electrically non-conducting, is placed between two metal plates connected to a source of AC. In effect the arrangement operates as a capacitor, and dielectric loss in the charge causes heat to be developed within it. This group includes **industrial microwave ovens**, in which dielectric products to be heated are subjected to the action of electromagnetic waves. By dielectric loss, the energy from the waves is converted simultaneously into heat throughout the mass of the product, ensuring very uniform heating. These ovens are used for drying, defrosting, moulding of plastics, firing ceramics, etc.
- (H) **Arc furnaces** in which the heat is generated by an electric arc, struck between electrodes or between an electrode and the charge to be heated. These furnaces are used for the production of pig iron, various ferro-alloys, calcium carbide, for reducing iron ore, for the fixation of nitrogen from the air, etc. Certain low temperature arc furnaces are also used for distilling materials of relatively low boiling point (e.g., zinc or phosphorus); if, however, they are equipped with condensers to collect the distillate, the whole is **excluded (heading 84.19)**.

(IJ) **Infra-red radiation ovens** heated by a number of infra-red lamps or radiation plates.

Certain furnaces or ovens use more than one method of heating (e.g., high and low frequency induction or resistance for melting and heating metals, etc.; infra-red and high frequency biscuit baking ovens; infra-red, resistance and dielectric capacitance (microwave) ovens for heating objects).

The furnaces and ovens described in this heading include, *inter alia* :

- (1) **Ovens for bread, pastry or biscuit making.**
- (2) **Dental ovens.**
- (3) **Crematorium furnaces.**
- (4) **Furnaces for incinerating waste.**
- (5) **Furnaces or ovens for annealing or tempering glass.**

This heading **excludes** electrically heated apparatus for drying, sterilising or similar operations (**heading 84.19**).

(II) OTHER INDUSTRIAL OR LABORATORY EQUIPMENT FOR THE HEAT TREATMENT OF MATERIALS BY INDUCTION OR DIELECTRIC LOSS

The heading also includes electric induction or dielectric heating equipment (for example, microwave equipment), even if not in the form of a furnace or oven. This equipment (used mainly for the heat treatment of small articles) consists essentially of electrical equipment for producing high-frequency oscillations, mounted together with the appropriate plates or coils, often of special design for the particular articles to be treated.

These include, *inter alia* :

- (1) Machines with induction coils for heating by induction objects made up of materials which are good conductors of electricity, by means of low, medium or high-frequency power (e.g., machines used for superficial hardening of crankshafts, cylinders, cog wheels or other metal parts; machines for melting, sintering, annealing, tempering or preheating metal parts).
- (2) Machines with electrodes serving as a capacitor (e.g., in the form of plates, bars) for dielectric (capacitive) heating of objects made up of materials which are non-conductors or bad conductors of electricity, by means of high frequency power (e.g., wood-drying machines; machines for preheating thermohardenable moulding materials in the form of pellets or powder, etc.).

Some special types of equipment are designed for the progressive heat-treatment of a bar passed through the coil, or for the repetitive treatment of a series of articles.

Rotary converters and high-frequency generators when presented together with heat-treatment equipment are also classified in this heading. When presented separately, they fall in **heading 85.02 or 85.43**, as the case may be.

However, machines for induction treatment used for soldering or brazing metals and machines for heat-treatment by dielectric loss used for welding plastics or other materials (e.g., high-frequency pressing machines for welding and high-frequency line welding machines) fall in **heading 85.15**. Presses incorporating heating devices are also **excluded (Chapter 84)**.

*
* * *

This heading also covers furnaces and other appliances specially designed for the separation, by pyrometallurgical processes, of irradiated nuclear fuels, appliances for the treatment of radioactive waste (e.g., for the firing of clays or glass containing radioactive residues or for the combustion of graphite or radioactive filters) or those for the sintering or heat-treatment of fissile material recovered for recycling. However, appliances for isotopic separation are classified in **heading 84.01**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here (e.g., armatures, doors, inspection holes, panels and domes, electrode holders and metal electrodes).

*
* *

However, the heading also **excludes** :

- (a) Bricks, blocks and similar refractory or ceramic goods for the construction or lining of electric furnaces (**Chapter 69**).
- (b) Electric furnaces and ovens for manufacturing semiconductor wafers or flat panel displays (**heading 84.86**).
- (c) Electric heating resistors (**heading 85.16** or **85.45**, as the case may be).
- (d) Electrodes of graphite or other carbon, with or without metal (**heading 85.45**).

85.15 - Electric (including electrically heated gas), laser or other light or photon beam, ultrasonic, electron beam, magnetic pulse or plasma arc soldering, brazing or welding machines and apparatus, whether or not capable of cutting; electric machines and apparatus for hot spraying of metals or cermets.

- Brazing or soldering machines and apparatus :

8515.11 -- Soldering irons and guns

8515.19 -- Other

- Machines and apparatus for resistance welding of metal :

8515.21 -- Fully or partly automatic

8515.29 -- Other

- Machines and apparatus for arc (including plasma arc) welding of metals :

8515.31 -- Fully or partly automatic

8515.39 -- Other

8515.80 - Other machines and apparatus

8515.90 - Parts

(I) SOLDERING, BRAZING OR WELDING MACHINES AND APPARATUS

This group covers certain soldering, brazing or welding machines and apparatus, whether portable or fixed. They are also classified here when they are capable of cutting.

Welding operations may be performed manually or be fully or partly automatic.

These include :

(A) Brazing or soldering machines and apparatus.

The heat is normally generated by induction or conduction using electrical power sources.

Brazing and soldering are operations in which metal parts are joined by means of a filler metal with a lower melting point that wets the parent metal(s). The parent metal(s) does(not) participate by fusion in making the joint. The filler metal is usually distributed between the surfaces of the joint by capillary attraction. Brazing can be distinguished from soldering by the melting point temperature of filler metals used. In brazing it is generally above 450 °C, whereas in soldering the melting point is achieved at a lower temperature.

Only machines and apparatus which, by reason of their special equipment (for example, a system for feeding in solder wire), are identifiable as solely or principally intended for brazing or soldering belong to this group. Other appliances are to be considered as furnaces, ovens or heating equipment within the meaning of heading 85.14.

This heading also covers electrically heated hand soldering irons and guns.

(B) Machines and apparatus for resistance welding of metal.

The heat required for forming welded joints is produced by the resistance to the flow of an electric current through the parts to be joined (Joule heat). During welding the parts are held together under pressure and fluxes or filler metals are not used.

These machines are of many kinds varying according to the type of article to be welded. They include, for example, butt welding or flash butt welding machines; single-spot welding machines comprising guns with or without built-in power sources; multipot machines and associated equipment; projection welding machines; seam welding machines; high-frequency resistance welding apparatus.

(C) Machines and apparatus for arc or plasma arc welding of metals, whether or not capable of cutting.

(1) Arc welding.

The source of heat is an electric arc struck either between two electrodes or between one such electrode and the work piece.

There are many machines of this kind, e.g., for manual metal arc welding with coated electrodes; for gas-shielded arc welding; for welding or cutting with consumable or non-consumable electrodes or with covered arc (inert-gas metal arc welding (MIG- Metal Inert Gas); active-gas metal arc welding (MAG- Metal Active Gas); inert-gas tungsten arc welding (TIG-Tungsten Inert Gas); submerged arc welding (SA), electro-slag or electro-gas welding, etc.).

(2) Plasma arc welding.

The source of heat is a constricted arc which, by ionisation and dissociation, converts auxiliary gas into a plasma (plasma jet). The gas may be inert (argon, helium), polyatomic (nitrogen, hydrogen) or a mixture of the two.

(D) Machines and apparatus for induction welding of metals.

The heat is produced by passing a current through one or more inductor coils.

(E) Machines and apparatus for electron beam welding, whether or not capable of cutting.

The heat is produced in the piece(s) to be welded or cut by impact of the electrons of a focussed electron beam generated in vacuum.

(F) Machines and apparatus for vacuum diffusion welding.

The heat is generally produced by induction but may be produced by electron beam or resistance.

The apparatus consists essentially of a vacuum chamber, vacuum pump, means of exerting pressure and heating equipment.

(G) Machines and apparatus for photon beam welding, whether or not capable of cutting.

Photon beam welding may be divided into :

(1) Laser beam welding.

The heat is derived from a source of essentially **coherent**, monochromatic radiation, which can be focussed into a high-intensity beam. It is produced by the impact of this beam on the piece to be welded.

(2) Light beam welding.

The heat is produced by impact of a **non-coherent** focussed light beam.

(H) Machines and apparatus for welding thermoplastic materials.

(1) Welding with electrically heated gas (hot gas welding).

The surfaces to be joined are warmed by electrically heated gas (generally air) and joined under pressure with or without additives.

(2) Welding with electrically heated elements (heating element welding).

The surfaces to be joined are warmed by means of electrically heated elements and joined under pressure with or without additives.

(3) High-frequency welding.

Surfaces of thermoplastic materials (e.g. acrylic polymers, polyethylene, poly(vinyl-chloride), polyamide (e.g. nylon)) with reasonably high dielectric losses are heated in a high-frequency alternating field and then joined under pressure. Additives may be used.

(IJ) Machines and apparatus for ultrasonic welding.

The parts to be joined are held together and subjected to ultrasonic vibrations. This process makes it possible to join metals or alloys which do not respond to ordinary welding techniques, and to weld metallic foils, parts of two or more different metals, or plastic films.

*
* * *

Electric soldering, welding or brazing machines are usually fed with low-voltage DC from a DC generator, or with low-voltage AC from a step-down transformer. The transformer, etc., is usually incorporated in the machine, but in some cases (e.g., in certain mobile machines), the welding head or welding appliance is connected to the transformer, etc., by electric cable. Even in the latter case the heading covers the whole apparatus **provided** the transformer, etc., is presented with its associated welding head or welding appliance; presented separately, the transformer or generator is classified in its own appropriate heading (**heading 85.02** or **85.04**).

This heading also covers industrial robots specially designed for welding purposes.

The heading also **excludes** :

- (a) Packaging machines fitted with electric welding appliances (**heading 84.22**).
- (b) Fusing presses (**heading 84.51**).
- (c) Machines designed exclusively for cutting (generally **heading 84.56**).
- (d) Friction welding machines (**heading 84.68**).
- (e) Soldering, brazing or welding machines and apparatus of a kind solely or principally used for the assembly of semiconductors (**heading 84.86**).

(II) ELECTRIC MACHINES AND APPARATUS FOR HOT SPRAYING OF METALS OR CERMETS

These are electric arc apparatus which melt down metals or cermets and at the same time spray them by means of compressed air.

The heading **does not cover** separately presented metal spraying pistols of **heading 84.24**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

These include, *inter alia*, soldering heads and tongs, electrode holders and metal contact electrodes (for example, contact points, rollers and jaws) as well as torch points and sets of nozzles for atomic hydrogen hand welding equipment.

The following, however, are **excluded** from this heading :

- (a) Consumable electrodes made of base metal or metal carbides (classified according to constituent material or in **heading 83.11**, as the case may be).
- (b) Electrodes of graphite or other carbon, with or without metal (**heading 85.45**).

85.16 - Electric instantaneous or storage water heaters and immersion heaters; electric space heating apparatus and soil heating apparatus; electro-thermic hair-dressing apparatus (for example, hair dryers, hair curlers, curling tong heaters) and hand dryers; electric smoothing irons; other electro-thermic appliances of a kind used for domestic purposes; electric heating resistors, other than those of heading 85.45.

8516.10 - Electric instantaneous or storage water heaters and immersion heaters

- Electric space heating apparatus and electric soil heating apparatus :

8516.21 -- Storage heating radiators

8516.29 -- Other

- Electro-thermic hair-dressing or hand-drying apparatus :

8516.31 -- Hair dryers

8516.32 -- Other hair-dressing apparatus

8516.33 -- Hand-drying apparatus

8516.40 - Electric smoothing irons

8516.50 - Microwave ovens

8516.60 - Other ovens; cookers, cooking plates, boiling rings, grillers and roasters

- Other electro-thermic appliances :

8516.71 -- Coffee or tea makers

8516.72 -- Toasters

8516.79 -- Other

8516.80 - Electric heating resistors

8516.90 - Parts

(A) ELECTRIC INSTANTANEOUS OR STORAGE WATER HEATERS AND IMMERSION HEATERS

This group includes :

- (1) **Geysers** in which the water is heated as it flows through.
- (2) **Storage water heaters** (whether or not of the pressure type), i.e., heat-insulated tanks with immersion heating elements. In these heaters water is heated gradually.
- (3) **Dual-system heaters** in which the water is heated either electrically or by connection to a fuel-heated hot water system; they are often equipped with a thermostatic control to operate them electrically only when the alternative means is insufficient.

- (4) **Electrode hot water boilers**, in which an AC passes through the water between two electrodes.
- (5) **Immersion heaters** of different shapes and forms depending on their use, are generally used in tanks, vats, etc., for heating liquids, semi-fluid (other than solid) substances or gases. They are also designed to be used in pots, pans, tumblers, cups, baths, beakers, etc., usually with a heat-insulated handle and a hook for hanging the heater in the vessel.

They have a reinforced protective sheath which is highly resistant to mechanical stress and to seepage from liquids, semi-fluid (other than solid) substances and gases. A powder (usually magnesium oxide) with good dielectric and thermal properties holds the wire resistor (resistance) in place within the sheath and insulates it electrically.

Assemblies consisting of immersion heaters permanently incorporated in a tank, vat or other vessel are classified in **heading 84.19 unless** they are designed for water heating only or for domestic use, in which case they remain in this heading. Solar water heaters are also classified in heading 84.19.

- (6) **Electric equipment for producing boiling water.**

Electric central heating boilers are classified in **heading 84.03.**

(B) ELECTRIC SPACE HEATING APPARATUS AND SOIL HEATING APPARATUS

This group includes :

- (1) **Electric storage heating apparatus**, in which electric elements heat up a solid (e.g., bricks) or a liquid which stores the heat produced and subsequently releases it, when required, to the surrounding atmosphere.
- (2) **Electric fires (fan heaters and radiant heaters)**, including portable types with parabolic reflectors and sometimes with built-in fans. Many of these fires are fitted with coloured lamps and flicker devices to imitate a coal or wood fire.
- (3) **Electric radiators**. These are apparatus in which electric elements heat up a liquid (for example, oil) which circulates in the radiator and which then radiates the heat to the surrounding atmosphere.
- (4) **Convection heaters**. These circulate air by convection currents, sometimes assisted by a fan.
- (5) **Heating panels** for mounting in the ceiling or to a wall including panels producing infra-red radiation for heating public places, streets, etc.
- (6) **Heating units for motor cars, railway coaches, aircraft, etc.**, other than defrosters and demisters.

(7) **Road heating equipment** to prevent the formation of frost and **soil heating equipment**, especially used to encourage plant growth, the elements of which are usually buried in the ground.

(8) **Engine heaters** for placing beneath a car to facilitate starting.

Electric central heating boilers are classified in **heading 84.03**.

(C) ELECTRO-THERMIC HAIR-DRESSING APPARATUS AND HAND DRYERS

These include :

- (1) **Hair dryers**, including drying hoods and those with a pistol grip and built-in fan.
- (2) **Hair curlers and electrical permanent waving apparatus**.
- (3) **Curling tong heaters**.
- (4) **Hand dryers**.

(D) ELECTRIC SMOOTHING IRONS

This group covers smoothing irons of all kinds, whether for domestic use or for tailors, dressmakers, etc., including cordless irons. These cordless irons consist of an iron incorporating a heating element and a stand which can be connected to the mains. The iron makes contact with the current only when placed in this stand. This group also includes electric steam smoothing irons whether they incorporate a water container or are designed to be connected to a steam pipe.

(E) OTHER ELECTRO-THERMIC APPLIANCES OF A KIND USED FOR DOMESTIC PURPOSES

This group includes all electro-thermic machines and appliances **provided** they are **normally used in the household**. Certain of these have been referred to in previous parts of this Explanatory Note (e.g., electric fires, geysers, hair dryers, smoothing irons, etc.). Others include :

- (1) Microwave ovens.
- (2) Other ovens and cookers, cooking plates, boiling rings, grillers and roasters (e.g., convection type, resistance type, infra-red, high frequency induction and combined gas-electric appliances).
- (3) Coffee or tea makers (including percolators).
- (4) Toasters, including toaster-ovens which are designed essentially for toasting bread but can also bake small items such as potatoes.
- (5) Kettles, saucepans, steamers; jacketed urns for heating milk, soup or the like.

- (6) Crepe makers.
- (7) Waffle irons.
- (8) Plate warmers and food warmers.
- (9) Sauté pans and chip pans (deep fryers).
- (10) Coffee roasting appliances.
- (11) Bottle heaters.
- (12) Yogurt and cheese makers.
- (13) Sterilising apparatus for preparing preserves.
- (14) Popcorn cookers.
- (15) Face dryers and the like.
- (16) Facial saunas incorporating a face mask in which water is vaporised for facial skin treatment.
- (17) Towel airers and heated towel rails.
- (18) Bed warmers.
- (19) Perfume or incense heaters, and heaters for diffusing insecticides.
- (20) Non-mechanical wash boilers.

This group **excludes** :

- (a) Electrically warmed blankets, bed pads, footmuffs or the like; electrically warmed clothing, footwear or ear pads or other electrically warmed articles worn on or about the person (classified in their appropriate heading, see Chapter Note 1).
- (b) Roller type ironing machines (**heading 84.20**) and clothes ironing or pressing machines (**heading 84.51**).
- (c) Counter-type coffee percolators, tea or milk urns, sauté pans and chip pans used, for example, in chip shops and other thermo-electric appliances which are not normally used in the household (**heading 84.19**, etc.).
- (d) Industrial microwave furnaces, ovens and equipment (for example, microwave ovens of a type designed to be used in restaurants) (**heading 85.14**).
- (e) Furniture (e.g., linen cupboards and serving trollies) equipped with heating elements (**Chapter 94**).
- (f) Cigarette lighters, gas lighters and the like (**heading 96.13**).

(F) ELECTRIC HEATING RESISTORS

With the **exception** of those of carbon (**heading 85.45**), all electrical heating resistors are classified here, irrespective of the classification of the apparatus or equipment in which they are to be used.

They consist of bars, rods, plates, etc., or lengths of wire (usually coiled), of special material which becomes very hot when current is passed through it. The material used varies (special alloys, compositions based on silicon carbide, etc.). They may be obtained in the form of individual components by a printing process.

Wire resistors are usually mounted on insulating formers (e.g., of ceramics, steatite, mica or plastics) or on soft insulating core (e.g., of glass fibres or asbestos). If not mounted, wire of this kind is classified here **only** if cut to length and coiled or otherwise formed to a shape identifying it as a heating resistor element. The same applies to bars, rods and plates which, to be classified here, **must** be cut to length or size ready for use.

Resistors remain classified here even if specialised for a particular machine or apparatus, but if assembled with parts other than a simple insulated former and electrical connections they are classified as parts of the machines or apparatus in question (e.g., base plates for smoothing irons and plates for electric cookers).

The heading also **excludes** defrosters and demisters. These consist of a resistance wire mounted in a frame for fitting to the windscreen (**heading 85.12**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

85.17 - Telephone sets, including telephones for cellular networks or for other wireless networks; other apparatus for the transmission or reception of voice, images or other data, including apparatus for communication in a wired or wireless network (such as a local or wide area network), other than transmission or reception apparatus of heading 84.43, 85.25, 85.27 or 85.28 (+).

- Telephone sets, including telephones for cellular networks or for other wireless networks :

8517.11 - - Line telephone sets with cordless handsets

8517.12 - - Telephones for cellular networks or for other wireless networks

8517.18 - - Other

- Other apparatus for transmission or reception of voice, images or other data, including apparatus for communication in a wired or wireless network (such as a local or wide area network) :

8517.61 - - Base stations

8517.62 - - Machines for the reception, conversion and transmission or regeneration of voice, images or other data, including switching and routing apparatus

8517.69 - - Other

8517.70 - Parts

This heading covers apparatus for the transmission or reception of speech or other sounds, images or other data between two points by variation of an electric current or optical wave flowing in a wired network or by electro-magnetic waves in a wireless network. The signal may be analogue or digital. The networks, which may be interconnected, include telephony, telegraphy, radio-telephony, radio-telegraphy, local and wide area networks.

**(I) TELEPHONE SETS, INCLUDING TELEPHONES
FOR CELLULAR NETWORKS OR
FOR OTHER WIRELESS NETWORKS**

This group includes :

(A) Line telephone sets.

Line telephone sets are communication apparatus that convert voice into signals for transmission to another device. Upon receipt of a signal, a line telephone set will convert the signal back to voice. They consist of :

- (1) The **transmitter**, a microphone which converts sound waves into a modulated current.
- (2) The **receiver** (headphone or earphone), which reconverts the modulated current into sound waves. In most cases, the transmitter and receiver are incorporated in a single moulding known as a hand-set. In other cases the transmitter and receiver are a combined headphone and microphone, designed to be worn on the user's head.

- (3) The **anti-sidetone circuit**, which prevents sound introduced in the transmitter from being reproduced in the receiver of the same hand-set.
- (4) The **ringer**, which gives warning of a call. These may be tone ringers which produce their sound electronically or mechanical ringers such as a bell or a buzzer. Some telephone sets incorporate a light or lamp which operates in conjunction with the ringer to provide a visual signal indicating an incoming call.
- (5) The **switching device** or “**switchhook**”, which interrupts or permits the flow of current from the network. It is usually operated by the hand-set being removed from or returned to a cradle.
- (6) The **dialling selector**, which enables the caller to obtain a connection. The selector may be of the push-button or keypad (tone) type or of the drum or rotary (pulse) type.

When separately presented, microphones and receivers (whether or not combined as hand-sets), and loudspeakers are classified in **heading 85.18** while bells and buzzers are classified in **heading 85.31**.

Telephone sets may incorporate or have fitted : a memory for storing and recalling telephone numbers; a visual display for showing the number dialled, incoming caller's number, date and time, and duration of a call; an extra loudspeaker and microphone to enable communication without using the hand-set; devices for automatically answering calls, transmitting a recorded message, recording incoming messages and playing back the recorded message on command; devices for holding a connection on line while communicating with a person on another telephone. Telephone sets incorporating these devices may also have keys or push-buttons which enable their operation, including a switching key which enables the telephone to be operated without removing the hand-set from the cradle. Many of these devices utilise a microprocessor or digital integrated circuits for their operation.

The heading covers all kinds of telephone sets including :

- (i) Cordless telephone sets which comprise a battery powered radio frequency transceiver hand-set which incorporates a dialling selector, switching key and a radio frequency transceiver base unit which is connected by line to the telephone network (other cordless telephone sets may not have hand-set but comprise a combined headphone and microphone which is connected to a portable combined battery powered radio frequency transceiver, dialling selector and switching key).
- (ii) Telephone sets which comprise a combined dialling selector and switching key unit (which is connected by line to the telephone network) and a combined headphone and microphone, presented together.

(B) Telephones for cellular networks or for other wireless networks.

This group covers telephones for use on any wireless network. Such telephones receive and emit radio waves which are received and retransmitted, e.g., by base stations or satellites.

These include, *inter alia* :

- (1) Cellular phones or mobile phones.
- (2) Satellite phones.

**(II) OTHER APPARATUS FOR TRANSMISSION OR RECEPTION OF VOICE,
IMAGES OR OTHER DATA, INCLUDING APPARATUS
FOR COMMUNICATION IN A WIRED OR WIRELESS NETWORK
(SUCH AS A LOCAL OR WIDE AREA NETWORK)**

(A) Base stations.

The most common types of base stations are those for cellular networks, which receive and transmit radio waves to and from cellular telephones or to other wired or wireless networks. Each base station covers a geographical area (a cell). If the user moves from one cell to another while telephoning, the call is automatically transferred from one cell to another without interruption.

(B) Entry-phone systems.

These systems usually consist of a telephone handset and keypad or a loudspeaker, a microphone and keys. These systems are usually mounted at the entrance of buildings housing a number of tenants. With these systems, visitors can call certain tenants, by pressing the appropriate keys and talk to them.

(C) Videophones.

Videophones for buildings, which are a combination consisting principally of a telephone set for line telephony, a television camera and a television receiver (transmission by line).

(D) Apparatus for telegraphic communication other than facsimile machines of heading 84.43.

These apparatus are essentially designed for converting characters, graphics, images or other data into appropriate electrical impulses, for transmitting those impulses, and at the receiving end, receiving these impulses and converting them either into conventional symbols or indications representing the characters, graphics, images or other data or into the characters, graphics, images or other data themselves.

Examples are :

- (1) **Apparatus for transmitting messages**, such as dial or keyboard transmitters and automatic transmitters (e.g., teleprinter or teletypewriter transmitters).
- (2) **Apparatus for receiving messages** (e.g., teletypewriter receivers). In some cases the receiver and the transmitter apparatus are combined into one receiver-transmitter.
- (3) **Picture telegraphic apparatus**. The ancillary photographic equipment used with this apparatus (e.g., developing equipment) falls in **Chapter 90**.

(E) Telephonic or Telegraphic Switching Apparatus.

(1) Automatic switchboards and exchanges.

These are of many types. The key feature of a switching system is the ability to provide, in response to coded signals, an automatic connection between users. Automatic switchboards and exchanges may operate by means of circuit switching, message switching or packet switching which utilize microprocessors to connect users by electronic means. Many automatic switchboards and exchanges incorporate analogue to digital converters, digital to analogue converters, data compression/decompression devices (codecs), modems, multiplexors, automatic data processing machines and other devices that permit the simultaneous transmission of both analogue and digital signals over the network, which enables the integrated transmission of speech, other sounds, characters, graphics, images or other data.

Some types of automatic switchboards and exchanges consist essentially of **selectors**, which select the line corresponding to the impulses received from the calling sets and establish the connection. They are operated automatically, either directly by the impulses from the calling set or via auxiliary apparatus such as **directors**.

The different types of selectors (pre-selectors, intermediate selectors, final selectors) and, where used, the directors, are often assembled in series and in groups of the same type on chassis which are then incorporated into the exchange on metal racks. Particularly in smaller-sized installations they may, however, all be mounted on a single rack to form a self-contained automatic exchange.

Automatic switchboards and exchanges may also incorporate such facilities as abbreviated dialling, call waiting, call forwarding, multi-party calling, voice mail, etc. These facilities are accessed from the user's telephone set through the telephone network.

They are used for the public network or for private networks that utilise a private branch exchange (PBX) which is connected to the public network. Automatic switchboards and exchanges may also be equipped with consoles similar to telephone sets for when intervention or service by an operator is required.

(2) Non-automatic switchboards and exchanges.

These consist of a frame on which are mounted the various manual switching devices. They require an operator to manually connect each call received by the switchboard or exchange. They comprise "call" or "clear" indicators for signalling that a call is being made or is completed; operators' telephone sets (sometimes specially mounted); switching devices (mounted jacks or sockets and plugs connected to a cord); and key switches electrically connected to the plugs and cords to enable the operator to answer the caller, supervise the progress of the call and note its completion.

(F) Transmitting and receiving apparatus for radio-telephony and radio-telegraphy.

This group includes :

- (1) Fixed apparatus for radio-telephony and radio-telegraphy (transmitters, receivers and transmitter-receivers). Certain types, used mainly in large installations, include special devices such as secrecy devices (e.g., spectrum inverters), multiplex devices (used for sending more than two messages simultaneously) and certain receivers, termed "diversity receivers", using multiple receiver technique to overcome fading.
- (2) Radio transmitters and radio receivers for simultaneous interpretation at multilingual conferences.
- (3) Automatic transmitters and special receivers for distress signals from ships, aircraft, etc.
- (4) Transmitters, receivers or transmitter/receivers of telemetric signals.
- (5) Radio-telephony apparatus, including radio-telephony receivers, for motor vehicles, ships, aircraft, trains, etc.
- (6) Portable receivers, usually battery operated, for example, portable receivers for calling, alerting or paging.

(G) Other communication apparatus.

This group includes apparatus which allows for the connection to a wired or wireless communication network or the transmission or reception of speech or other sounds, images or other data within such a network.

Communication networks include, *inter alia*, carrier-current line systems, digital-line systems and combinations thereof. They may be configured, for example, as public switched telephone networks, Local Area Networks (LAN), Metropolitan Area Networks (MAN) and Wide Area Networks (WAN), whether proprietary or open architecture.

This group includes :

- (1) Network interface cards (e.g., Ethernet interface cards).
- (2) Modems (combined modulators-demodulators).
- (3) Routers, bridges, hubs, repeaters and channel to channel adaptors.
- (4) Multiplexers and related line equipment (e.g., transmitters, receivers or electro-optical converters).
- (5) Codecs (data compressors/decompressors) which have the capability of transmission and reception of digital information.
- (6) Pulse to tone converters which convert pulse dialled signals to tone signals.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are also classified here.

*
* *

The heading also **excludes** :

- (a) Facsimile machines (**heading 84.43**).

- (b) Perforating machines, whether or not electric, used to perforate paper bands ready for use in automatic telegraphic apparatus (**heading 84.72**).
- (c) Induction coils for insertion in telephone or telegraph line circuits (**heading 85.04**).
- (d) Cells, batteries and accumulators (**heading 85.06 or 85.07**).
- (e) Telephone answering machines designed to operate with a telephone set but not forming an integral part of the set (**heading 85.19**).
- (f) Apparatus for the transmission or reception of radio-broadcasting or television signals (**headings 85.25, 85.27 or 85.28**).
- (g) Electric bells or indicators (e.g., luminous indicators operated by the dial of a telephone) (**heading 85.31**).
- (h) Relays and switching equipment, such as selectors for automatic telephone exchanges, of **heading 85.36**.
- (ij) Insulated electric wire, cable, etc., as well as optical fibre cables, made up of individually sheathed fibres, whether or not fitted with connectors, including cords with plugs for switchboards (**heading 85.44**).
- (k) Telecommunication satellites (**heading 88.02**)
- (l) Telephone call registers and counters (**Chapter 90**).
- (m) Carrier-current and other transmitters and receivers which form a single unit with analogue or digital telemetering instruments or apparatus, or which, together with the latter, constitute a functional unit within the meaning of Note 3 to Chapter 90 (**Chapter 90**).
- (n) Calculographs (time recorders) (**heading 91.06**).
- (o) Monopods, bipods, tripods and similar articles (**heading 96.20**).

◦
◦ ◦

Subheading Explanatory Note.

Subheading 8517.62

This subheading includes cordless handsets or base units, when presented separately.

85.18 - Microphones and stands therefor; loudspeakers, whether or not mounted in their enclosures; headphones and earphones, whether or not combined with a microphone, and sets consisting of a microphone and one or more loudspeakers; audio-frequency electric amplifiers; electric sound amplifier sets.

8518.10 - Microphones and stands therefor

- Loudspeakers, whether or not mounted in their enclosures :

8518.21 -- Single loudspeakers, mounted in their enclosures

8518.22 -- Multiple loudspeakers, mounted in the same enclosure

8518.29 -- Other

8518.30 - Headphones and earphones, whether or not combined with a microphone, and sets consisting of a microphone and one or more loudspeakers

8518.40 - Audio-frequency electric amplifiers

8518.50 - Electric sound amplifier sets

8518.90 - Parts

This heading covers microphones, loudspeakers, headphones, earphones and audio-frequency electric amplifiers of all kinds presented separately, regardless of the particular purpose for which such apparatus may be designed (e.g., telephone microphones, headphones and earphones, and radio receiver loudspeakers).

The heading also covers electric sound amplifier sets.

(A) MICROPHONES AND STANDS THEREFOR

Microphones convert sound vibrations into corresponding variations or oscillations of electric current, thus enabling them to be transmitted, broadcast or recorded. According to their working principle, they include :

- (1) **Carbon microphones.** These depend on the variations in the electrical resistance of carbon granules, caused by differences in the pressure exerted upon them when the diaphragm is displaced by sound waves. The carbon granules (or powder) are packed in a container between two electrodes, one of which constitutes or is fixed to the diaphragm.
- (2) **Piezo-electric microphones,** in which the pressure of the sound waves, transmitted by means of a diaphragm, sets up strains in a specially cut piece of crystal (e.g., quartz or rock crystal), thus causing the production of electric charges on the crystal. This type of element is often used in the "contact" microphone that is used in the pick-up of acoustic musical instruments such as guitars, pianos, brass and string orchestral instruments etc.
- (3) **Moving coil or ribbon microphones** (also known as dynamic microphones), in which the sound vibrations are brought to bear on a coil or an aluminium ribbon situated in a magnetic field, thus producing electric impulses by induction.

- (4) **Capacitance or electrostatic (condenser) microphones**, containing two plates (or electrodes), one fixed (the backplate) and one able to vibrate (the diaphragm), with an air gap between the two. The sound waves produce differences in capacity between the two plates.
- (5) **Thermal or hot wire microphones**, containing a heated resistance wire, the temperature of which, and therefore the resistance, is varied by the effect of the sound waves.

This heading also covers wireless microphone sets, each set consisting of one or more wireless microphones and a wireless receiver. The wireless microphone transmits a signal representing the sound waves it receives, by means of radio-transmission circuitry and an internal or external aerial. The receiver has one or more aerials to receive the transmitted radio waves and internal circuitry to convert the radio waves to an electrical audio signal, and may have one or more volume controls and output plugs.

There are many varied applications of microphones (e.g., in public address equipment; telephony; sound recording; aircraft or submarine detectors; trench listening devices; study of heart beats).

Generally the electric current output from microphones is in the form of an analogue signal, however some microphones incorporate an analogue to digital converter where the output is in the form of a digital signal. Microphones are sometimes rendered more sensitive by the addition of amplifiers (usually referred to as pre-amplifiers). Capacitors are sometimes fitted for tone correction. Some microphones require an electrical power supply for their operation. This power supply may be supplied from a mixing console or the sound recording apparatus or it may be in the form of a separate power pack. Power packs presented separately are not classified in this heading (**generally heading 85.04**). Microphones are also sometimes fitted with devices for concentrating the sound waves, and may have, as in the case of public address microphones, special **stands** for placing on a table, a desk, etc., or on the ground, or from which the microphones are suspended. Such stands or devices fall in this heading, even if presented separately, **provided** they are of a kind specially designed for use with or for fitting to microphones.

On the other hand, monopods, bipods, tripods and similar articles are excluded (**heading 96.20**).

(B) LOUDSPEAKERS, WHETHER OR NOT MOUNTED IN THEIR ENCLOSURES

The function of loudspeakers is the converse of that of microphones : they reproduce sound by converting electrical variations or oscillations from an amplifier into mechanical vibrations which are communicated to the air. They include the following types :

- (1) **Moving iron or moving coil loudspeakers**. In the moving iron loudspeaker an armature or reed of soft iron is placed in the field of a permanent magnet and under the influence of the coils in which the current passes. The field varies in accordance with this current, and a diaphragm fixed to the armature or reed sets up corresponding vibrations in the air. Moving coil loudspeakers consist essentially of a coil which is placed in the field of a permanent or electro-magnet and which is energised by the varying current. The coil is rigidly connected to a diaphragm.
- (2) **Piezo-electric loudspeakers**, based on the principle that certain natural or artificial crystals are subject to mechanical distortion when an electric current is applied to them. Such loudspeakers are usually known as "crystal loudspeakers".
- (3) **Electrostatic loudspeakers** (also known as **condenser-type loudspeakers**). These depend on the electrostatic reactions between two plates (or electrodes), one plate serving as a diaphragm.

Matching transformers and amplifiers are sometimes mounted together with loudspeakers. Generally the electrical input signal received by loudspeakers is in analogue form, however in some cases the input signal is in digital format. Such loudspeakers incorporate digital to analogue converters and amplifiers from which the mechanical vibrations are communicated to the air.

Loudspeakers may be mounted on frames, chassis or in cabinets of different types (often acoustically designed), or even in articles of furniture. They remain classified in this heading **provided** the main function of the whole is to act as a loudspeaker. Separately presented frames, chassis, cabinets, etc., also fall in this heading **provided** they are identifiable as being mainly designed for mounting loudspeakers; articles of furniture of Chapter 94 designed to receive loudspeakers in addition to their normal function remain classified in **Chapter 94**.

The heading includes loudspeakers designed for connection to an automatic data processing machine, when presented separately.

(C) HEADPHONES AND EARPHONES, WHETHER OR NOT COMBINED WITH A MICROPHONE, AND SETS CONSISTING OF A MICROPHONE AND ONE OR MORE LOUDSPEAKERS

Headphones and earphones are electroacoustic receivers used to produce low-intensity sound signals. Like loudspeakers, described above, they transform an electrical effect into an acoustic effect; the means used are the same in both cases, the only difference being in the powers involved.

The heading covers headphones and earphones, whether or not combined with a microphone, for telephony or telegraphy; headsets consisting of a special throat microphone and permanently-fixed earphones (used, for example, in aviation); line telephone handsets which are combined microphone/speaker sets for telephony and which are generally used by telephone operators; headphones and earphones for plugging into radio or television receivers, sound reproducing apparatus or automatic data processing machines.

The heading also covers sets consisting of a microphone and one or more loudspeakers which may be fitted together. A headphone or earphone may be included with the set for private listening. These sets are designed to be plugged into or connected to a central control system which includes an amplifier. These units may be used by participants at meetings or conferences.

The heading also includes prenatal listening apparatus which generally consist of a microphone, a headphone, a loudspeaker, a listening cone, on/off/volume control and battery compartment. This apparatus makes it possible to hear the sounds of a foetus as well as the mother's heartbeat. This apparatus does not include a sound recording device. The apparatus is designed for non-medical use.

However, electro-diagnostic apparatus of a type designed for use by professionals in medical, surgical or veterinary sciences is classified in **heading 90.18**.

(D) AUDIO-FREQUENCY ELECTRIC AMPLIFIERS

Audio-frequency amplifiers are used for the amplification of electrical signals of frequencies falling within the range of the human ear. The great majority are based on transistors or integrated circuits, but some are still based on thermionic valves. They are generally powered by a built-in power pack which may be fed from the mains or, particularly in the case of portable amplifiers, from electric accumulators or batteries.

The input signals to audio-frequency amplifiers may be derived from a microphone, a laser optical disc reader, a pick-up cartridge, a magnetic tape head, a radio feeder unit, a film sound track head or some other source of audio-frequency electric signals. Generally speaking, the output is fed into a loudspeaker, but this is not always the case (pre-amplifiers can feed into a succeeding amplifier or be incorporated in an amplifier).

Audio-frequency amplifiers may contain a volume control for varying the gain of the amplifier, and also commonly incorporate controls (bass boost, treble lift, etc.) for varying their frequency response.

The heading includes audio-frequency amplifiers used as repeaters in telephony or as measurement amplifiers.

High or intermediate frequency amplifiers are classified in **heading 85.43** as electrical appliances having an individual function. Audio mixers and equalisers are also classified in **heading 85.43**.

(E) ELECTRIC SOUND AMPLIFIER SETS

This heading also covers amplifier sets consisting of microphones, audio-frequency amplifiers and loudspeakers. This type of equipment is extensively used for public entertainment, public address systems, advertising vehicles, police vehicles or with certain musical instruments, etc. Similar systems are also used on large lorries (particularly those with trailers) for enabling the driver to hear irregular noises or sound signals from behind, which otherwise he could not hear above the sound of the engine.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* * *

The heading also **excludes** :

- (a) Airmen's headgear incorporating headphones with or without a microphone (**heading 65.06**).
- (b) Telephone sets (**heading 85.17**).
- (c) Hearing aids of **heading 90.21**.

85.19 - Sound recording or reproducing apparatus (+).

- 8519.20 - Apparatus operated by coins, banknotes, bank cards, tokens or by other means of payment
- 8519.30 - Turntables (record-decks)
- 8519.50 - Telephone answering machines
 - Other apparatus :
- 8519.81 - - Using magnetic, optical or semiconductor media
- 8519.89 - - Other

This heading covers apparatus for recording sound, apparatus for reproducing sound and apparatus that is capable of both recording and reproducing sound. Generally, sound is recorded onto or reproduced from an internal storage device or media (e.g., magnetic tape, optical media, semiconductor media or other media of heading 85.23).

Sound recording apparatus modify a recording medium so that **sound reproducing apparatus** can subsequently reproduce the original sound-wave (speech, music, etc.). This includes recording based on the receipt of a sound-wave or by other methods, e.g., by recording data sound files, downloaded from an Internet page or a compact disc by an automatic data processing machine, onto the internal memory (e.g., flash memory) of a digital audio device (e.g., MP3 player). Devices which record sound as digital code generally are not capable of reproducing sound unless they incorporate a means for converting the recording from digital code to an analogue signal.

(I) APPARATUS OPERATED BY COINS, BANKNOTES, BANK CARDS, TOKENS OR BY OTHER MEANS OF PAYMENT

These apparatus operate by coins, banknotes, bank cards, tokens or other means of payment and allow for the selection and playing of audio recordings in a chosen sequence or randomly. They are commonly referred to as “**juke boxes**”.

(II) TURNTABLES (RECORD-DECKS)

These apparatus rotate the discs mechanically or electrically. They may or may not incorporate a sound-head, but they do not include an acoustic device nor electrical means of amplifying sound (see “**record players**” below). They may be fitted with an automatic device enabling a series of records to be played in succession.

(III) TELEPHONE ANSWERING MACHINES

These apparatus are designed to operate in conjunction with a telephone set (but not forming an integral part of the set). They transmit a previously recorded message and may have the capability to record incoming messages left by callers.

(IV) OTHER APPARATUS USING MAGNETIC, OPTICAL OR SEMICONDUCTOR MEDIA

The apparatus of this group may be portable. They may also be equipped with, or designed to be attached to acoustic devices (loudspeakers, earphones, headphones) and an amplifier.

(A) Apparatus using magnetic media

This group includes apparatus which use tapes or other magnetic media. Sound is recorded by altering the magnetic properties of the media. The sound is reproduced by passing the medium in front of a magnetic sound-head. Examples include cassette-players, tape recorders and cassette recorders.

(B) Apparatus using optical media

This group includes apparatus which use optical media. Sound is recorded as digital code converted from amplified currents of variable intensity (analogue signal) onto the surface of the recording medium. Sound is reproduced using a laser to read such medium. Examples include compact disc players and minidisc players. These types also cover apparatus which uses media combining magnetic and optical technologies. An example of such an apparatus uses magneto-optical discs, on which the areas of varying reflectivity are created using a magnetic technology but are read using an optical (e.g., laser) beam.

(C) Apparatus using semiconductor media

This group includes apparatus which use semiconductor (e.g., solid-state non-volatile) media. Sound is recorded as digital code converted from amplified currents of variable intensity (analogue signal) on the recording medium. Sound is reproduced by reading such medium. The semiconductor media may be permanently installed in the apparatus or may be in the form of removable solid-state non-volatile storage media. Examples include flash memory audio players (e.g., certain MP3 players) which are portable battery operated apparatus consisting essentially of a housing incorporating a flash memory (internal or removable), a microprocessor, an electronic system including an audio-frequency amplifier, an LCD screen and control buttons. The microprocessor is programmed to use MP3 or similar file formats. The apparatus can be connected to an automatic data processing machine for downloading MP3 or similar files.

(D) Apparatus using any combination of magnetic, optical or semiconductor media

These apparatus incorporate devices which are capable of recording or reproducing by using any two or all of magnetic, optical or semiconductor media.

(V) OTHER SOUND RECORDING OR SOUND REPRODUCING APPARATUS

This group includes :

- (1) **Record players.** These apparatus produce sound from records (grooved discs) by electric amplifiers and loudspeakers, mechanical vibrations being converted into electrical vibrations by a sound-head (pick-up cartridge). They may be fitted with an automatic device enabling a series of records to be played in succession.

- (2) **Cinematographic sound recording apparatus** which record sound by **photoelectrical methods**. Sound may be photoelectrically recorded on film as a strip, either (a) of variable area or (b) of variable density.

Cinematographic sound recording apparatus comprises, in addition to the sound recording head, a magazine for holding the film, a motor driving mechanism for synchronising the speed of the film with that of the cinematographic camera working with it, and a film transport mechanism.

- (3) **Cinematographic sound reproducers.** These are equipped with a reader which incorporates a photoelectric sound-head and a charge-coupled device.
- (4) **Re-recording apparatus, for cinematography**, used, for example, for photoelectric or digital rerecording of sound tracks recorded by other means, e.g., magnetically, optically, or electronically.

*
* *

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the apparatus of this heading are classified in **heading 85.22**.

*
* *

The heading **excludes** :

- (a) Presses or injection moulding machinery for replicating recorded optical discs of plastics (**heading 84.77**).
- (b) Telephone answering machines forming an integral part of a telephone set (**heading 85.17**).
- (c) Separately presented microphones, loudspeakers, audio-frequency electric amplifiers and electric sound amplifier sets (**heading 85.18**).
- (d) Video recording or reproducing apparatus of **heading 85.21**.
- (e) Sound recording or reproducing apparatus combined in the same housing with reception apparatus for radio-broadcasting (**heading 85.27**).
- (f) Sound recording or reproducing apparatus combined with television receivers (**heading 85.28**).
- (g) Cinematographic cameras and projectors combined with sound recording or reproducing apparatus (**heading 90.07**).

○
○ ○

Subheading Explanatory Note.

Subheading 8519.81

This subheading covers apparatus using one or more of the following : magnetic, optical or semiconductor media.

[85.20]

85.21 - Video recording or reproducing apparatus, whether or not incorporating a video tuner.

8521.10 - Magnetic tape-type

8521.90 - Other

(A) RECORDING AND COMBINED RECORDING AND REPRODUCING APPARATUS

These are apparatus which, when connected to a television camera or a television receiver, record on media electric impulses (analogue signals) or analogue signals converted into digital code (or a combination of these) which correspond to the images and sound captured by a television camera or received by a television receiver. Generally the images and sound are recorded on the same media. The method of recording can be by magnetic or optical means and the recording media is usually tapes or discs.

The heading also includes apparatus which record, generally on a magnetic disc, digital code representing video images and sound, by transferring the digital code from an automatic data processing machine (e.g., digital video recorders).

In magnetic recording on tape the images and sound are recorded on different tracks on the tape whereas in magnetic recording on disc the images and sound are recorded as magnetic patterns or spots in spiral tracks on the surface of the disc.

In optical recording, digital data representing the images and sound are encoded by a laser onto a disc.

Video recording apparatus which receive signals from a television receiver also incorporate a tuner which enables selection of the desired signal (or channel) from the frequency band of signals transmitted by the television transmitting station.

When used for reproduction, the apparatus convert the recording into video signals. These signals are passed on either to a transmitting station or to a television receiver.

(B) REPRODUCING APPARATUS

These apparatus are designed only to reproduce images and sound directly on a television receiver. The media to be used in these instruments are prerecorded mechanically, magnetically or optically on special recording equipment. The following are examples of such apparatus :

- (1) Apparatus using discs in which the image and sound data are stored on the disc by various methods and picked up by a laser optical reading system, capacitive sensor, pressure sensor or magnetic head. Subject to Note 3 to Section XVI, apparatus which are capable of reproducing both video and audio recordings are to be classified in this heading.
- (2) Apparatus that decodes and converts into a video signal image data recorded on a light sensitive film (the sound being recorded by a magnetic process on the same film).

PARTS AND ACCESSORIES

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts and accessories of the apparatus of this heading are classified in **heading 85.22**.

*
* *

The heading **excludes** :

- (a) The recording media of **heading 85.23**.
- (b) Video cameras (**heading 85.25**).
- (c) Reception apparatus for television (whether or not incorporating radio-broadcast receivers or sound or video recording or reproducing apparatus) and video monitors and video projectors (**heading 85.28**).

85.22 - Parts and accessories suitable for use solely or principally with the apparatus of heading 85.19 or 85.21.

8522.10 - Pick-up cartridges

8522.90 - Other

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts and accessories suitable for use **solely or principally** with the apparatus of heading 85.19 or 85.21.

The range of parts and accessories classified here includes :

- (1) **Pick-up cartridges** for discs or mechanically recorded sound films. These convert mechanical vibrations (obtained with a stylus which follows the groove in the recorded medium) into electrical impulses.
- (2) **Laser optical reading systems.**
- (3) **Magnetic type sound-heads** for recording, play-back or erasing.
- (4) **Cassette shaped adapters** which enable sound reproduction from a portable optical disc player through a magnetic tape player.
- (5) **Photoelectric sound-heads.**
- (6) **Apparatus for winding or unwinding tapes.** Essentially this apparatus usually consists of two reel supporting brackets, at least one of which is fitted with a device enabling it to be rotated.
- (7) **Tone-arms, tables for turntables.**
- (8) **Mounted or unmounted worked sapphires and diamonds for styli.**
- (9) **Record cutters.** These are component parts of the recording apparatus. They convert sound vibrations into mechanical vibrations and modify the shape of the groove.
- (10) **Furniture**, specially designed and constructed for sound recording or reproducing apparatus.
- (11) **Cassettes for cleaning** the magnetic heads of sound or video recording or reproducing apparatus, whether or not put up in retail packings together with a cleaning solution.
- (12) **Other specialised parts and accessories for magnetic sound recording or reproducing apparatus**, e.g., magnetic erasing heads and bars and erasing machines; magnetic needle-points; scales showing point reached in dictation.
- (13) **Other specialised parts and accessories for video recording or reproducing apparatus**, e.g., video signal recording head drums; vacuum devices for maintaining the magnetic tape in contact with the recording heads or pick-ups; tape-winding devices; etc.

The heading **excludes** :

- (a) Spools, reels or similar supports, including video or audio cassettes without magnetic tape (classified according to their constituent material, for example, in **Chapter 39** or **Section XV**).
- (b) Electric motors for sound recording or reproducing apparatus, not combined with parts or accessories of such recording or reproducing apparatus (**heading 85.01**).
- (c) Recording media of **heading 85.23**.
- (d) Devices equipped with sound-heads which are used together with frame viewers on synchronisation tables (**heading 90.10**).

85.23 - Discs, tapes, solid-state non-volatile storage devices, "smart cards" and other media for the recording of sound or of other phenomena, whether or not recorded, including matrices and masters for the production of discs, but excluding products of chapter 37.

- Magnetic media :

8523.21 -- Cards incorporating a magnetic stripe

8523.29 -- Other

- Optical media :

8523.41 -- Unrecorded

8523.49 -- Other

- Semiconductor media :

8523.51 -- Solid-state non-volatile storage devices

8523.52 -- "Smart cards"

8523.59 -- Other

8523.80 - Other

This heading covers different types of media, whether or not recorded, for the recording of sound or of other phenomena (e.g., numerical data; text; images, video or other graphical data; software). Such media are generally inserted into or removed from recording or reading apparatus and may be transferred from one recording or reading apparatus to another.

The media of this heading may be presented recorded, unrecorded, or with some pre-recorded information, but capable of having more information recorded on them.

This heading includes media in intermediate forms (e.g., matrices, master discs, mother discs, stamper discs) for use in the mass-production of finished recorded media.

However, this heading does not include the device which records the data on the media or retrieves the data from the media.

In particular, this heading covers :

(A) MAGNETIC MEDIA

Products of this group are commonly in the form of discs, cards or tapes. They are made using different materials (generally plastics, paper or paperboard, or metal), either magnetic in themselves or coated with a magnetic material. This group includes, for example, cassette tapes and other tapes for tape recorders, tapes for camcorders and other video recording apparatus (e.g., VHS, Hi-8TM, mini-DV), diskettes and cards with a magnetic stripe.

This group does not include magneto-optical media.

(B) OPTICAL MEDIA

Products of this group are generally in the form of discs made of glass, metal or plastics with one or more light-reflective layers. Any data (sound or other phenomena) stored on such discs are read by means of a laser beam. This group includes recorded discs and unrecorded discs whether or not rewritable.

This group includes, for example, compact discs (e.g., CDs, V-CDs, CD-ROMs, CD-RAMs), digital versatile discs (DVDs).

This group also includes magneto-optical media.

(C) SEMICONDUCTOR MEDIA

Products of this group contain one or more electronic integrated circuits.

Thus, this group includes :

- (1) **Solid-state, non-volatile data storage devices for recording data from an external source** (See Note 5 (a) to this chapter). These devices (also known as “flash memory cards” or “flash electronic storage cards”) are used for recording data from an external source, or providing data to, devices such as navigation and global positioning systems, data collection terminals, portable scanners, medical monitoring appliances, audio recording apparatus, personal communicators, mobile phones, digital cameras and automatic data processing machines. Generally, the data are stored onto, and read from, the device once it has been connected to that particular appliance, but can also be uploaded onto or downloaded from an automatic data processing machine.

The media use only power supplied from the appliances to which they are connected, and require no battery.

These non-volatile data storage devices are comprised of, in the same housing, one or more flash memories (“FLASH E²PROM/EEPROM”) in the form of integrated circuits mounted on a printed circuit board, and incorporate a connecting socket to a host appliance. They may include capacitors, resistors and a microcontroller in the form of an integrated circuit. Example of solid state non-volatile storage devices are USB flash drives.

- (2) **“Smart cards”** (see Note 5 (b) to this chapter), which have embedded in them one or more electronic integrated circuits (a microprocessor, random access memory (RAM) or read-only memory (ROM)) in the form of chips. “Smart cards” may contain contacts, a magnetic stripe or an embedded antenna but do not contain any other active or passive circuit elements.

These “smart cards” also include certain articles known as “proximity cards or tags” if they meet the conditions of Note 5 (b) to this Chapter. Proximity cards/tags usually consist of an integrated circuit with a read only memory, which is attached to a printed antenna. The card/tag operates by creating a field interference (the nature of which is determined by a code contained in the read only memory) at the antenna in order to affect a signal transmitted from, and reflected back to, the reader. This type of card/tag does not transmit data.

(D) OTHER

This group includes gramophone records.

This heading **excludes** :

- (a) Photographic or cinematographic films with one or several sound tracks (**Chapter 37**).
- (b) Sensitised film for photoelectric recording (**heading 37.02**).
- (c) Articles intended for use as media for recording sound or other phenomena but not yet prepared as such; these are classified in their respective headings (for example, in **Chapter 39** or **48**, or **Section XV**).
- (d) Data-bearing paper tapes or punch cards, the recording of which has been made usually by perforation (**Chapter 48**).
- (e) Certain electronic memory modules (e.g., SIMMs (Single In-Line Memory Modules) and DIMMs (Dual In-Line Memory Modules)) which are to be classified by application of Note 2 to Section XVI (see the General Explanatory Note to this Chapter).
- (f) Cartridges for game machines (**heading 95.04**).

[85.24]

85.25 - Transmission apparatus for radio-broadcasting or television, whether or not incorporating reception apparatus or sound recording or reproducing apparatus; television cameras, digital cameras and video camera recorders.

8525.50 - Transmission apparatus

8525.60 - Transmission apparatus incorporating reception apparatus

8525.80 - Television cameras, digital cameras and video camera recorders

**(A) TRANSMISSION APPARATUS FOR RADIO-BROADCASTING
OR TELEVISION, WHETHER OR NOT INCORPORATING
RECEPTION APPARATUS OR SOUND RECORDING
OR REPRODUCING APPARATUS**

The apparatus for radio-broadcasting falling in this group must be for the transmission of signals by means of electro-magnetic waves transmitted through the ether without any line connection. On the other hand television apparatus falls here whether the transmission is by electro-magnetic waves or by line.

This group includes :

- (1) Transmitters for radio-broadcasting or television.
- (2) Relay apparatus used to pick up a broadcast and retransmit it and so increase the range (including television relay apparatus for mounting in aircraft).
- (3) Relay television transmitters for transmission, by means of an aerial and parabolic reflector, from the studio or site of an outside broadcast to the main transmitter.
- (4) Television transmitters for industrial use (e.g., for reading instruments at a distance, or for observation in dangerous localities). With this apparatus the transmission is often by line.

**(B) TELEVISION CAMERAS, DIGITAL CAMERAS AND
VIDEO CAMERA RECORDERS**

This group covers cameras that capture images and convert them into an electronic signal that is :

- (1) transmitted as a video image to a location outside the camera for viewing or remote recording (i.e., television cameras); or
- (2) recorded in the camera as a still image or as a motion picture (i.e., digital cameras and video camera recorders).

Many of the cameras of this heading may physically resemble the photographic cameras of heading 90.06 or the cinematographic cameras of heading 90.07. The cameras in heading 85.25 and the cameras in Chapter 90 typically include optical lenses to focus the image on a light-sensitive medium and adjustments to vary the amount of light entering the camera. However, photographic and cinematographic cameras of Chapter 90 expose images onto photographic film of Chapter 37, while the cameras of this heading convert the images into analogue or digital data.

The cameras of this heading capture an image by focusing the image onto a light-sensitive device, such as a complementary metal oxide semiconductor (CMOS) or charge-coupled device (CCD). The light-sensitive device sends an electrical representation of the images to be further processed into an analogue or digital record of the images.

Television cameras may or may not have an incorporated device for remote control of lens and diaphragm as well as for remote control of the horizontal and vertical movement of the camera (e.g., television cameras for television studios or for reporting, those used for industrial or scientific purposes, in closed circuit television (surveillance) or for supervising traffic). These cameras do not have any inbuilt capability of recording images.

Some of these cameras may also be used with automatic data processing machines (e.g., webcams).

“Travelling”, mobile mechanical equipment for television cameras, whether or not presented separately, is excluded from this heading (**heading 84.28**).

Also excluded from this heading is electrical equipment for long-distance control and focussing of television cameras, when presented separately (**heading 85.37**).

In **digital cameras and video camera recorders**, images are recorded onto an internal storage device or onto media (e.g., magnetic tape, optical media, semiconductor media or other media of heading 85.23). They may include an analogue/digital converter (ADC) and an output terminal which provides the means to send images to units of automatic data processing machines, printers, televisions or other viewing machines. Some digital cameras and video camera recorders include input terminals so that they can internally record analogue or digital image files from such external machines.

Generally, the cameras of this group are equipped with an optical viewfinder or a liquid crystal display (LCD), or both. Many cameras equipped with an LCD can employ the display both as a viewfinder when capturing images and as a screen for displaying images received from other sources or for reproducing images already recorded.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.29**.

*
* * *

The heading also excludes :

- (a) Apparatus of **heading 85.17**.
- (b) Separately presented radio-broadcasting reception apparatus for incorporation in relay apparatus (**heading 85.27**).
- (c) Satellite television receivers and satellite television reception systems (**heading 85.28**).
- (d) Special purpose vehicles permanently equipped with radio-broadcasting or television transmitters of this heading (generally **heading 87.05**).
- (e) Telecommunication satellites (**heading 88.02**).

85.26 - Radar apparatus, radio navigational aid apparatus and radio remote control apparatus.

8526.10 - Radar apparatus

- Other :

8526.91 -- Radio navigational aid apparatus

8526.92 -- Radio remote control apparatus

This heading includes :

- (1) Radio navigational aid equipment (e.g., radio beacons and radio buoys, with fixed or rotating aerials; receivers, including radio compasses equipped with multiple aerials or with a directional frame aerial). It also includes global positioning system (GPS) receivers.
- (2) Ship or aircraft navigational radar equipment (whether for mounting on the ship, aircraft, etc., or on land), including port radar equipment, and identification equipment placed on buoys, beacons, etc.
- (3) Blind approach landing or traffic control apparatus for airports. These are very complex. Certain types combine normal radio, radar and television devices showing at the control point the position and height of aircraft in the neighbourhood, and transmitting to the aircraft both the necessary instructions for landing and the radar picture of other aircraft in the vicinity.
- (4) Radar height measuring apparatus (radio altimeters).
- (5) Meteorological radar for tracking storm clouds or meteorological balloons.
- (6) Blind bombing equipment.
- (7) Radar devices for proximity fuses of shells or bombs.

The complete fuses with their detonator fall in **heading 93.06**.

- (8) Air raid warning radar apparatus.
- (9) Range and direction finding radar apparatus for naval or anti-aircraft guns.
- (10) Radar transponders; these receive radar pulses and transmit pulses often carrying superimposed intelligence in response to those it receives. Transponders are used on aircraft to enable them to be identified by radar operators, and in instrument balloons for the determination of range and direction and the transmission of meteorological information.
- (11) Radio apparatus for the remote control of ships, pilotless aircraft, rockets, missiles, toys, model ships or aircraft, etc.
- (12) Radio apparatus for the detonation of mines, or for the remote control of machines.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.29**.

*
* *

Special purpose vehicles permanently equipped with radar or other apparatus of this heading are **excluded** (generally **heading 87.05**).

85.27 - Reception apparatus for radio-broadcasting, whether or not combined, in the same housing, with sound recording or reproducing apparatus or a clock.

- Radio-broadcast receivers capable of operating without an external source of power :

8527.12 -- Pocket-size radio cassette-players

8527.13 -- Other apparatus combined with sound recording or reproducing apparatus

8527.19 -- Other

- Radio-broadcast receivers not capable of operating without an external source of power, of a kind used in motor vehicles :

8527.21 -- Combined with sound recording or reproducing apparatus

8527.29 -- Other

- Other :

8527.91 -- Combined with sound recording or reproducing apparatus

8527.92 -- Not combined with sound recording or reproducing apparatus but combined with a clock

8527.99 -- Other

The sound radio-broadcasting apparatus falling in this heading must be for the reception of signals by means of electro-magnetic waves transmitted through the ether without any line connection.

This group includes :

- (1) Domestic radio receivers of all kinds (table models, consoles, receivers for mounting in furniture, walls, etc., portable models, receivers, whether or not combined, in the same housing, with sound recording or reproducing apparatus or a clock).
- (2) Car radio receivers.
- (3) Separately presented reception apparatus for incorporation in relay apparatus of **heading 85.25**.
- (4) Pocket-size radio cassette-players (see Subheading Note 1 to this Chapter).
- (5) Stereo systems (hi-fi systems) containing a radio receiver, put up in sets for retail sale, consisting of modular units in their own separate housing, e.g., in combination with a CD player, a cassette recorder, an amplifier with equaliser, loudspeakers, etc. The radio receiver gives the system its essential character.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.29**.

*
* *

The heading **excludes**, *inter alia* :

- (a) Articles of heading **85.17** or **85.25**.
- (b) Special purpose vehicles permanently equipped with radio-broadcasting receivers of this heading (generally **heading 87.05**).

85.28 - Monitors and projectors, not incorporating television reception apparatus; reception apparatus for television, whether or not incorporating radio-broadcast receivers or sound or video recording or reproducing apparatus.

- Cathode-ray tube monitors :

8528.42 - - Capable of directly connecting to and designed for use with an automatic data processing machine of heading 84.71

8528.49 - - Other

- Other monitors :

8528.52 - - Capable of directly connecting to and designed for use with an automatic data processing machine of heading 84.71

8528.59 - - Other

- Projectors :

8528.62 - - Capable of directly connecting to and designed for use with an automatic data processing machine of heading 84.71

8528.69 - - Other

- Reception apparatus for television, whether or not incorporating radio-broadcast receivers or sound or video recording or reproducing apparatus :

8528.71 - - Not designed to incorporate a video display or screen

8528.72 - - Other, colour

8528.73 - - Other, monochrome

This heading includes :

- (1) Monitors and projectors, not incorporating television reception apparatus.
- (2) Television reception apparatus, whether or not incorporating radio-broadcast receivers or sound or video recording or reproducing apparatus, for the display of signals (television sets).
- (3) Apparatus for the reception of television signals, without display capabilities (e.g., receivers of satellite television broadcasts).

Monitors, projectors and television sets utilize different technologies, such as CRT (cathode-ray tube), LCD (liquid crystal display), DMD (digital micromirror device), OLED (organic light-emitting diodes) and plasma, to display images.

Monitors and projectors may be capable of receiving a variety of signals from different sources. However, if they incorporate a television tuner they are considered to be reception apparatus for television.

**(A) MONITORS CAPABLE OF DIRECTLY CONNECTING TO AND
DESIGNED FOR USE WITH AN AUTOMATIC DATA PROCESSING
MACHINE OF HEADING 84.71**

This group includes monitors which are capable of accepting a signal from the central processing unit of an automatic data processing machine and provide a graphical presentation of the data processed. These monitors are distinguishable from other types of monitors (see (B) below) and from television receivers.

The monitors of this group may be characterised by the following features :

- (i) They usually display signals of graphics adaptors (monochrome or colour) which are integrated in the central processing unit of the automatic data processing machine;
- (ii) They do not incorporate a channel selector or video tuner;
- (iii) They are fitted with connectors characteristic of data processing systems (e.g., RS-232C interface, DIN, D-SUB, VGA, DVI, HDMI or DP (display port) connectors);
- (iv) The viewable image size of these monitors does not generally exceed 76 cm (30 inches);
- (v) They have a display pitch size (usually smaller than 0.3 mm) suitable for close proximity viewing;
- (vi) They may have an audio circuit and built-in speakers (generally, 2 watts or less in total);
- (vii) They usually have control buttons situated in the front panel;
- (viii) They usually cannot be operated by a remote control;
- (ix) They may incorporate tilt, swivel and height adjusting mechanisms, glare-free surfaces, flicker-free display, and other ergonomic design characteristics to facilitate prolonged periods of viewing at close proximity to the monitor;
- (x) They may utilize wireless communication protocol to display data from an automatic data processing machine of heading 84.71.

(B) MONITORS OTHER THAN THOSE CAPABLE OF DIRECTLY CONNECTING TO AND DESIGNED FOR USE WITH AN AUTOMATIC DATA PROCESSING MACHINE OF HEADING 84.71

This group includes monitors which are capable of receiving signals when connected directly to the video camera or recorder by means of composite video, s-video or co-axial cables, so that all the radio-frequency circuits are eliminated. They are typically used by television companies or for closed-circuit television (airports, railway stations, factories, hospitals, etc.). They can, moreover, have separate inputs for red (R), green (G) and blue (B), or be coded in accordance with a particular standard (NTSC, SECAM, PAL, DMAC, etc.). For reception of coded signals, the monitor must be equipped with a decoding device covering (the separation of) the R, G and B signals. They are not fitted with connectors characteristic of data processing systems, and they do not incorporate tilt, swivel and height adjusting mechanisms, glare-free surfaces, flicker-free display, and other ergonomic design characteristics to facilitate prolonged periods of viewing at close proximity to the monitor. They do not incorporate a channel selector or video tuner.

(C) PROJECTORS

Projectors enable the image normally reproduced on the screen of a television receiver or of a monitor to be projected on an external surface. They may be based on CRT or flat panel (e.g., DMD, LCD, plasma) technology.

(D) RECEPTION APPARATUS FOR TELEVISION

This group includes apparatus whether or not designed to incorporate a video display or screen, such as :

- (1) Receivers of television broadcasts (terrestrial, cable or satellite) which do not include a display device (CRT, LCD, etc.). These apparatus receive signals and convert them into a signal suitable for display. They may also incorporate a modem for connection to the Internet.

These receivers are intended to be used with video recording or reproducing apparatus, monitors, projectors or televisions. However, devices which simply isolate high-frequency television signals (sometimes called video tuners) are to be classified as parts in **heading 85.29**.

- (2) Television receivers for industrial use (e.g., for reading instruments at a distance, or for observation in dangerous localities). With this apparatus the transmission is often by line.
- (3) Television receivers of all kinds (LCD, plasma, CRT, etc.) used in the home (television sets), whether or not incorporating a radio-broadcast receiver, video cassette recorder, DVD player, DVD recorder, satellite receiver, etc.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.29**.

*
* *

The heading **excludes**, *inter alia* :

- (a) Video recording or reproducing apparatus (**heading 85.21**).
- (b) Special purpose vehicles (e.g., vans for broadcasting) permanently equipped with television receivers or other apparatus of this heading (generally **heading 87.05**).
- (c) Cinematographic projectors (**heading 90.07**) and image projectors of **heading 90.08**.

85.29 - Parts suitable for use solely or principally with the apparatus of headings 85.25 to 85.28.

8529.10 - Aerials and aerial reflectors of all kinds; parts suitable for use therewith

8529.90 - Other

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts of the apparatus of the four preceding headings. The range of parts classified here includes :

- (1) Aerials of all kinds and aerial reflectors, transmission and reception.
- (2) Rotor systems for radio-broadcast or television-broadcast receiving aerials consisting essentially of an electric motor mounted on the aerial mast to rotate it and a separate control box to aim and position the aerial.
- (3) Cases and cabinets specialised to receive the apparatus of headings 85.25 to 85.28.
- (4) Aerial filters and separators.
- (5) Frames (chassis).

*
* *

This heading **excludes** :

- (a) Aerial masts (e.g., **heading 73.08**).
- (b) High-tension generators (**heading 85.04**).
- (c) Accumulators for cellular phones also referred to as mobile phones (**heading 85.07**).
- (d) Parts equally suitable for use principally with the goods of heading 85.17 and of headings 85.25 to 85.28 (**heading 85.17**).
- (e) Earphones and headphones, whether or not combined with a microphone, for telephony or telegraphy as well as earphones and headphones which can be connected to radio or television receivers (**heading 85.18**).
- (f) Cathode-ray tubes and parts thereof (e.g., deflection coils) (**heading 85.40**).
- (g) Aerial amplifiers and radio-frequency oscillator units (**heading 85.43**).
- (h) Lenses and optical filters for television cameras (**heading 90.02**).
- (ij) Monopods, bipods, tripods and similar articles (**heading 96.20**).

85.30 - Electrical signalling, safety or traffic control equipment for railways, tramways, roads, inland waterways, parking facilities, port installations or airfields (other than those of heading 86.08).

8530.10 - Equipment for railways or tramways

8530.80 - Other equipment

8530.90 - Parts

This heading covers all electrical equipment used for controlling the traffic on railways, hovertrain systems, roads or inland waterways. To a certain extent similar equipment is also used for controlling ships or boats (e.g., in harbours), aircraft (e.g., at airports) and for parking facilities, and this equipment is also covered by the heading. But the heading **excludes** similar equipment which is operated mechanically, even if incorporating minor electrical features (e.g., mechanical signals with electrical means of illumination, or hydraulic or pneumatic controls set in motion electrically); this falls in **heading 86.08**.

Static signs, even if lit electrically (e.g., illuminated panels used as direction signs), are not regarded as traffic control equipment. They are therefore not covered by this heading but are classified in their own appropriate headings (**headings 83.10, 94.05**, etc.).

(A) **Railway or tramway equipment (including equipment for underground mine railways) and hovertrain transport system equipment.** This falls in two groups :

(1) **Signalling or safety equipment.** This consists of the actual signals (usually a number of coloured lights, or moving arms or discs, mounted on a post or in a framework of some sort), the actuating equipment and the control equipment (whether hand-operated or automatic).

Signalling equipment of this kind is used for the control of traffic at stations, junctions, level crossings, etc., or for controlling the passage of a number of trains over the same sections of line. The latter type includes automatic section signalling equipment, the passage of a train from one section of a track to the next automatically operating the necessary signals.

The heading also covers equipment for signalling to stations or to signal boxes (either by means of a warning bell or a visual display) the position or approach of trains, or the position taken up by points, signals, etc.

Certain types of signalling equipment incorporate means of passing the signal direct to the cab of the engine itself. Contacts or sensors mounted on the line actuate a mechanism on the engine as it passes, and either give visual or audible warning to the driver in the cab itself or, in some cases, operate the controls of the engine to bring it to a stop. That part of the equipment mounted in the engine is not covered by this heading.

(2) **Track control equipment**, e.g., equipment for the remote control of points. This equipment consists essentially of the actual operating equipment (including in some cases locking devices) which is mounted on the track near each set of points, and the control panel and equipment mounted at some centralised control point (signal box, etc.).

This group includes certain complex equipment for the automatic control of wagons in marshalling yards, e.g., progression relay storage equipment and wagon movement control apparatus ("ball robot") installed in some big marshalling yards.

(B) **Equipment for roads, inland waterways or parking facilities.** This group includes :

(1) **Automatic level crossing signals**, e.g., winking lights, bells, illuminated stop signs.

Electrical equipment for operating gates or barriers is also covered by this heading.

(2) **Traffic lights.** These usually consist of a system of coloured lights installed at cross-roads, junctions, etc. They comprise the actual light installations, control equipment and means of operating the controls. The lights may be hand-operated (lights operated by a traffic policeman or, on certain pedestrian crossings, by the pedestrian) or automatic (lights operated on a time basis, and lights operated by the passage of vehicles, either by means of photoelectric cells or by contacts placed on the road).

(C) **Electrical traffic control equipment for port installations or airfields.**

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* * *

The heading **does not cover** electrical lighting or signalling equipment for mounting on cycles or motor vehicles (**heading 85.12**).

85.31 - Electric sound or visual signalling apparatus (for example, bells, sirens, indicator panels, burglar or fire alarms), other than those of heading 85.12 or 85.30.

8531.10 - Burglar or fire alarms and similar apparatus

8531.20 - Indicator panels incorporating liquid crystal devices (LCD) or light-emitting diodes (LED)

8531.80 - Other apparatus

8531.90 - Parts

With the **exception** of signalling apparatus used on cycles or motor vehicles (**heading 85.12**) and that for traffic control on roads, railways, etc. (**heading 85.30**), this heading covers all electrical apparatus used for signalling purposes, whether using sound for the transmission of the signal (bells, buzzers, hooters, etc.) or using visual indication (lamps, flaps, illuminated numbers, etc.), and whether operated by hand (e.g., door bells) or automatically (e.g., burglar alarms).

Static signs, even if lit electrically (e.g., lamps, lanterns, illuminated panels, etc.) are not regarded as signalling apparatus. They are therefore not covered by this heading but are classified in their own appropriate headings (**headings 83.10, 94.05**, etc.).

The heading includes, *inter alia* :

(A) **Electric bells, buzzers, door chimes, etc.** The bells consist essentially of an electro-magnetically operated appliance which causes a small hammer to vibrate and strike a bell dome. Buzzers are similar but without the bell dome. Both are used very extensively for domestic purposes (e.g., as door bells), and in offices, hotels, etc. The heading also covers electric door chimes in which one or more metal tubes are struck, emitting a musical note or series of musical notes, and electrically operated church bells, **other than** carillons suitable for playing music (**Chapter 92**).

Electric bells and door chimes are usually designed to be operated from a low tension supply (primary cell or battery), but in certain cases they incorporate a transformer to step down the mains voltage.

(B) **Electric sound signalling apparatus, horns, sirens, etc.** The sound is produced by a vibrating reed, by a rotating disc set in motion electrically or electronic sound generator; they include factory sirens, air raid sirens, ships' sirens, etc.

(C) **Other electrical signalling apparatus** (winking or intermittent lights, etc.) for aircraft, ships, trains or other vehicles (**other than** for cycles or motor vehicles **heading 85.12**), but not radio or radar apparatus of **heading 85.26**.

(D) **Indicator panels and the like.** These are used (e.g., in offices, hotels and factories) for calling personnel, indicating where a certain person or service is required, indicating whether a room is free or not. They include :

(1) **Room indicators.** These are large panels with numbers corresponding to a number of rooms. When a button is pressed in the room concerned the corresponding number is either lit up or exposed by the falling away of a shutter or flap.

- (2) **Number indicators.** The signals appear as illuminated figures on the face of a small box; in some apparatus of this kind the calling mechanism is operated by the dial of a telephone. Also clock type indicators in which the numbers are indicated by a hand moving round a dial.
- (3) **Office indicators**, for example, those used to indicate whether the occupant of a particular office is free or not. Some types are merely a simple "come in" or "engaged" sign illuminated at will by the occupant of the office.
- (4) **Lift indicators.** These indicate, on an illuminated board, where the lift is and whether it is going up or down.
- (5) **Engine room telegraph apparatus for ships.**
- (6) **Station indicating panels** for showing the times and platforms of trains.
- (7) **Indicators for race courses, football stadiums, bowling alleys, etc.**

Certain of these indicator panels, etc., also incorporate bells or other sound signalling devices.

The heading **does not cover** public maps of roads or railways in which a particular place, road, section or route is illuminated on pressing an appropriate button, nor electric advertising signs.

- (E) **Burglar alarms.** These consist of two parts : a detecting part, and a signalling part (bell, buzzer, visual indicator, etc.) which is set off automatically when the detecting part operates. Burglar alarms operate by various means, e.g. :
 - (1) **By electrical contacts** which are operated by stepping on a certain part of the floor, opening a door, breaking or touching fine wires, etc.
 - (2) **By capacitance effects.** These are used often in connection with safes; the safe acts as one plate of a capacitor whose capacitance is affected by the approach of any body, thus upsetting the electrical circuit and setting off the alarm.
 - (3) **Photoelectric devices.** A ray (often of infra-red light) is focussed on a photoelectric cell; when the ray is interrupted, the change in current in the photoelectric cell circuit sets off the alarm.
- (F) **Fire alarms.** Automatic alarms also consist of two parts : a detecting part, and a signalling part (bell, buzzer, visual indicator, etc.). They include :
 - (1) **Apparatus operated by a fusible product** (wax or special alloy) which melts when the temperature rises above a certain point, thus allowing electrical contacts to close and set off the alarm.

- (2) **Apparatus based on the expansion of a bi-metal strip, liquid or gas** - expansion beyond a certain point operating the alarm. In one type, the expansion of a gas forces a piston to move in a cylinder; a valve is incorporated so that a slow expansion does not set off the alarm, but only a sudden expansion due to a sudden rise in temperature.
- (3) **Apparatus based on the variation in the electrical resistance** of an element subjected to a change in temperature.
- (4) **Apparatus based on photoelectric cells**. A ray of light is focussed on the cell and, if obscured to a predetermined extent by smoke, operates the alarm. Similar apparatus fitted with a graduated indicator or a recording system fall in **Chapter 90**.

In addition to the automatic fire alarms, the heading also covers non-automatic alarms, such as are mounted in streets, for calling the fire brigade.

- (G) **Electric vapour or gas alarms**, consisting of a detector and a sound or visual alarm, to warn of the presence of hazardous gaseous mixtures (e.g., natural gas, methane).
- (H) **Flame alarms** (flame detectors) incorporating a photoelectric cell which operates the alarm through a relay when the flame lights or goes out. Detectors not incorporating electric sound or visual alarm devices are classified in **heading 85.36**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

*
* *

The heading also **excludes** :

- (a) Switches and switch-panels, whether or not incorporating simple indicating lights (**heading 85.36** or **85.37**).
- (b) Fire alarms incorporating smoke detectors containing a radioactive substance (**heading 90.22**).
- (c) LCD monitors or television receivers (**heading 85.28**).

85.32 - Electrical capacitors, fixed, variable or adjustable (pre-set) (+).

8532.10 - Fixed capacitors designed for use in 50/60 Hz circuits and having a reactive power handling capacity of not less than 0.5 kvar (power capacitors)

- Other fixed capacitors :

8532.21 -- Tantalum

8532.22 -- Aluminium electrolytic

8532.23 -- Ceramic dielectric, single layer

8532.24 -- Ceramic dielectric, multilayer

8532.25 -- Dielectric of paper or plastics

8532.29 -- Other

8532.30 - Variable or adjustable (pre-set) capacitors

8532.90 - Parts

Electrical capacitors (or condensers) consist, in principle, of two conducting surfaces separated by an insulating material (dielectric), e.g., air, paper, mica, oil, resins, rubber and plastics, ceramics or glass.

They are used for various purposes in many branches of the electrical industry (e.g., to improve the power factor of AC circuits, to produce phase-shifted currents for rotating fields in induction motors, to protect electrical contacts from the effects of arcing, for storing and releasing given quantities of electricity, in oscillating circuits, in frequency filters, and very widely in the radio, television or telephone industries or for industrial electronic equipment).

Their characteristics (shape, size, capacitance, nature of dielectric, etc.) vary according to their intended use. The heading, however, covers all capacitors irrespective of their type and method of manufacture and whatever their intended use (including standard capacitors used in laboratories or in numerous measuring instruments, specially made within fine limits and designed to remain constant during use).

The heading also covers capacitors grouped together on a chassis or in a container (e.g., certain large power factor capacitors and capacitor boxes consisting of a number of standard capacitors with means of connecting them together, in series or in parallel, to obtain any required capacitance).

(A) FIXED CAPACITORS

Fixed capacitors are those in which the capacitance cannot be varied. The main types are : dry capacitors, "oil" impregnated capacitors, "gas" impregnated capacitors, "oil" filled capacitors and electrolytic capacitors.

- (1) In dry capacitors the plates and dielectric are usually in the form of superimposed plates or rolled strip or foil. In certain dry capacitors a metal covering is applied by a chemical or thermic process to a fixed dielectric. Dry capacitors may be enclosed in a clamp-equipped box or be used without a box.

- (2) "Oil" impregnated capacitors are similar to dry capacitors but the dielectric, usually of plastic film or plastic film and paper, is impregnated with oil or other liquid.
- (3) "Gas" impregnated capacitors are capacitors consisting of two or more electrodes separated by a gas, other than air, which serves as a dielectric.
- (4) In some cases the capacitor ("oil filled capacitor") is enclosed in a container filled with oil or other suitable liquid, and many incorporate accessory devices such as pressure gauges and safety valves.
- (5) In electrolytic capacitors, one of the plates is generally of aluminium or tantalum while the role of the other is fulfilled by a suitable electrolyte to which the current is led by means of an electrode, sometimes similar in form to the aluminium or tantalum plate. The electrolytic action produces on the aluminium or tantalum a thin layer of complex chemical compounds which thereafter constitutes the dielectric. The capacitor is sometimes enclosed in a container, but generally the outer electrode itself constitutes the container; these capacitors are often fitted with a pin base similar to that of a valve. Certain capacitors of this type containing a pasty form of electrolyte are also called "dry electrolytic capacitors".

(B) VARIABLE CAPACITORS

Variable capacitors are those in which the capacitance can be varied at will. In most cases air is the dielectric, and the plates usually consist of two groups of metal plates, one group fixed while the other, mounted on an axis, can be turned so that its plates can pass between the fixed plates. The degree to which the mobile plates (rotors) are turned and overlap with the fixed plates (stators) varies the capacitance of the capacitor.

(C) PRE-SET OR ADJUSTABLE CAPACITORS

Pre-set or adjustable capacitors (including trimming capacitors) are those in which the capacitance can be adjusted within narrow limits to a precise value. This adjustment can be made in different ways. In certain types the distance between the plates may be varied by means of a screw. Other types consist of two metal cylinders, one of which can be moved to a variable extent within the other or of two mutually moved semicircles. Usually, the dielectrics used are, for example, mica, ceramics, plastics or air.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of capacitors are also classified here.

*
* *

The heading **does not cover** certain synchronous motors used for power factor improvement, even though they are often called "synchronous capacitors" (**heading 85.01**).

○
○ ○

Subheading Explanatory Notes.

Subheading 8532.23

This subheading covers single layer ceramic dielectric fixed capacitors, which are in the form of discs or tubes.

Subheading 8532.24

This subheading covers multilayered ceramic dielectric fixed capacitors, which have connecting leads or are in the form of chips.

85.33 - Electrical resistors (including rheostats and potentiometers), other than heating resistors.

8533.10 - Fixed carbon resistors, composition or film types

- Other fixed resistors :

8533.21 -- For a power handling capacity not exceeding 20 W

8533.29 -- Other

- Wirewound variable resistors, including rheostats and potentiometers :

8533.31 -- For a power handling capacity not exceeding 20 W

8533.39 -- Other

8533.40 - Other variable resistors, including rheostats and potentiometers

8533.90 - Parts

(A) **Resistors (resistances).** These are conductors whose function is to provide a given electrical resistance in a circuit (e.g., to limit the current flowing). They vary greatly in size and shape, and in the materials of which they are made. They may be made of metals (in the form of bars, shapes or wire, often coiled in bobbins) or of carbon in the form of rods, or of carbon, silicon carbide, metal or metal oxide film. They may be obtained in the form of individual components by a printing process. Certain resistors may be fitted with a number of terminals allowing the whole or part to be included in the circuit.

The heading includes :

- (1) **Oil immersed resistors.**
- (2) **Carbon resistance lamps**, in the form of an electric light bulb but with a special carbon filament; however, carbon filament lamps for lighting purposes are **excluded (heading 85.39)**.
- (3) **Barretters** consisting of iron filaments assembled in a glass tube filled with hydrogen or helium; these have the property of varying automatically within certain limits and so keeping the current constant.
- (4) **Standard resistors** used for comparison and measuring purposes (e.g., in laboratories); also resistance boxes consisting of a number of such resistors assembled in a box with switching or terminal arrangements for connecting any required combinations of the resistors into the circuit.
- (5) **Non-linear resistors** : depending on temperature (thermistors) with a negative or positive temperature coefficient (usually mounted in glass tubes), and non-linear resistors depending on voltage (varistors/VDR), but **not including** varistor diodes of **heading 85.41**.
- (6) **Resistors known as "strain gauges"** being the sensitive elements of a strain measuring instrument.

The heading **excludes** :

- (a) Heating resistors (**heading 85.16 or 85.45**).
 - (b) Light dependent resistors (**heading 85.41**).
- (B) **Rheostats.** These are variable resistors with a sliding contact or other means enabling the value of resistance in the circuit to be varied at will. They include, slide wire rheostats with a cursor sliding over a resistance coil; step-by-step rheostats; hydro-rheostats with movable electrodes immersed in a liquid conductor; automatic rheostats (e.g., with minimum or maximum current or voltage operating mechanisms); and centrifugal rheostats. Certain rheostats are designed for particular purposes (e.g., theatre dimmers used in a lighting circuit to extinguish the lighting slowly; and motor starters and controllers consisting of a number of resistors with the necessary switching arrangement for switching in or out one or more resistors in the motor circuit). Nevertheless, they remain classified here.
- (C) **Potentiometers.** These consist of a fixed resistor between two contacts and a sliding tapping which can make contact on any point of the resistor.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the resistors of this heading are also classified here.

85.34 - Printed circuits.

In accordance with Note 6 to this Chapter, this heading covers the circuits which are made by forming on an insulating base, by any printing process (conventional printing or embossing, plating-up, etching, etc.), conductor elements (wiring), contacts or other printed components such as inductances, resistors and capacitors ("passive" elements), **other than** elements which can produce, rectify, detect, modulate or amplify electric signals, such as diodes, triodes or other "active" elements. Some basic or "blank" circuits may comprise only printed conductor elements generally consisting of thin uniform strips or wafers with, if appropriate, connectors or contact devices. Others combine several of the above elements according to a pre-established pattern.

The insulating base material is generally flat but may also be in the shape of a cylinder, a truncated cone, etc. The circuit may be printed on one or both sides (double circuits). Several printed circuits may be assembled in multiple layers and interconnected (multiple circuits).

The heading also covers thin- or thick-film circuits consisting solely of passive elements.

Thin-film circuits are formed by the deposition on glass or ceramic plates of specific patterns of metallic and dielectric film, by vacuum evaporation, cathode sputtering or chemical methods. The patterns may be formed by deposition through masks or by deposition of a continuous sheet with subsequent selective etching.

Thick-film circuits are formed by screen printing onto ceramic plates of similar patterns, using pastes (or inks) containing mixtures of powdered glass, ceramics and metals with suitable solvents. The plates are then furnace-fired.

Printed circuits may be provided with holes or fitted with non-printed connecting elements either for mounting mechanical elements or for the connection of electrical components not obtained during the printing process. Film circuits are generally supplied in metallic, ceramic or plastic capsules which are fitted with connecting leads or terminals.

Individual passive components such as inductances, capacitors and resistors obtained by any printing process are not regarded as printed circuits of this heading but are classifiable in their own appropriate headings (e.g., **heading 85.04, 85.16, 85.32 or 85.33**).

Circuits on which mechanical elements or electrical components have been mounted or connected are not regarded as printed circuits within the meaning of this heading. They generally fall to be classified in accordance with Note 2 to Section XVI or Note 2 to Chapter 90, as the case may be.

85.35 - Electrical apparatus for switching or protecting electrical circuits, or for making connections to or in electrical circuits (for example, switches, fuses, lightning arresters, voltage limiters, surge suppressors, plugs and other connectors, junction boxes), for a voltage exceeding 1,000 volts.

8535.10 - Fuses

- Automatic circuit breakers :

8535.21 -- For a voltage of less than 72.5 kV

8535.29 -- Other

8535.30 - Isolating switches and make-and-break switches

8535.40 - Lightning arresters, voltage limiters and surge suppressors

8535.90 - Other

This heading covers electrical apparatus generally used in power distribution systems. The provisions of Explanatory Note to heading 85.36 apply, *mutatis mutandis*, as regards the technical characteristics and the functioning of apparatus for switching or protecting electrical circuits, or for making connections to or in electrical circuits. The heading covers apparatus of the kinds described in Explanatory Note to heading 85.36, when for a voltage exceeding 1,000 volts.

These include :

- (A) **Fuses** and **automatic circuit breakers** which automatically interrupt the current when its intensity or voltage exceeds a certain limit.
- (B) **Make-and-break switches** specialised for high tension circuits. They are usually of a complex and robust construction having special devices to prevent arcing, and they may have multiple contacts or be remote controlled by different means (e.g., levers, servomotors). These switches are often mounted in containers of metal or insulating material, which have been filled with a fluid (e.g., oil) or a gas, or in which a vacuum has been created.
- (C) **Lightning arresters**. These are protective devices designed to protect high tension cables or electrical installations from the effects of lightning; they consist of a device normally insulating to the high tension line but which breaks down and becomes a conducting path to earth in the event of exceptionally high voltages which otherwise would damage the line or electrical installation. Among the many types are metal oxide arresters, carbon granule arresters, arresters consisting of a horned spark gap or guard shield mounted on an insulator or an insulator chain, electrolytic arresters, etc. However, lightning arresters based on the principle of radioactivity are classified in **heading 90.22**.
- (D) **Voltage limiters**. These are devices intended to ensure that the potential difference between two conductors or between the conductors and the earth does not exceed a predetermined value. These devices are sometimes constructed in the same manner as discharge lamps, but not being usable for lighting purposes, they cannot be considered as lamps.

However, the heading **does not cover** automatic voltage regulators (**heading 90.32**).

- (E) **Isolating switches** are used for isolating sections of a line; they are of the slow break type, but unlike make-and-break switches they are not generally intended to be used when the circuit is loaded.

- (F) **Surge or spike suppressors.** These are assemblies of coils, capacitors, etc., inserted in series or in parallel with a line or electrical apparatus to absorb high frequency surges. Simple coils or capacitors used on their own for this purpose remain classified in their respective headings.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.38**.

*
* * *

The heading **excludes** assemblies (**other than** simple switch assemblies) of the apparatus mentioned above (**heading 85.37**).

85.36 - Electrical apparatus for switching or protecting electrical circuits, or for making connections to or in electrical circuits (for example, switches, relays, fuses, surge suppressors, plugs, sockets, lamp-holders and other connectors, junction boxes), for a voltage not exceeding 1,000 volts; connectors for optical fibres, optical fibre bundles or cables.

8536.10 - Fuses

8536.20 - Automatic circuit breakers

8536.30 - Other apparatus for protecting electrical circuits

- Relays :

8536.41 -- For a voltage not exceeding 60 V

8536.49 -- Other

8536.50 - Other switches

- Lamp-holders, plugs and sockets :

8536.61 -- Lamp-holders

8536.69 -- Other

8536.70 - Connectors for optical fibres, optical fibre bundles or cables

8536.90 - Other apparatus

This heading covers electrical apparatus for a voltage not exceeding 1,000 volts generally used for dwellings or industrial equipment. However, **heading 85.35** covers the apparatus described below for a voltage exceeding 1,000 volts. This heading also covers connectors for optical fibres, optical fibre bundles or cables.

The heading includes :

(I) APPARATUS FOR SWITCHING ELECTRICAL CIRCUITS

These apparatus consist essentially of devices for making or breaking one or more circuits in which they are connected, or for switching from one circuit to another; they may be known as single pole, double pole, triple pole, etc., according to the number of switch circuits incorporated. This group also includes change-over switches and relays.

(A) The **switches** of this heading include small switches for use in radio apparatus, electrical instruments, etc., switches of a kind used in domestic electrical wiring (e.g., tumbler switches, lever operated switches, rotary switches, pendant switches, push button switches) and switches for industrial application (such as, limit switches, cam switches, microswitches and proximity switches).

Switches operated by the opening or closing of a door and automatic thermo-electric switches (starters) for starting fluorescent lamps are classified here.

Other examples classified here include electronic AC switches consisting of optically coupled input and output circuits (insulated thyristor AC switches); electronic switches, including temperature protected electronic switches, consisting of a transistor and a logic chip (chip-on-chip technology) for a voltage not exceeding 1,000 volts; and electro-mechanical snap-action switches for a current not exceeding 11 amps (toggle switch).

Electronic switches which operate by contactless means, using semiconductor components (e.g., for transistors, thyristors, integrated circuits).

Door locks which themselves incorporate a switch are excluded (**heading 83.01**).

(B) **Change-over switches** are used to connect one or more lines to one or more other lines.

In the simplest type one line is connected to a central point which, by means of a moving arm, can be connected to any one of the other lines. More complicated apparatus of this type includes starting switches for electric motors, and control gear for electric vehicles. These often include not only the switching gear, but also a number of resistors to be switched in or out of the circuit as required (see Explanatory Note to heading 85.33).

The heading also covers complicated switching-units used in radio or television sets, etc.

(C) **Relays** are electrical devices by means of which the circuit is automatically controlled by a change in the same or another circuit. They are used, for example, in telecommunication apparatus, road or rail signalling apparatus, for the control or protection of machine-tools, etc.

The various types can be distinguished by, for example :

- (1) **The electrical means of control used** : electromagnetic relays, permanent magnet relays, thermo-electric relays, induction relays, electro-static relays, photoelectric relays, electronic relays, etc.
- (2) **The predetermined conditions on which they operate** : maximum current relays, maximum or minimum voltage relays, differential relays, fast acting cut-out relays, time delay relays, etc.

Contactors, which are also considered as relays, are devices for making and breaking electrical circuits, which automatically reset without a mechanical locking device or hand operation. They are generally operated and maintained in an active state by an electric current.

(II) APPARATUS FOR PROTECTING ELECTRICAL CIRCUITS

The heading includes **fuses**. These normally consist of a device in which a length of fuse wire is incorporated (or can be incorporated) so that, when they are inserted in the circuit, the fuse wire will melt and so break the circuit if the current increases dangerously. They vary considerably in design according to the type of circuit and current for which they are intended. Cartridge fuses consist of a tube containing the fuse wire in contact with metal caps at the ends; other fuses consist of a base or socket (for incorporation in the line), and a connecting piece (which may be screwed into the socket or pushed in between spring contacts) on which the fuse wire is mounted. The heading covers the complete fuse, with or without wire. Sockets and connecting pieces presented separately are also classified here **except** those wholly of insulating material (apart from any minor components of metal incorporated during moulding solely for purposes of assembly) (**heading 85.47**). Fuse wire is classified according to its constituent material, but short lengths of fuse wire with loops or other means of connection so as to be ready for use remain in this heading.

The heading includes other devices for preventing overload of circuits (e.g., electro-magnetic devices which automatically break the circuit when the current exceeds a certain value).

The heading also **excludes** constant voltage transformers (**heading 85.04**) and automatic voltage regulators (**heading 90.32**).

(III) APPARATUS FOR MAKING CONNECTIONS TO OR IN ELECTRICAL CIRCUITS

This apparatus is used to connect together the various parts of an electrical circuit. It includes :

(A) **Plugs, sockets and other contacts** for connecting a movable lead or apparatus to an installation which is usually fixed. This category includes :

- (1) **Plugs and sockets** (including those for connecting two movable leads). A plug may have one or more pins or side contacts which match corresponding holes or contacts in the socket. The rim or one of the pins may be used for earthing purposes.
- (2) **Sliding contacts** such as brushes for motors and current-collectors for electric traction vehicles, lifting appliances, etc. (overhead or third rail collectors, etc.) **other than** such articles of "carbon" or graphite (**heading 85.45**). They may consist of block metal, wire cloth or laminated strip, and remain in this heading even when coated with an **external** lubricating layer of graphite.
- (3) **Lamp or valve sockets and lamp-holders**. Certain lamp-holders are in the form of candles for mounting in candelabra or are designed to form a bracket against a wall; these remain classified here **provided** their main function is to act as lamp-holders.

Plugs and sockets, etc., assembled with a length of wire are **excluded** (**heading 85.44**).

(B) **Other connectors, terminals, terminal strips, etc.** These include small squares of insulating material fitted with electrical connectors (dominoes), terminals which are metal parts intended for the reception of conductors, and small metal parts designed to be fitted on the end of electrical wiring to facilitate electrical connection (spade terminals, crocodile clips, etc.).

Terminal strips consist of strips of insulating material fitted with a number of metal terminals or connectors to which electrical wiring can be fixed. The heading also covers tag strips or panels; these consist of a number of metal tags set in insulating material so that electrical wires can be soldered to them. Tag strips are used in radio or other electrical apparatus.

- (C) **Junction boxes.** These consist of boxes fitted internally with terminals or other devices for connecting together electrical wires. Boxes not fitted with means of electrical connection or provisions therefor, are **excluded** and are classified according to their constituent material.

(IV) CONNECTORS FOR OPTICAL FIBRES, OPTICAL FIBRE BUNDLES OR CABLES

For the purpose of heading 85.36, “connectors for optical fibres, optical fibre bundles or cables” means connectors that simply mechanically align optical fibres end to end in a digital line system. They perform no other function, such as the amplification, regeneration or modification of a signal. Connectors for optical fibres, without cables, remain classified in this heading but those connectors for optical fibres with cables are **excluded (heading 85.44 or 90.01)**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the apparatus of this heading are classified in **heading 85.38**.

*
* *

The heading also **excludes** :

- Non-linear voltage resistors (varistors/VDR) used as voltage controllers (**heading 85.33**).
- Assemblies (**other than** simple switch assemblies) of the apparatus mentioned above (**heading 85.37**).
- Semiconductor diodes used as voltage controllers (**heading 85.41**).

85.37 - Boards, panels, consoles, desks, cabinets and other bases, equipped with two or more apparatus of heading 85.35 or 85.36, for electric control or the distribution of electricity, including those incorporating instruments or apparatus of Chapter 90, and numerical control apparatus, other than switching apparatus of heading 85.17.

8537.10 - For a voltage not exceeding 1,000 V

8537.20 - For a voltage exceeding 1,000 V

These consist of an assembly of apparatus of the kind referred to in the two preceding headings (e.g., switches and fuses) on a board, panel, console, etc., or mounted in a cabinet, desk, etc. They usually also incorporate meters, and sometimes also subsidiary apparatus such as transformers, valves, voltage regulators, rheostats or luminous circuit diagrams.

The goods of this heading vary from small switchboards with only a few switches, fuses, etc. (e.g., for lighting installations) to complex control panels for machine-tools, rolling mills, power stations, radio stations, etc., including assemblies of several of the articles cited in the text of this heading.

The heading also covers :

- (1) Numerical control panels with built-in automatic data processing machine, which are generally used to control machine-tools.
- (2) Programmed switchboards to control apparatus; these permit variations in the choice of operations to be followed. They are normally used in domestic electrical appliances, such as washing machines and dish washers.
- (3) "Programmable controllers" which are digital apparatus using a programmable memory for the storage of instructions for implementing specific functions such as logic, sequencing, timing, counting and arithmetic, to control, through digital or analog input/output modules, various types of machines.

The heading **does not cover** automatic controlling apparatus of **heading 90.32**.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are classified in **heading 85.38**.

*
* * *

The heading **excludes** :

- (a) Telephone switchboards (**heading 85.17**).
- (b) Simple switch assemblies, such as those consisting of two switches and a connector (**heading 85.35** or **85.36**).
- (c) Cordless infrared devices for the remote control of television receivers, video recorders or other electrical equipment (**heading 85.43**).
- (d) Time switches with clock or watch movement or with synchronous motor (**heading 91.07**).

85.38 - Parts suitable for use solely or principally with the apparatus of heading 85.35, 85.36 or 85.37.

8538.10 - Boards, panels, consoles, desks, cabinets and other bases for the goods of heading 85.37, not equipped with their apparatus

8538.90 - Other

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), this heading covers parts of the goods of the three preceding headings.

The heading includes, for example, boards for switchboards, generally of plastics or metal, without their instruments, **provided** they are clearly recognisable as parts of switchboards.

85.39 - Electric filament or discharge lamps, including sealed beam lamp units and ultra-violet or infra-red lamps; arc-lamps; light-emitting diode (LED) lamps.

8539.10 - Sealed beam lamp units

- Other filament lamps, excluding ultra-violet or infra-red lamps :

8539.21 -- Tungsten halogen

8539.22 -- Other, of a power not exceeding 200 W and for a voltage exceeding 100 V

8539.29 -- Other

- Discharge lamps, other than ultra-violet lamps :

8539.31 -- Fluorescent, hot cathode

8539.32 -- Mercury or sodium vapour lamps; metal halide lamps

8539.39 -- Other

- Ultra-violet or infra-red lamps; arc-lamps :

8539.41 -- Arc-lamps

8539.49 -- Other

8539.50 - Light-emitting diode (LED) lamps

8539.90 - Parts

Electric light lamps consist of glass or quartz containers, of various shapes, containing the necessary elements for converting electrical energy into light rays (including infra-red or ultra-violet rays).

The heading covers all electric light lamps, whether or not specially designed for particular uses (including flashlight discharge lamps).

The heading covers filament lamps, gas or vapour discharge lamps, arc-lamps and light-emitting diode (LED) lamps.

(A) SEALED BEAM LAMP UNITS

Sealed beam lamp units are sometimes designed for incorporation in the bodywork of cars; they consist of a lens and reflector and a filament sealed within a gas-filled or vacuum-type lamp.

(B) OTHER FILAMENT LAMPS, EXCLUDING ULTRA-VIOLET OR INFRA-RED LAMPS (see Part (D))

The light is produced by a filament (metal or carbon) which is heated to incandescence by the passage of an electric current, the glass envelope (sometimes coloured) being either evacuated or filled with an inert gas under low pressure; in the base, which may be of the screw or bayonet type for fixing in the lamp-holder, are the necessary electrical contacts.

These lamps are of various shapes, e.g., spherical (with or without a neck); pear or onion shaped; flame shaped; tubular (straight or curved); special fancy shapes for illuminations, decorations, Christmas trees, etc.

This group also covers halogen lamps.

(C) DISCHARGE LAMPS, OTHER THAN ULTRA-VIOLET LAMPS (see Part (D))

These consist of a glass envelope (usually tubular) or a quartz envelope (usually in an outer envelope of glass), furnished with electrodes and containing, under low pressure, either a gas which becomes luminous under the influence of an electric discharge or a substance which gives off a vapour having similar properties; certain lamps may contain both a gas and a vapour producing substance. Some lamps have valves for the removal of compounds resulting from the action of the gas on the electrodes; others may be vacuum jacketed or water cooled. In some cases the internal wall of the lamps is coated with special substances which transform the ultra-violet rays into visible light thus increasing the efficiency of the lamp (fluorescent lamps). Some lamps operate on high voltages, others on low.

The principal lamps of this kind include :

- (1) **Gas discharge tubes** containing gases such as neon, helium, argon, nitrogen or carbon dioxide, including flashing discharge lamps used for photography or stroboscopic examination.
- (2) **Sodium vapour lamps.**
- (3) **Mercury vapour lamps.**
- (4) **Gas filled dual lamps**, in which the light is produced both by an incandescent filament and a gas discharge.
- (5) **Metal halide lamps.**
- (6) **Xenon and alphanumeric tubes.**
- (7) **Spectral discharge and glow discharge lamps.**

These lamps are used for many purposes, e.g., domestic lighting; street lighting; office, factory, shop, etc., lighting; lighting of machines; and lighting for decorative or publicity purposes. The heading includes simple straight or curved tubes, and tubes in various complex forms (e.g., scrolls, letters, figures and stars).

(D) ULTRA-VIOLET AND INFRA-RED LAMPS

Ultra-violet lamps are used for medical, laboratory, germicidal or other purposes. They usually consist of a fused quartz tube containing mercury; they are sometimes enclosed in an outer envelope of glass. Some are known as black light lamps (e.g., those used for theatrical purposes).

Infra-red lamps are filament lamps specially designed to produce infra-red rays. In many cases the interior of the lamp is coppered or silvered to form a reflector. They are used, for example, for medical purposes or as a source of heat in industry.

(E) ARC-LAMPS

In lamps of this kind the light is emitted by an arc, or by an arc and by the incandescence of one or both of the electrodes between which the arc is maintained. These electrodes are generally of carbon or tungsten. Some lamps have an automatic device to bring the electrodes close together in order to strike the arc, and subsequently to maintain them at the correct distance apart in spite of the progressive using up of electrodes. Lamps designed for AC working have supplementary electrodes for starting purposes. In open arc-lamps the arc burns in free air; in others it is in a glass envelope with suitable baffles communicating with the free air.

It should be noted that arc-lamps are complex apparatus, and are not merely simple lighting elements as is the case of the other goods of this heading.

(F) LIGHT-EMITTING DIODE (LED) LAMPS

The light from these lamps is produced by one or more light-emitting diodes (LED). These lamps consist of a glass or plastic envelope, one or more light-emitting diodes (LED), circuitry to rectify AC power and to convert voltage to a level useable by the LEDs, and a base (e.g., screw, bayonet or bi-pin type) for fixing in the lamp-holder. Certain lamps may also contain a heat sink.

These lamps are of various shapes, e.g., spherical (with or without a neck); pear or onion shaped; flame shaped; tubular (straight or curved); special fancy shapes for illuminations, decorations, Christmas trees, etc.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here. They include :

- (1) Bases for incandescent and discharge electric lamps and bulbs.
- (2) Metal electrodes for discharge lamps and tubes.

*
* *

The heading **excludes** :

- (a) Glass envelopes, and glass parts having the essential character thereof (e.g., spotlight bulb reflectors) for lamps (**heading 70.11**).

- (b) Resistance lamps with carbon filaments and variable lamps with iron filaments in hydrogen (**heading 85.33**).
- (c) Automatic thermo-electric switches (starters) for starting fluorescent lamps (**heading 85.36**).
- (d) Thermionic valves and tubes (**heading 85.40**).
- (e) Light-emitting diodes (LED) of **heading 85.41**.
- (f) Electro-luminescent devices, generally in strips, plates or panels, and based on electro-luminescent substances (e.g., zinc sulphide) placed between two layers of conductive material (**heading 85.43**).
- (g) Arc-lamp carbons and carbon filaments (**heading 85.45**).

85.40 - Thermionic, cold cathode or photo-cathode valves and tubes (for example, vacuum or vapour or gas filled valves and tubes, mercury arc rectifying valves and tubes, cathode-ray tubes, television camera tubes).

- Cathode-ray television picture tubes, including video monitor cathode-ray tubes :

8540.11 -- Colour

8540.12 -- Monochrome

8540.20 - Television camera tubes; image converters and intensifiers; other photo-cathode tubes

8540.40 - Data/graphic display tubes, monochrome; data/graphic display tubes, colour, with a phosphor dot screen pitch smaller than 0.4 mm

8540.60 - Other cathode-ray tubes

-Microwave tubes (for example, magnetrons, klystrons, travelling wave tubes, carcinotrons), excluding grid-controlled tubes :

8540.71 -- Magnetrons

8540.79 -- Other

- Other valves and tubes :

8540.81 -- Receiver or amplifier valves and tubes

8540.89 -- Other

- Parts :

8540.91 -- Of cathode-ray tubes

8540.99 -- Other

This heading covers only those valves and tubes which, for different purposes, utilise the effect of electrons emitted from a cathode either in a vacuum or in gas.

There are three types : thermionic valves and tubes, in which the cathode must be heated before the electrons are emitted; cold cathode valves and tubes; and photo-cathode valves and tubes, in which the cathode is excited by the action of light. According to the number of their electrodes they are termed diodes, triodes, tetrodes, etc. The same envelope may contain two or more systems with different functions (compound valves). The envelopes are of glass, ceramic or metal or of combinations of these materials and may incorporate means of cooling (cooling fins, water circulation system, etc.).

There are many kinds of valves and tubes, some of which are designed for special purposes such as microwave tubes (e.g., magnetrons, travelling wave tubes, carcinotrons, klystrons), disc-sealed (lighthouse) tubes, stabilising valves, thyratrons, ignitrons, etc.

The heading includes :

- (1) **Rectifying tubes and valves.** These are designed for rectifying AC into DC. They may be vacuum type, gas-filled or filled with vapour (e.g., mercury vapour), and in general have two electrodes. Certain types (e.g., thyratrons) have control grids so that their operation can be regulated and even reversed (thus converting DC into AC).
- (2) **Cathode-ray tubes.**
 - (a) Television camera tubes (image pick-up tubes, e.g., image orthicons or vidicons). These are electron-beam tubes for the conversion of an optical image into a corresponding electrical signal, usually by a scanning process.
 - (b) Image converter tubes. These are vacuum tubes in which an image (usually of infra-red radiation) is projected on to a photoemissive surface which in turn produces a corresponding visible image on a luminescent surface.
 - (c) Image intensifier tubes. These are electronic tubes in which an image projected on to a photoemissive surface produces a corresponding intensified image on a luminescent surface.
 - (d) Other cathode-ray tubes in which electrical signals are converted, directly or indirectly, into visible images. An example of this type is the storage tube. In television receiver or video monitor tubes, the electrons from the cathode(s), after being focussed, deflected, etc., fall in the form of a beam on a part of the inner wall (usually the end of the tube) covered with fluorescent material, which constitutes a screen showing the picture the viewer sees.

Cathode-ray tubes are also used in radar, in oscilloscopes and in certain automatic data processing system terminals (display tubes).

- (3) **Photoemissive tubes, vacuum or gas-filled** (also known as **photoemissive cells**). These consist of a glass or quartz tube containing two electrodes, of which the cathode is coated with a layer of photosensitive material (usually alkaline metal); under the action of the light, this layer emits electrons which establish conductivity between the electrodes and are collected on the anode.

Photomultipliers are photosensitive vacuum tubes comprising a photoemissive cathode and an electron multiplier.

- (4) **Other valves and tubes.** These are usually vacuum type, and some have several electrodes. They are used for producing high frequency oscillations, as amplifiers, as detectors, as scan converters (without the use of a photocathode), etc.

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here, for example, electrodes (cathodes, grids, anodes), envelopes (of materials other than glass) for tubes, anti-explosion casings for cathode-ray tubes, deflection coils for mounting around the necks of cathode-ray tubes for scanning purposes.

*
* *

The heading **excludes** :

- (a) Glass face-plates and cones of envelopes for cathode-ray tubes (**heading 70.11**).
- (b) Metal tank mercury arc rectifiers (**heading 85.04**).
- (c) X-ray tubes (**heading 90.22**).

85.41 - Diodes, transistors and similar semiconductor devices; photosensitive semiconductor devices, including photovoltaic cells whether or not assembled in modules or made up into panels; light-emitting diodes (LED); mounted piezo-electric crystals (+).

8541.10 - Diodes, other than photosensitive or light-emitting diodes (LED)

- Transistors, other than photosensitive transistors :

8541.21 -- With a dissipation rate of less than 1 W

8541.29 -- Other

8541.30 - Thyristors, diacs and triacs, other than photosensitive devices

8541.40 - Photosensitive semiconductor devices, including photovoltaic cells whether or not assembled in modules or made up into panels; light-emitting diodes (LED)

8541.50 - Other semiconductor devices

8541.60 - Mounted piezo-electric crystals

8541.90 - Parts

(A) DIODES, TRANSISTORS AND SIMILAR SEMICONDUCTOR DEVICES

These are defined in Note 9 (a) to this Chapter.

The operation of the devices of this group is based on the electronic properties of certain "semiconductor" materials.

The main characteristics of these materials is that at room temperature their resistivity lies in the range between that of conductors (metals) and that of insulators. They consist, for instance, of certain ores (e.g., crystal galena), tetravalent chemical elements (germanium, silicon, etc.) or combinations of chemical elements (e.g., trivalent and pentavalent elements, such as gallium arsenide, indium antimonide).

Semiconductor materials consisting of a tetravalent chemical element are generally monocrystalline. They are not used in their pure state but after very light doping (in a proportion expressed in parts per million) with a specific "impurity" (dopant).

For a tetravalent element, the "impurity" may be a pentavalent chemical element (phosphorus, arsenic, antimony, etc.) or a trivalent element (boron, aluminium, gallium, indium, etc.). The former produce n-type semiconductors with excess electrons (negatively charged); the latter produce p-type semiconductors with electron deficiency, that is to say that holes (positively charged) predominate.

Semiconductor materials combining tri- and pentavalent chemical elements are also doped.

In the semiconductor materials consisting of ores, the impurities contained naturally in the ore act as dopants.

The semiconductor devices of this group generally comprise one or more "junctions", between p-type and n-type semiconductor materials.

They include :

- (I) **Diodes** which are two-terminal devices with a single p n junction; they allow current to pass in one direction (forward) but offer a very high resistance in the other (reverse). They are used for detection, rectification, switching, etc.

The main types of diodes are signal diodes, power rectifier diodes, voltage regulator diodes, voltage reference diodes.

- (II) **Transistors** are three- or four-terminal devices capable of amplification, oscillation, frequency conversion, or switching of electrical currents. The operation of a transistor depends on the variation in resistivity between two of the terminals upon the application of an electric field to the third terminal. The applied control signal or field is weaker than the resulting action brought about by the change in resistance and thus amplification results.

Transistors include :

- (1) Bipolar transistors, which are three-terminal devices consisting of two diode type junctions, and whose transistor action depends on both positive and negative charge carriers (hence, bipolar).
- (2) Field effect transistors (also known as metal oxide semiconductors (MOS)), which may or may not have a junction, but which depend on the induced depletion (or enhancement) of available charge carriers between two of the terminals. The transistor action in a field effect transistor employs only one type of charge carrier (hence, unipolar). A parasitic body diode, which is produced in a MOS type transistor (also known as MOSFET), may operate as a freewheeling diode during inductive load switching. MOSFET which have four terminals are known as tetrodes.
- (3) Insulated Gate Bipolar Transistors (IGBT), which are three-terminal devices consisting of a gate terminal and two load terminals (emitter and collector). By applying appropriate voltages across the gate and emitter terminals, current in one direction can be controlled, i.e. turned on and turned off. IGBT chips may be incorporated with diodes in a single package (packaged IGBT devices), which protect the IGBT device and allow it to continue to function as a transistor.

- (III) **Similar semiconductor devices.** The “ similar ” devices referred to here are semiconductor devices whose operation depends on variations in resistivity on the application of an electric field.

They include :

- (1) **Thyristors**, consisting of four conductivity regions in semiconducting materials (three or more p n junctions) through which a direct current passes in a predetermined direction when a control pulse initiates conductivity. They are used as controlled rectifiers, as switches or as amplifiers and function as two interlocking, complementary transistors with a common collector/base junction.
- (2) **Triacs** (bi-directional triode thyristors), consisting of five conductivity regions in semiconducting materials (four p n junctions) through which an alternating current passes when a control pulse initiates conductivity.
- (3) **Diacs**, consisting of three conductivity regions in semiconducting materials (two p n junctions) and used to provide the pulses required to operate a triac.
- (4) **Varactors** (or variable capacitance diodes).
- (5) **Field effect devices**, such as gridistors.
- (6) **Gunn effect devices**.

However, this group **does not include** semiconductor devices which differ from those described above in that their operation depends primarily on temperature, pressure, etc., such as non-linear semiconductor resistors (thermistors, varistors, magneto-resistors, etc.) (**heading 85.33**).

For photosensitive devices the operation of which depends on light rays (photodiodes, etc.), see group (B).

The devices described above fall in this heading whether presented mounted, that is to say with their terminals or leads or packaged (components), unmounted (elements) or even in the form of undiced discs (wafers). However, natural semiconductor materials (e.g., galena) are classified in this heading only when mounted.

The heading also **excludes** chemical elements of **Chapter 28** (for example, silicon and selenium) doped for use in electronics, in the form of discs, wafers, or similar forms, polished or not, whether or not coated with a uniform epitaxial layer, **provided** they have not been selectively doped or diffused to create discrete regions.

(B) PHOTORESISTIVE SEMICONDUCTOR DEVICES

This group comprises photosensitive semiconductor devices in which the action of visible rays, infra-red rays or ultra-violet rays causes variations in resistivity or generates an electromotive force, by the internal photoelectric effect.

Photoemissive tubes (photoemissive cells) the operation of which is based on the external photoelectric effect (photoemission), belong to **heading 85.40**.

The main types of photosensitive semiconductor devices are :

- (1) **Photoconductive cells (light dependent resistors)**, usually consisting of two electrodes between which is a semiconductor substance (cadmium sulphide, lead sulphide, etc.) whose electrical resistance varies with the intensity of illumination falling on the cell.

These cells are used in flame detectors, in exposure meters for automatic cameras, for counting moving objects, for automatic precision measuring devices, in automatic door opening systems, etc.

- (2) **Photovoltaic cells**, which convert light directly into electrical energy without the need for an external source of current. Photovoltaic cells based on selenium are used mainly in luxmeters and exposure meters. Those based on silicon have a higher output and are used, in particular, in control and regulating equipment, for detecting light impulses, in communication systems using fibre optics, etc.

Special categories of photovoltaic cells are :

- (i) **Solar cells**, silicon photovoltaic cells which convert sunlight directly into electric energy. They are usually used in groups as sources of electric power, e.g., in rockets or satellites employed in space research, for mountain rescue transmitters.

The heading also covers solar cells, whether or not assembled in modules or made up into panels. However the heading **does not cover** panels or modules equipped with elements, however simple, (for example, diodes to control the direction of the current), which supply the power directly to, for example, a motor, an electrolyser (**heading 85.01**).

(ii) **Photodiodes** (germanium, silicon, etc.), characterised by a variation in resistivity when light rays strike their p n junction. They are used in automatic data processing (reading of data storage), as photocathodes in certain electronic tubes, in radiation pyrometers, etc. **Phototransistors** and **photothyristors** belong to this category of photoelectric receivers.

The devices of this category differ, when packaged, from the diodes, transistors and thyristors of Part (A) above by their housing, which is partly transparent to permit the passage of light.

(iii) **Photocouples** and **photorelays** consisting of electroluminescent diodes combined with photodiodes, phototransistors or photothyristors.

Photosensitive semiconductor devices fall in this heading whether presented mounted (i.e., with their terminals or leads), packaged or unmounted.

(C) LIGHT-EMITTING DIODES (LED)

Light-emitting diodes (LED), or **electroluminescent diodes**, (based, *inter alia*, on gallium arsenide or gallium phosphide) are devices which convert electric energy into visible, infra-red or ultra-violet rays. They are used, e.g., for displaying or transmitting data in control systems.

Laser diodes emit a coherent light beam and are used, e.g., in detecting nuclear particles, in altimetering or in telemetering equipment, in communication systems using fibre optics.

(D) MOUNTED PIEZO-ELECTRIC CRYSTALS

These are mainly barium titanate (including polycrystalline polarised elements of barium titanate), lead titanate zirconate or other crystals of **heading 38.24** (see the corresponding Explanatory Note), or quartz or tourmaline crystals. They are used in microphones, loudspeakers, ultrasonic apparatus, stabilised frequency oscillating circuits, etc. They are classified here **only** if mounted. They are generally in the form of plates, bars, discs, rings, etc., and must, at least, be equipped with electrodes or electric connections. They may be coated with graphite, varnish, etc., or arranged on supports and they are often inside an envelope (e.g., metal box, glass bulb). If, however, because of the addition of other components, the complete article (mounting plus crystal) can no longer be regarded as merely a mounted crystal but has become identifiable as a specific part of a machine or appliance, the assembly is classified as a part of the machine or appliance in question : e.g., piezo-electric cells for microphones or loudspeakers (**heading 85.18**), sound-heads (**heading 85.22**), pick-up elements (feelers) for ultrasonic thickness measuring or detecting instruments (generally classified in accordance with Note 2 (b) to Chapter 90 or in **heading 90.33**, as the case may be), quartz oscillators for electronic watches (**heading 91.14**).

This heading also **excludes** unmounted piezo-electric crystals (generally **heading 38.24**, **71.03** or **71.04**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are classified here.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 8541.21

The dissipation rate of a transistor is measured by applying the specified operating voltage to the device and measuring the continuous power handling capability using a case temperature limit of 25° C. For example, if a transistor is capable of handling a 0.2 ampere load continuously at a specified operating voltage of five volts while maintaining a case temperature of 25° C, its dissipation rate is 1 watt (Amperage x Voltage = Wattage).

For transistors with a means of heat dissipation (for example, a tab, a metal case), the reference temperature of 25° C is that of the bottom or of the case, whereas for other transistors (for example, with simple casing of plastics), the room temperature applies.

85.42 - Electronic integrated circuits.

- Electronic integrated circuits :

- 8542.31 -- Processors and controllers, whether or not combined with memories, converters, logic circuits, amplifiers, clock and timing circuits, or other circuits
- 8542.32 -- Memories
- 8542.33 -- Amplifiers
- 8542.39 -- Other
- 8542.90 - Parts

The articles of this heading are defined in Note 9 (b) to the Chapter.

Electronic integrated circuits are devices having a high passive and active element or component density, which are regarded as single units (see Explanatory Note to heading 85.34, first paragraph concerning elements or components to be regarded as "passive" or "active"). However, electronic circuits containing only passive elements are **excluded** from this heading.

Unlike electronic integrated circuits, discrete components may have a single active electrical function (semiconductor devices defined by Note 9 (a) to Chapter 85) or a single passive electrical function (resistors, capacitors, inductances, etc.). Discrete components are indivisible and are the basic electronic construction components in a system.

However, components consisting of several electric circuit elements and having multiple electrical functions, such as integrated circuits, are not considered as discrete components.

Electronic integrated circuits include memories (e.g., DRAMS, SRAMs, PROMS, EPROMS, EEPROMS (or E²PROMS)), microcontrollers, control circuits, logic circuits, gate arrays, interface circuits, etc.

Electronic integrated circuits include :

(I) Monolithic integrated circuits.

These are microcircuits in which the circuit elements (diodes, transistors, resistors, capacitors, inductances, etc.) are created in the mass (essentially) and on the surface of a semiconductor material (doped silicon, for example) and are therefore inseparably associated. Monolithic integrated circuits may be digital, linear (analogue) or digital-analogue.

Monolithic integrated circuits may be presented :

- (i) Mounted, i.e., with their terminals or leads, whether or not encased in ceramic, metal or plastics. The casings may be cylindrical, in the form of parallelepipeds, etc.
- (ii) Unmounted, i.e., as chips, usually rectangular, with sides generally measuring a few millimetres.
- (iii) In the form of undiced wafers (i.e., not yet cut into chips).

Monolithic integrated circuits include :

- (i) Metal oxide semiconductors (MOS technology).
- (ii) Circuits obtained by bipolar technology.
- (iii) Circuits obtained by a combination of bipolar and MOS technologies (BIMOS technology).

Metal oxide semiconductor (MOS), especially complementary metal oxide semiconductor (CMOS), and bipolar technologies are the “generic” technologies involved in the manufacture of transistors. As the basic components of monolithic integrated circuits, these transistors give the integrated circuit its identity. Bipolar circuits are preferred for systems where maximum logic speed is sought. On the other hand, MOS circuits are preferred for systems in which a high component density and low energy requirements are desirable. Further, CMOS circuits have the lowest energy requirements. Thus, they are preferred in applications where power supply is limited or where cooling problems are expected. The complementary relationship between bipolar and MOS technologies is even more apparent in the BICMOS technology, which combines the speed of bipolar circuits with the high integration and low power consumption of CMOS circuits.

(II) **Hybrid integrated circuits.**

These are microcircuits built up on an insulating substrate on which a thin or thick film circuit has been formed. This process allows certain passive elements (resistors, capacitors, inductances, etc.) to be produced at the same time. However, to become a hybrid integrated circuit of this heading, semiconductors must be incorporated and mounted on the surface, either in the form of chips, whether or not encased, or as encased semiconductors (e.g., in specially designed miniature casings). Hybrid integrated circuits may also contain separately produced passive elements which are incorporated into the basic film circuit in the same way as the semiconductors. Usually these passive elements are components such as capacitors, resistors or inductors in the form of chips.

Substrates made up of several layers, generally ceramic, heat-bonded together to form a compact assembly, are to be taken to form a single substrate within the meaning of Note 9 (b) (ii) to this Chapter.

The components forming a hybrid integrated circuit must be combined **to all intents and purposes indivisibly**, i.e., though some of the elements could theoretically be removed and replaced, this would be a long and delicate task which would be uneconomic under normal manufacturing conditions.

(III) **Multichip integrated circuits.**

These consist of two or more interconnected monolithic integrated circuits combined to all intents and purposes indivisibly, whether or not on one or more insulating substrates, with or without leadframes, but with no other active or passive circuit elements.

Multichip integrated circuits generally come in the following configurations :

- Two or more monolithic integrated circuits mounted side by side;

- Two or more monolithic integrated circuits stacked one upon the other;
- Combinations of the configurations above consisting of three or more monolithic integrated circuits.

These monolithic integrated circuits are combined and interconnected into a single body and may be packaged through encapsulation or otherwise. They are combined to all intents and purposes indivisibly, i.e., though some of the elements could theoretically be removed and replaced, this would be a long and delicate task which would be uneconomic under normal manufacturing conditions.

Insulating substrates of the multichip integrated circuits may incorporate electrically conductive regions. These regions may be composed of specific materials or formed in specific shapes to provide passive functions by means other than discrete circuit elements. Where conductive regions are present in the substrate, they are typically relied upon as a means by which the monolithic integrated circuits are interconnected. These substrates may also be referred to as "interposers" or "spacers" when placed above the bottom-most chip or die.

Monolithic integrated circuits are interconnected by a variety of means, such as adhesives, wire bonds, or "flip chip" technology.

(IV) Multi-component integrated circuits (MCOs).

These are combinations of the circuits and elements mentioned in Note 9 (b) (iv) to this Chapter.

Multi-component integrated circuits (MCOs) are a combination of one or more monolithic, hybrid, or multi-chip integrated circuits with either silicon based sensors, actuators, oscillators, resonators and combinations thereof, or one or more components performing the functions of articles classifiable under heading 85.32, 85.33, 85.41 or inductors classifiable under heading 85.04.

This includes the possibility that MCOs also can contain MCOs as long as they meet the conditions of the Note 9 (b) (iv) to Chapter 85.

All separate (tradeable) units, which are not classifiable under 85.32, 85.33, 85.04, 85.41 or which do not fall under the definition of silicon based sensors, actuators, resonators, oscillators and combinations thereof are **excluded** from the definition of an MCO (e.g., transformers (heading 85.04) or magnets (heading 85.05)).

However, other different elements that are not mentioned but which are intrinsically or necessarily part of a MCO (or of IC packages), such as substrates whether or not functioning as printed circuits, gold wires or conductive regions, or are necessary for the construction and function, e.g. mold compound or lead frames, are accepted parts/elements of the MCO.

The integrated circuits and components forming a MCO are combined and interconnected physically, electrically or optically into or onto a single body (a component existing as particular or independent technical unit with common connection to the outside world through pins, leads, balls, lands, bumps, or pads) whether or not on one or more insulating substrates, with or without lead frames, and may be packaged through encapsulation or otherwise.

The components must be combined to all intents and purposes indivisibly, i.e., though some of the elements could theoretically be removed and replaced, this would be uneconomical under normal manufacturing conditions.

The MCOs are often intended for mounting with their terminals or leads in, or on, a supporting carrier (e.g., printed circuit boards (PCBs) or other carriers, such as thick-film, thin-film, insulated metal substrates, etc.) or connecting to an electric interface. Packages of the MCOs can be made of several materials, have various designs and forms, and can protect the unit from mechanical and environmental influences.

The MCOs can have different features (e.g., a package can be solid, or have holes, windows or membranes) or attachments that are necessary for specific functions. The MCOs use these different features and attachments to receive input from outside supplied physical or chemical quantities and process these data for output in relation with silicon-based sensors, actuators, oscillators, resonators.

They can be used in a variety of applications, including computer, communication (e.g., telephones for cellular networks), consumer, industrial or automotive applications.

The heading excludes film circuits consisting solely of passive elements (**heading 85.34**).

This heading does not include solid-state non-volatile storage devices, “smart cards” and other media for the recording of sound or of other phenomena (see **heading 85.23** and Note 5 to this chapter).

Except for the combinations (to all intents and purposes indivisible) referred to in Parts (II), (III) and (IV) above concerning hybrid integrated circuits, multichip integrated circuits and multi-component integrated circuits (MCOs), the heading also **excludes** assemblies formed by :

- (a) Mounting one or more discrete components on a support formed, for example, by a printed circuit;
- (b) Adding one or more other devices, such as diodes, transformers, or resistors to an electronic microcircuit;
- (c) Combinations of discrete components or combinations of electronic microcircuits other than multichip-type or multi-component-type integrated circuits.
- (d) Combinations of one or more monolithic, hybrid, multi-chip, or multi-component integrated circuits with components not mentioned in Note 9 (b) (iv) to this Chapter (e.g., transformers (heading 85.04) or magnets (heading 85.05)).

Such assemblies are classified as follows :

- (i) Assemblies which constitute a complete machine or appliance (or one classified as complete), in the heading appropriate to the machine or appliance;
- (ii) Other assemblies, in accordance with the provisions for the classification of machine parts (Notes 2 (b) and 2 (c) to Section XVI, in particular).

This is the case, in particular, for certain electronic memory modules (e.g., SIMMs (Single In-line Memory Modules) and DIMMs (Dual In-line Memory Modules)). Those modules are to be classified by application of Note 2 to Section XVI. (See the General Explanatory Note to this Chapter).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are classified here.

85.43 - Electrical machines and apparatus, having individual functions, not specified or included elsewhere in this Chapter.

8543.10 - Particle accelerators

8543.20 - Signal generators

8543.30 - Machines and apparatus for electroplating, electrolysis or electrophoresis

8543.70 - Other machines and apparatus

8543.90 - Parts

This heading covers all electrical appliances and apparatus, **not falling** in any other heading of this Chapter, **nor covered more specifically** by a heading of any other Chapter of the Nomenclature, nor excluded by the operation of a Legal Note to Section XVI or to this Chapter. The principal electrical goods covered more specifically by other Chapters are electrical machinery of **Chapter 84** and certain instruments and apparatus of **Chapter 90**.

The electrical appliances and apparatus of this heading must have individual functions. The introductory provisions of Explanatory Note to heading 84.79 concerning machines and mechanical appliances having individual functions apply, *mutatis mutandis*, to the appliances and apparatus of this heading.

Most of the appliances of this heading consist of an assembly of electrical goods or parts (valves, transformers, capacitors, chokes, resistors, etc.) operating wholly electrically. However, the heading also includes electrical goods incorporating mechanical features **provided** that such features are subsidiary to the electrical function of the machine or appliance.

The heading includes, *inter alia* :

- (1) **Particle accelerators.** These are devices for imparting high kinetic energy to charged particles (electrons, protons, etc.).

Particle accelerators are used mainly in nuclear research, but they also serve in the production of radioactive materials, in medical or industrial radiography, for the sterilisation of certain products, etc.

Particle accelerators usually consist of large installations (which may weigh several thousands of tons). They comprise a particle source, an acceleration chamber, and devices for producing high frequency voltage, variations of the flux or radio-frequencies which are used to accelerate the particles. They may contain one or more targets.

Acceleration, focalisation and deflection of the particles are achieved by electrostatic or electro-magnetic devices which are fed by high voltage or high frequency generators. Accelerator and generators are often enclosed in an anti-radiation screen.

The particle accelerators covered by this heading include, Van de Graaff accelerators, Cockcroft and Walton accelerators, linear accelerators, cyclotrons, betatrons, synchrocyclotrons, synchrotrons, etc.

Betatrons and other particle accelerators specially adapted for the production of X-rays, including those capable of producing either beta-rays or gamma-rays as required, fall in **heading 90.22**.

- (2) **Signal generators.** These are apparatus for the production of electrical signals, of known wave-form and magnitude, at an assignable frequency (high or low frequency, for example). These include, *inter alia*: impulse generators, pattern generators, wobbulators (sweep generators).
- (3) **Mine detectors** based on the change of magnetic flux produced in the apparatus when brought near to a metal object. Similar detectors are used, for example, for detecting foreign metallic bodies in casks of tobacco, food products, timber, etc., and for locating buried pipes.
- (4) **Mixing units**, used in sound recording for combining the output from two or more microphones; they are sometimes combined with an amplifier. Audio mixers and equalisers are also included under this heading. But mixing units specialised for cinematography are **excluded (heading 90.10)**.
- (5) **Noise reduction units** for use with sound recording apparatus.
- (6) **Defrosters and demisters with electric resistors** for aircraft, ships, trains or other vehicles (except cycles or motor vehicles - **heading 85.12**).
- (7) **Synchronisers** for use when several generators are feeding into a common circuit.
- (8) **Electrical mine detonators**, consisting of a hand generator (dynamo) and a capacitor.
- (9) **High or intermediate frequency amplifiers** (including measurement amplifiers and aerial amplifiers).
- (10) **Machines and apparatus for electroplating, electrolysis or electrophoresis (other than machines and apparatus of heading 84.86 and electrophoresis instruments of heading 90.27).**
- (11) **Ultra-violet irradiation equipment** for general industrial uses.
- (12) **Ozone generating and diffusing apparatus, electric**, designed for non-therapeutic purposes (e.g., for industrial uses, for the ozonisation of premises).
- (13) **Electronic musical modules** for incorporation in a wide variety of utilitarian or other goods, e.g., wrist watches, cups and greeting cards. These modules usually consist of an electronic integrated circuit, a resistor, a loudspeaker and a mercury cell. They contain fixed musical programmes.
- (14) **Electric fence energisers.**
- (15) **Cordless infrared devices for the remote control** of television receivers, video recorders or other electrical equipment.
- (16) **Electro-luminescent devices**, generally in strips, plates or panels, and based on electro-luminescent substances (e.g., zinc sulphide) placed between two layers of conductive material.
- (17) **Digital flight-data recorders (flight recorders)** in the form of a fire-proof, crash-proof electronic apparatus for the continuous in-flight recording of specific flight data.

This heading **excludes** :

- (a) Ion implanters for doping semiconductor or flat panel materials (**heading 84.86**).
- (b) Apparatus for physical vapour deposition for the manufacture of semiconductor wafers, semiconductor devices, electronic integrated circuits, or flat panel displays (**heading 84.86**).
- (c) “Smart cards” (including proximity cards or tags) as defined in Note 5 (b) to this Chapter (**heading 85.23**).

PARTS

Subject to the general provisions regarding the classification of parts (see the General Explanatory Note to Section XVI), parts of the goods of this heading are also classified here.

85.44 - Insulated (including enamelled or anodised) wire, cable (including co-axial cable) and other insulated electric conductors, whether or not fitted with connectors; optical fibre cables, made up of individually sheathed fibres, whether or not assembled with electric conductors or fitted with connectors.

- Winding wire :

8544.11 - - Of copper

8544.19 - - Other

8544.20 - Co-axial cable and other co-axial electric conductors

8544.30 - Ignition wiring sets and other wiring sets of a kind used in vehicles, aircraft or ships

- Other electric conductors, for a voltage not exceeding 1,000 V :

8544.42 - - Fitted with connectors

8544.49 - - Other

8544.60 - Other electric conductors, for a voltage exceeding 1,000 V

8544.70 - Optical fibre cables

Provided they are insulated, this heading covers electric wire, cable and other conductors (e.g., braids, strip, bars) used as conductors in electrical machinery, apparatus or installations. **Subject** to this condition, the heading includes wiring for interior work or for exterior use (e.g., underground, submarine or aerial wires or cables). These goods vary from very fine insulated wire to thick cables of more complex types.

Non-metal conductors are also covered by this heading.

The goods of this heading are made up of the following elements :

- (A) A conductor - this may be single strand or multiple, and may be wholly of one metal or of different metals.
- (B) One or more coverings of insulating material - the aim of these coverings is to prevent leakage of electric current from the conductor, and to protect it against damage. The insulating materials mostly used are rubber, paper, plastics, asbestos, mica, micanite, glass fibre yarns, textile yarns (whether or not waxed or impregnated), varnish, enamel, pitch, oil, etc. In certain cases the insulation is obtained by anodising or by a similar process (e.g., the production of a surface coating of metallic oxides or salts).
- (C) In certain cases a metal sheath (e.g., lead, brass, aluminium or steel); this serves as a protective covering for the insulation, as a channel for an insulation of gas or oil, or as a supplementary conductor in certain co-axial cables.
- (D) Sometimes a metal armouring (e.g., spiral wound steel or iron wire or strip), used mainly for protecting underground or submarine cable.

The insulated wires, cables, etc., of this heading may be in the form of :

- (i) Single or multiple strand insulated wire.
- (ii) Two or more such insulated wires twisted together.

(iii) Two or more such insulated wires assembled together in a common insulating sheath.

The heading covers, *inter alia* :

- (1) **Lacquered or enamelled wire**, usually very thin and mainly used for coil windings.
- (2) **Anodised, etc., wire**.
- (3) **Telecommunications wires and cables** (including submarine cables and data transmission wires and cables) are generally made up of a pair, a quad or a cable core, the whole usually covered with a sheath. A pair or a quad consists of two or four insulated wires, respectively (each wire is made up of a single copper conductor insulated with a coloured material of plastics having a thickness not exceeding 0.5 mm), twisted together. A cable core consists of a single pair or a quad or multiple stranded pairs or quads.
- (4) **Insulated aerial cables**.
- (5) **Cables for permanent long-distance connections** often with channels for filling with insulating gas or oil.
- (6) **Armoured underground cables** with anti-corrosive sheathing.
- (7) **Cables for use in mine shafts**; these have a longitudinal armouring to withstand the effects of tension.

In addition the heading covers plaited wire coated with lacquer or inserted in an insulating sheath.

It also includes insulated strip generally used in large electrical machinery or control equipment.

Wire, cable, etc., remain classified in this heading if cut to length or fitted with connectors (e.g., plugs, sockets, lugs, jacks, sleeves or terminals) at one or both ends. The heading also includes wire, etc., of the types described above made up in sets (e.g., multiple cables for connecting motor vehicle sparking plugs to the distributor).

The heading also covers optical fibre cables, made up of individually sheathed fibres, whether or not assembled with electric conductors or fitted with connectors. The sheaths are usually of different colours to permit identification of the fibres at both ends of the cable. Optical fibre cables are used mainly in telecommunications because their capacity for the transmission of data is greater than that of electrical conductors.

The heading **excludes** electric heating resistors sheathed in insulating material (e.g., special alloy wire wound spirally around a core of glass fibres or asbestos) of **heading 85.16**; connectors for optical fibres, optical fibre bundles or cables of **heading 85.36**.

85.45 - Carbon electrodes, carbon brushes, lamp carbons, battery carbons and other articles of graphite or other carbon, with or without metal, of a kind used for electrical purposes.

- Electrodes :

8545.11 -- Of a kind used for furnaces

8545.19 -- Other

8545.20 - Brushes

8545.90 - Other

This heading covers all articles of graphite or other carbon which are recognisable by their shape, dimensions or otherwise, as being for electrical purposes, whether or not they contain metal.

In general, these articles are obtained by the extrusion or by the moulding (usually under pressure) and heat-treatment of a composition which, in addition to its basic constituent (natural carbon, carbon black, gas carbon, coke, natural or artificial graphite, etc.) and the necessary binders (pitch, tar, etc.), may also contain other substances such as metallic powders.

In some cases the articles of this heading may be coated electrolytically or by spraying (e.g., with copper) to increase their conductivity and decrease their rate of wear. They remain classified here even if fitted with eyelets, terminals or other means of connection.

The heading includes :

(A) Carbon electrodes for furnaces.

These are generally in the form of cylinders or rods, and are sometimes threaded or tapped at the ends to enable them to be screwed into position.

(B) Carbon welding electrodes.

These are generally in the form of rods.

(C) Carbon electrodes for electrolysis.

These may be in the form of plates, bars (including bars of triangular cross-section), cylinders, etc. They are designed to be mounted or suspended in electrolysis baths, and may be furnished with fittings for this purpose such as hooks or rings. Certain types may be pierced with holes or grooved to facilitate the removal of gases formed on them during use.

(D) Carbon brushes.

These are used as sliding contacts for generators, motors, etc., as current-collectors for electric locomotives, etc. Though some may be made by direct moulding, the large majority are cut from the "carbon" blocks or plates described in Explanatory Note to heading 38.01. They are all made very accurately to size and the faces are carefully machined to tolerances of a few hundredths of a millimetre. They can therefore be identified by their sizes, shapes, and highly-finished surfaces; in many cases, they may also be wholly or partly metal-coated or be fitted with connectors (brackets, cables, terminals, springs, etc.).

Such carbon brushes may be of any of the grades described in Explanatory Note to heading 38.01, or may contain silver.

This heading **does not**, however, **include** metal brushes coated with an external lubricating layer of graphite (**heading 85.35** or **85.36**). Brush holders (whether or not complete with their brushes) are classified as parts of machines (e.g., **heading 85.03**).

(E) **Arc-lamp or other lamp carbons.**

Arc-lamp carbons are usually in the form of rods or pencils; they sometimes have a core of special composition to improve arc stability and to provide high intensity light output, or to give the flame a special colour. The heading also covers carbon filaments for electrical resistance lamps.

(F) **Battery carbons.**

According to the type of battery for which they are intended, these may be in the form of rods, plates, tubes, etc.

(G) **Carbon parts of microphones.**

These may consist of discs or other identifiable parts.

(H) **Other articles of graphite or other carbon, such as :**

- (1) Connecting pieces (nipples) for joining together furnace carbons.
- (2) Anodes, grids and screens for rectifying valves.
- (3) Heating resistors, in the form of rods, bars, etc., for various types of heating apparatus.
- (4) Resistance discs and plates for automatic voltage regulators.
- (5) Other contacts or electrodes of carbon.

The heading also **excludes** :

- (a) Graphite or other carbon in the form of powders or granules (**Chapter 38**).
- (b) Carbon resistors (**heading 85.33**).

85.46 - Electrical insulators of any material.

8546.10 - Of glass

8546.20 - Of ceramics

8546.90 - Other

Insulators of this heading are used for the fixing, supporting or guiding of electric current conductors while at the same time insulating them electrically from each other, from earth, etc. The heading **excludes** insulating fittings (other than insulators) for electrical machinery, appliances or equipment; these fittings fall in **heading 85.47** if they consist wholly of insulating material (apart from any minor components of metal incorporated during moulding solely for purposes of assembly).

Usually there is a relation between the size of the insulator and the voltage (large for high voltages, smaller for low voltages). Similarly, the shape of the various types of insulators is influenced by electric, thermic and mechanical considerations. The external surface is very smooth in order to prevent the formation of deposits of non-insulating materials, such as water, salts, dusts, oxides and smoke. Insulators are often given bell, accordion, petticoat, grooved, cylinder or other shapes. Certain types are constructed in such a way that when in position they may contain oil to prevent contamination of the surface by conducting materials.

Insulators may be made of any insulating material, usually very hard and non-porous, e.g., ceramic material (porcelain, steatite), glass, fused basalt, hardened rubber, plastics or compounded insulating materials. They may contain fixing devices (e.g., metal brackets, screws, bolts, clips, laces, slings, pins, cross pieces, caps, rods, suspension or carrying clamps). Insulators equipped with metal horns or guard shields or other devices to form lightning arresters are **excluded (heading 85.35)**.

Insulators are used on outdoor cables, e.g., in telecommunications, power networks, electrical traction systems (railway, tramway, trolleybus, etc.), and also for indoor installations or on certain machines and appliances.

The insulators of this heading include :

(A) Suspension insulators, such as :

- (1) **Chain suspension insulators**. These are used mainly on outdoor networks, and consist of several insulating elements. The conductor cable or wire is fixed at the bottom of the assembly which is hung on a suitable support (pylon arm, suspension cable, etc.).

Suspension chain insulators include cap or hood type insulators, double petticoat insulators; chain link insulators; linked rod insulators.

- (2) **Other suspension insulators** (e.g., insulators in the form of balls, bells, pulleys, etc.) for overhead lines of railways, trolleybuses, cranes, etc., or for aerials.

(B) Rigid insulators.

These may be fitted with supports (e.g., metal hooks, pins or the like); or they may be without supports, but intended to be attached to power or telegraph poles, etc., or fitted to walls, ceilings, floors, etc., by means of nails, screws, bolts, etc. Insulators with fixed supports may be built up of two or more elements; those without supports are usually single units. They may be of various shapes (e.g., bells, cones, cylinders, buttons, pulleys).

(C) Leading-in insulators.

These are used for guiding cables or wires through walls, etc. They are of various forms (e.g., cone or double cone shaped insulators, disc insulators, sleeves, pipes and tubular bends).

The heading **excludes** insulated electrical conduit tubing and joints therefor (**heading 85.47**).

85.47 - Insulating fittings for electrical machines, appliances or equipment, being fittings wholly of insulating material apart from any minor components of metal (for example, threaded sockets) incorporated during moulding solely for purposes of assembly, other than insulators of heading 85.46; electrical conduit tubing and joints therefor, of base metal lined with insulating material.

8547.10 - Insulating fittings of ceramics

8547.20 - Insulating fittings of plastics

8547.90 - Other

**(A) INSULATING FITTINGS FOR ELECTRICAL MACHINES,
APPLIANCES OR EQUIPMENT, BEING FITTINGS WHOLLY
OF INSULATING MATERIAL APART FROM ANY MINOR
COMPONENTS OF METAL (FOR EXAMPLE, THREADED SOCKETS)
INCORPORATED DURING MOULDING SOLELY FOR PURPOSES OF
ASSEMBLY, OTHER THAN INSULATORS OF HEADING 85.46**

With the **exception** of insulators as such (**heading 85.46**), this group covers all fittings for electrical machinery, appliances or apparatus, **provided** :

- (i) They are **wholly** of insulating material, or are **wholly** of insulating material (e.g., plastics) **apart from** any minor components of metal (screws, threaded sockets, sleeves, etc.) incorporated during moulding **solely** for purposes of assembly.

and (ii) They are designed for insulating purposes even though at the same time they have other functions (e.g., protection).

In general the fittings of this group are obtained by moulding or casting, or by sawing, cutting or otherwise working the raw material. They may be drilled, threaded, filed, grooved, etc.

They may be made of any insulating material (e.g., glass, ceramics, steatite, hardened rubber, plastics, resin impregnated paper or paperboard, asbestos-cement or mica).

These fittings may be in various forms. This group includes, *inter alia*, covers, bases and other parts of switches, circuit breakers, etc.; bases and supports for fuses; rings and other parts for lamp-holders; formers for resistors or coils; connection strips and dominoes **not fitted** with their terminals; cores for bobbins and windings of various kinds; sparking plug bodies.

The heading **does not cover** fittings which, even though made wholly of insulating material (or made wholly of insulating material apart from any minor components of metal incorporated during moulding solely for the purposes of assembly), have not been specially constructed for insulating purposes, such as containers, covers and separator plates for accumulators (**heading 85.07**).

(B) ELECTRICAL CONDUIT TUBING AND JOINTS THEREFOR, OF BASE METAL LINED WITH INSULATING MATERIAL

This group covers the metal tubing used in permanent electrical installations (e.g., house wiring) as insulation and protection for the wires, **provided it has an interior lining of insulating material**. Uninsulated metal tubing, often used for the same purpose, is **excluded (Section XV)**.

The tubing of this group consists either of spiralled metal strip wound on to an interior tube of insulating material, or of rigid metal tubing (usually iron or steel) coated or lined on the inside with insulating material. The insulating material may be special electrically insulating varnish, paper or paperboard, rubber, plastics, etc. Metal tubing simply coated with varnish to prevent corrosion is **excluded (Section XV)**.

This group also covers joints used for connecting the tubing of this heading **provided** they are also of base metal and coated or lined with insulating material (e.g., straight joints, elbows, tee joints and cross-overs).

Joints such as tee joints, cross-overs, etc., fitted with terminals for electrical connections are **excluded (heading 85.35 or 85.36)**.

The heading also **excludes** tubing wholly of insulating material (e.g., of rubber, plastics, braided textile yarns or glass fibre yarns); this is classified according to the constituent material, unless constituting an insulator of **heading 85.46**.

85.48 - Waste and scrap of primary cells, primary batteries and electric accumulators; spent primary cells, spent primary batteries and spent electric accumulators; electrical parts of machinery or apparatus, not specified or included elsewhere in this Chapter.

8548.10 - Waste and scrap of primary cells, primary batteries and electric accumulators; spent primary cells, spent primary batteries and spent electric accumulators

8548.90 - Other

(A) WASTE AND SCRAP OF PRIMARY CELLS, PRIMARY BATTERIES AND ELECTRIC ACCUMULATORS; SPENT PRIMARY CELLS, SPENT PRIMARY BATTERIES AND SPENT ELECTRIC ACCUMULATORS

This heading covers waste and scrap of primary cells, of primary batteries and of electric accumulators, as well as spent primary cells, spent primary batteries and spent electric accumulators, as defined in Note 10 to this Chapter.

These products are generally identifiable as waste obtained during manufacture, or consist of primary cells, primary batteries and electric accumulators which are definitely unusable as such because of breakage, cutting-up, wear or other reasons, or are not capable of being recharged, and scrap thereof.

These products take the form of consignments and generally come from the manufacturers of primary cells, primary batteries and electric accumulators; from scrap merchants who buy waste and scrap from manufacturers; and from merchants who collect and dismantle electric accumulators or collect primary cells and primary batteries.

Consignments from battery manufacturers may consist of positive plates with a few negative plates; negative plates with a few positive plates; a mixture of positive and negative plates in equal proportion; half-assembled elements (e.g., reels made up of a negative plate and a positive plate separated by a fabric "separator" and coiled). The reels may also be already assembled inside the container. They may also be mixed with defective finished batteries unusable as such.

Consignments from the dismantling or reclamation of old batteries contain a mixture of positive and negative plates, with or without separator, as packs, plates or reels.

Spent primary cells, spent primary batteries and spent electric accumulators are generally intended for processing to recover metals (lead, nickel, cadmium, etc.) metal compounds or slag.

Spent electric accumulators generally have the electrolyte removed and bear signs of wear.

(B) ELECTRICAL PARTS OF MACHINERY OR APPARATUS NOT SPECIFIED OR INCLUDED ELSEWHERE IN THIS CHAPTER

This heading also includes all electrical parts of machinery or apparatus, **other than** :

(a) Those suitable for use solely or principally with a particular machine or appliance.

- (b) Parts covered by an earlier heading of this Chapter or which are excluded by Note 1 to Section XVI.

This heading therefore covers articles which are identifiable as electrical parts of machinery or apparatus but **not** as parts of a **particular** machine or apparatus, and which incorporate electrical connections, insulated sections, coils, contacts or other specifically electrical elements.

Section XVII

VEHICLES, AIRCRAFT, VESSELS AND ASSOCIATED TRANSPORT EQUIPMENT

Notes.

- 1.- This Section does not cover articles of heading 95.03 or 95.08, or bobsleighs, toboggans or the like of heading 95.06.
- 2.- The expressions " parts " and " parts and accessories " do not apply to the following articles, whether or not they are identifiable as for the goods of this Section :
 - (a) Joints, washers or the like of any material (classified according to their constituent material or in heading 84.84) or other articles of vulcanised rubber other than hard rubber (heading 40.16);
 - (b) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
 - (c) Articles of Chapter 82 (tools);
 - (d) Articles of heading 83.06;
 - (e) Machines or apparatus of headings 84.01 to 84.79, or parts thereof, other than the radiators for the articles of this Section; articles of heading 84.81 or 84.82 or, provided they constitute integral parts of engines or motors, articles of heading 84.83;
 - (f) Electrical machinery or equipment (Chapter 85);
 - (g) Articles of Chapter 90;
 - (h) Articles of Chapter 91;
 - (ij) Arms (Chapter 93);
 - (k) Lamps or lighting fittings of heading 94.05; or
 - (l) Brushes of a kind used as parts of vehicles (heading 96.03).
- 3.- References in Chapters 86 to 88 to " parts " or " accessories " do not apply to parts or accessories which are not suitable for use solely or principally with the articles of those Chapters. A part or accessory which answers to a description in two or more of the headings of those Chapters is to be classified under that heading which corresponds to the principal use of that part or accessory.
- 4.- For the purposes of this Section :
 - (a) Vehicles specially constructed to travel on both road and rail are classified under the appropriate heading of Chapter 87;
 - (b) Amphibious motor vehicles are classified under the appropriate heading of Chapter 87;
 - (c) Aircraft specially constructed so that they can also be used as road vehicles are classified under the appropriate heading of Chapter 88.
- 5.- Air-cushion vehicles are to be classified within this Section with the vehicles to which they are most akin as follows :
 - (a) In Chapter 86 if designed to travel on a guide-track (hovertrains);
 - (b) In Chapter 87 if designed to travel over land or over both land and water;

- (c) In Chapter 89 if designed to travel over water, whether or not able to land on beaches or landing-stages or also able to travel over ice.

Parts and accessories of air-cushion vehicles are to be classified in the same way as those of vehicles of the heading in which the air-cushion vehicles are classified under the above provisions.

Hovertrain track fixtures and fittings are to be classified as railway track fixtures and fittings, and signalling, safety or traffic control equipment for hovertrain transport systems as signalling, safety or traffic control equipment for railways.

GENERAL

(I) GENERAL CONTENT OF THE SECTION

This Section covers railway vehicles of all types and hovertrains (Chapter 86), other land vehicles, including air-cushion vehicles (Chapter 87), aircraft and spacecraft (Chapter 88) and ships, boats, hovercraft and floating structures (Chapter 89), **except** the following :

- (a) Certain mobile machines (see Part (II) below).
- (b) Demonstrational models of **heading 90.23**.
- (c) Toys, certain winter sports equipment, and vehicles for fairground use. The Section **excludes**, for example, toy cycles (other than bicycles), pedal cars, etc., designed to be ridden by children, toy boats and aircraft (**heading 95.03**); bobsleighs, toboggans and the like (**heading 95.06**); “dodge’em” cars (**heading 95.08**).

In addition, the Section includes certain specified items of associated transport equipment such as containers specially designed and equipped for carriage by one or more modes of transport, certain railway or tramway track fittings and fixtures, and mechanical (including electro-mechanical) signalling equipment (Chapter 86) and parachutes, aircraft launching gear, deck-arrestor or similar gear and ground flying trainers (Chapter 88).

Subject to the provisions of Part (III) below, the Section also covers parts and accessories of the vehicles, aircraft, etc., of Chapters 86 to 88.

(II) SELF-PROPELLED OR OTHER MOBILE MACHINES

Many machines or equipment (in particular of the type falling in Section XVI) can be mounted on the vehicle chassis or on the floating bases of Section XVII; the classification of the resultant mobile machine depends on various factors, in particular on the type of base.

For example, all mobile machines, formed by mounting a machine on a floating base are classified in Chapter 89 (e.g., floating cranes, dredgers, grain elevators, etc.). For the classification of mobile machines formed by mounting equipment on a vehicle chassis of Chapter 86 or 87, see the Explanatory Notes to heading 86.04, 87.01, 87.05, 87.09 or 87.16.

(III) PARTS AND ACCESSORIES

It should be noted that Chapter 89 makes **no provision** for parts (other than hulls) or accessories of ships, boats or floating structures. Such parts and accessories, even if identifiable as being for ships, etc., are therefore classified in other Chapters in their respective headings. The other Chapters of this Section each provide for the classification of parts and accessories of the vehicles, aircraft or equipment concerned.

It should, however, be noted that these headings apply **only** to those parts or accessories which comply with **all three** of the following conditions :

- (a) They must not be excluded by the terms of Note 2 to this Section (see paragraph (A) below).
- and (b) They must be suitable for use solely or principally with the articles of Chapters 86 to 88 (see paragraph (B) below).
- and (c) They must not be more specifically included elsewhere in the Nomenclature (see paragraph (C) below).

(A) Parts and accessories excluded by Note 2 to Section XVII.

This Note **excludes** the following parts and accessories, whether or not they are identifiable as for the articles of this Section :

- (1) **Joints, gaskets, washers and the like**, of any material (classified according to their constituent material or in **heading 84.84**) and other articles of vulcanised rubber **other than** hard rubber (e.g., mudguard-flaps and pedal covers) (**heading 40.16**).
- (2) **Parts of general use as defined in Note 2 to Section XV**, for example, cable and chain (whether or not cut to length or equipped with end fittings, other than brake cables, accelerator **cables** and similar cables suitable for use in vehicles of **Chapter 87**), nails, bolts, nuts, washers, coppers and cotter-pins, springs (including leaf springs for vehicles) (such goods of base metals fall in **Chapters 73 to 76 and 78 to 81**, and similar goods of plastics fall in **Chapter 39**), and locks, fittings or mountings for vehicle coachwork (e.g., made up ornamental beading strips, hinges, door handles, grip bars, foot rests, window opening mechanisms), number plates, nationality plates, etc. (such goods of base metals fall in **Chapter 83**, and similar goods of plastics fall in **Chapter 39**).
- (3) **Spanners, wrenches and other tools of Chapter 82**.
- (4) **Bells (e.g., for cycles) and other articles of heading 83.06**.
- (5) **Machines and mechanical appliances, and parts thereof, of headings 84.01 to 84.79**, for example :
 - (a) Boilers and boiler equipment (**heading 84.02** or **84.04**).
 - (b) Producer gas generators (e.g., for cars) (**heading 84.05**).
 - (c) Steam turbines of **heading 84.06**.
 - (d) Engines of all kinds including engines fitted with gear boxes and parts thereof, falling in **headings 84.07 to 84.12**.
 - (e) Pumps, compressors and fans (**heading 84.13** or **84.14**).
 - (f) Air-conditioning machines (**heading 84.15**).

- (g) Mechanical appliances for projecting, dispersing or spraying liquids or powders; fire extinguishers (**heading 84.24**).
 - (h) Lifting, handling, loading or unloading machinery (e.g., hoists, jacks, derricks), moving, grading, levelling, scraping, excavating, tamping, compacting, extracting or boring machinery, for earth, minerals or ores (**heading 84.25, 84.26, 84.28, 84.30 or 84.31**).
 - (ij) Agricultural machinery of **heading 84.32** or **84.33** (e.g., threshing, seed distributing, mowing, etc., attachments) constructed for mounting on vehicles.
 - (k) Machinery of a kind described in **heading 84.74**.
 - (l) Windscreen wiping mechanisms of **heading 84.79**.
- (6) **Certain other goods of Chapter 84**, e.g. :
- (a) Taps, cocks, valves and similar appliances (e.g., radiator drainage taps, inner-tube valves) (**heading 84.81**).
 - (b) Ball or roller bearings (**heading 84.82**).
 - (c) Internal parts of engines or motors (crank shafts, cam shafts, flywheels, etc.) falling in **heading 84.83**.
- (7) **Electrical machinery or equipment of Chapter 85**, for example :
- (a) Electric motors, generators, transformers, etc., of **heading 85.01** or **85.04**.
 - (b) Electro-magnets, electro-magnetic clutches, brakes, etc., of **heading 85.05**.
 - (c) Electric accumulators (**heading 85.07**).
 - (d) Electrical ignition or starting equipment of a kind used for spark-ignition or compression-ignition internal combustion engines (sparkling plugs, starter motors, etc.) (**heading 85.11**).
 - (e) Electrical lighting, signalling, windscreen wiping, defrosting, demisting, equipment for cycles or motor vehicles (**heading 85.12**); electrical signalling apparatus for other vehicles (e.g., trains) or for aircraft or ships (**heading 85.31**); electrical defrosters or demisters for such other vehicles, aircraft or ships (**heading 85.43**).
 - (f) Electric heating units for motor or railway vehicles, aircraft, etc. (**heading 85.16**).
 - (g) Microphones, loudspeakers and audio-frequency electric amplifiers (**heading 85.18**).
 - (h) Radio transmitters and receivers (**heading 85.25** or **85.27**).
 - (ij) Electrical capacitors (**heading 85.32**).
 - (k) Pantographs and other current collectors for electric traction vehicles, and fuses, switches and other electrical apparatus of **heading 85.35** or **85.36**.
 - (l) Electric filament lamps and electric discharge lamps, including sealed beam lamp units, of **heading 85.39**.

(m) Other electrical fittings, such as insulated electric wire and cable (including wiring sets) and electrical articles of graphite or other carbon, whether or not fitted with terminals; insulators, insulating fittings (**headings 85.44 to 85.48**).

(8) **Instruments and apparatus of Chapter 90**, including those used on certain vehicles, such as :

- (a) Photographic or cinematographic cameras (**heading 90.06 or 90.07**).
- (b) Navigational instruments and appliances (**heading 90.14**).
- (c) Instruments and appliances used in medical, surgical, dental or veterinary sciences (**heading 90.18**).
- (d) Apparatus based on the use of X-rays and other apparatus of **heading 90.22**.
- (e) Manometers (**heading 90.26**).
- (f) Revolution counters, taximeters, speed indicators and tachometers and other instruments and apparatus of **heading 90.29**.
- (g) Measuring or checking instruments, appliances and machines of **heading 90.31**.

(9) **Clocks** (e.g., instrument panel clocks) (**Chapter 91**).

(10) **Arms** (**Chapter 93**).

(11) **Lamps and lighting fittings** (e.g., headlamps for aircraft or trains) of **heading 94.05**.

(12) **Brushes** (e.g., for road sweeper lorries) (**heading 96.03**).

(B) Criterion of sole or principal use.

(1) Parts and accessories classifiable both in Section XVII and in another Section.

Under Section Note 3, parts and accessories which are not suitable for use **solely or principally** with the articles of Chapters 86 to 88 are **excluded** from those Chapters.

The effect of Note 3 is therefore that when a part or accessory can fall in one or more other Sections as well as in Section XVII, its final classification is determined by its **principal use**. Thus the steering gear, braking systems, road wheels, mudguards, etc., used on many of the mobile machines falling in Chapter 84, are virtually identical with those used on the lorries of Chapter 87, and since their principal use is with lorries, such parts and accessories are classified in this Section.

(2) Parts and accessories classifiable in two or more headings of the Section.

Certain parts and accessories are suitable for use on more than one type of vehicle (motor cars, aircraft, motorcycles, etc.); examples of such goods include brakes, steering systems, wheels, axles, etc. Such parts and accessories are to be classified in the heading relating to the parts and accessories of the vehicles with which they are **principally used**.

(C) Parts and accessories covered more specifically elsewhere in the Nomenclature.

Parts and accessories, even if identifiable as for the articles of this Section, are **excluded** if they are covered more specifically by another heading elsewhere in the Nomenclature, e.g. :

- (1) Profile shapes of vulcanised rubber other than hard rubber, whether or not cut to length (**heading 40.08**).
 - (2) Transmission belts of vulcanised rubber (**heading 40.10**).
 - (3) Rubber tyres, interchangeable tyre treads, tyre flaps and inner tubes (**headings 40.11 to 40.13**).
 - (4) Tool bags of leather or of composition leather, of vulcanised fibre, etc. (**heading 42.02**).
 - (5) Bicycle or balloon nets (**heading 56.08**).
 - (6) Towing ropes (**heading 56.09**).
 - (7) Textile carpets (**Chapter 57**).
 - (8) Unframed safety glass consisting of toughened or laminated glass, whether or not shaped (**heading 70.07**).
 - (9) Rear-view mirrors (**heading 70.09** or **Chapter 90** - see the corresponding Explanatory Notes).
 - (10) Unframed glass for vehicle headlamps (**heading 70.14**) and, in general, the goods of **Chapter 70**.
 - (11) Flexible shafts for speed indicators, revolution counters, etc. (**heading 84.83**).
 - (12) Vehicle seats of **heading 94.01**.
-

Chapter 86

Railway or tramway locomotives, rolling-stock and parts thereof; railway or tramway track fixtures and fittings and parts thereof; mechanical (including electro-mechanical) traffic signalling equipment of all kinds

Notes.

- 1.- This Chapter does not cover :
 - (a) Railway or tramway sleepers of wood or of concrete, or concrete guide-track sections for hovertrains (heading 44.06 or 68.10);
 - (b) Railway or tramway track construction material of iron or steel of heading 73.02; or
 - (c) Electrical signalling, safety or traffic control equipment of heading 85.30.
- 2.- Heading 86.07 applies, *inter alia*, to :
 - (a) Axles, wheels, wheel sets (running gear), metal tyres, hoops and hubs and other parts of wheels;
 - (b) Frames, underframes, bogies and bissel-bogies;
 - (c) Axle boxes; brake gear;
 - (d) Buffers for rolling-stock; hooks and other coupling gear and corridor connections;
 - (e) Coachwork.
- 3.- Subject to the provisions of Note 1 above, heading 86.08 applies, *inter alia*, to :
 - (a) Assembled track, turntables, platform buffers, loading gauges;
 - (b) Semaphores, mechanical signal discs, level crossing control gear, signal and point controls, and other mechanical (including electro-mechanical) signalling, safety or traffic control equipment, whether or not fitted for electric lighting, for railways, tramways, roads, inland waterways, parking facilities, port installations or airfields.

GENERAL

This Chapter covers locomotives and rolling-stock, and parts thereof, and certain track fixtures and fittings, for railways or tramways of any kind (including narrow gauge railways, single rail railways, etc.). It also covers containers specially designed and equipped for carriage by one or more modes of transport. Mechanical (including electro-mechanical) signalling, safety or traffic control equipment for traffic of all kinds (including that for parking facilities) is also covered.

Throughout this Chapter, the expressions " railway " and " tramway " refer not only to conventional railways and tramways using steel rails, but also to similar guided systems such as those using magnetic levitation or concrete tracks.

These various goods are classified as follows :

- (A) Self-propelled railway vehicles of all types, such as locomotives, motorised railway or tramway coaches and rail-cars (headings 86.01 to 86.03). Heading 86.02 also includes locomotive tenders. Locomotives operated by two types of power are classified in the heading corresponding to the main type of power used.
- (B) Railway or tramway maintenance or service vehicles, whether or not self-propelled (heading 86.04).
- (C) Various types of hauled vehicles (railway or tramway passenger coaches and luggage vans, railway or tramway goods vans, wagons and trucks, etc.) (headings 86.05 and 86.06).
- (D) Parts of railway or tramway locomotives and rolling-stock (heading 86.07), and also railway or tramway track fixtures and fittings, and mechanical (including electro-mechanical) equipment, for signalling to or controlling road, rail or other vehicles, ships or aircraft (heading 86.08).
- (E) Containers specially designed and equipped for carriage by one or more modes of transport (heading 86.09).

The Chapter also includes air-cushion vehicles designed to travel on a guide-track (hovertrains), parts of these vehicles, and hovertrain track fixtures, fittings and mechanical (including electro-mechanical) signalling, safety or traffic control equipment for hovertrain transport systems (see Note 5 to Section XVII).

Incomplete or unfinished vehicles are classified with the corresponding complete or finished vehicles, **provided** they have the essential character thereof. Such vehicles may include :

- (1) Locomotives or motorised railway or tramway coaches, not fitted with a power unit, measuring instruments, safety apparatus or service equipment.
- (2) Passenger coaches not fitted with seats.
- (3) Truck underframes complete with suspension and wheels.

On the other hand, bodies of motorised railway or tramway coaches, of vans, wagons or trucks or of tenders, **not mounted on underframes**, are classified as parts of railway or tramway locomotives or rolling-stock (heading 86.07).

The Chapter **excludes** :

- (a) Model railway rolling-stock for demonstrational purposes, of **heading 90.23**.
- (b) Heavy artillery mounted on railway trucks (**heading 93.01**).
- (c) Toy trains (**heading 95.03**).
- (d) Equipment not constituting rolling-stock proper, specially designed for use on roundabouts or other fairground amusements (**heading 95.08**).

86.01 - Rail locomotives powered from an external source of electricity or by electric accumulators.

8601.10 - Powered from an external source of electricity

8601.20 - Powered by electric accumulators

This heading covers all types of electric locomotives in which the required electrical energy is derived either from powerful accumulators carried on the vehicle, or from an external conductor which may be either a rail or an overhead cable.

86.02 - Other rail locomotives; locomotive tenders.

8602.10 - Diesel-electric locomotives

8602.90 - Other

(A) LOCOMOTIVES

This group covers all types of rail locomotives **other than** those powered from an external source of electricity or by electric accumulators (**heading 86.01**) whatever the type of power unit (steam engine, diesel engine, gas turbine, petrol engine, pneumatic power engine, etc).

These include :

- (1) **Diesel locomotives** which are of three types :
 - (a) **Diesel-electric locomotives** in which the diesel engine drives a generator to produce electricity which in turn powers traction motors driving the wheels.
 - (b) **Diesel-hydraulic locomotives** in which power from a diesel engine is transmitted to the wheels using a hydraulic system.
 - (c) **Diesel-mechanical locomotives** where power from the diesel engine reaches the wheels through a clutch or fluid flywheel and gear box.
- (2) **Steam locomotives** of all types, including turbine locomotives using an electric drive, tank locomotives and fireless locomotives, i.e., those fitted with a steam reservoir instead of a boiler which is charged from an industrial plant.

*
* * *

The heading includes certain locomotives of moderate power which are not equipped with bogies and are usually fitted with only two driving axles. They are mainly used in stations for moving wagons and by industrial facilities connected with railways.

(B) LOCOMOTIVE TENDERS

Locomotive tenders are vehicles, coupled to steam locomotives, which carry the water and fuel required for the boiler. They consist essentially of a frame carried on two or more axles and a sheet metal superstructure comprising a closed tank for water and a coal bunker or fuel-oil tank.

*
* * *

Tractors constructed to travel on both road and rail are **excluded (heading 87.01)**.

86.03 - Self-propelled railway or tramway coaches, vans and trucks, other than those of heading 86.04.

8603.10 - Powered from an external source of electricity

8603.90 - Other

Self-propelled railway or tramway coaches, vans and trucks differ from locomotives because, in addition to being equipped with a power unit, they are also designed to carry passengers or freight. These vehicles may be designed to travel singly, or to be coupled to one or more vehicles of the same type, or to one or more trailer vehicles.

The main feature of these vehicles is that they are fitted with a control cab either at one or both ends, or in a raised position (conning-tower) in the middle.

The various types of self-propelled coaches, vans and trucks falling in the heading include :

(A) **Electrically-propelled coaches** in which electrical energy is received from a stationary external source, e.g., through a pantograph or trolley in the case of an overhead cable, or through collector shoes mounted on the bogies in the case of a third rail.

Tramway coaches. These sometimes use two conductor rails placed in a slot rail and current is collected via a special device known as a "plough".

(B) **Rail-cars**, i.e., self-contained vehicles running under their own power and equipped with diesel or other internal combustion engines, etc.

Some rail-cars are fitted with solid or pneumatic tyres and others are of the rack-rail type.

(C) **Self-propelled vehicles functioning by means of storage batteries.**

This heading also includes **electro-gyro rail vehicles**. The principle of this system is based on the accumulation of kinetic energy in a fast revolving flywheel. This energy is then by means of an electric generator transmitted to a driving motor in the form of electric current. The scope of this system is rather limited, but it may be applied in light rail-cars or in trams.

It should be noted that the heading **excludes** road motor-coaches convertible into rail-cars simply by changing the wheels and locking the steering, the motor remaining unchanged (**heading 87.02**).

86.04 - Railway or tramway maintenance or service vehicles, whether or not self-propelled (for example, workshops, cranes, ballast tampers, trackliners, testing coaches and track inspection vehicles).

The vehicles covered by this heading, whether or not self-propelled, are specially designed for use, e.g., in the installation, servicing and maintenance of the permanent way and structures alongside the track.

The heading includes :

- (1) Workshop vans and trucks fitted with tools, machine-tools, electric generators, lifting machinery (jacks, hoists, etc.), welding equipment, chains, cables, etc.
- (2) Breakdown and other crane-vehicles; locomotive or coach lifting crane-vehicles; crane-vehicles for lifting or placing rails; crane-vehicles for loading and unloading at station platforms.
- (3) Winch trucks.
- (4) Trucks fitted with special equipment for cleaning or tamping ballast.
- (5) Trucks fitted with machinery for mixing cement for use on the track (for the foundations of electric cable pylons, etc.).
- (6) Trucks for calibrating weigh-bridges.
- (7) Scaffold trucks for the installation and maintenance of electric cables.
- (8) Spraying vans for weed-killing.
- (9) Self-propelled vehicles for track maintenance (in particular, railway trackliners), equipped with one or more engines which not only power the working machines mounted thereon (track-setters, ballast tampers, etc.), and propel the vehicle while work is in progress but also enable it to travel rapidly along the track, as a self-propelled unit, when the working machines are not in operation.
- (10) Railway testing coaches fitted with special equipment such as automatic instruments for checking the working of the engine, brakes, etc. (for example, for measuring the load hauled, detecting defects in the rails, track base, bridges, etc.); track checking coaches which record, whilst travelling, any track irregularity.
- (11) Mechanically-propelled track inspection trolleys, including motorised rail-cycles, used by the railway staff for track maintenance. They are usually fitted with internal combustion engines, are self-propelled, and provide a rapid means of transport both for maintenance personnel and for materials to be carried or picked up along the track.
- (12) Non-mechanically-propelled track inspection trolleys, including rail-cycles, used by railway inspection staff (e.g., hand- or foot-propelled types).

*
* *

When mounted on simple wheeled platforms and not on true railway or tramway underframes (not constituting, therefore, true railway or tramway rolling-stock), machines, measuring instruments and other equipment, are **excluded** from this heading and fall in other more specific headings (**headings 84.25, 84.26, 84.28, 84.29, 84.30**, etc.).

86.05 - Railway or tramway passenger coaches, not self-propelled; luggage vans, post office coaches and other special purpose railway or tramway coaches, not self-propelled (excluding those of heading 86.04).

This heading covers a group of railway or tramway rolling-stock **not** self-propelled (including tramway trailer coaches and funicular (cable) railway coaches), of the type usually coupled into passenger trains.

The heading includes :

- (1) Passenger coaches of all kinds, including sleeping cars, restaurant cars, saloon coaches, recreation coaches (specially fitted for entertainment, dancing, etc.).
- (2) Funicular (cable) railway coaches.
- (3) Tramway trailer coaches.
- (4) Special coaches for underground transportation of miners.
- (5) Living coaches for railway staff.
- (6) Luggage vans and combined passenger-luggage coaches.
- (7) Travelling post office coaches.
- (8) Ambulance, hospital, X-ray or similar coaches.
- (9) Prison coaches.
- (10) Armoured coaches.
- (11) Coaches specially equipped with radio or telegraph apparatus.
- (12) Instruction coaches fitted with apparatus, machines or scale models (e.g., for instruction of the staff).
- (13) Exhibition coaches.

86.06 - Railway or tramway goods vans and wagons, not self-propelled.

8606.10 - Tank wagons and the like

8606.30 - Self-discharging vans and wagons, other than those of subheading 8606.10

- Other :

8606.91 -- Covered and closed

8606.92 -- Open, with non-removable sides of a height exceeding 60 cm

8606.99 -- Other

This heading covers vehicles for the transport of goods on railway networks (of any gauge). It also covers small vehicles or trucks for the transport of goods by rail, in mines, on building sites, in factories, warehouses, etc. These latter generally differ from true wagons, carriages, etc., in that they are not fitted with springs.

In addition to the usual open wagons and trucks (flat trucks, tipping wagons, etc.) and covered vans, the heading includes the following specialised types :

- (1) Tank wagons and the like (e.g., reservoir wagons, cask wagons).
- (2) Insulated or refrigerated vans and wagons.
- (3) Self-discharging vans and wagons (tipping wagons, hopper wagons, etc.).
- (4) Underslung flat trucks for the transport of heavy goods.
- (5) Timber carrying trucks.
- (6) Reservoir wagons fitted with stoneware, etc., reservoirs for the transport of chemicals.
- (7) Horse boxes.
- (8) Double deck wagons (e.g., for carrying cars).
- (9) Vans specially equipped for the transport of live poultry or live fish.
- (10) Platform trucks for carrying other trucks.
- (11) Narrow gauge wagons of all kinds.
- (12) Mining wagons.
- (13) Trolleys for the transport of rails, girders, etc.
- (14) Trucks fitted with rails, for carrying rail-road trailers.
- (15) Wagons and trucks specially designed for the transport of highly radioactive products.

“Road-rail” trailers devised for transport by special trucks fitted with guide rails are **excluded (heading 87.16)**.

86.07 - Parts of railway or tramway locomotives or rolling-stock.

- Bogies, bissel-bogies, axles and wheels, and parts thereof :

8607.11 -- Driving bogies and bissel-bogies

8607.12 -- Other bogies and bissel-bogies

8607.19 -- Other, including parts

- Brakes and parts thereof :

8607.21 -- Air brakes and parts thereof

8607.29 -- Other

8607.30 - Hooks and other coupling devices, buffers, and parts thereof

- Other :

8607.91 -- Of locomotives

8607.99 -- Other

This heading covers parts of railway or tramway locomotives or rolling-stock, **provided** the parts fulfil **both** the following conditions :

- (i) They must be identifiable as being suitable for use solely or principally with the above-mentioned vehicles;
- (ii) They must not be excluded by the provisions of the Notes to Section XVII.

Parts of railway or tramway locomotives or rolling-stock include :

- (1) Bogies, with two or more axles, and bissel-bogies consisting of a frame with only one axle.
- (2) Straight or cranked axles, whether or not assembled.
- (3) Wheels and parts thereof (wheel centres, metal tyres, etc.).
- (4) Axle-boxes, also known as lubricating or grease-boxes, and parts thereof (e.g., axle-box bodies).
- (5) All types of brake gear, including :
 - (a) Hand-brakes, controlled directly from each individual vehicle (lever and screw brakes).
 - (b) Continuous brakes with a single control for all the vehicles of the train. These include compressed air and vacuum brakes.
 - (c) Parts of brake gear including shoes, cylinders, levers, etc.
- (6) Buffers.

- (7) Coupling gear (e.g., hook, screw or chain type, draft gears); some coupling devices may be automatic.
- (8) Frames and parts thereof (longerons, cross-girders, axle-box guides, etc.); frames cast in one piece.
- (9) Corridor connections and connecting platforms.
- (10) Bodies (**not** mounted on underframes) for motorised or non-self-propelled railway or tramway rolling-stock (e.g., for coaches, trucks, wagons, etc.); parts of such bodies (e.g., coach or truck doors, partitions, hinged sides of wagons, side stanchions, running boards, water tanks for tenders).
- (11) Pipes with coupling heads for the braking or heating systems.
- (12) Hydraulic shock absorbers for bogies.

It should be noted, however, that angles, shapes, sections, sheets, plates and other parts of frames, and also tubes and pipes, etc., of base metal, remain classified in **Section XV unless** they have been worked to such an extent that they are clearly identifiable as parts of locomotives or rolling-stock.

86.08 - Railway or tramway track fixtures and fittings; mechanical (including electro-mechanical) signalling, safety or traffic control equipment for railways, tramways, roads, inland waterways, parking facilities, port installations or airfields; parts of the foregoing.

(A) RAILWAY OR TRAMWAY TRACK FIXTURES AND FITTINGS

This group includes :

- (1) **Assembled track**, i.e., rails already fixed to sleepers or other supports. Such track may be in the form of junction, switch or cross-over points, curves, straight runs, etc.
- (2) **Turntables, whether or not electrically operated**, i.e., large platforms usually circular, which can rotate about the centre, and which are fitted with railway or tramway tracks; most are also equipped with rollers carrying the perimeter of the platform.

Locomotives, etc., can therefore be rotated on the turntable and driven off in a new direction. The heading also includes hand-operated turntables, for narrow gauge railways on building sites, quarries, etc.

However, the heading **excludes** locomotives or wagon traversers which transfer railway vehicles from one track to another. These and other machines for handling rolling-stock (e.g., wagon tippers, wagon pushers) fall in **heading 84.28**.

- (3) **Platform buffers**, i.e., hydraulic or spring-loaded stopping devices placed at the end of each run of track to minimise the shock if rolling-stock does not stop before reaching the track terminal. They are designed either to be embedded into the masonry (e.g., of terminal stations) or into robust frameworks (e.g., in shunting yards).
- (4) **Loading gauges**, i.e., arch-shaped structures which ensure that trains passing beneath them do not exceed the maximum clearance height and width prescribed for the route involved.

The heading **does not cover** wooden sleepers (**heading 44.06**), concrete sleepers (**heading 68.10**) or sleepers, rails or other items of unassembled track construction material, of iron or steel specified in **heading 73.02** (see the corresponding Explanatory Note).

Pylons and portals for carrying overhead cables are not regarded as railway or tramway fixtures or fittings and are classified according to their constituent materials in **headings 68.10, 73.08**, etc.

(B) MECHANICAL (INCLUDING ELECTRO-MECHANICAL) SIGNALLING, SAFETY OR TRAFFIC CONTROL EQUIPMENT FOR RAILWAYS, TRAMWAYS, ROADS, INLAND WATERWAYS, PARKING FACILITIES, PORT INSTALLATIONS OR AIRFIELDS

This group covers essentially apparatus in which the signal, etc., is operated from a control point, generally at some distance, by the movement of levers, cranks, rods, wires, chains, etc., or by hydro-pneumatic devices or electric motors. Electropneumatically operated equipment (e.g., for railways) is also classified in this heading. In this type, the signals or points are activated by a pneumatic power engine, the admission or release of air into or from the motor cylinder being controlled by an electro-magnetic valve which is in turn controlled by the electric control board in the signal box. The signal and its pneumatic activating device is regarded as mechanical equipment of this heading, but the electric control board, etc., is proper to **Chapter 85**.

The term “signalling equipment” refers to apparatus which can be made to show two or more aspects each conveying instructions to vehicles, ships or aircraft. It **does not cover** road, rail, etc., sign-plates with no mechanical features (e.g., speed limit, direction or gradient sign-plates); these are classified according to the constituent material (e.g., in **heading 44.21** or **83.10**).

Provided they are mechanically or electro-mechanically operated as described above, the following types of apparatus fall in this group :

- (1) **Signal box equipment.** A complete unit consists of a number of control levers with their transmission wheels, rods, wires, etc., mounted in a frame. In most cases interlocking devices are incorporated to prevent signals or points being set in a conflicting manner.
- (2) **Signal arms, signal discs, complete signal posts or signal gantries.**
- (3) **Controlling or slotting lever mechanisms** fitted to interdependent signals to ensure their co-ordinated action.
- (4) **Trackside mechanisms** (ground frames, etc., of the lever, pedal, crank or other types) for operating points, signals, etc.
- (5) **Point detectors.** These are activated by the movement of the points themselves; their movements are transmitted back to the signal box so that the signalman knows that the points are in the position he intends.
- (6) **Point locks and locking bars.** These devices, fitted to the track itself, ensure that the passage of a train automatically locks the points, so that they cannot be changed from the signal box until the train is clear.
- (7) **Railbrakes.** These devices are used to slow down or stop rolling-stock (e.g., to slow shunted wagons entering a marshalling yard siding). They usually consist essentially of a pair of bars fitted to each rail of the track; under hydraulic or compressed air control, these bars can be made to exert braking pressure on the wheels of rolling-stock passing over the track.
- (8) **Derailers and stop blocks.** When slid free of the rail, these allow the passage of a wagon, but when slid on to the running surface of the rail they act as a stop block or as a deflecting blade to “jump” a wagon off the track.
- (9) **Train stops.** These usually consist of a T shaped bar device fixed alongside the track and operated by compressed air. The bar is interconnected with the signal so that when the latter is at danger, the bar is raised to a position where it will “trip” a brake control lever on any train overrunning the signal.
- (10) **Automatic fog-signalling apparatus.** These devices, also usually pneumatically operated, automatically place a fog signal on the track each time the signal is at danger.
- (11) **Level crossing control gear for raising and lowering, or opening and closing the gates.** This gear usually consists of a hand-operated crank wheel and gearing device, or of a leverage system operated from the signal box as with signal or point control gear.

Level crossing gates themselves are classified according to their constituent material (**heading 73.08** if made of iron or steel, or **heading 44.21** if made of wood), but mechanically or electro-mechanically operated signals indicating whether the gates are open or shut fall in this heading.

- (12) **Hand- or electro-mechanically operated signals** designed to show "Stop" and "Go" signs to road or maritime traffic.

PARTS

The heading also includes identifiable parts of the apparatus referred to above (e.g., turntable platforms, signal arms and discs, control levers, point lock cases, interlocking slot mechanisms).

*
* *

The heading also **excludes** :

- (a) Chains and other parts of general use as defined in Note 2 to Section XV, of base metal (**Section XV**), and similar goods of plastics (**Chapter 39**); general purpose material (such as wire and rod) and metal structures and metal parts of such structures, falling in **Section XV**. It should be noted that point rods which run beneath the rails to connect the trackside control mechanism to the switch blades fall in **heading 73.02** together with certain other specified railway or tramway track construction material of iron or steel.
- (b) Signal lamps (**heading 85.30** or **94.05**).
- (c) Sirens, fog horns and other sound signalling instruments (classified in their own appropriate headings).
- (d) Apparatus for signalling on board vehicles, ships, etc., (e.g., alarm signalling apparatus on trains, emergency station signalling apparatus for ships, etc.) (classified in their own appropriate headings).

86.09 - Containers (including containers for the transport of fluids) specially designed and equipped for carriage by one or more modes of transport.

These containers (including lift vans) are packing receptacles specially designed and equipped for carriage by one or more modes of transport (e.g., road, rail, water or air). They are equipped with fittings (hooks, rings, castors, supports, etc.) to facilitate handling and securing on the transporting vehicle, aircraft or vessel. They are thus suitable for the "door-to-door" transport of goods without intermediate repacking and, being of robust construction, are intended to be used repeatedly.

The more usual type, which may be of wood or metal, consists of a large box equipped with doors, or with removable sides.

The principal types of container include :

- (1) Furniture removal containers.
- (2) Insulated containers for perishable foods or goods.
- (3) Containers (generally cylindrical) for the transport of liquids or gases. These containers fall in this heading **only** if they incorporate a support enabling them to be fitted to any type of transporting vehicle or vessel; otherwise they are classified according to their constituent material.
- (4) Open containers for bulk transport of coal, ores, paving blocks, bricks, tiles, etc. These often have hinged bottoms or sides to facilitate unloading.
- (5) Special types for particular goods, especially for fragile goods such as glassware, ceramics, etc., or for live animals.

Containers usually vary in size from 4 to 145 m³ capacity. Certain types are however smaller, but their capacity is not normally less than 1 m³.

The heading **excludes** :

- (a) Cases, crates, etc., which though designed for the "door-to-door" transport of goods are not specially constructed as described above to be secured to the transporting vehicle, aircraft or vessel; these are classified according to their constituent material.
 - (b) Road-rail trailers (intended mainly for use as road trailers, but so designed that they may be transported on special railway wagons fitted with guide rails) (**heading 87.16**).
-

Chapter 87

Vehicles other than railway or tramway rolling-stock, and parts and accessories thereof

Notes.

- 1.- This Chapter does not cover railway or tramway rolling-stock designed solely for running on rails.
- 2.- For the purposes of this Chapter, "tractors" means vehicles constructed essentially for hauling or pushing another vehicle, appliance or load, whether or not they contain subsidiary provision for the transport, in connection with the main use of the tractor, of tools, seeds, fertilisers or other goods.
Machines and working tools designed for fitting to tractors of heading 87.01 as interchangeable equipment remain classified in their respective headings even if presented with the tractor, and whether or not mounted on it.
- 3.- Motor chassis fitted with cabs fall in headings 87.02 to 87.04, and not in heading 87.06.
- 4.- Heading 87.12 includes all children's bicycles. Other children's cycles fall in heading 95.03.

GENERAL

This Chapter covers the following vehicles, with the **exception** of certain mobile machines of **Section XVI** (see the Explanatory Notes to headings 87.01, 87.05 and 87.16) :

- (1) Tractors (heading 87.01).
- (2) Motor vehicles designed for the transport of persons (heading 87.02 or 87.03) or goods (heading 87.04) or for special purposes (heading 87.05).
- (3) Works trucks, self-propelled, not fitted with lifting or handling equipment, of the type used in factories, warehouses, dock areas or airports for short distance transport of goods, and tractors of the type used on railway station platforms (heading 87.09).
- (4) Armoured fighting vehicles, motorised (heading 87.10).
- (5) Motorcycles and side-cars; cycles and carriages for disabled persons, whether or not motorised (headings 87.11 to 87.13).
- (6) Baby carriages (heading 87.15).
- (7) Trailers and semi-trailers, and other vehicles, not mechanically propelled, i.e., vehicles for towing by another vehicle, pushing or pulling by hand or drawing by animals (heading 87.16).

The Chapter also covers air-cushion vehicles designed to travel over land or over both land and certain tracts of water (swamps, etc.) (see Note 5 to Section XVII).

The classification of a motor vehicle is not affected by operations which are carried out after assembling all parts into a complete motor vehicle, such as: vehicle identification number fixation, brake system charging and bleeding air from brakes, charging of the steering booster system (power steering) and cooling and conditioning systems, headlights regulation, wheel geometry regulation (alignment) and regulation of brakes. This includes classification by the application of General Interpretative Rule 2 (a).

An incomplete or unfinished vehicle, whether or not assembled, is classified as the corresponding complete or finished vehicle **provided** it has the essential character of the latter (see General Interpretative Rule 2 (a)), as for example :

- (A) A motor vehicle, not yet fitted with the wheels or tyres and battery.
- (B) A motor vehicle not equipped with its engine or with its interior fittings.
- (C) A bicycle without saddle and tyres.

This Chapter also covers parts and accessories which are identifiable as being suitable for use **solely or principally** with the vehicles included therein, **subject** to the provisions of the Notes to Section XVII (see the General Explanatory Note to the Section).

*
* * *

It should be noted that amphibious motor vehicles are classified as motor vehicles of this Chapter. But aircraft specially constructed so that they can also be used as road vehicles remain classified as aircraft (**heading 88.02**).

The Chapter also **excludes** :

- (a) Vehicles and parts thereof, cross-sectioned, designed for demonstrational purposes, unsuitable for other uses (**heading 90.23**).
- (b) Wheeled toys designed to be ridden by children, and children's cycles (other than children's bicycles) (**heading 95.03**).
- (c) Winter sports equipment such as bobsleighs, toboggans and the like (**heading 95.06**).
- (d) Vehicles used on roundabouts or in other fairground amusements (**heading 95.08**).

87.01 - Tractors (other than tractors of heading 87.09) (+).

8701.10 - Single axle tractors

8701.20 - Road tractors for semi-trailers

8701.30 - Track-laying tractors

- Other, of an engine power :

8701.91 -- Not exceeding 18 Kw

8701.92 -- Exceeding 18 kW but not exceeding 37 kW

8701.93 -- Exceeding 37 kW but not exceeding 75 kW

8701.94 -- Exceeding 75 kW but not exceeding 130 kW

8701.95 -- Exceeding 130 kW

For the purposes of this heading, **tractors** means wheeled or track-laying vehicles constructed essentially for hauling or pushing another vehicle, appliance or load. They may contain subsidiary provision for the transport, in connection with the main use of the tractor, of tools, seeds, fertilisers or other goods, or provision for fitting with working tools as a subsidiary function.

The heading **does not cover** propelling bases specially designed, constructed or reinforced to form an integral part of a machine performing a function such as lifting, excavating, levelling, etc., even if the propelling base uses traction or propulsion for the execution of this function.

The heading covers tractors (**other than** tractors of the type used on railway station platforms, falling in **heading 87.09**) of various types (tractors for agricultural or forestry work, road tractors, heavy duty tractors for constructional engineering work, winch tractors, etc.), whatever their mode of propulsion (internal combustion piston engine, electric motor, etc.). It also includes tractors which can be used both on rails and on road, but **not** those which are designed exclusively for use on rails.

The tractors of this heading may be fitted with coachwork (a body) or may have seats for the crew or a driving cab. They may be equipped with a tool box, with provision for raising and lowering agricultural implements, with a coupling device for trailers or semi-trailers (e.g., on mechanical horses and similar tractive units), or with a power take-off for driving machines such as threshers and circular saws.

The chassis of a tractor may be mounted on wheels, on tracks or on a combination of wheels and tracks. In the last case, only the front steering axle is fitted with wheels.

This heading also covers **pedestrian controlled tractors**. These are small agricultural tractors equipped with a single driving axle carried on one or two wheels; like normal tractors, they are designed for use with interchangeable implements which they may operate by means of a general purpose power take-off. They are not usually fitted with a seat and the steering is effected by means of two handles. Some types, however, also have a one- or two-wheeled rear carriage with a seat for the driver.

Similar pedestrian controlled tractors are also used for industrial purposes.

The heading includes **tractors fitted with winches** (e.g., as used for hauling out bogged-down vehicles; for up-rooting and hauling trees; or for the remote haulage of agricultural implements).

The heading further includes straddle-type tractors (stilt tractors) used, for example, in vineyards and forestry plantations.

*
* *

The heading also **excludes** motor breakdown lorries equipped with cranes, lifting tackle, winches, etc. (**heading 87.05**).

TRACTORS FITTED WITH OTHER MACHINERY

It should be noted that agricultural machines designed for fitting to tractors as interchangeable equipment (ploughs, harrows, hoes, etc.) remain classified in their respective headings even if mounted on the tractor at the time of presentation. The tractive unit in such cases is separately classified in this heading.

Tractors and industrial working tools are also classified separately when the tractor is designed essentially for hauling or pushing another vehicle or load, and includes, in the same way as an agricultural tractor, simple devices for operating (raising, lowering, etc.) the working tools. In such a case, the interchangeable working tools are **classified in their appropriate headings**, even if presented with the tractor, and whether or not mounted on it, while the tractor with its operating equipment is classified in this heading.

In the case of articulated motor lorries with semi-trailers, tractors coupled to semi-trailers, and heavy duty tractors coupled, in the same way as to semi-trailers, to working machines of Chapter 84, the hauling element is classified in this heading whereas the semi-trailer or the working machine is classified in its appropriate heading.

On the other hand, this heading **does not cover** the propelling bases of machines referred to, for example, in **headings 84.25, 84.26, 84.29, 84.30 and 84.32**, in which the propelling base, the operating controls, the working tools and their actuating equipment are specially designed for fitting together to form an integral mechanical unit. Such is the case with loaders, bulldozers, motorised ploughs, etc.

As a general rule, propelling bases forming an integral part of a machine designed for handling, excavating, etc., can be distinguished from the tractors of this heading by their special constructional features (shape, chassis, means of locomotion, etc.). For propelling bases of the tractor type, various technical features relating essentially to the structure of the complete unit and to equipment specially designed for functions other than hauling or pushing should be taken into consideration. For instance, the propelling bases **not covered** by this heading incorporate robust elements (such as supporting blocks, plates or beams, platforms for swivelling cranes) forming a part of or fixed, generally by welding, to the chassis-body framework to carry the actuating equipment for the working tools. In addition, such propelling bases may comprise several of the following typical parts : powerful equipment with built-in hydraulic system for operating the working tools; special gear boxes, in which, for example, the top speed in reverse gear is not less than the top speed in forward gear; hydraulic clutch and torque converter; balancing counterweight; longer tracks to increase stability of the base; special frame for rear mounted engine, etc.

◦
◦ ◦

Subheading Explanatory Notes.

Subheading 8701.10

See the Explanatory Note to heading 87.01, sixth and seventh paragraphs.

Subheading 8701.20

For the purposes of this subheading, the expression “road tractors” refers to motor vehicles which are designed to haul semi-trailers over long distances. The road tractor and semi-trailer form a combination known by various names (e.g., “articulated lorries”, “tractor-trailers”, etc.). These vehicles usually contain diesel engines and may be driven at speeds in excess of urban traffic speeds on the road network (i.e., streets in the general sense, including avenues, boulevards and motorways) with fully loaded trailers. Such vehicles have a closed cab for the driver and passengers (sometimes with sleeping facilities), headlamps and dimensions authorized domestically, and are usually equipped with a fifth wheel coupling allowing rapid shift between semi-trailers performing different functions.

Similar vehicles used to haul semi-trailers over short distances are excluded from this subheading (generally subheading 8701.90).

Subheading 8701.30

This subheading also covers tractors with a combination of wheels and tracks.

Subheading 8701.90

This subheading includes vehicles used to haul semi-trailers over short distances. These types of vehicles are known by various names (e.g., “terminal tractors”, “port tractors”, etc.) and they are intended to position or shuttle trailers within a defined area. They are not suitable for long-haul road use for which road tractors of subheading 8701.20 are designed. They are distinguishable from road tractors in that they are usually equipped with diesel engines with a maximum speed normally not exceeding 50 km/h and are generally equipped with a small, single-seat enclosed cab for the driver only.

87.02 - Motor vehicles for the transport of ten or more persons, including the driver.

8702.10 - With only compression-ignition internal combustion piston engine (diesel or semi-diesel)

8702.20 - With both compression-ignition internal combustion piston engine (diesel or semi-diesel) and electric motor as motors for propulsion

8702.30 - With both spark-ignition internal combustion reciprocating piston engine and electric motor as motors for propulsion

8702.40 - With only electric motor for propulsion

8702.90 - Other

This heading covers all motor vehicles designed for the transport of ten persons or more (including the driver).

This heading includes motor buses, coaches, trolleybuses and gyrobuses.

The vehicles of this heading may have any type of motor (internal combustion piston engine, electric motor, combination of an internal combustion piston engine and one or more electric motors, etc.).

Vehicles, which have the combination of an internal combustion piston engine and one or more electric motors, are known as "Hybrid Electric Vehicles (HEVs)". For the purpose of mechanical propulsion, these vehicles draw energy from both a consumable fuel and an electrical energy/power storage device (e.g., electric accumulator, capacitor, flywheel/generator). There are various types of Hybrid Electric Vehicles (HEVs), which can be differentiated by their powertrain configuration (such as, parallel hybrids, series hybrids, power-split or series-parallel hybrids) and degree of hybridization (i.e., full hybrids, mild hybrids and plug-in hybrids).

Electric vehicles are propelled by an electric motor or motors powered by electric accumulator packs.

Trolleybuses obtain current from overhead wires and "gyrobuses" operate on the principle that kinetic energy can be stored in a high-speed flywheel and used to drive an electric generator which supplies current to a motor.

This heading also includes motor coaches convertible into rail-cars by changing the wheels and locking the steering, the motor remaining unchanged.

87.03 - Motor cars and other motor vehicles principally designed for the transport of persons (other than those of heading 87.02), including station wagons and racing cars.

- 8703.10 - Vehicles specially designed for travelling on snow; golf cars and similar vehicles
 - Other vehicles, with only spark-ignition internal combustion reciprocating piston engine :
- 8703.21 -- Of a cylinder capacity not exceeding 1,000 cc
- 8703.22 -- Of a cylinder capacity exceeding 1,000 cc but not exceeding 1,500 cc
- 8703.23 -- Of a cylinder capacity exceeding 1,500 cc but not exceeding 3,000 cc
- 8703.24 -- Of a cylinder capacity exceeding 3,000 cc
 - Other vehicles, with only compression-ignition internal combustion piston engine (diesel or semi-diesel) :
- 8703.31 -- Of a cylinder capacity not exceeding 1,500 cc
- 8703.32 -- Of a cylinder capacity exceeding 1,500 cc but not exceeding 2,500 cc
- 8703.33 -- Of a cylinder capacity exceeding 2,500 cc
- 8703.40 - Other vehicles, with both spark-ignition internal combustion reciprocating piston engine and electric motor as motors for propulsion, other than those capable of being charged by plugging to external source of electric power
- 8703.50 - Other vehicles, with both compression-ignition internal combustion piston engine (diesel or semi-diesel) and electric motor as motors for propulsion, other than those capable of being charged by plugging to external source of electric power
- 8703.60 - Other vehicles, with both spark-ignition internal combustion reciprocating piston engine and electric motor as motors for propulsion, capable of being charged by plugging to external source of electric power
- 8703.70 - Other vehicles, with both compression-ignition internal combustion piston engine (diesel or semi-diesel) and electric motor as motors for propulsion, capable of being charged by plugging to external source of electric power
- 8703.80 - Other vehicles, with only electric motor for propulsion".
- 8703.90 - Other

This heading covers motor vehicles of various types (including amphibious motor vehicles) designed for the transport of persons; it **does not**, however, **cover** the motor vehicles of **heading 87.02**. The vehicles of this heading may have any type of motor (internal combustion piston engine, electric motor, gas turbine, combination of an internal combustion piston engine and one or more electric motors, etc.).

The heading includes :

- (1) Vehicles specially designed for travelling on snow; golf cars and similar vehicles.

(a) **Vehicles specially designed for travelling on snow** (e.g., snowmobiles).

(b) **Golf cars and similar vehicles.**

(2) Other vehicles.

(a) **Motor cars** (e.g., limousines, taxis, sports cars and racing cars).

(b) **Specialised transport vehicles** such as ambulances, prison vans and hearses.

(c) **Motor-homes** (*campers*, etc.), vehicles for the transport of persons, specially equipped for habitation (with sleeping, cooking, toilet facilities, etc.).

(d) **Four-wheeled motor vehicles** with tube chassis, having a motor-car type steering system (e.g., a steering system based on the Ackerman principle).

For the purposes of this heading, the expression "station wagons" means vehicles with a maximum seating capacity of nine persons (including the driver), the interior of which may be used, without structural alteration, for the transport of both persons and goods.

The classification of certain motor vehicles in this heading is determined by certain features which indicate that the vehicles are principally designed for the transport of persons rather than for the transport of goods (**heading 87.04**). These features are especially helpful in determining the classification of motor vehicles which generally have a gross vehicle weight rating of less than 5 tonnes and which have a single enclosed interior space comprising an area for the driver and passengers and another area that may be used for the transport of both persons and goods. Included in this category of motor vehicles are those commonly known as "multipurpose" vehicles (e.g., van-type vehicles, sports utility vehicles, certain pick-up type vehicles). The following features are indicative of the design characteristics generally applicable to the vehicles which fall in this heading :

- (a) Presence of permanent seats with safety equipment (e.g., safety seat belts or anchor points and fittings for installing safety seat belts) for each person or the presence of permanent anchor points and fittings for installing seats and safety equipment in the rear area behind the area for the driver and front passengers; such seats may be fixed, fold-away, removable from anchor points or collapsible;
- (b) Presence of rear windows along the two side panels;
- (c) Presence of sliding, swing-out or lift-up door or doors, with windows, on the side panels or in the rear;
- (d) Absence of a permanent panel or barrier between the area for the driver and front passengers and the rear area that may be used for the transport of both persons and goods;
- (e) Presence of comfort features and interior finish and fittings throughout the vehicle interior that are associated with the passenger areas of vehicles (e.g., floor carpeting, ventilation, interior lighting, ashtrays).

The heading also covers lightweight three-wheeled vehicles such as :

- those fitted with motorcycle engine and wheels, etc. which, by virtue of their mechanical structure, possess the characteristics of conventional motor cars, that is motor car type steering system or both reverse gear and differential;

- those mounted on a T-shaped chassis, whose two rear wheels are independently driven by separate electric accumulator-powered electric motors. These vehicles are normally operated by means of a single central control stick with which the driver can start, accelerate, brake, stop and reverse the vehicle, as well as steer it to the right or to the left by applying a differential torque to the drive wheels or by turning the front wheel.

Three-wheeled vehicles of the above-described character are classified under **heading 87.04** if they are designed for the transport of goods.

The vehicles of this heading may be of the wheeled or track-laying type.

Vehicles, which have the combination of an internal combustion piston engine and one or more electric motors, are known as “Hybrid Electric Vehicles (HEVs)”. For the purpose of mechanical propulsion, these vehicles draw energy from both a consumable fuel and an electrical energy/power storage device (e.g., electric accumulator, capacitor, flywheel/generator). There are various types of Hybrid Electric Vehicles (HEVs), which can be differentiated by their powertrain configuration (such as, parallel hybrids, series hybrids, power-split or series-parallel hybrids) and degree of hybridization (i.e., full hybrids, mild hybrids and plug-in hybrids).

Plug-in Hybrid Electric Vehicles (PHEVs) are those which can recharge their electric accumulators by plugging them into an electrical power grid outlet or charging station.

Vehicles propelled by one or more electric motors powered by electric accumulator packs are known as “Electric Vehicles (EVs)”.

Vehicles specialised for use in fairgrounds, e.g., “dodge’em” cars are classified in **heading 95.08**.

87.04 - Motor vehicles for the transport of goods (+).

8704.10 - Dumpers designed for off-highway use

- Other, with compression-ignition internal combustion piston engine (diesel or semi-diesel) :

8704.21 -- g.v.w. not exceeding 5 tonnes

8704.22 -- g.v.w. exceeding 5 tonnes but not exceeding 20 tonnes

8704.23 -- g.v.w. exceeding 20 tonnes

- Other, with spark-ignition internal combustion piston engine :

8704.31 -- g.v.w. not exceeding 5 tonnes

8704.32 -- g.v.w. exceeding 5 tonnes

8704.90 - Other

This heading covers in particular :

The heading also covers lightweight three-wheeled vehicles, such as :

- those fitted with motorcycle engine and wheels, etc. which, by virtue of their mechanical structure, possess the characteristics of conventional motor cars, that is motor car type steering system or both reverse gear and differential;
- those mounted on a T-shaped chassis, whose two rear wheels are independently driven by separate battery-powered electric motors. These vehicles are normally operated by means of a single central control stick with which the driver can start, accelerate, brake, stop and reverse the vehicle, as well as steer it to the right or to the left by applying a differential torque to the drive wheels or by turning the front wheel.

Three-wheeled vehicles of the above-described character are classified in **heading 87.03** if they are designed for the transport of persons.

Ordinary lorries (trucks) and vans (flat, tarpaulin-covered, closed, etc.); delivery trucks and vans of all kinds, removal vans; lorries (trucks) with automatic discharging devices (tipping lorries (trucks), etc.); tankers (whether or not fitted with pumps); refrigerated or insulated lorries (trucks); multi-floored lorries (trucks) for the transport of acid in carboys, cylinders of butane, etc.; dropframe heavy-duty lorries (trucks) with loading ramps for the transport of tanks, lifting or excavating machinery, electrical transformers, etc.; lorries (trucks) specially constructed for the transport of fresh concrete, **other than** concrete-mixer lorries (trucks) of **heading 87.05**; refuse collectors whether or not fitted with loading, compressing, damping, etc., devices.

The classification of certain motor vehicles in this heading is determined by certain features which indicate that the vehicles are designed for the transport of goods rather than for the transport of persons (**heading 87.03**). These features are especially helpful in determining the classification of motor vehicles, generally vehicles having a gross vehicle weight rating of less than 5 tonnes, which have either a separate closed rear area or an open rear platform normally used for the transport of goods, but may have rear bench-type seats that are without safety seat

belts, anchor points or passenger amenities and that fold flat against the sides to permit full use of the rear platform for the transport of goods. Included in this category of motor vehicles are those commonly known as "multipurpose" vehicles (e.g., van-type vehicles, pick-up type vehicles and certain sports utility vehicles). The following features are indicative of the design characteristics generally applicable to the vehicles which fall in this heading :

- (a) Presence of bench-type seats without safety equipment (e.g., safety seat belts or anchor points and fittings for installing safety seat belts) or passenger amenities in the rear area behind the area for the driver and front passengers. Such seats are normally fold-away or collapsible to allow full use of the rear floor (van-type vehicles) or a separate platform (pick-up vehicles) for the transport of goods;
- (b) Presence of a separate cabin for the driver and passengers and a separate open platform with side panels and a drop-down tailgate (pick-up vehicles);
- (c) Absence of rear windows along the two side panels; presence of sliding, swing-out or lift-up door or doors, without windows, on the side panels or in the rear for loading and unloading goods (van-type vehicles);
- (d) Presence of a permanent panel or barrier between the area for the driver and front passengers and the rear area;
- (e) Absence of comfort features and interior finish and fittings in the cargo bed area which are associated with the passenger areas of vehicles (e.g., floor carpeting, ventilation, interior lighting, ashtrays).

This heading also covers :

- (1) **Dumpers**, sturdily built vehicles with a tipping or bottom opening body, designed for the transport of excavated or other materials. These vehicles, which may have a rigid or articulated chassis, are generally fitted with off-the-road wheels and can work over soft ground. Both heavy and light dumpers are included in this group; the latter are sometimes characterised by a two-way seat, two seats facing in opposite directions or by two steering wheels, to enable the vehicles to be steered with the driver facing the body for unloading.
- (2) **Shuttle cars**. These vehicles are used in mines to transport coal or ore from the hewing machinery to the conveyor belts. They are heavy, underslung vehicles, equipped with tyres and fitted with internal combustion piston engines or electric motors; they unload automatically by means of a conveyor belt which forms the floor of the vehicle.
- (3) **Self-loading vehicles** equipped with winches, elevating devices, etc., but designed essentially for transport purposes.
- (4) **Road-rail lorries (trucks)** specially equipped to travel both by road and rail. These vehicles, the road-wheels of which rest on the railway track, are fitted at the front and rear with a bogie-type device which can be raised by means of a jack to allow the vehicle to travel by road.

Motor vehicle chassis, fitted with an engine and cab, are also classified here.

*
* * *

The heading also **excludes** :

- (a) Straddle carriers used in factories, warehouses, dock areas or airports, etc., for the handling of long loads or containers (**heading 84.26**).

- (b) Loader-transporters used in mines (**heading 84.29**).
- (c) Motorcycles, motor-scooters or motorized cycles equipped for the transport of goods, such as delivery motorcycles, tricycles, etc., which do not have the characteristics of three-wheeled vehicles of this heading (**heading 87.11**).

○
○ ○

Subheading Explanatory Notes.

Subheading 8704.10

These dumpers can generally be distinguished from other vehicles for the transport of goods (in particular, tipping lorries (trucks)) by the following characteristics :

- the dumper body is made of very strong steel sheets; its front part is extended over the driver's cab to protect the cab; the whole or part of the floor slopes upwards towards the rear;
- in some cases the driver's cab is half-width only;
- lack of axle suspension;
- high braking capacity;
- limited speed and area of operation;
- special earth-moving tyres;
- because of their sturdy construction the tare weight/payload ratio does not exceed 1 : 1.6;
- the body may be heated by exhaust gases to prevent materials from sticking or freezing.

It should be noted, however, that certain dumpers are specially designed for working in mines or tunnels, for example, those with a bottom-opening body. These have some of the characteristics mentioned above, but do not have a cab or an extended protective front part of the body.

Subheadings 8704.21, 8704.22, 8704.23, 8704.31 and 8704.32

The **g.v.w.** (gross vehicle weight) is the road weight specified by the manufacturer as being the maximum design weight capacity of the vehicle. This weight is the combined weight of the vehicle, the maximum specified load, the driver and a tank full of fuel.

87.05 - Special purpose motor vehicles, other than those principally designed for the transport of persons or goods (for example, breakdown lorries, crane lorries, fire fighting vehicles, concrete-mixer lorries, road sweeper lorries, spraying lorries, mobile workshops, mobile radiological units) (+).

8705.10 - Crane lorries

8705.20 - Mobile drilling derricks

8705.30 - Fire fighting vehicles

8705.40 - Concrete-mixer lorries

8705.90 - Other

This heading covers a range of motor vehicles, specially constructed or adapted, equipped with various devices that enable them to **perform certain non-transport functions**, i.e., the primary purpose of a vehicle of this heading is **not** the transport of persons or goods.

The heading includes :

- (1) Motor breakdown lorries (trucks) consisting of a lorry (truck) chassis, with or without a floor, equipped with lifting gear such as non-rotating cranes, trestles, pulleys or winches, designed for lifting and towing broken-down vehicles.
- (2) Motor pump vehicles, with a pump usually driven by the vehicle's engine (e.g., fire fighting vehicles).
- (3) Lorries (trucks) fitted with ladders or elevator platforms for the maintenance of overhead cables, street lighting, etc.; lorries (trucks) with an adjustable arm and platform ("dollies") for cinematographic or television work.
- (4) Lorries (trucks) used for cleansing streets, gutters, airfield runways, etc., (e.g., sweepers, sprinklers, sprinklersweepers and cesspool emptiers).
- (5) Snow-ploughs and snow-blowers, **with built-in equipment**; i.e., vehicles constructed **solely** for snow clearance, and usually equipped with turbines, rotating blades, etc., driven either by the vehicle engine or by a separate engine.

Interchangeable snow-plough or snow-blower equipment of all types is in all cases **excluded (heading 84.30)**, whether or not presented mounted on a vehicle.

- (6) Spraying lorries (trucks) of all kinds, whether or not fitted with heating equipment, for spreading tar or gravel, for agricultural use, etc.
- (7) Crane lorries (trucks), not for the transport of goods, consisting of a motor vehicle chassis on which a cab and a rotating crane are permanently mounted. However, lorries (trucks) with self-loading devices are **excluded (heading 87.04)**.
- (8) Mobile drilling derricks (i.e., lorries (trucks) fitted with a derrick assembly, winches and other appliances for drilling, etc.).

- (9) Lorries (trucks) fitted with stacking mechanisms (i.e., with a platform which moves on a vertical support and is generally powered by the vehicle engine). But the heading **excludes** self-loading motor vehicles equipped with winches, elevating devices, etc., but which are constructed essentially for the transport of goods (**heading 87.04**).
- (10) Concrete-mixer lorries (trucks) consisting of a cab and a motor vehicle chassis, on which is permanently mounted a concrete-mixer, capable of use for both making and transporting concrete.
- (11) Mobile electric generator sets, consisting of a motor lorry (truck) on which is mounted an electric generator driven either by the vehicle engine or by a separate motor.
- (12) Mobile radiological units (e.g., fitted with an examination room, dark room and complete radiological equipment).
- (13) Mobile clinics (medical or dental) with operating theatre, anaesthetic equipment and other surgical apparatus.
- (14) Searchlight lorries (trucks), consisting of a searchlight mounted on a vehicle, with current usually supplied by a generator driven by the vehicle motor.
- (15) Outside broadcast vans.
- (16) Telegraphy, radio-telegraphy or radio-telephony transmitting and receiving vans; radar vehicles.
- (17) "Tote" vans, fitted with calculating machines for automatic calculation of wins and odds on racecourses.
- (18) Mobile laboratories (e.g., for checking the performance of agricultural machinery).
- (19) Test lorries (trucks), fitted with recording instruments for determining the tractive power of motor vehicles towing them.
- (20) Mobile bakeries fully equipped (kneader, oven, etc.); field kitchens.
- (21) Workshop vans, equipped with various machines and tools, welding appliances, etc.
- (22) Mobile banks, travelling libraries, and mobile showrooms for the display of goods.

The heading also **excludes** :

- (a) Self-propelled road rollers (**heading 84.29**).
- (b) Agricultural rollers (**heading 84.32**).
- (c) Small mobile pedestrian-controlled appliances, fitted with an auxiliary engine (e.g. sweepers for parks, public gardens, etc., and appliances used to mark lines on roads) (**heading 84.79**).
- (d) Motor-homes (**heading 87.03**).

MOTOR VEHICLE CHASSIS OR LORRIES (TRUCKS) COMBINED WITH WORKING MACHINES

It should be noted that to be classified in this heading, a vehicle comprising lifting or handling machinery, earth levelling, excavating or boring machinery, etc., **must** form what is in fact an essentially complete motor vehicle chassis or lorry (truck) in that it comprises at least the following mechanical features : propelling engine, gear box and controls for gear-changing, and steering and braking facilities.

On the other hand, self-propelled machines (e.g., cranes, excavators) in which one or more of the propelling or control elements referred to above are located in the cab of a working machine mounted on a wheeled or track-laying chassis, whether or not the whole can be driven on the road under its own power, remain classified in, for example, **heading 84.26, 84.29 or 84.30**.

Similarly, this heading **excludes** self-propelled wheeled machines in which the chassis and the working machine are specially designed for each other and form an integral mechanical unit (e.g., self-propelled motor graders). In this case, the machine is not simply mounted on a **motor vehicle chassis**, but is completely integrated with a chassis that cannot be used for other purposes and may incorporate the essential automobile features referred to above.

It should be noted, however, that **self-propelled snow-ploughs or snow-blowers with built-in equipment** always fall in this heading.

◦◦◦

Subheading Explanatory Note.

Subheading 8705.10

See the Explanatory Note to heading 87.05, Item (7).

87.06 - Chassis fitted with engines, for the motor vehicles of headings 87.01 to 87.05.

This heading covers the chassis-frames or the combined chassis-body framework (unibody or monocoque construction), for the motor vehicles of headings 87.01 to 87.05, fitted with their engines and with their transmission and steering gear and axles (with or without wheels). That is to say, goods of this heading are motor vehicles without bodies.

The chassis classified in this heading may, however, be fitted with bonnets (hoods), windscreens (windshields), mudguards, running-boards and dashboards (whether or not equipped with instruments). Chassis also remain classified here whether or not fitted with tyres, carburettors or batteries or other electrical equipment. However, if the article is a complete or substantially complete tractor or other vehicle it is **not covered** by this heading.

The heading also **excludes** :

- (a) Chassis fitted with engines and cabs, whether or not the cab is complete (e.g., without seat) (**headings 87.02 to 87.04**) (see Note 3 to this Chapter).
- (b) Chassis not fitted with engines, whether or not equipped with various mechanical parts (**heading 87.08**).

87.07 - Bodies (including cabs), for the motor vehicles of headings 87.01 to 87.05.

8707.10 - For the vehicles of heading 87.03

8707.90 - Other

This heading covers the bodies (including cabs) for the motor vehicles of headings 87.01 to 87.05.

It covers not only bodies designed to be mounted on a chassis, but also bodies for vehicles without chassis (in which case the body itself supports the engine and axles); it further includes unit construction bodies in which certain elements of the chassis are incorporated in the body.

The heading covers a wide range of bodies for various types of vehicles (e.g., passenger vehicles, lorries (trucks) and special purpose vehicles). They are generally made of steel, lightweight alloys, wood or plastics.

They may be completely equipped (e.g., with all their fittings and accessories such as dashboards, boots (trunks), seats and cushions, mats, luggage racks and electrical fittings).

Incomplete bodies also fall in this heading, for example, those in which parts such as windscreens or doors remain to be added, or those in which the upholstery or paintwork has not been completely finished.

Driving cabs (e.g., for lorries (trucks) and tractors) are also classified in this heading.

87.08 - Parts and accessories of the motor vehicles of headings 87.01 to 87.05.

8708.10 - Bumpers and parts thereof

- Other parts and accessories of bodies (including cabs) :

8708.21 -- Safety seat belts

8708.29 -- Other

8708.30 - Brakes and servo-brakes; parts thereof

8708.40 - Gear boxes and parts thereof

8708.50 - Drive-axles with differential, whether or not provided with other transmission components, and non-driving axles; parts thereof

8708.70 - Road wheels and parts and accessories thereof

8708.80 - Suspension systems and parts thereof (including shock-absorbers)

- Other parts and accessories :

8708.91 -- Radiators and parts thereof

8708.92 -- Silencers (mufflers) and exhaust pipes; parts thereof

8708.93 -- Clutches and parts thereof

8708.94 -- Steering wheels, steering columns and steering boxes; parts thereof

8708.95 -- Safety airbags with inflater system; parts thereof

8708.99 -- Other

This heading covers parts and accessories of the motor vehicles of headings 87.01 to 87.05, **provided** the parts and accessories fulfil **both** the following conditions :

(i) They must be identifiable as being suitable for use solely or principally with the above-mentioned vehicles;

and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts and accessories of this heading include :

(A) Assembled motor vehicle chassis-frames (whether or not fitted with wheels **but without engines**) and parts thereof (side-members, braces, cross-members; suspension mountings; supports and brackets for the coachwork, engine, running-boards, battery or fuel tanks, etc.).

- (B) Parts of bodies and associated accessories, for example, floor boards, sides, front or rear panels, luggage compartments, etc.; doors and parts thereof; bonnets (hoods); framed windows, windows equipped with heating resistors and electrical connectors, window frames; running-boards; wings (fenders), mudguards; dashboards; radiator cowlings; number-plate brackets; bumpers and over-riders; steering column brackets; exterior luggage racks; visors; non-electric heating and defrosting appliances which use the heat produced by the engine of the vehicle; safety seat belts designed to be permanently fixed into motor vehicles for the protection of persons; floor mats (**other than** of textile material or unhardened vulcanised rubber), etc. Assemblies (including unit construction chassis-bodies) **not** yet having the character of incomplete bodies, e.g., not yet fitted with doors, wings (fenders), bonnets (hoods) and rear compartment covers, etc., are classified in this heading and not in heading 87.07.
- (C) Clutches (cone, plate, hydraulic, automatic, etc., but **not** the electro-magnetic clutches of **heading 85.05**), clutch casings, plates and levers, and mounted linings.
- (D) Gear boxes (transmissions) of all types (mechanical, overdrive, preselector, electro-mechanical, automatic, etc.); torque converters; gear box (transmission) casings; shafts (**other than** internal parts of engines or motors); gear pinions; direct-drive dog-clutches and selector rods, etc.
- (E) Drive-axles, with differential; non-driving axles (front or rear); casings for differentials; sun and planet gear pinions; hubs, stub-axles (axle journals), stub-axle brackets.
- (F) Other transmission parts and components (for example, propeller shafts, half-shafts; gears, gearing; plain shaft bearings; reduction gear assemblies; universal joints). But the heading **excludes** internal parts of engines, such as connecting-rods, push-rods and valvelifters of **heading 84.09** and crank shafts, cam shafts and flywheels of **heading 84.83**.
- (G) Steering gear parts (for example, steering column tubes, steering track rods and levers, steering knuckle tie rods; casings; racks and pinions; servo-steering mechanisms).
- (H) Brakes (shoe, segment, disc, etc.) and parts thereof (plates, drums, cylinders, mounted linings, oil reservoirs for hydraulic brakes, etc.); servo-brakes and parts thereof.
- (IJ) Suspension shock-absorbers (friction, hydraulic, etc.) and other suspension parts (**other than** springs), torsion bars.
- (K) Road wheels (pressed steel, wire-spoked, etc.), whether or not fitted with tyres; tracks and sets of wheels for tracked vehicles; rims, discs, hub-caps and spokes.
- (L) Control equipment, for example, steering wheels, steering columns and steering boxes, steering wheel axles; gear-change and hand-brake levers; accelerator, brake and clutch pedals; connecting-rods for brakes, clutches.
- (M) Radiators, silencers (mufflers) and exhaust pipes, fuel tanks, etc.
- (N) Clutch cables, brakes cables, accelerator cables and similar cables, consisting of a flexible outer casing and a moveable inner cable. They are presented cut to length and equipped with end fittings.

- (O) Safety airbags of all types with inflater system (e.g., driver-side airbags, passenger-side airbags, airbags to be installed in door panels for side-impact protection or airbags to be installed in the ceiling of the vehicle for extra protection for the head) and parts thereof. The inflater systems include the igniter and propellant in a container that directs the expansion of gas into the airbag. The heading **excludes** remote sensors or electronic controllers, as they are not considered to be parts of the inflater system.

The heading **does not cover** hydraulic or pneumatic cylinders of **heading 84.12**.

87.09 - Works trucks, self-propelled, not fitted with lifting or handling equipment, of the type used in factories, warehouses, dock areas or airports for short distance transport of goods; tractors of the type used on railway station platforms; parts of the foregoing vehicles.

- Vehicles :

8709.11 -- Electrical

8709.19 -- Other

8709.90 - Parts

This heading covers a group of self-propelled vehicles of the types used in factories, warehouses, dock areas or airports for the short distance transport of various loads (goods or containers) or, on railway station platforms, to haul small trailers.

Such vehicles are of many types and sizes. They may be driven either by an electric motor with current supplied by accumulators or by an internal combustion piston engine or other engine.

The main features common to the vehicles of this heading which generally distinguish them from the vehicles of heading 87.01, 87.03 or 87.04 may be summarised as follows :

- (1) Their construction and, as a rule, their special design features, make them unsuitable for the transport of passengers or for the transport of goods by road or other public ways.
- (2) Their top speed when laden is generally not more than 30 to 35 km/h.
- (3) Their turning radius is approximately equal to the length of the vehicle itself.

Vehicles of this heading do not usually have a closed driving cab, the accommodation for the driver often being no more than a platform on which he stands to steer the vehicle. Certain types may be equipped with a protective frame, metal screen, etc., over the driver's seat.

The vehicles of this heading may be pedestrian controlled.

Works trucks are self-propelled trucks for the transport of goods which are fitted with, for example, a platform or container on which the goods are loaded.

Small tank trucks of a kind generally used in railway stations, whether or not fitted with subsidiary pumps, are also classified here.

Tractors of the type used on railway station platforms are designed primarily to tow or push other vehicles, e.g., small trailers. They do not themselves carry goods, and are generally lighter and less powerful than the tractors of heading 87.01. Tractors of this type may also be used on wharfs, in warehouses, etc.

PARTS

This heading also covers parts of the vehicles specified in the heading, **provided** the parts fulfil **both** the following conditions :

(i) They must be identifiable as being suitable for use solely or principally with such vehicles;

and (ii) They must not be excluded from this heading by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts of this heading include :

- (1) Chassis.
- (2) Bodies, platforms, detachable sides, tipping bodies.
- (3) Wheels, whether or not fitted with tyres.
- (4) Clutches.
- (5) Gear boxes (transmissions), differentials.
- (6) Axles.
- (7) Steering wheels or bars.
- (8) Braking systems and parts thereof.
- (9) Clutch cables, brake cables, accelerator cables and similar cables, consisting of a flexible outer casing and a moveable inner cable. They are presented cut to length and equipped with end fittings.

The heading **excludes** :

- (a) Straddle carriers and works trucks fitted with a crane (**heading 84.26**).
- (b) Fork-lift trucks and other works trucks fitted with lifting or handling equipment (**heading 84.27**).
- (c) Dumpers (**heading 87.04**).

87.10 - Tanks and other armoured fighting vehicles, motorised, whether or not fitted with weapons, and parts of such vehicles.

This heading covers tanks and other armoured fighting " Vehicles, motorised, whether or not fitted with weapons, and " parts of such vehicles.

Tanks are armoured fighting vehicles mounted on tracks, and armed with various weapons (guns, machine-guns, flame-throwers, etc.) usually housed in a traversing turret. They are sometimes fitted with a special gyroscopic stabilisation gear to keep the sights on the target, irrespective of the movement of the vehicle. They may also be equipped with anti-mining devices, such as a " flail " (a rotating drum which is carried on arms in front of the tank and to which are attached chains with ball ends) or a number of heavy rollers attached to the front of the tanks.

The heading also includes amphibious tanks.

Armoured cars are faster and lighter than tanks and cannot carry such heavy armour or mount such large guns. Sometimes they are only partly armoured. They are mainly used for police duties, reconnaissance or for transport in fighting areas. Some armoured cars are track-laying, but the majority are of the road-wheel type. They may be amphibious (e.g., track-laying armoured landing vehicles).

This heading also covers :

- (A) Tanks equipped with a crane for the recovery of fighting vehicles.
- (B) Armoured supply vehicles, generally of the track-laying type, whether or not they are designed to be armed; these are used for the transport of petrol, ammunition, etc., in fighting areas.
- (C) Small remote-controlled " tanks " which carry ammunition to advanced fighting vehicles or artillery units.
- (D) Armoured vehicles permanently fitted with special demolition equipment.
- (E) Armoured personnel carriers.

The heading **excludes** cars and lorries of the conventional type, lightly armoured or equipped with subsidiary removable armour (**headings 87.02 to 87.05** as appropriate).

Self-propelled artillery weapons fall in **heading 93.01**; they are characterised by the fact that they are designed to fire when stationary, the weapon itself having a limited traverse.

PARTS

The heading also covers parts of the above-mentioned vehicles **provided** the parts fulfil **both** the following conditions :

- (i) They must be identifiable as being suitable for use solely or principally with such vehicles;
- and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts of this heading include :

- (1) Bodies of armoured vehicles and parts thereof (turrets, armoured doors and bonnets, etc.).
- (2) Tracks, specially constructed for use with tanks.
- (3) Special road-wheels for armoured cars.
- (4) Propulsion wheels for tank tracks.
- (5) Armour plates, worked to such an extent that they are identifiable as parts of the vehicles of this heading.
- (6) Clutch cables, brake cables, accelerator cables and similar cables, consisting of a flexible outer casing and a moveable inner cable. They are presented cut to length and equipped with end fittings.

87.11 - Motorcycles (including mopeds) and cycles fitted with an auxiliary motor, with or without side-cars; side-cars.

8711.10 - With reciprocating internal combustion piston engine of a cylinder capacity not exceeding 50 cc

8711.20 - With reciprocating internal combustion piston engine of a cylinder capacity exceeding 50 cc but not exceeding 250 cc

8711.30 - With reciprocating internal combustion piston engine of a cylinder capacity exceeding 250 cc but not exceeding 500 cc

8711.40 - With reciprocating internal combustion piston engine of a cylinder capacity exceeding 500 cc but not exceeding 800 cc

8711.50 - With reciprocating internal combustion piston engine of a cylinder capacity exceeding 800 cc

8711.60 - With electric motor for propulsion

8711.90 - Other

This heading covers a group of two-wheeled motorised vehicles which are essentially designed for carrying persons.

In addition to motorcycles of the conventional type, the heading includes motor-scooters, characterised by their small wheels and by a horizontal platform which joins the front and rear portions of the vehicle; mopeds, equipped with both a built-in engine and a pedal system; and cycles fitted with an auxiliary motor.

This heading also covers two-wheeled, electrically-powered transportation devices, designed for carrying a single person, for use within low speed areas such as pavements (sidewalks), paths, and bicycle lanes. Their technology allows the rider to stand upright while a system composed of gyroscope sensors and multiple onboard microprocessors maintains both the device's and rider's balance on two independent, non-tandem wheels. Motorcycles of this heading, which are propelled by one or more electric motors, are known as "Electric Motorcycles". These motorcycles incorporate an electric accumulator pack supplying power to the electric motors. The electric accumulators of these "plug-in" type motorcycles can be recharged by plugging them into an electrical power grid outlet or charging station.

Motorcycles may be equipped to protect the driver against the weather or be fitted with a side-car.

Three-wheeled vehicles (e.g., the "delivery tricycle" type) are also classified here **provided** they do not have the characteristics of motor vehicles of heading 87.03 or heading 87.04 (see the Explanatory Notes to headings 87.03 and 87.04).

The heading further covers side-cars of all kinds, a type of vehicle which is designed for the transport of passengers or goods, and which cannot be used independently. They are equipped with a wheel on one side, the other side bearing fittings enabling the side-car to be attached to, and to travel alongside, a cycle or motorcycle.

The heading **excludes** :

- (a) Four-wheeled motor vehicles, for the transport of persons, with tube chassis, having a motor-car type steering system (e.g., a steering system based on the Ackerman principle) (**heading 87.03**).
- (b) Trailers designed for attachment to a cycle or motorcycle (**heading 87.16**).

87.12 - Bicycles and other cycles (including delivery tricycles), not motorised.

This heading covers non-motorised cycles, i.e., pedal-operated vehicles equipped with one or more wheels (e.g., bicycles (including those for children), tricycles and quadricycles).

The heading includes, in addition to cycles of conventional design, various specialised types such as the following :

- (1) Delivery tricycles, usually in the form of an articulated unit incorporating a container (sometimes insulated) which is constructed over the two leading wheels.
- (2) Tandem bicycles.
- (3) Monocycles (unicycles) and bicycles specially designed for music-hall artists and characterised by their light weight, fixed wheel, etc.
- (4) Bicycles specially constructed for the disabled (e.g., with a special attachment so that the bicycle can be pedalled with one foot).
- (5) Bicycles equipped with a wheeled balancing-support fitted to a hub of the rear-wheel.
- (6) Racing bicycles.
- (7) Quadricycles, equipped with several seats and several sets of pedals, the whole being enclosed within a lightweight structure.
- (8) Pedal-driven bicycle-like scooters designed to be ridden by children, youngsters and adults, with bicycle-type adjustable steering column and handle-bar, inflatable wheels, frame and hand brakes, equipped with a single pedal attached to a chain and sprocket system.

The cycles of this heading equipped with side-cars remain classified here, but side-cars presented separately are **excluded** (**heading 87.11**).

The heading also **excludes** :

- (a) Cycles fitted with an auxiliary motor (**heading 87.11**).
- (b) Children's cycles (other than children's bicycles) (**heading 95.03**).
- (c) Special cycles suitable only for fairground use (**heading 95.08**).

87.13 - Carriages for disabled persons, whether or not motorised or otherwise mechanically propelled.

8713.10 - Not mechanically propelled

8713.90 - Other

This heading covers carriages, wheelchairs, or similar vehicles, specially designed for the transport of disabled persons, whether or not fitted with means of mechanical propulsion.

Vehicles fitted with means of mechanical propulsion are usually driven by a light motor, or propelled by hand by means of a lever or handle-operated mechanism. The other carriages for disabled persons are pushed by hand or propelled by direct manual operation of the wheels.

The heading **excludes** :

- (a) Normal vehicles simply adapted for use by disabled persons (for example, a motor car fitted with a hand-operated clutch, accelerator, etc. (**heading 87.03**), or a bicycle fitted with a special attachment and pedalled with one foot (**heading 87.12**)).
- (b) Trolley-stretchers (**heading 94.02**).

87.14 - Parts and accessories of vehicles of headings 87.11 to 87.13.

8714.10 - Of motorcycles (including mopeds)

8714.20 - Of carriages for disabled persons

- Other :

8714.91 -- Frames and forks, and parts thereof

8714.92 -- Wheel rims and spokes

8714.93 -- Hubs, other than coaster braking hubs and hub brakes, and free-wheel sprocket-wheels

8714.94 -- Brakes, including coaster braking hubs and hub brakes, and parts thereof

8714.95 -- Saddles

8714.96 -- Pedals and crank-gear, and parts thereof

8714.99 -- Other

This heading covers parts and accessories of a kind used with motorcycles (including mopeds), cycles fitted with an auxiliary motor, side-cars, non-motorised cycles, or carriages for disabled persons, **provided** the parts and accessories fulfil **both** the following conditions:

(i) They must be identifiable as being suitable for use solely or principally with the above-mentioned vehicles;

and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts and accessories of this heading include :

- (1) Bodies and parts thereof for delivery tricycles, side-cars or carriages for disabled persons (hoods, doors, floors, etc.).
- (2) Chassis and frames, and parts thereof.
- (3) Gearing, gear boxes, clutches and other transmission equipment, and parts thereof, for motorcycles.
- (4) Wheels and parts thereof (hubs, rims, spokes, etc.).
- (5) Free-wheel sprocket-wheels.
- (6) Derailleurs and other gear mechanisms, and parts thereof.
- (7) Crank-gear and parts thereof (crank-wheels, cranks, axles, etc.), pedals and parts thereof (axles, etc.); toe-clips.
- (8) Kickstarters, levers and other control gear.

- (9) Brakes of all kinds (cantilever brakes, caliper brakes, drum brakes, hub brakes, disc brakes, coaster braking hubs, etc.), and parts thereof (levers, block-holder levers, drums and shoes for hub brakes, yokes for cantilever brakes).
- (10) Handle-bars, handle-bar stems, and handle-bar grips (of cork, plastics, etc.).
- (11) Saddles (seats) and saddle-pillars (seat-posts); saddle-covers.
- (12) Forks, including telescopic forks, and parts thereof (fork crowns and blades, etc.).
- (13) Tubes and lugs for cycle frames.
- (14) Hydraulic shock-absorbers and parts thereof.
- (15) Mudguards and their supports (stays, fastening rods, etc.).
- (16) Reflectors (mounted).
- (17) Clothes protectors (**other than** nets of **heading 56.08**); transmission-chain covers; foot-rests and leg-protectors.
- (18) Stands for motorcycles.
- (19) Tilting cowls and spare-wheel covers, for scooters.
- (20) Silencers (mufflers) and parts thereof.
- (21) Fuel tanks.
- (22) Windscreens (windshields).
- (23) Luggage racks; lamp brackets; water-bottle brackets.
- (24) Propelling levers and crank-handles, back-rests and back-rest steering columns, foot-rests, leg-supports, armrests, etc., for carriages for disabled persons.
- (25) Clutch cables, brake cables, accelerator cables and similar cables, consisting of a flexible outer casing and a moveable inner cable. They are presented cut to length and equipped with end fittings.

87.15 - Baby carriages and parts thereof.

The heading covers :

- (I) **Baby carriages**, whether or not folding, fitted with two or more wheels and generally pushed by hand (push-chairs, perambulators, strollers, etc.).
- (II) **Parts of the above-mentioned carriages, provided** the parts fulfil **both** the following conditions :
 - (i) They must be identifiable as being suitable for use solely or principally with the carriages of this heading;
 - and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts of this heading include :

- (1) Bodywork for mounting on chassis, including the removable type of perambulator bodies which can be used as cradles.
- (2) Chassis and parts thereof.
- (3) Wheels (whether or not fitted with their tyres) and parts thereof.

87.16 - Trailers and semi-trailers; other vehicles, not mechanically propelled; parts thereof.

- 8716.10 - Trailers and semi-trailers of the caravan type, for housing or camping
- 8716.20 - Self-loading or self-unloading trailers and semi-trailers for agricultural purposes
 - Other trailers and semi-trailers for the transport of goods :
- 8716.31 -- Tanker trailers and tanker semi-trailers
- 8716.39 -- Other
- 8716.40 - Other trailers and semi-trailers
- 8716.80 - Other vehicles
- 8716.90 - Parts

This heading covers a group of **non-mechanically** propelled vehicles (**other than** those of the preceding headings) equipped with one or more wheels and constructed for the transport of goods or persons. It also includes non-mechanical vehicles not fitted with wheels (e.g., sledges, special sleds running on timber trackways).

The vehicles of this heading are designed to be towed by other vehicles (tractors, lorries, trucks, motorcycles, bicycles, etc.), to be pushed or pulled by hand, to be pushed by foot or to be drawn by animals.

The heading includes :

(A) Trailers and semi-trailers.

For the purposes of this heading, the terms "trailers" and "semi-trailers" means vehicles (other than side-cars) of a kind designed solely to be coupled to another vehicle by means of a special coupling device (whether or not automatic).

The most important types of trailers and semi-trailers falling in this group are those designed for use with motor vehicles. Trailers usually have two or more sets of wheels, and a coupling system mounted on the swivelling front wheels which steer the vehicles. Semi-trailers are fitted with rear wheels only, the forward end resting on the platform of the towing vehicle to which it is coupled by a special coupling device.

For the purposes of the following Explanatory Note, the term "trailers" includes semi-trailers.

Trailers falling here include :

- (1) Trailers of the caravan type (travel trailers), for housing or camping.
- (2) Self-loading agricultural trailers fitted with automatic loading devices and possibly also with attachments for chopping forage, maize (corn) stalks, etc.

This heading **does not cover** self-loading trailers permanently mounted with harvesting equipment, for cutting, chopping and transporting grass, maize (corn), etc. (**heading 84.33**).

(3) Self-unloading trailers for carrying different products (forage, manure, etc.), with a moving floor for unloading purposes; these vehicles can be fitted with various attachments (manure chopper, forage shredder, etc.) to adapt them for use as a muck spreader, forage box or root trailer.

(4) Other trailers for the transport of goods such as :

- (a) Tanker trailers (whether or not fitted with pumps).
- (b) Agricultural, public works, etc., trailers (whether or not tipping).
- (c) Refrigerator or insulated trailers for the transport of perishable goods.
- (d) Removal trailers.
- (e) Single or double-decker trailers for the transport of livestock, motor cars, cycles, etc.
- (f) Trailers adapted for the transport of certain goods (e.g., plate glass).
- (g) "Road-rail" (intermodal) trailers (intended mainly for use as road trailers, but so designed that they may be transported on special railway wagons fitted with guide rails).
- (h) Trailers fitted with rails for road transport of railway wagons.
- (ij) Drop-frame trailers with loading ramps for the transport of heavy equipment (tanks, cranes, bulldozers, electrical transformers, etc.).
- (k) Two- or four-wheel independent timber-carrying bogies.
- (l) Logging trailers for the transport of timber.
- (m) Small trailers towed by cycles or motor cycles.

(5) Other trailers such as :

- (a) Motor vehicle trailers specially designed for the conveyance of persons.
- (b) Fairground caravans (**other than** those of **heading 95.08**).
- (c) Exhibition trailers.
- (d) Library-trailers.

(B) Hand- or foot-propelled vehicles.

This group includes :

- (1) Trucks and trolleys of various kinds including those specialised for use in particular industries (in the textile or ceramic industries, in dairies, etc.).

- (2) Wheelbarrows, luggage-trucks, hopper-trucks and tipping-trucks.
- (3) Food carts, buffet trolleys (**other than** the type falling in **heading 94.03**), of a kind used in railway stations.
- (4) Hand-carts, e.g., for waste disposal.
- (5) Rickshaws.
- (6) Small insulated barrows for use by ice cream vendors.
- (7) Tradesmen's barrows of all kinds. These lightweight vehicles are sometimes fitted with pneumatic tyres.
- (8) Sledges (hand-drawn) for the transport of wood in mountainous country.
- (9) "Kicksleds", propelled by the direct pressure of the rider's foot on the snow covered ground, designed particularly for the transport of persons in subarctic regions.

This heading **does not cover** :

- (a) Walking aids known as "walker-rollators", which generally consist of a tubular metal frame on three or four wheels (some or all of which may swivel), handles and hand-brakes (**heading 90.21**).
- (b) Small wheeled-containers (e.g., wheeled-baskets) of basketwork, metal, etc., not incorporating a chassis, of a kind used in shops (classification according to their constituent material).

(C) Vehicles drawn by animals.

This group includes :

- (1) State (ceremonial) -coaches, coupés, calashes, hackney-coaches, cabriolets.
- (2) Hearses.
- (3) Sulkies.
- (4) Children's donkey-carts and pony-carts used in public gardens, squares, etc.
- (5) Delivery vehicles of all kinds; removal vans.
- (6) Carts of all kinds, including tipping-carts.
- (7) Sledges and sleighs.

VEHICLES FITTED WITH MACHINERY, ETC.

The classification of units consisting of vehicles with **permanently built-on** machines or appliances is determined according to the **essential character of the whole**. The heading therefore covers such units which derive their essential character from the vehicle itself. On the other hand, units deriving their essential character from the machine or appliance they incorporate are **excluded**.

It follows from the above that :

- (I) Trucks, carts or trailers with built-on tanks, whether or not they are fitted with subsidiary pumps for filling or emptying purposes, are classified here.
- (II) The following, for example, are **excluded** and fall in the heading relating to the machine or appliance :
 - (a) Hand-truck, animal cart or trailer-type spraying appliances of **heading 84.24**.
 - (b) Machines and appliances mounted on a simple wheeled chassis, designed to be towed, such as mobile pumps and compressors (**heading 84.13** or **84.14**) and mobile cranes and ladders (**heading 84.26** or **84.28**).
 - (c) Trailed concrete mixers (**heading 84.74**).

PARTS

This heading also includes parts of the vehicles mentioned above, **provided** the parts comply with **both** the following conditions :

- (i) They must be identifiable as being suitable for use solely or principally with such vehicles;
- and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

Parts of this heading include :

- (1) Chassis and component parts thereof (frame side members, cross members, etc.).
- (2) Axles.
- (3) Bodies and parts thereof.
- (4) Wooden or steel wheels and parts thereof, including wheels fitted with their tyres.
- (5) Coupling devices.
- (6) Brakes and parts thereof.
- (7) Shafts, swingle-bars and similar parts.

*
* *

Winter sports equipment, such as toboggans, bobsleighs (bobsleds), etc., is **excluded** (**heading 95.06**).

Chapter 88

Aircraft, spacecraft, and parts thereof

Subheading Note.

- 1.- For the purposes of subheadings 8802.11 to 8802.40, the expression "unladen weight" means the weight of the machine in normal flying order, excluding the weight of the crew and of fuel and equipment other than permanently fitted items of equipment.

GENERAL

This Chapter covers balloons and dirigibles and non-powered aircraft (heading 88.01), other aircraft, spacecraft (including satellites) and spacecraft launch vehicles (heading 88.02), certain allied equipment such as parachutes (heading 88.04), and aircraft launching gear, deck-arrestor gear and ground flying trainers (heading 88.05). **Subject** to the provisions of the Notes to Section XVII (see the General Explanatory Note to the Section), it also covers parts of such equipment.

Incomplete or unfinished aircraft (e.g., aircraft not equipped with engines or internal equipment) are classified as the corresponding complete or finished aircraft, **provided** they have the essential character of the latter.

88.01 - Balloons and dirigibles; gliders, hang gliders and other non-powered aircraft.

(I) BALLOONS AND DIRIGIBLES

This group covers lighter-than-air aircraft whatever their intended use (military, sporting, scientific, publicity, etc.). These comprise **balloons**, free or captive (i.e., moored to the ground by a cable), and mechanically driven **dirigibles**.

This group also includes balloons of the following types, used in aeronautics or meteorology :

- (1) **Sounding balloons.** These are used to carry radio-sounding instruments to high altitudes. They may weigh up to 4,500 g, but their normal weight varies between 350 and 1,500 g.
- (2) **Pilot balloons.** These are released to indicate the speed and direction of wind. Normally they weigh from 50 to 100 g.
- (3) **Ceiling balloons.** These are smaller than the balloons in (1) and (2) above and normally weigh 4 to 30 g. They are used to determine cloud height.

In most cases balloons used in meteorology are of very thin, high quality rubber allowing a high degree of expansion. Children's toy balloons are **excluded (heading 95.03)**. They may be distinguished by their inferior quality, short inflation necks and the advertisements or decorations often found on them.

(II) GLIDERS AND HANG GLIDERS

Gliders are heavier-than-air aircraft which stay airborne using atmospheric currents. However, gliders fitted with or designed to be fitted with an engine are classified in **heading 88.02**.

Hang gliders include, in particular, delta wings which enable one or two persons, suspended by a harness, to perform certain aerial manoeuvres. These wings consist of material (generally textile) stretched over a rigid structure, usually tubular and of metal, incorporating a horizontal steering bar in the centre. Other types of hang gliders may be otherwise shaped, but are similar to delta wings in their structure and aerodynamic behaviour.

(III) OTHER NON-POWERED AIRCRAFT

This group includes **kites** which are heavier-than-air aircraft without mechanical propulsion. Kites are moored to the ground by a line in the same way as captive balloons and may be used, for example, to carry meteorological instruments.

Kites clearly designed as toys are **excluded (heading 95.03)**.

*
* * *

The heading also **excludes** models, whether or not built accurately to scale, used, for example, for decoration (e.g., **heading 44.20** or **83.06**), for purely demonstrational purposes (**heading 90.23**), or as toys or models for recreational purposes (**heading 95.03**).

88.02 - Other aircraft (for example, helicopters, aeroplanes); spacecraft (including satellites) and suborbital and spacecraft launch vehicles.

- Helicopters :

8802.11 -- Of an unladen weight not exceeding 2,000 kg

8802.12 -- Of an unladen weight exceeding 2,000 kg

8802.20 - Aeroplanes and other aircraft, of an unladen weight not exceeding 2,000 kg

8802.30 - Aeroplanes and other aircraft, of an unladen weight exceeding 2,000 kg but not exceeding 15,000 kg

8802.40 - Aeroplanes and other aircraft, of an unladen weight exceeding 15,000 kg

8802.60 - Spacecraft (including satellites) and suborbital and spacecraft launch vehicles

This heading covers :

- (1) **Heavier-than-air aircraft**, which are mechanically propelled. This group includes **aeroplanes** (landplanes, seaplanes and amphibians), **gyroplanes** (equipped with one or more rotors rotating freely on vertical axes), and **helicopters** (equipped with one or more mechanically driven rotors).

Such aircraft may be used for military purposes, the transport of persons or goods or for such activities as training, aerial photography, agricultural work, rescue duties, fire fighting or for meteorological or other scientific purposes.

Radio-guided aircraft controlled from the ground or from another aircraft are covered by this heading, as are aircraft specially constructed so that they can be used as road vehicles.

- (2) **Spacecraft**, which are vehicles able to travel outside the earth's atmosphere (e.g., telecommunications or meteorological satellites).
- (3) **Spacecraft launch vehicles** whose function is to place a given payload on a trajectory orbiting the earth ("satellite launch vehicles") or falling under the influence of a gravitational field other than that of the earth ("spacecraft launch vehicles"). These vehicles impart to the payload a terminal velocity exceeding 7,000 m/s at the end of the powered flight.
- (4) **Suborbital launch vehicles** that follow a parabolic trajectory and generally carry instrumentation for scientific or other technical purposes, whether or not in the form of a retrievable payload, beyond the earth's atmosphere. In cases where payloads are released, these vehicles do not impart a terminal velocity exceeding 7,000 m/s. Payloads are often returned to the earth's surface by parachute for recovery.

The heading **excludes**, however, artillery rockets, guided missiles, e.g., "ballistic missiles", and similar munitions of war which do not impart a terminal velocity exceeding 7,000 m/s to the payload (**heading 93.06**). They deliver munitions of war, e.g., explosives, submunitions, chemical agents, and after following a parabolic trajectory cause the payload to impact on a target.

The heading also **excludes** :

- (a) Models, whether or not built accurately to scale, used, for example, for decoration (e.g., **heading 44.20** or **83.06**) or for purely demonstrational purposes (**heading 90.23**).
- (b) Toys or models for recreational purposes (**heading 95.03**).

88.03 - Parts of goods of heading 88.01 or 88.02.

8803.10 - Propellers and rotors and parts thereof

8803.20 - Under-carriages and parts thereof

8803.30 - Other parts of aeroplanes or helicopters

8803.90 - Other

This heading covers parts of the goods falling in heading 88.01 or 88.02, **provided** the parts fulfil **both** the following conditions :

(i) They must be identifiable as being suitable for use solely or principally with the goods of the above-mentioned headings;

and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

The parts of this heading include :

(I) Parts of balloons and dirigibles, such as :

- (1) Nacelles.
- (2) Envelopes and parts thereof (strips or panels).
- (3) Carrier hoops.
- (4) Ballonets.
- (5) Rigid frames and sections thereof.
- (6) Stabilisers and rudders.
- (7) Propellers for dirigibles.

(II) Parts of aircraft including gliders and kites, e.g. :

- (1) Fuselages and hulls; fuselage or hull sections; also their internal or external parts (radomes, tail cones, fairings, panels, partitions, luggage compartments, floors, instrument panels, frames, doors, escape chutes and slides, windows, port-holes, etc.).
- (2) Wings and their components (spars, ribs, cross-members).
- (3) Control surfaces, whether or not movable (ailerons, slats, spoilers, flaps, elevators, rudders, stabilisers, servo-tabs, etc.).
- (4) Nacelles, cowlings, engine pods and pylons.
- (5) Undercarriages (including brakes and brake assemblies) and their retracting equipment; wheels (with or without tyres); landing skis.
- (6) Seaplane floats.
- (7) Propellers (airscrews), rotors for helicopters and gyroplanes; blades for propellers and rotors; pitch control mechanisms for propellers and rotors.
- (8) Control levers (control columns, rudder-bars and various other operational levers).
- (9) Fuel tanks, including auxiliary fuel tanks.

88.04 - Parachutes (including dirigible parachutes and paragliders) and rotochutes; parts thereof and accessories thereto.

This heading covers parachutes used for the descent of personnel, military supplies or equipment, meteorological instruments, flares, etc.; certain types are used as tail chutes for slowing jet propelled aircraft. According to their use, they may be of various sizes, and may be made of silk, man-made fibre materials, linen, cotton, paper, etc.

The upper part of the conventional type of parachute, as used by personnel, usually consists of a small **pilot chute** which opens when the rip cord is pulled. This, in turn, opens the **main chute canopy** to which are attached a certain number of **shroud lines**. These cords are brought together at the bottom into two or more **risers**, attached to the **harness** which is worn by the parachutist and which consists of an assembly of straps, fitted with buckles and snap-hooks. The pilot chute, the main chute canopy and the shroud lines are packed carefully in a **container** which is opened by means of the rip cords.

This heading also covers **paragliders** which are designed for launching oneself from the side of a mountain, the top of a cliff, etc., and which consist of a folding canopy or shroud (wing), cord shroud lines for steering in air currents and a harness for the pilot.

However, their similarity to parachutes does not extend to aerodynamic behaviour, since under certain conditions and if air currents so permit, paragliders may follow ascending trajectories.

The heading also includes **rotochutes**, a type of apparatus with a rotating wing unit, used in meteorology to control the descent of rocket-launched radio-sounding instruments.

The heading also covers parts and accessories for parachutes, such as the container, harness and spring frames for opening the parachute, and parts and accessories for rotochutes.

88.05 - Aircraft launching gear; deck-arrestor or similar gear; ground flying trainers; parts of the foregoing articles.

8805.10 - Aircraft launching gear and parts thereof; deck-arrestor or similar gear and parts thereof

- Ground flying trainers and parts thereof :

8805.21 -- Air combat simulators and parts thereof

8805.29 -- Other

This heading covers three entirely distinct types of goods, viz. :

(A) Aircraft launching gear.

Aircraft launching gear, generally used on board ships, incorporates a metal structure which guides the aircraft to be launched. The acceleration required for the take-off is provided by the action of compressed air, steam, exploding cartridges, etc., exerted on a trolley or ram on which the aircraft is mounted.

The heading **excludes** :

- (a) Motor driven winch gear used for launching gliders (**heading 84.25**).
- (b) Rocket-launching ramps and towers which merely guide rockets during take-off without propelling them, the rockets climbing under their own power (**heading 84.79**).

(B) Deck-arrestor or similar gear.

This gear, used on aircraft carriers and at some aerodromes, serves to reduce the speed of an aircraft at the moment of landing, in order to shorten the length of runway needed for the aircraft to come to a halt.

The heading **does not**, however, **cover** other equipment, such as safety equipment (nets, for example).

(C) Ground flying trainers.

Examples of these devices which are used for training pilots include :

- (1) **Flight simulators** which function electronically. Flying conditions are simulated by electronic apparatus which feed into the controls the correct combination of "feel" and reading corresponding to given flying conditions. **Air combat simulators** refer to any electronic or mechanical system for training aircraft pilots by simulating air combat conditions during flight.

When mounted on a motor vehicle chassis or trailer, this type of equipment is classified in **heading 87.05** or **87.16** respectively (but see the Explanatory Note to heading 87.16).

- (2) A device known as a "link trainer" comprising a small cabin pivoting on a base and equipped as an aeroplane cockpit enabling the pupil to carry out all the manoeuvres required in normal flying.

PARTS

This heading also covers parts of the above-mentioned articles, **provided** the parts fulfil **both** the following conditions :

- (i) They must be identifiable as being suitable for use solely or principally with such articles;
- and (ii) They must not be excluded by the provisions of the Notes to Section XVII (see the corresponding General Explanatory Note).

* * *

The heading **excludes**, however, equipment principally intended to register human reactions under arduous flying conditions (e.g., high acceleration, shortage of oxygen); such equipment (e.g., compartments built on a rotating arm which simulate supersonic flying conditions) is in the nature of reflex-testing apparatus and as such is classified in **heading 90.19**.

Equipment which is not specially designed for the flying training of pilots but for the general instruction of aircrews (e.g., large scale models of gyroscopes) is also **excluded** (**heading 90.23**).

Chapter 89

Ships, boats and floating structures

Note.

- 1.- A hull, an unfinished or incomplete vessel, assembled, unassembled or disassembled, or a complete vessel unassembled or disassembled, is to be classified in heading 89.06 if it does not have the essential character of a vessel of a particular kind.

GENERAL

This Chapter covers ships, boats and other vessels of all kinds (whether or not self-propelled), and also floating structures such as coffer-dams, landing stages and buoys. It also includes air-cushion vehicles (hovercraft) designed to travel over water (sea, estuaries, lakes), whether or not able to land on beaches or landing-stages or also able to travel over ice (see Note 5 to Section XVII).

The Chapter also includes :

- (A) Unfinished or incomplete vessels (e.g., those not equipped with their propelling machinery, navigational instruments, lifting or handling machinery or interior furnishings).
- (B) Hulls of any material.

Complete vessels presented unassembled or disassembled, and hulls, unfinished or incomplete vessels (whether assembled or not), are classified as vessels of a particular kind, if they have the essential character of that kind of vessel. In other cases, such goods are classified in heading 89.06.

Contrary to the provisions relating to the transport equipment falling in other Chapters of Section XVII, this Chapter **excludes** all separately presented parts (**other than** hulls) and accessories of vessels or floating structures, even if they are clearly identifiable as such. Such parts and accessories are classified in the appropriate headings elsewhere in the Nomenclature, for example :

- (1) The parts and accessories specified in Note 2 to Section XVII.
- (2) Wooden oars and paddles (**heading 44.21**).
- (3) Ropes and cables of textile material (**heading 56.07**).
- (4) Sails (**heading 63.06**).
- (5) Masts, hatchways, gangways, rails and bulkheads for ships or boats and parts of hulls, having the character of metal structures of **heading 73.08**.
- (6) Cables of iron or steel (**heading 73.12**).
- (7) Anchors of iron or steel (**heading 73.16**).
- (8) Propellers and paddle-wheels (**heading 84.87**).
- (9) Rudders (**headings 44.21, 73.25, 73.26**, etc.) and other steering or rudder equipment for ships or boats (**heading 84.79**).

The following are also **excluded** from this Chapter :

- (a) Model vessels used for ornamental purposes (e.g., galleons and other sailing vessels) (**headings 44.20, 83.06**, etc.).
- (b) Demonstrational apparatus or models of **heading 90.23**.
- (c) Torpedoes, mines and similar munitions of war (**heading 93.06**).
- (d) Wheeled toys, in the form of boats, designed to be ridden by children and other toys (**heading 95.03**).
- (e) Water-skis and the like (**heading 95.06**).
- (f) Small boats for use on roundabouts or other fairground amusements (**heading 95.08**).
- (g) Antiques of an age exceeding 100 years (**heading 97.06**).

Amphibious motor vehicles and air-cushion vehicles designed to travel over both land and certain tracts of water (swamps, etc.) are classified as motor vehicles in **Chapter 87**, and seaplanes and flying boats fall in **heading 88.02**.

89.01 - Cruise ships, excursion boats, ferry-boats, cargo ships, barges and similar vessels for the transport of persons or goods.

8901.10 - Cruise ships, excursion boats and similar vessels principally designed for the transport of persons; ferry-boats of all kinds

8901.20 - Tankers

8901.30 - Refrigerated vessels, other than those of subheading 8901.20

8901.90 - Other vessels for the transport of goods and other vessels for the transport of both persons and goods

This heading covers all vessels for the transport of persons or goods, **other than** vessels of **heading 89.03** and lifeboats (other than rowing boats), troop-ships and hospital ships (**heading 89.06**); they may be for sea navigation or inland navigation (e.g., on lakes, canals, rivers, estuaries).

The heading includes :

- (1) Cruise ships and excursion boats.
- (2) Ferry-boats of all kinds, including train-ferries, car-ferries and small river-ferries.
- (3) Tankers (petrol, methane, wine, etc.).
- (4) Refrigerated vessels for the transport of meat, fruit, etc.
- (5) Cargo vessels of all kinds (other than tankers and refrigerated vessels), whether or not specialised for the transport of specific goods. These include ore vessels and other bulk carriers (for the transport of, e.g., grain, coal), container ships, Ro-Ro (roll-on-roll-off) ships and LASH-type vessels.
- (6) Barges of various kinds, lighters and pontoons being flat-decked vessels used for the transport of goods and, sometimes, of persons.
- (7) Vessels of the hydroglider type, hydrofoils and hovercraft.

89.02 - Fishing vessels; factory ships and other vessels for processing or preserving fishery products.

This heading covers all types of fishing vessels designed for commercial fishing at sea or on inland waters, but **excluding** rowing boats for fishing (**heading 89.03**). These include trawlers and tuna fishing vessels.

The heading also includes factory ships (for preserving fish, etc.).

Fishing vessels which may be used for excursions, generally during the tourist season, are also classified in this heading.

Sports fishing vessels are, however, **excluded** (**heading 89.03**).

89.03 - Yachts and other vessels for pleasure or sports; rowing boats and canoes (+).

8903.10 - Inflatable

- Other :

8903.91 -- Sailboats, with or without auxiliary motor

8903.92 -- Motorboats, other than outboard motorboats

8903.99 -- Other

This heading covers all vessels for pleasure or sports and all rowing boats and canoes.

This heading includes yachts, marine jets and other sailboats and motorboats, dinghies, kayaks, sculls, skiffs, pedalos (a type of pedal-operated float), sports fishing vessels, inflatable craft and boats which can be folded or disassembled.

The heading also covers lifeboats propelled by oars (other lifeboats fall in **heading 89.06**).

Sailboards are, however, **excluded (heading 95.06)**.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 8903.92

“ Outboard motors ” are described in the Explanatory Note to heading 84.07.

89.04 - Tugs and pusher craft.

This heading covers :

- (A) **Tugs.** These are vessels primarily designed for towing other craft. They may be of the type used for sea or for inland navigation. They are distinguishable from other vessels by their specially shaped and strengthened hulls, by their powerful engines disproportionate to the size of the vessel, and by various deck fittings designed to carry a tow rope, hawser, etc.
- (B) **Pusher craft.** These are vessels specially designed for pushing barges, lighters, etc. They are mainly distinguished by a snub bow (for pushing) and an elevated wheel house (which may be telescopic).

The heading also covers “ **pusher-tugs** ” designed for use both as pusher craft and as tugs. Like pusher craft they have a snub bow, but the stern is raked so that they can make way in that direction and tow barges, etc.

Tugs designed to assist ships in distress, are also covered by this heading.

The vessels of this heading are not designed for the transport of persons or goods. They may be fitted with specialised auxiliary equipment for fire-fighting, pumping, cargo heating, etc. However, fire-floats are **excluded (heading 89.05)**.

89.05 - Light-vessels, fire-floats, dredgers, floating cranes, and other vessels the navigability of which is subsidiary to their main function; floating docks; floating or submersible drilling or production platforms.

8905.10 - Dredgers

8905.20 - Floating or submersible drilling or production platforms

8905.90 - Other

This heading covers :

(A) Light-vessels, fire-floats, dredgers, floating cranes, and other vessels the navigability of which is subsidiary to their main function.

These normally perform their main function in a stationary position. They include : light-vessels; drill-ships; fire-floats; dredgers of all kinds (e.g., grab or suction dredgers); salvage ships for the recovery of sunken vessels; permanently moored air-sea rescue floats; bathyscaphes; pontoons fitted with lifting or handling machines (e.g., derricks, cranes, grain elevators) and pontoons clearly designed to serve as a base for these machines.

House-boats, laundry boats and floating mills are also covered by this group.

(B) Floating docks.

Floating docks are a type of floating workshop used instead of dry docks.

They are generally structures of a U-section comprising a platform and side-walls, and are equipped with pumping compartments which enable them to be partly submerged to permit the entrance of vessels requiring repair. In some cases they may be towed.

A further type of floating dock functions in a similar manner, but is self-propelled and equipped with powerful engines. These are used for the repair or transport of amphibious vehicles or other craft.

(C) Floating or submersible drilling or production platforms.

Such platforms are generally designed for the discovery or exploitation of off-shore deposits of oil or natural gas. Apart from the equipment required for drilling or production, such as derricks, cranes, pumps, cementing units, silos, etc., these platforms have living quarters for the personnel.

These platforms, which are towed or in some cases self-propelled to the exploration or production site and are sometimes capable of being floated from one site to another, may be divided into the following main groups :

- (1) Self-elevating platforms** which, apart from the working platform itself, are fitted with devices (hulls, caissons, etc.) which enable them to float, and with retractable legs which are lowered on the work site so that they are supported on the sea bed and raise the working platform above the water level.

- (2) **Submersible platforms**, the substructures of which are submerged over the work sites with their ballast tanks resting on the sea bed in order to provide a high degree of stability to the working platform which is kept above the water level. The ballast tanks may have skirts or piles which penetrate more or less deeply into the sea bed.
- (3) **Semi-submersible platforms** which are similar to submersible platforms, but differ from them in that the submerged part does not rest on the sea bed. When working, these floating platforms are kept in a fixed position by anchor lines or by dynamic positioning.

Fixed platforms used for the discovery or exploitation of off-shore deposits of oil or natural gas, which are neither floating nor submersible, are **excluded** from this heading (**heading 84.30**).

This heading also **excludes** ferry-boats (**heading 89.01**), factory ships for processing fishery products (**heading 89.02**), cable-laying ships and weather ships (**heading 89.06**).

89.06 - Other vessels, including warships and lifeboats other than rowing boats.

8906.10 - Warships

8906.90 - Other

This heading covers all vessels not included in the more specific **headings 89.01 to 89.05**.

It covers :

(1) Warships of all kinds, these include :

(a) Ships designed for warfare, fitted with various offensive weapons and defensive weapons and incorporating protective shields against projectiles (e.g., armour-plating or multiple watertight bulkheads), or with underwater devices (anti-magnetic mine-detectors). They are generally also fitted with detection and listening devices such as radar, sonar, infra-red detection apparatus and scrambling equipment for radio transmissions.

Ships of this category may be distinguished from merchant ships by their greater speed and manoeuvrability, by the size of the crew, by bigger fuel tanks and by special magazines for the transport and use of ammunition at sea.

(b) Certain specially fitted ships which do not carry weapons or armour-plating but yet are recognisable as wholly or mainly for use in warfare, such as landing craft or certain fleet auxiliaries (for transporting ammunition or mines, etc.), troop-ships.

(c) Submarines.

(2) Ships having certain characteristics of warships but which are used by public authorities (e.g., by Customs and police).

(3) Lifeboats for placing on board ships, as well as those which are intended to be placed at certain points around the coast to help ships in distress. However, lifeboats propelled by oars fall in **heading 89.03**.

(4) Scientific research vessels; laboratory ships; weather ships.

(5) Vessels for the transportation and mooring of buoys; cable ships for laying underwater cables, e.g., for telecommunications.

(6) Pilot-boats.

(7) Ice-breakers.

(8) Hospital ships.

(9) Hopper-barges for the disposal of dredged material, etc.

The heading also includes “**dracones**”, i.e., collapsible contrivances for the waterborne transport (by simple towing) of fluids and other goods, consisting of a flexible casing of coated textile fabric, identifiable by their shape (generally like a cigar) and by the presence of various devices such as stabilisers, towing fittings and sometimes buoyancy tubes.

The heading also **excludes** :

- (a) Pontoons (flat-decked vessels used for the transport of persons or goods) (**heading 89.01**).
- (b) Pontoons clearly designed to serve as bases for floating cranes, etc. (**heading 89.05**).
- (c) Pontoons of the hollow cylinder type for the support of temporary bridges, etc., and rafts of all kinds (**heading 89.07**).

89.07 - Other floating structures (for example, rafts, tanks, coffer-dams, landing-stages, buoys and beacons).

8907.10 - Inflatable rafts

8907.90 - Other

This heading covers certain floating structures **not having** the character of vessels. They are generally stationary when in use and include :

- (1) pontoons of the hollow cylinder type used for the support of temporary bridges, etc. But pontoons having the character of vessels are **excluded (heading 89.01 or 89.05)**.
- (2) Floating tanks used to contain live crustaceans or fish.
- (3) Floating tanks used in certain harbours to supply ships with oil, water, etc.
- (4) Coffer-dams being cases used in bridge building, etc.
- (5) Floating landing-stages.
- (6) Buoys, such as mooring buoys, marking buoys, light or bell buoys.
- (7) Beacons used for marking channels, navigational hazards, etc.
- (8) Re-floating appliances used to refloat boats.
- (9) Paravanes, a type of float used in mine-sweeping.
- (10) Rafts of all kinds including floating craft of circular shape, which inflate automatically on contact with the sea, for carrying shipwrecked persons.
- (11) Floating structures designed to function as dock-gates.

The heading also **excludes** :

- (a) Diving bells of the type comprising a metal chamber lowered or raised by external means (i.e., a lifting appliance); these are generally classified in **heading 84.79**.
- (b) Life-belts and life-jackets (classified according to their constituent material).
- (c) Sailboards (**heading 95.06**).

89.08 - Vessels and other floating structures for breaking up.

This heading is restricted to the vessels and other floating structures of headings 89.01 to 89.07 when presented for the purpose of being broken up. Such vessels may be obsolete or damaged, and may have had their instruments, machinery, etc., removed prior to presentation.

Section XVIII

**OPTICAL, PHOTOGRAPHIC, CINEMATOGRAPHIC, MEASURING,
CHECKING, PRECISION, MEDICAL OR SURGICAL INSTRUMENTS
AND APPARATUS; CLOCKS AND WATCHES;
MUSICAL INSTRUMENTS;
PARTS AND ACCESSORIES THEREOF**

Chapter 90

Optical, photographic, cinematographic, measuring, checking, precision, medical or surgical instruments and apparatus; parts and accessories thereof

Notes.

1.- This Chapter does not cover :

- (a) Articles of a kind used in machines, appliances or for other technical uses, of vulcanised rubber other than hard rubber (heading 40.16), of leather or of composition leather (heading 42.05) or of textile material (heading 59.11);
- (b) Supporting belts or other support articles of textile material, whose intended effect on the organ to be supported or held derives solely from their elasticity (for example, maternity belts, thoracic support bandages, abdominal support bandages, supports for joints or muscles) (Section XI);
- (c) Refractory goods of heading 69.03; ceramic wares for laboratory, chemical or other technical uses, of heading 69.09;
- (d) Glass mirrors, not optically worked, of heading 70.09, or mirrors of base metal or of precious metal, not being optical elements (heading 83.06 or Chapter 71);
- (e) Goods of heading 70.07, 70.08, 70.11, 70.14, 70.15 or 70.17;
- (f) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV) or similar goods of plastics (Chapter 39);
- (g) Pumps incorporating measuring devices, of heading 84.13; weight-operated counting or checking machinery, or separately presented weights for balances (heading 84.23); lifting or handling machinery (headings 84.25 to 84.28); paper or paperboard cutting machines of all kinds (heading 84.41); fittings for adjusting work or tools on machine-tools or water-jet cutting machines, of heading 84.66, including fittings with optical devices for reading the scale (for example, "optical" dividing heads) but not those which are in themselves essentially optical instruments (for example, alignment telescopes); calculating machines (heading 84.70); valves or other appliances of heading 84.81; machines and apparatus (including apparatus for the projection or drawing of circuit patterns on sensitised semiconductor materials) of heading 84.86;
- (h) Searchlights or spotlights of a kind used for cycles or motor vehicles (heading 85.12); portable electric lamps of heading 85.13; cinematographic sound recording, reproducing or re-recording apparatus (heading 85.19); sound-heads (heading 85.22); television cameras, digital cameras and video camera recorders (heading 85.25); radar apparatus, radio navigational aid apparatus or radio remote control apparatus (heading 85.26); connectors for optical fibres, optical fibre bundles or cables (heading 85.36); numerical control apparatus of heading 85.37; sealed beam lamp units of heading 85.39; optical fibre cables of heading 85.44;
- (ij) Searchlights or spotlights of heading 94.05;
- (k) Articles of Chapter 95;
- (l) Monopods, bipods, tripods and similar articles, of heading 96.20;
- (m) Capacity measures, which are to be classified according to their constituent material; or
- (n) Spools, reels or similar supports (which are to be classified according to their constituent material, for example, in heading 39.23 or Section XV).

2.- Subject to Note 1 above, parts and accessories for machines, apparatus, instruments or articles of this Chapter are to be classified according to the following rules :

- (a) Parts and accessories which are goods included in any of the headings of this Chapter or of Chapter 84, 85 or 91 (other than heading 84.87, 85.48 or 90.33) are in all cases to be classified in their respective headings;
- (b) Other parts and accessories, if suitable for use solely or principally with a particular kind of machine, instrument or apparatus, or with a number of machines, instruments or apparatus of the same heading (including a machine, instrument or apparatus of heading 90.10, 90.13 or 90.31) are to be classified with the machines, instruments or apparatus of that kind;
- (c) All other parts and accessories are to be classified in heading 90.33.

3.- The provisions of Notes 3 and 4 to Section XVI apply also to this Chapter.

4.- Heading 90.05 does not apply to telescopic sights for fitting to arms, periscopic telescopes for fitting to submarines or tanks, or to telescopes for machines, appliances, instruments or apparatus of this Chapter or Section XVI; such telescopic sights and telescopes are to be classified in heading 90.13.

5.- Measuring or checking optical instruments, appliances or machines which, but for this Note, could be classified both in heading 90.13 and in heading 90.31 are to be classified in heading 90.31.

6.- For the purposes of heading 90.21, the expression "orthopaedic appliances" means appliances for :

- Preventing or correcting bodily deformities; or
- Supporting or holding parts of the body following an illness, operation or injury.

Orthopaedic appliances include footwear and special insoles designed to correct orthopaedic conditions, provided that they are either (1) made to measure or (2) mass-produced, presented singly and not in pairs and designed to fit either foot equally.

7.- Heading 90.32 applies only to :

- (a) Instruments and apparatus for automatically controlling the flow, level, pressure or other variables of liquids or gases, or for automatically controlling temperature, whether or not their operation depends on an electrical phenomenon which varies according to the factor to be automatically controlled, which are designed to bring this factor to, and maintain it at, a desired value, stabilised against disturbances, by constantly or periodically measuring its actual value; and
- (b) Automatic regulators of electrical quantities, and instruments or apparatus for automatically controlling non-electrical quantities the operation of which depends on an electrical phenomenon varying according to the factor to be controlled, which are designed to bring this factor to, and maintain it at, a desired value, stabilised against disturbances, by constantly or periodically measuring its actual value.

GENERAL

(I) GENERAL CONTENT AND ARRANGEMENT OF THE CHAPTER

This Chapter covers a wide variety of instruments and apparatus which are, as a rule, characterised by their high finish and high precision. Most of them are used mainly for scientific purposes (laboratory research work, analysis, astronomy, etc.), for specialised technical or industrial purposes (measuring or checking, observation, etc.) or for medical purposes.

The Chapter includes in particular :

- (A) A wide group comprising not only simple optical elements of headings 90.01 and 90.02, but also optical instruments and apparatus ranging from spectacles of heading 90.04 to more complex instruments used in astronomy, photography, cinematography or for microscopic observation.
- (B) Instruments and apparatus designed for certain specifically defined uses (surveying, meteorology, drawing, calculating, etc.).
- (C) Instruments and appliances for medical, surgical, dental or veterinary uses, or for related purposes (radiology, mechano-therapy, oxygen therapy, orthopaedy, prosthetics, etc.).
- (D) Machines, instruments and appliances for testing materials.
- (E) Laboratory instruments and appliances.
- (F) A large group of measuring, checking or automatically controlling instruments and apparatus, whether or not optical or electrical and in particular those of heading 90.32 as defined in Note 7 to the Chapter.

Some of these instruments are specified in certain headings, for example, compound optical microscopes (heading 90.11), electron microscopes (heading 90.12), other instruments and apparatus are covered by more general descriptions in headings which refer to a particular science, industry, etc. (e.g., astronomical instruments of heading 90.05, surveying instruments and appliances of heading 90.15, X-ray, etc., apparatus of heading 90.22). This Chapter also includes vacuum apparatus of a kind used in medical, surgical, dental or veterinary sciences (**heading 90.18**).

There are certain exceptions to the general rule that the instruments and apparatus of this Chapter are high precision types. For example, the Chapter also covers ordinary goggles (heading 90.04), simple magnifying glasses and non-magnifying periscopes (heading 90.13), divided scales and school rules (heading 90.17) and fancy hygrometers, irrespective of their accuracy (heading 90.25).

Except for certain exclusions referred to in Note 1 to this Chapter (e.g., rubber or leather washers and gaskets, and leather diaphragms for meters), the instruments, apparatus and parts thereof falling in this Chapter may be of any material (including precious metals or metal clad with precious metal, precious or semi-precious stones (natural, synthetic or reconstructed)).

(II) INCOMPLETE OR UNFINISHED MACHINES, APPARATUS, ETC.

(See General Interpretative Rule 2 (a))

Provided they have the essential character of the complete or finished article, incomplete or unfinished machines, appliances, instruments or apparatus are classified with the corresponding complete or finished articles (for example, a photographic camera or a microscope presented without its optical elements or an electricity supply meter without its totalling device).

(III) PARTS AND ACCESSORIES

(Chapter Note 2)

Subject to Chapter Note 1, parts or accessories identifiable as suitable for use **solely or principally** with the machines, appliances, instruments or apparatus of this Chapter are classified with those machines, appliances, etc.

This general rule **does not**, however, **apply to** :

- (1) Parts or accessories which in themselves constitute articles falling in any particular heading of this Chapter or of **Chapter 84, 85 or 91 (other than** the residual **heading 84.87, 85.48 or 90.33**. For example, a vacuum pump for an electron microscope remains a pump of **heading 84.14**; transformers, electro-magnets, capacitors, resistors, relays, lamps or valves, etc., remain classified in **Chapter 85**; the optical elements of **heading 90.01** or **90.02** remain in the headings cited regardless of the instruments or apparatus to which they are to be fitted; a clock or watch movement is always classified in **Chapter 91**; a photographic camera falls in **heading 90.06** even if it is of a kind designed for use with another instrument (microscope, stroboscope, etc.).
- (2) Parts or accessories suitable for use with several categories of machines, appliances, instruments or apparatus falling in different headings of this Chapter are classified in **heading 90.33, unless** they are in themselves complete instruments, etc., specified in another heading (see paragraph (1) above).

(IV) MULTI-FUNCTION OR COMPOSITE MACHINES, APPARATUS, ETC.; FUNCTIONAL UNITS

(Chapter Note 3)

Note 3 specifies that the provisions of Notes 3 and 4 to Section XVI apply also to this Chapter (see Parts (VI) and (VII) of the General Explanatory Note to Section XVI).

In general, multi-function machines are classified according to the principal function of the machine.

Multi-function machines are able to carry out different operations.

Where it is not possible to determine the principal function, and where, as provided in Note 3 to Section XVI, the context does not otherwise require, it is necessary to apply General Interpretative Rule 3 (c).

Composite machines or apparatus consisting of two or more machines or apparatus of different kinds, fitted together to form a whole, consecutively or simultaneously performing **separate** functions which are generally complementary and are described in different headings of this Chapter, are also classified according to the principal function of the composite machine or apparatus.

For the purposes of the above provisions, machines or apparatus of different kinds are taken to be **fitted together to form a whole** when incorporated one in the other or mounted one on the other, or mounted on a common base or frame or in a common housing.

Assemblies of machines or apparatus should not be taken to be fitted together to form a whole unless the machines or apparatus are designed to be permanently attached either to each other or to a common base, frame, housing, etc. This **excludes** assemblies which are of a temporary nature or are not normally built as a composite machine, apparatus, etc.

The bases, frames or housings may be provided with wheels so that the composite machines or apparatus can be moved about as required during use, **provided** they do not thereby acquire the character of an article (e.g., a vehicle) more specifically covered by a particular heading of the Nomenclature.

Floors, concrete bases, walls, partitions, ceilings, etc., even if specially fitted out to accommodate machines or apparatus should not be regarded as a common base joining such machines or apparatus to form a whole.

The provisions of Note 3 to Section XVI **need not be invoked** when the composite machines or apparatus are covered as such by a particular heading."

This Chapter covers, as functional units, for example, the electrical (including electronic) instruments or apparatus which make up an **analogue or digital telemetering system**. These are essentially the following :

(I) Apparatus at the transmitting end :

- (i) **A primary detector** (transducer, transmitter, analogue-digital converter, etc.) which transforms the quantity to be measured, whatever its nature, into a proportional current, voltage or digital signal.
- (ii) **A measurement amplifier, transmitter and receiver basic unit** which (if necessary) boosts this current, voltage or digital signal to the level required by the pulse or frequency-modulated transmitter.
- (iii) **A pulse or frequency-modulated transmitter** which transmits an analogue or digital signal to another station.

(II) Devices at the receiving end :

- (i) **A pulse, frequency-modulated or digital signal receiver** which converts the information into an analogue or digital signal.
- (ii) **A measurement amplifier or converter** which, if necessary, amplifies the analogue or digital signal.
- (iii) **Indicating or recording instruments** calibrated in terms of the primary quantity and equipped with a mechanical pointer or opto-electronic display.

Telemetering systems are mainly used in oil, gas and production pipelines, water, gas and sewage disposal installations and environmental monitoring systems.

Line or radio transmitters and receivers for telemetering pulses remain in their respective headings (**heading 85.17**, **85.25** or **85.27**, as the case may be) **unless** they are combined as a single unit with the instruments and apparatus referred to in (I) and (II) above or the whole forms a functional unit within the meaning of Note 3 to Chapter 90; the complete unit then falls in this Chapter.

* * *

In addition to the exclusions mentioned in the text of the Explanatory Notes, the following are always **excluded** from this Chapter :

- (a) Articles of a kind used in machines, appliances or for other technical uses, of vulcanised rubber other than hard rubber (**heading 40.16**), of leather or of composition leather (**heading 42.05**) or of textile material (**heading 59.11**).
- (b) Parts of general use, as defined in Note 2 to Section XV, of base metal (**Section XV**) or similar goods of plastics (**Chapter 39**).
- (c) Lifting or handling machinery (**headings 84.25** to **84.28** and **84.86**); fittings for adjusting work or tools on machine-tools or water-jet cutting machines, of **heading 84.66**, including fittings with optical devices for reading the scale (for example, "optical" dividing heads) but not those which are in themselves essentially optical instruments (for example, alignment telescopes); radar apparatus, radio navigational aid apparatus or radio remote control apparatus (**heading 85.26**).
- (d) Spacecraft equipped with instruments or apparatus of this Chapter (**heading 88.02**).
- (e) Toys, games, sports requisites and other articles of **Chapter 95**, and parts and accessories thereof.
- (f) Capacity measures; these are classified according to their constituent material.
- (g) Spools, reels or similar supports (classified according to their constituent material, for example, in **heading 39.23** or **Section XV**).

90.01 - Optical fibres and optical fibre bundles; optical fibre cables other than those of heading 85.44; sheets and plates of polarising material; lenses (including contact lenses), prisms, mirrors and other optical elements, of any material, unmounted, other than such elements of glass not optically worked.

9001.10 - Optical fibres, optical fibre bundles and cables

9001.20 - Sheets and plates of polarising material

9001.30 - Contact lenses

9001.40 - Spectacle lenses of glass

9001.50 - Spectacle lenses of other materials

9001.90 - Other

This heading covers :

(A) **Optical fibres and optical fibre bundles, as well as optical fibre cables other than those of heading 85.44.**

Optical fibres consist of concentric layers of glass or plastics of different refractive indices. Those drawn from glass have a very thin coating of plastics, invisible to the naked eye, which renders the fibres less prone to fracture. Optical fibres are usually presented on reels and may be several kilometers in length. They are used to make optical fibre bundles and optical fibre cables.

Optical fibre bundles may be rigid, in which case the fibres are agglomerated by a binder along their full length, or they may be flexible, in which case they are bound only at their ends. If coherently bundled, they are used for transmission of images, but if randomly bundled, they are suitable only for transmission of light for illumination.

Optical fibre cables of this heading (which may be fitted with connectors) consist of a sheath containing one or more optical fibre bundles, the fibres of which are not individually sheathed.

Optical fibre bundles and cables are used primarily in optical apparatus, particularly in endoscopes of heading 90.18.

(B) **Polarising material in sheets or plates** which consist of specially treated sheets or plates of plastics, or of sheets or plates in which a layer of "active" plastics is supported on one or both sides by other plastics or by glass. This sheet or plate material is cut to shape to make the polarising elements described at Item (6) below.

(C) **Optical elements of glass, optically worked, not permanently mounted.** In order to distinguish between optical elements of glass of this heading and those of **Chapter 70** it is necessary to determine whether or not they have been optically worked.

The optical working of glass is usually performed in two stages, viz., the production of the surfaces to the shape required (i.e., with the necessary curvature, at the correct angle, etc.), and the polishing of these surfaces. This working consists of grinding the surfaces by means of abrasives, rough at first, then gradually finer, the successive operations being roughing, trueing, smoothing and polishing. Finally, in the case of lenses required to be of an exact diameter, the edges are ground; this is known as the centring and edging operation. This heading applies only to optical elements of which the whole or part of their surface has been polished in order to produce the required optical properties. It applies therefore to elements which have been ground and polished as described above, and also to elements which have been polished after moulding. The heading **does not apply** to unpolished elements having undergone merely one or more of the processes which precede polishing. Such elements fall in **Chapter 70**.

- (D) **Optical elements of any material other than glass, whether or not optically worked, not permanently mounted** (e.g., elements of quartz (other than fused quartz), fluorspar, plastics or metal; optical elements in the form of cultured crystals of magnesium oxide or of the halides of the alkali or the alkaline-earth metals).

Optical elements are manufactured in such a way that they produce a required optical effect. An optical element does more than merely allow light (visible, ultraviolet or infrared) to pass through it, rather the passage of light must be altered in some way, for example, by being reflected, attenuated, filtered, diffracted, collimated, etc.

Optical elements with a temporary mounting provided **solely** for protection during transport are considered to be unmounted.

Subject to the provisions set out above regarding optical elements of glass, this heading includes :

- (1) **Prisms and lenses** (including compound prisms and lenses assembled by means of an adhesive cement), whether or not with unfinished edges.
- (2) **Plates and discs with plane or plane-parallel faces** (e.g., proof planes or optical flats for checking the flatness of a surface).
- (3) **Ophthalmic lenses**. These lenses may be aspherical, spherical, spherocylindrical, uni-focal, bi-focal or multi-focal. They also include **contact lenses**.
- (4) **Mirrors constituting optical elements**. These are used, for example, in telescopes, projectors, microscopes, medical, dental or surgical instruments, and sometimes as vehicle rear-view mirrors.
- (5) **Colour filters** (e.g., for photographic cameras).
- (6) **Polarising elements** (for microscopes or other scientific instruments; for sunglasses; for spectacles for viewing three-dimensional cinematograph films, etc.).
- (7) **Diffraction gratings**. These may be :
 - (a) Highly polished glass on which parallel lines have been cut close together at regular intervals (e.g., 100 lines per millimetre).
 - (b) "Replica" gratings consisting of a thin film of plastics or gelatin on a support such as a plate of glass. The thin film bears an impression of the lines of an original ruled grating.

These gratings are used in the same way as prisms for study of spectra.

- (8) **Interference filters.** These consist of alternate very thin films of, for example, magnesium fluoride and silver sandwiched between two plates of glass or between two 45° glass prisms (forming a cube). They are used as colour filters or for splitting a beam of light into two components.
- (9) **Halftone or similar printing screens, generally round or rectangular (including square), of carefully polished glass** (original screens for photogravure or process engraving), consisting of :
- (i) two plates of glass, etched with very fine parallel lines, rendered opaque with a special varnish, which are then stuck together so that the lines are exactly at right angles; or
 - (ii) a single glass plate on which small hollows, usually square, have been etched and rendered opaque with a special varnish.

Some of the optical elements listed above (lenses, prisms, etc.) may be coloured, or coated with an anti-reflection film of cryolite, calcium or magnesium fluoride, etc. This does not affect their classification in this heading.

The heading **does not cover** :

- (a) Cultured crystals, not being optical elements (generally **heading 38.24**).
- (b) Mirrors of **heading 70.09**, i.e., glass mirrors not optically worked. Simple plane or even curved mirrors (e.g., shaving mirrors and mirrors for powder compacts) are therefore classified in **heading 70.09**.
- (c) Optical elements of glass of **heading 70.14**, i.e., elements not optically worked (generally moulded) (see Explanatory Note to heading 70.14).
- (d) Glasses of **heading 70.15**, not optically worked (e.g., blanks for contact lenses or for corrective spectacle lenses, for goggles, for protecting the dials of measuring instruments, etc.).
- (e) Mirrors, not constituting optical elements, of precious metal (**Chapter 71**), or of base metal (**heading 83.06**).
- (f) Connectors for optical fibres, optical fibre bundles or cables (**heading 85.36**).
- (g) Optical fibre cables made up of individually sheathed fibres (**heading 85.44**).

90.02 - Lenses, prisms, mirrors and other optical elements, of any material, mounted, being parts of or fittings for instruments or apparatus, other than such elements of glass not optically worked.

- Objective lenses :

9002.11 -- For cameras, projectors or photographic enlargers or reducers

9002.19 -- Other

9002.20 - Filters

9002.90 - Other

With the exception of ophthalmic lenses (which when mounted constitute spectacles, lorgnettes or the like of heading 90.04), this heading covers the articles referred to in Items (B), (C) and (D) of the Explanatory Note to heading 90.01 when in a permanent mounting (viz., fitted in a support or frame, etc.) suitable for fitting to an apparatus or instrument. The articles of the heading are mainly designed to be incorporated with other parts to form a specific instrument or part of an instrument. The heading does not include mounted optical elements which are in themselves separate appliances, for example, hand magnifying glasses (heading 90.13), and mirrors for medical or dental purposes (heading 90.18).

Subject to the above conditions, the heading includes :

- (1) Objective lenses, additional lenses, colour filters, viewfinders, etc., for photographic or cinematographic cameras or for projectors.
- (2) Polarising filters for microscopes or polarimeters.
- (3) Eyepieces and objectives (including polarising) for astronomical instruments, binoculars or refracting telescopes, microscopes, etc.
- (4) Mounted prisms for instruments or apparatus for physical or chemical analysis (polarimeters, etc.).
- (5) Mounted mirrors for telescopes, projectors, microscopes, medical or surgical instruments, etc.
- (6) Optical elements (lenses and prisms) for lighthouses or beacons, mounted on panels or drums.
- (7) Mounted lenses clearly identifiable as fittings for optical benches.
- (8) Mounted halftone or similar printing screens.

The objective lens in an optical instrument is the lens system that faces the object, giving an image of the latter. It may be a single lens but is usually a group of lenses in a single mounting.

Eyepieces are optical systems (placed near the eyes) through which a magnified image is observed.

The heading does not cover :

- (a) Optical elements with a temporary mounting provided solely for protection during transport (heading 90.01).
- (b) Mounted glass mirrors, optically worked, which are unsuitable for fitting to instruments or apparatus (for example, certain rear-view mirrors, chimney or drain inspection mirrors, and special mirrors for wind-tunnel observations) (heading 90.13).
- (c) Sets of lenses put up in cases and designed for fitting into special frames for sight testing (used by opticians) (heading 90.18).

90.03 - Frames and mountings for spectacles, goggles or the like, and parts thereof.

- Frames and mountings :

9003.11 -- Of plastics

9003.19 -- Of other materials

9003.90 - Parts

This heading covers frames and mountings, and parts thereof, for the spectacles or other articles of heading 90.04 (see the Explanatory Note to that heading). They are generally of base metal, precious metal, metal clad with precious metal, plastics, tortoise-shell or mother-of-pearl. They may also be of leather, rubber or fabric, for example, frames for goggles.

Parts of frames include spectacle side-pieces and side-piece cores, hinges or joints, eye-rims, bridges, nose-pieces, spring devices for pince-nez, handles for lorgnettes, etc.

Screws, chains (without securing device) and springs of base metal are **not** classified as parts of mountings but fall in their own respective headings (see Note 1 (f) to this Chapter).

This heading also **excludes** mountings and parts thereof of articles sometimes referred to as "spectacles" but which do not fall in heading 90.04, e.g., special spectacles used by oculists for examining eyes (**heading 90.18**).

90.04 - Spectacles, goggles and the like, corrective, protective or other.

9004.10 - Sunglasses

9004.90 - Other

This heading covers articles (usually comprising a frame or support with lenses or shields of glass or other material), for use in front of the eyes, generally intended either to correct certain defects of vision or to protect the eyes against dust, smoke, gas, etc., or dazzle; it also covers spectacles for viewing stereoscopic (three-dimensional) pictures.

Spectacles, pince-nez, lorgnettes, monocles, etc., used for correcting vision, generally have optically worked lenses.

Protective spectacles and goggles generally consist of plane or curved discs of ordinary glass (whether or not optically worked, or tinted), of safety glass, of plastics (poly(methyl methacrylate) polystyrene, etc.), of mica, or of metal (wire gauze, or slotted plates). These articles include sunglasses, spectacles used for mountaineering or winter sports, goggles for airmen, motorists, motor-cyclists, chemists, welders, foundry workers, moulders, sand-blast machine operators, electricians, roadmen, quarrymen, etc.

The heading also includes goggles for underwater use; removable spectacles (e.g., sunglasses) for fitting to other spectacles (generally corrective spectacles) and used either as protective filters or, in some cases, as additional corrective lenses; polarising spectacles fitted with lenses of plastics for viewing three-dimensional films (whether or not with a paperboard frame).

PARTS

Frames and mountings, and parts thereof, for spectacles or the like, are classified in **heading 90.03**. Eyepieces of glass are classified in **heading 70.15** if not optically worked, or in **heading 90.01** if optically worked; eyepieces of materials other than glass are classified in **heading 90.01** if they constitute optical elements; otherwise they are classified in this heading.

*
* *

As the heading covers **only** those spectacles, etc., designed to cover the eyes, it **excludes** articles designed to cover or protect most of the face (e.g., visors for welders; screens and eye-shades for motor-cyclists; face masks for underwater swimming).

The heading also **excludes** :

- (a) Contact lenses of **heading 90.01**.
- (b) Opera or racing glasses and similar articles, made with spectacle mountings (**heading 90.05**).
- (c) Toy spectacles (**heading 95.03**).
- (d) Carnival articles (**heading 95.05**).

90.05 - Binoculars, monoculars, other optical telescopes, and mountings therefor; other astronomical instruments and mountings therefor, but not including instruments for radio-astronomy.

9005.10 - Binoculars

9005.80 - Other instruments

9005.90 - Parts and accessories (including mountings)

This heading includes :

- (1) **Binoculars**, such as opera glasses, binoculars for touring or hunting, military binoculars (including night glasses and certain periscopic binoculars) and binoculars made in the form of spectacles.
- (2) **Telescopes** for hunting, touring, for use at sea, for firing ranges, for health resorts (for observing scenery or the sky), etc. They may be in one piece (pocket or other telescopes) or with sliding drawers for focussing; they may also be designed to be fitted on a stand. Certain telescopes may incorporate a device so that they can be used only after the insertion of a coin.
- (3) **Astronomical refracting telescopes**. Unlike reflecting telescopes which have a mirror for objective, refracting telescopes have objectives consisting of a system of lenses, some of which may be of large diameter. They are not equipped with an erecting eyepiece which would cause loss of light.

The heading includes refracting telescopes whether designed for visual, visual and photographic, or solely for photographic observation. When equipped with a photographic camera which forms an integral part of the complete instrument, they are classified in this heading; however, a photographic camera which does not form an integral part of the complete instrument is classified in **heading 90.06**.

- (4) **Reflecting telescopes**. These are the main general purpose astronomical instruments. The objective, which forms the primary image, consists of a concave parabolic mirror which may be of a considerable diameter; the reflecting surface is silvered or aluminised.

Reflecting telescopes are usually designed to be mounted on stands which are frequently large structures with considerable associated equipment. When equipped with a photographic camera which forms an integral part of the complete instrument, they are classified in this heading; however, a photographic camera which does not form an integral part of the complete instrument is classified in **heading 90.06**.

This heading includes the Schmidt reflecting telescope, often referred to as the Schmidt camera. This is used solely in astronomy for photographic observation. It uses a spherical mirror and a correcting plate which is placed parallel to the mirror at the centre of its arc. The image is recorded at the focal point on a convex film.

- (5) **Astronomical telescopes** fitted with photo-multipliers or image converter tubes. In this type of telescope the energy of the incident light is used to free electrons from a photoelectric surface placed where the eyepiece would otherwise be. The electrons may be multiplied and measured to show the amount of light originally received by the telescope, or may be focussed (e.g., by magnetic lenses) to form an image on a photographic plate or fluorescent screen.
- (6) **Transit instruments**, which are used to observe the apparent passage (due to the rotation of the earth) of celestial bodies above the meridian line at the place of observation. They consist essentially of a telescope mounted on an East-West horizontal axis and can therefore move within the meridian plane.
- (7) **Equatorial telescopes**. These are mounted on an equatorial stand which allows the telescope to move round an axis parallel to that of the earth (polar axis) and round another axis perpendicular to the former (axis of declination).
- (8) **Zenith telescopes**, which are telescopes mounted so as to move round a horizontal and a vertical axis.
- (9) **Altazimuths, or azimuth circles**. These are telescopes movable round a horizontal axis whereas their frames are movable round a vertical axis. These instruments are designed to measure both altitudes and azimuths. Theodolites are smaller instruments designed on the same principle, but used for surveying and are **excluded (heading 90.15)**.
- (10) **Coelostats**, which are instruments intended to facilitate astronomical observations, particularly by reflecting a given part of the sky into a vertical or horizontal stationary instrument (telescope, spectroheliograph). They consist essentially of two plane mirrors, one of which is controlled by a clockwork movement and turns a complete circle in 48 hours.

Heliosstats and siderostats are special types of coelostats used for astronomical purposes. Certain instruments also called heliosstats are used for surveying; these are **excluded (heading 90.15)**.

- (11) **Spectroheliographs and spectrohelioscopes**, which are instruments used in studying the sun. The spectroheliograph is used to take photographs of the sun in the light of any desired wavelength. It consists of a spectroscope with a slit in place of the eyepiece so that only light of the desired wavelength can pass through it on to a photographic plate. The spectrohelioscope operates on the same principle as the spectroheliograph but uses a rapidly oscillating slit so that the sun can be viewed by the naked eye. Other methods (e.g., rotating glass prism with a fixed slit) are used to obtain the same result.
- (12) **Heliometers**, which consist of a telescope with its object glass divided along a diameter, the two halves being movable; they are used for measuring the sun's angular diameter and the angular distance between two heavenly bodies.
- (13) **Coronographs and similar instruments**, which are used to observe the sun's corona at times other than that of a total solar eclipse.

The heading also includes telescopes, **and more particularly binoculars**, which utilize infra-red light and which incorporate image converter tubes to convert the magnified infra-red image into an image which can be seen by the human eye; these infra-red instruments are used at night, particularly by armed forces. Also included are telescopes, binoculars and the like which utilise light amplifiers (also known as image intensifiers) to increase the brightness of an image which is below the visual threshold to a level where the image can be seen.

However, in accordance with Note 4 to this Chapter, this heading **does not cover** telescopic sights for fitting to arms, perisopic telescopes for fitting to submarines or tanks, or telescopes for machines, appliances, instruments or apparatus of this Chapter (for example, telescopes for fitting to theodolites, levels or other surveying instruments) or of Section XVI (**heading 90.13**).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), this heading also covers parts and accessories of the goods of this heading. Such parts and accessories include: frames, housings, tubes and mountings; filar micrometers used with equatorial telescopes for measuring the diameters of planets (these devices consist of a graduated disc mounted on the eyepiece of the telescope and fitted with two fixed wires and one movable wire); Gerrish drives used with a motor to move astronomical instruments.

*
* *

The heading also **excludes**:

- (a) Superstructures used for installing the instruments or facilitating access to them (domes, platforms, control boards, etc.); these are classified in their own appropriate headings (for example, in **Section XV**).
- (b) Optical elements such as mirrors, lenses and prisms, presented separately (**heading 90.01** or **90.02** as the case may be).
- (c) Blink microscopes, used in astronomy to find new stars by comparing photographs of the sky (**heading 90.11**).
- (d) "Door eyes" or through door viewers (**heading 90.13**).
- (e) Instruments used to determine a terrestrial position in relation to the stars, e.g., sextants (**heading 90.14**).
- (f) Microphotometers or microdensitometers for the study of spectrograms (**heading 90.27**).
- (g) Astronomical clocks (**Chapter 91**).

90.06 - Photographic (other than cinematographic) cameras; photographic flashlight apparatus and flashbulbs other than discharge lamps of heading 85.39.

9006.30 - Cameras specially designed for underwater use, for aerial survey or for medical or surgical examination of internal organs; comparison cameras for forensic or criminological purposes

9006.40 - Instant print cameras

- Other cameras :

9006.51 -- With a through-the-lens viewfinder (single lens reflex (SLR)), for roll film of a width not exceeding 35 mm

9006.52 -- Other, for roll film of a width less than 35 mm

9006.53 -- Other, for roll film of a width of 35 mm

9006.59 -- Other

- Photographic flashlight apparatus and flashbulbs :

9006.61 -- Discharge lamp ("electronic") flashlight apparatus

9006.69 -- Other

- Parts and accessories :

9006.91 -- For cameras

9006.99 -- Other

(I) PHOTOGRAPHIC (OTHER THAN CINEMATOGRAPHIC) CAMERAS

This group covers all kinds of photographic cameras (**other than** cinematographic cameras), whether for professional or amateur use, and whether or not presented with their optical elements (objective lenses, viewfinders, etc.). Photographic cameras are those in which the exposure of a chemical based film (e.g., silver halide), plate or paper to the image or light from the camera's optical system causes a chemical change to the film, plate or paper. Further processing is required to create a viewable image.

There are many different types of **cameras**, but the conventional types consist essentially of a light-tight chamber, a lens, a shutter, a diaphragm, a holder for a photographic plate or film, and a viewfinder. Variations in these essential features characterise the different kinds of cameras, such as :

(A) **Box cameras**; these are the simplest type.

(B) **Folding or collapsible cameras**, for studio or amateur use.

(C) **Reflex cameras**. In the majority of these cameras, the image received by the objective lens is reflected from a mirror to the viewfinder by means of a special prism (single lens reflex). Other apparatus of this type have a second objective lens from which the image is reflected onto a screen at the top of the camera (twin lens reflex).

(D) **Pocket cameras** which generally use film cassettes; however, some types use discs.

These cameras may also incorporate an automatic focusing system, a motor drive for winding film, an integral flash and a liquid crystal display all of which may be controlled by a microprocessor.

The cameras of this group include :

- (1) **Stereo cameras**, equipped with two identical lenses and a shutter which exposes two images simultaneously.
- (2) **Panoramic cameras**, used to photograph a wide panorama or a long line of people. The camera can be rotated at a uniform rate about a vertical axis, the exposure being made by a vertical slit which travels across the plate or film.
- (3) **Recording cameras**. These cameras generally have no shutter, the film moving continuously behind the lens. They are usually intended for combining with other apparatus (for example, cathode-ray oscilloscopes) for recording transitory and ultra-rapid phenomena.
- (4) **Instant print cameras (portable or cabinet type) in which processing is carried out automatically after exposure** so that the finished photograph is available in a short time. Coin-, token- or magnetic card operated cabinet type instant print cameras are classified here and not in heading 84.76.
- (5) **Cameras with wide angle lenses** to cover a very wide field. Special lenses are used to give an all round view of the horizon. Extreme wide-angle cameras swing the lens during exposure in synchronisation with the shutter.
- (6) "**Disposable**" cameras, also known as "single-use" or "one-time use" cameras, which are pre-loaded with film which is generally not replaced after use.
- (7) **View cameras**. These consist of a flexible bellows which is attached to the front and rear panels that swing on a rigid base. The front panel holds the lens mounted on a board and the rear panel contains a film holder. The bellows connects the lens board to the film holder and allows them to move freely in relation to one another.
- (8) **Cameras with air- and watertight cases** for underwater photography.
- (9) **Cameras with automatic shutter release** (such as those with an electronically operated shutter) controlled by a watch movement designed to permit a series of shots to be taken at regular intervals. This type also includes cameras designed for photographing subjects without their knowledge; they are fitted with a photoelectric cell placed in the circuit of the shutter release, and some are in the form of a small wrist-watch.
- (10) **Aerial survey cameras** designed to take successive pictures at predetermined time intervals so that a strip of ground is covered by overlapping photographs. Some aerial survey cameras have multiple lenses to take vertical and oblique views. This group includes cameras for aerial photogrammetry.

- (11) **Cameras for terrestrial photogrammetry** consisting of two cameras, interconnected and fixed on a tripod, for taking photographs simultaneously. These cameras are mainly used for archeological research, the upkeep of monuments or at road accidents.
- (12) **Comparison cameras for forensic or criminological purposes.** With these cameras two articles can be photographed simultaneously and the images compared; these are used for verifying fingerprints, checking forgeries, etc.
- (13) **Cameras for medical or surgical purposes**, e.g., those introduced in the stomach, for examination and subsequent diagnosis.

The heading **does not cover** video cameras used for these purposes (**heading 85.25**).

(14) **Cameras for microphotography.**

- (15) **Cameras used for copying documents** (letters, receipts, cheques, drafts, order forms, etc.), including those recording on microfilms, microfiches or other microforms or on sensitive paper.
- (16) **Laser photoplotter for creating latent “printed circuit board” images on photosensitive film, generally from digital formats,** (which is subsequently used in the production of printed circuit boards) **by means of a laser beam.** It is comprised of a keyboard, a screen (cathode ray tube), a raster image processor and an image reproducer.
- (17) **Cameras used for composing or preparing printing plates or cylinders** by photographic means. This apparatus may be of considerable size and may differ considerably from the other types of photographic cameras mentioned above. This group includes :
 - (i) Vertical and horizontal process cameras, three-colour cameras, etc.
 - (ii) Cameras which photograph blocks of type previously set by hand or by machine.
 - (iii) Apparatus to select the primary colours in illustrations (photographs, transparencies, etc.), consisting essentially of an optical device and an electronic calculator, designed for the production, by photographic means, of screened and corrected negatives which will be used in the preparation of printing plates.
 - (iv) Laser photoplotter for creating latent images on photosensitive film, generally from digital formats, (e.g., colour transparencies, which are used to reproduce digital artwork with continuous-tone) by means of a laser beam. To reproduce an image, the primary colours (cyan, magenta and yellow) are first selected, whereupon each colour is separately turned into rasterized data by an automatic data processing machine or raster image processor. The raster image processor may be incorporated in the photoplotter.

Apparatus for preparing printing plates or cylinders by a photocopying or thermocopying process are excluded from this heading and fall in **heading 84.43**. Photographic enlarging or reducing apparatus fall in **heading 90.08**.

(II) PHOTOGRAPHIC FLASHLIGHT APPARATUS AND FLASHBULBS

This group covers photographic flashlight apparatus and flashbulbs which are used for professional or amateur photography, in photographic laboratories or in photogravure work.

These devices produce very bright light for a very short duration (flash) and are thus distinguished from photographic lighting equipment of **heading 94.05**.

Photographic flashighting can be obtained either by means of electrically or mechanically ignited devices or by means of discharge lamps (see Explanatory Note to heading 85.39).

Included here are :

(1) Separate flashbulbs.

In these the light is produced by a chemical reaction initiated by an electric current. A flashbulb can be used only once. It consists of a bulb enclosing the active substance and the igniting device (either a filament or electrodes).

The most common types of flashbulbs are :

- (i) Oxygen-filled bulbs containing wire or finely shredded strip of, for example, aluminium, zirconium, aluminium-magnesium alloy or aluminium-zirconium alloy.
- (ii) Bulbs in which a ball of paste, consisting of one or more metal powders (e.g., zirconium) mixed with an oxidising agent, is attached to each of the electrodes.

(2) Flashcubes.

These are devices in the form of a cube containing four flashbulbs and four reflectors. Each bulb in the cube is ignited in turn either electrically, or mechanically by percussion of an explosive material.

(3) Battery flashlamps.

Such lamps are fitted with an electric battery and an electrically ignited flashbulb or flashcube, and are usually operated by a synchroniser in the camera shutter.

The apparatus using discharge lamps is more complex. Whether built as a single unit or comprising several elements, it usually consists of :

- (A) A mains, battery or accumulator-operated power pack; this works on the principle of the charge and discharge of a condenser and is usually controlled by a synchroniser incorporated in the camera shutter. Some types may have provision for varying the flash intensity and duration.
- (B) The discharge lamp with its stand and reflector.

- (C) A control lamp.
- (D) A socket for connecting extra flashlamps.

Power packs without the flashlamp stands and reflectors but comprising, besides the discharge elements, the flash release device and (possibly) auxiliary equipment for varying the intensity and duration of the flashes, fall in this heading as incomplete apparatus having the essential character of the complete apparatus.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), this heading also covers parts and accessories of the goods of this heading. Such parts and accessories include : camera bodies; bellows; ball and socket mounting heads; shutters and diaphragms; shutter (including delayed action) releases; magazines for plates or films; lens hoods, specialised stands or bases for forensic photography to which a camera is fitted (these often include discharge lamps and an adjustable calibrated mast for varying the height of the camera).

On the other hand, monopods, bipods, tripods and similar articles are, however, **excluded (heading 96.20)**.

*
* *

The heading **does not apply** to apparatus consisting of an instrument equipped to record images by photographic means, but essentially designed for some other purpose, e.g., a telescope, microscope, spectrograph, stroboscope. A camera presented separately, however, even if it is a specialised part of another instrument (telescope, microscope, spectrograph, photo-theodolite, stroboscope, etc.) is classified in this heading and not as a part of that instrument.

The heading also **excludes** :

- (a) Halftone or similar printing screens (**headings 37.05, 90.01, 90.02**, etc., as the case may be).
- (b) Photocopying or thermocopying apparatus (**heading 84.43**).
- (c) Digital cameras (**heading 85.25**).
- (d) Digital camera backs (**heading 85.29**).
- (e) Electric flashlight discharge lamps (**heading 85.39**).
- (f) Photographic enlargers and reducers of **heading 90.08**.
- (g) Electron diffraction apparatus (**heading 90.12**).
- (h) Photographic rangefinders (**heading 90.15**), exposure meters (**heading 90.27**), whether or not designed to be mounted on cameras.
- (ij) X-ray diffraction cameras (used in conjunction with X-ray apparatus for the examination of crystals), radiography apparatus (**heading 90.22**).

90.07 - Cinematographic cameras and projectors, whether or not incorporating sound recording or reproducing apparatus.

9007.10 - Cameras

9007.20 - Projectors

- Parts and accessories :

9007.91 -- For cameras

9007.92 -- For projectors

This heading covers :

- (A) **Cinematographic cameras** (including cameras for cinephotomicrography). They are similar in principle to the photographic cameras of heading 90.06, but they have specialised features enabling them to take a series of pictures in rapid succession.
- (B) **Cinematographic cameras** for recording both image and sound on the same film.
- (C) **Cinematographic projectors** which are static or portable apparatus for the diascopic projection of moving pictures whether or not having a sound track on the same film. They have an optical system which consists essentially of a light source, reflector, condenser and projection lens. The projectors also have a mechanism, generally consisting of a maltese cross movement, which draws the film intermittently past the optical system, usually at the same rate as the film was taken, and the light source is cut off when the film is being moved through the projection gate. The light source in cinema projectors is commonly an electric arc-lamp, but filament lamps may be used in some projectors. Cinematographic projectors may be equipped with a device to rewind the film and with a fan. Some projectors may be equipped with a refrigerated water cooling system.

The heading includes special types of cinematographic projectors, for example, projectors which project magnifications of varying degree on to an optically flat surface to permit a scientific study of photographed phenomena. "Frames" may be examined singly or continuously at varying numbers of frames per second. On the other hand "animated" viewers, specially designed for editing films, are **excluded (heading 90.10)**.

Cinematographic projectors may be combined with sound recording or reproducing apparatus, these being equipped with a reader which incorporates a photoelectric sound-head and a charge-coupled device. The sound tracks for most commercial films are printed in dual format, i.e., analogue and digital. The analogue format sound tracks are printed between the frames and the sprocket perforations whereas digital format sound tracks are printed either on the edges of the film, outside the sprocket perforations, or between the sprocket perforations. Some commercial films are printed with an analogue sound track and digital timecode information only on the edges of the film, where the digital sound track is not printed on the film but is recorded separately on a CD-ROM. As the film passes through the reader the photoelectric sound-head reads the analogue sound track and the charge-coupled device reads the digital sound track, or in the latter case the timecode information to ensure synchronisation of sound from the CD-ROM with the projected moving pictures. The printing of dual format sound tracks enables sound to be reproduced if one of the sound track formats is damaged or where the sound reproducing apparatus does not have dual format reading capability.

Other cinematographic projectors may be equipped with either a photoelectric or a magnetic sound-head depending upon the process used for recording the sound-track - or with both types of sound-head for alternative use.

This heading covers motion picture cameras, etc., whether for the film industry or for use by amateurs. The heading also covers special type cinematographic cameras, e.g., those designed to be fitted on aircraft (aerial cinematography); watertight cameras for submarine cinematography; cameras and projectors for colour, three-dimensional (stereoscopic) or "panoramic" films.

Cinematographic apparatus presented without optical parts remain in this heading.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), this heading also covers parts and accessories of the goods of this heading. Such parts and accessories include: camera bodies and stands; ball and socket mounting heads; casings ("blimps") designed to eliminate motor noise (**other than** those made of textile materials; these fall in **heading 59.11**); cases for portable cinematographic projectors, designed for use as projector stands; film cleaning devices (**except** those for laboratory apparatus; these fall in **heading 90.10**); multi-storey film cycling spools designed to simultaneously supply film to and rewind film from a cinematographic projector.

On the other hand, monopods, bipods, tripods and similar articles are, however, **excluded** (**heading 96.20**).

*
* *

As regards instruments and apparatus (e.g., microscopes, stroboscopes) equipped to record cinematographically, see the corresponding part of the Explanatory Note to **heading 90.06**.

*
* *

The heading also **excludes**:

- (a) Lifting or handling machinery (e.g., camera dollies) of **Chapter 84**.
- (b) Microphones, loudspeakers and audio-frequency electric amplifiers, other than those presented with and forming an integral part of any of the instruments of this heading (**heading 85.18**).
- (c) Sound recording or reproducing apparatus and television image and sound recording or reproducing apparatus (**heading 85.19** or **85.21**).
- (d) Photoelectric sound-heads (**heading 85.22**).
- (e) Television cameras (**heading 85.25**).
- (f) Video projectors (**heading 85.28**).
- (g) Apparatus and equipment for cinematographic laboratories, e.g., splicers, editing desks, etc. (**heading 90.10**).
- (h) Toy cinematographic projectors (**heading 95.03**).

90.08 - Image projectors, other than cinematographic; photographic (other than cinematographic) enlargers and reducers.

9008.50 - Projectors, enlargers and reducers

9008.90 - Parts and accessories

- (A) Whereas the apparatus of the previous heading is designed for projecting enlarged animated images on a screen, the instruments of this heading are designed for projecting still images. The most common type is the **projection lantern (or dioscope)** which is used to project the image of a transparent object (slide or transparency). It uses two lenses : one, the condenser, forms an image of the light source on the second lens, called the projection lens. The transparency is placed between the two lenses so that the projection lens forms an image of the transparency on the screen. A high power light source is used, the light from which is concentrated by a reflector. Slides may be changed manually, semi-automatically (by means of an electromagnet or by a motor controlled by the operator) or automatically (by means of a timer).

Certain diascopes (overhead projectors) have a large object field for the projection of written or printed texts on transparent positives.

The **episcope** is an image projector designed to throw on to a screen an enlarged image of a brightly illuminated opaque object. A source of light is directed on to the surface of the object and the light reflected from that surface is projected by a lens on to a screen.

The **epidiascope** is a projector which can be used either as a dioscope or as an episcope.

The heading includes slide projectors and other still image projectors as used in schools, lecture rooms, etc.; spectrum projectors; instruments for projecting radiographs; magnifying microfilm, microfiche or other microform readers, whether or not subsidiarily used for photocopying these documents; and the projection apparatus used in the preparation of printing plates or cylinders.

The heading also includes projectors incorporating a small screen on which an enlarged image of the slide is projected.

- (B) The heading also includes **photographic (other than cinematographic) enlargers and reducers**. These usually consist of a light source, a diffusing screen or a condensing lens, a negative holder, one or more objectives with a focussing device (often automatic), and an easel for supporting the sensitised paper; these parts are mounted on an adjustable vertical or horizontal support.

Photographic enlargers and reducers of the type used in the preparation of printing plates or cylinders for the printing industry are also classified in this heading.

*
* * *

The above-mentioned apparatus is classified in this heading whether or not presented with optical parts. The optical elements presented separately are **excluded** (**heading 90.01** or **90.02**, as the case may be).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), this heading also covers parts and accessories of the goods of this heading. Such parts and accessories include bodies, frames and supports, enlarger masking frames, microfilm or microfiche feeders.

*
* *

The heading also **excludes** :

- (a) Halftone or similar printing screens (**headings 37.05, 90.01, 90.02**, etc., as the case may be).
- (b) Microfilm photocopying apparatus incorporating an optical system, with a small glass image positioning screen (**heading 84.43**).
- (c) Apparatus for the projection of circuit patterns on sensitised semiconductor materials ("projection mask alignment") (**heading 84.86**).
- (d) Projectors, projection panels, display units or monitors (**heading 85.28**).
- (e) Cinematographic reducers and enlargers (for example, those used for making a copy, on film, of an original film of a different size) (**heading 90.10**)
- (f) Compound optical microscopes provided with means for projecting the image (**heading 90.11**).
- (g) Slide viewers fitted with a single magnifying lens and used for examining photographic slides (**heading 90.13**).
- (h) Photogrammetrical distortion-correcting ("restitution") apparatus (**heading 90.15**).
- (ij) Profile projectors (**heading 90.31**).
- (k) Toy magic lanterns (**heading 95.03**).

[90.09]

90.10 - Apparatus and equipment for photographic (including cinematographic) laboratories, not specified or included elsewhere in this Chapter; negatoscopes; projection screens.

9010.10 - Apparatus and equipment for automatically developing photographic (including cinematographic) film or paper in rolls or for automatically exposing developed film to rolls of photographic paper

9010.50 - Other apparatus and equipment for photographic (including cinematographic) laboratories; negatoscopes

9010.60 - Projection screens

9010.90 - Parts and accessories

(I) APPARATUS AND EQUIPMENT FOR PHOTOGRAPHIC (INCLUDING CINEMATOGRAPHIC) LABORATORIES, NOT SPECIFIED OR INCLUDED ELSEWHERE IN THIS CHAPTER

This group includes :

- (A) **Automatic machines for developing rolls of photographic film or for exposing developed photographic film to rolls of photographic paper.**
- (B) **Special film developing tanks.** These may be of metal, plastics, stoneware, etc.; they generally incorporate devices such as supporting rods, baskets for removing the films from the bath. Certain developing tanks are also used for rinsing, fixing and washing films.
- (C) **Special trays** (of plastics, stainless steel, enamelled sheet iron, etc.), clearly intended for photographic use, but **not including** articles which may also be used for other purposes (e.g., for general purpose laboratory or hospital use).
- (D) **Tanks for washing negatives**, including rotary washing apparatus.
- (E) **Print driers, glazers and drier-glazers** (single face, double face, rotary types, etc.); **drying machines** (hand-operated, etc.); roller squeegees; polished stainless steel plates and chromium-plated plates clearly designed to be fitted to these articles or used separately.
- (F) **Printing frames, including vacuum printing frames**, (of metal or of metal and wood) for contact printing; **printing machines** (for professional or amateur photographers, etc.); and **illuminated frames**, without a developer, for making exposures only.
- (G) **Film cutting machines and apparatus**, of a kind used in photographic (including cinematographic) laboratories.
- (H) **Special holding frames** for retouching negatives.

(IJ) **Dry-mounting presses** for photographic use.

(K) **Specialised machines and apparatus used in cinematographic laboratories**, such as :

- (1) **Film developing machines** whether or not automatic.
- (2) **Film slitting or cutting machines** (e.g., for cutting 35 mm film into two 16 mm films).
- (3) **Printing machines and cinematographic reducers and enlargers (optical printers)**.
- (4) **Optical effects machines**.
- (5) **Sound control units** for editing and synchronising sound films.
- (6) **Recording apparatus** which reproduces on a paper strip a “ slowed down ” and enlarged image of the sound track on a film, for use in synchronising and dubbing.
- (7) **Film cleaning machines; machines for treating worn negatives before reprinting; combined cleaning and treatment machines; machines for cleaning negatives**.
- (8) **Waxing machines** for depositing a thin coat of wax on both edges of the emulsion-coated side of the film.
- (9) **Joiners (splicers)** (hand- or pedal-operated, etc.).
- (10) **Film editing units**. These may be fitted with a picture-head and a sound-head. Such apparatus may be used, for example, to synchronise images with a sound track.

Separately presented picture-heads, and devices equipped with sound-heads which are used together with frame viewers on synchronisation tables, also fall in this heading. However, separately presented sound-heads are **excluded** (**heading 85.22**).

- (11) **Machines for numbering copies of films by perforation**.
- (12) **Editing desks for handling films**; these are fitted with spool rewinders. **Special film re-winders** for winding negatives (e.g., after printing); **film measurers and footage counters**, to check the length of films (separately presented counter mechanisms are **excluded**, see **heading 90.29**).
- (13) **Film titling apparatus**.
- (14) **Film viewers for editing printed cinematographic film**. These viewers may be combined with sound recording or reproducing apparatus.

(L) **Film viewers for still images** used to examine photographic negatives in photographic laboratories.

(M) **Specialised equipment used in reproduction work** (not being photocopying apparatus of **heading 84.43**), e.g., apparatus for developing specially sensitised paper by the ammonia vapour process.

(II) NEGATOSCOPES

Negatoscopes are used mainly for examining medical radiographs or radiophotographs. They may be of very different types, ranging from wall-mounted light boxes to automatic magazine-fed radiograph viewers.

(III) PROJECTION SCREENS

These screens are used in cinemas, schools, lecture rooms, etc. They include projection screens for three-dimensional presentation; also portable screens, rolled in sheaths or contained in boxes, for mounting on tripods, on tables, or for hanging from the ceiling.

They are often made of a fabric coated white, silver or with glass grains (microspheres), or of sheets of plastics; these fabrics or sheets are generally perforated. To fall in this heading, however, they **must be clearly identifiable** (e.g., by means of hems or rims, eyelet-holes).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories identifiable as being solely or principally for use with the apparatus and equipment of this heading also fall here.

* * *

This heading also **excludes** :

- (a) Photographic (including cinematographic) studio equipment, such as lighting apparatus, reflectors, spotlights, electric lighting lamps and tubes of all kinds, sound effect equipment, microphone booms, scenery, etc.; these fall in their respective headings.
- (b) Halftone or similar printing screens (**headings 37.05, 90.01, 90.02**, etc. as the case may be).
- (c) Paper or paperboard cutting machines of all kinds (**heading 84.41**).
- (d) Apparatus for the projection or drawing of circuit patterns on sensitized semiconductor materials (**heading 84.86**).
- (e) Loudspeakers, microphones and audio-frequency electric amplifiers, **other than** those presented with and forming an integral part of any of the instruments of this heading (**heading 85.18**).
- (f) Cameras for recording documents on microfilm, microfiche or other microforms (**heading 90.06**).
- (g) X-ray fluorescent and intensifying screens (**heading 90.22**).
- (h) Exposure calculating discs and rulers (**heading 90.17**); exposure meters, photometers, densitometers, colour temperature meters (**heading 90.27**).
- (ij) Hand-operated stamps for numbering prints (**heading 96.11**).

90.11 - Compound optical microscopes, including those for photomicrography, cinephotomicrography or micropojection.

9011.10 - Stereoscopic microscopes

9011.20 - Other microscopes, for photomicrography, cinephotomicrography or micropojection

9011.80 - Other microscopes

9011.90 - Parts and accessories

Whereas magnifiers of **heading 90.13** have only a single stage of magnification of relatively low power, the **compound optical microscope** of this heading has a second stage of magnification for the observation of an already magnified image of the object.

A compound optical microscope normally comprises :

- (I) An optical system consisting essentially of an objective designed to produce a magnified image of the object, and an eyepiece which further magnifies the observed image. The optical system usually also incorporates provision for illuminating the object from below (by means of a mirror illuminated by an external or an integral light source), and a set of condenser lenses which direct the beam of light from the mirror on to the object.
- (II) A specimen stage, one or two eyepiece-holder tubes (according to whether the microscope is the monocular or binocular type), and an objective-holder (generally revolving).

The whole is fixed on a stand to which a limb or bracket and various adjusting accessories may be attached.

This heading covers microscopes as used by amateurs, teachers, etc., and those for industrial use or for research laboratories; they remain in the heading whether or not they are presented with their optical elements (objectives, eyepieces, mirrors, etc.). The heading includes universal microscopes; polarising microscopes; metallurgical microscopes; stereoscopic microscopes; phase contrast and interference microscopes; reflecting microscopes, microscopes with drawing attachments; special microscopes for examining clock or watch jewels; microscopes with heating or freezing stages.

Special purpose microscopes include :

- (1) **Trichinoscopes**, a type of projection microscope, used for examining pork suspected of threadworm.
- (2) **Microscopes for measuring or checking operations** in certain manufacturing processes; these may be of the conventional types or may be special models designed for fitting to machines. These appliances include comparison microscopes (for comparing the surface finish of precision articles with that of a standard article); co-ordinate reading microscopes (for locating the position of clock or watch parts); tool-makers' or other measuring microscopes (for checking threads, profiles, gear-cutters or cutting tool profiles, etc.); small portable microscopes for placing directly on the object to be examined (for the Brinell hardness test, for printers' type, printing blocks, etc.); centring microscopes (fitted on spindles of machine-tools, instead of the tool, to bring the work into the correct position before working); etc.

Some of the last mentioned instruments (e.g., those for checking the profile of worked parts), may be fitted with projection devices which are usually in the form of a small circular screen fitted on top of the microscope.

- (3) **Laboratory measuring microscopes**, e.g., for measuring line separation in spectrograms.
- (4) **Surgical microscopes** for use by surgeons when operating on a very small portion of the body. Their light sources result in independent light paths which provide a three-dimensional image.

*
* *

The heading also covers :

- (A) **Microscopes for photomicrography and microscopes for cinephotomicrography**. In addition to the visual observation of the specimen, these also permit the photographic recording of magnified images. They may be composed either of a microscope permanently incorporating a photographic or cinematographic camera (usually specially designed for this purpose), or of a conventional microscope to which a conventional photographic or cinematographic camera can be temporarily fixed by means of a simple attachment.

Separately presented photographic or cinematographic cameras for photomicrography or cinephotomicrography are excluded (**heading 90.06 or 90.07**, respectively).

- (B) **Microscopes for microprojection with compound magnification**. These are used for the horizontal or vertical projection of images magnified by a microscope incorporated in the apparatus. They are equipped with special microscopes enabling rapid change of focus, and are used in education, scientific and medical demonstration rooms, technical laboratories, etc.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories identifiable as being solely or principally for use with microscopes are also classified here. These include :

Stands (brackets, bases, etc.); eyepiece-holder tubes and revolving objective-holder tubes (whether or not with lenses); specimen stages (including heating or freezing stages); specimen-guides; optical attachments enabling the image to be sketched; diaphragm-adjusting levers; etc.

*
* *

The heading also **excludes** :

- (a) Specimen slides or covers, of glass (**heading 70.17**).
- (b) Ophthalmic binocular-type microscopes (**heading 90.18**).
- (c) Prepared slides for microscopic study (**heading 90.23**).
- (d) Microtomes; refractometers (**heading 90.27**).
- (e) Profile projectors and other apparatus with optical devices for checking mechanical parts, **not** being microscopes or microprojection apparatus, e.g., optical comparators, measuring benches, etc. (**heading 90.31**).

90.12 - Microscopes other than optical microscopes; diffraction apparatus.

9012.10 - Microscopes other than optical microscopes; diffraction apparatus

9012.90 - Parts and accessories

This heading includes :

- (A) **Electron microscopes** differ from optical microscopes in that they use a beam of electrons instead of light rays.

The normal type of electron microscope is an assembly of the following devices usually enclosed in a common frame as a unit :

- (1) A device (known as an electron gun) for emitting and accelerating the electrons.
- (2) A system (playing the part of the optical system of an ordinary microscope) consisting of electrostatic or electromagnetic "lenses" (which are respectively electrically charged plates or coils carrying a current); these act as condenser, objective and projector. There is usually also a further so-called field "lens", between the objective and the projector, which serves to vary the range of magnification while not altering the scope of the scanned field.
- (3) The specimen stage.
- (4) The vacuum pump unit which maintains a vacuum in the electron tube; these are sometimes self-contained units connected to the appliance.
- (5) The elements for visual observation on a fluorescent screen and for photographic recording of the image.
- (6) Control stands and panels bearing the elements controlling and regulating the electron beam.

This heading also includes scanning electron microscopes in which a very fine beam of electrons is directed repeatedly onto different points of the sample. Information is obtained by measuring, for example, the electrons transmitted, the secondary electrons emitted, or the optical rays. The result may then be displayed on a monitor screen which can be incorporated in the microscope.

The electron microscope has many uses both in the field of pure science (biological or medical research, composition of matter, etc.), and in industrial technique (examination of fumes, dust, textile fibres, colloids, etc.; examination of the structure of metals, paper, etc.).

- (B) **Proton microscopes.** In place of electrons, these employ protons which have a wavelength 40 times shorter than the former. A correspondingly higher separating power is thus obtained and this permits the production of even more highly magnified images.

The structure and functioning of the proton microscope do not differ appreciably from those of the electron microscope; the electron gun is replaced by a proton gun and the source used is hydrogen.

- (C) **Electron diffraction apparatus.** By means of a beam of electrons directed at a specimen, these produce diffraction patterns which are photographed. The dimensions, orientation and atomic arrangement of the crystals of the specimen examined can be calculated from the diameter, intensity and sharpness of the rings in the pattern.

This apparatus, which is chiefly used for studies on corrosion, lubrication, catalysis, etc., does not differ appreciably in principle from an electron microscope, and has the same essential elements (electron gun, cathode-ray tube, electro-magnetic coils, specimen holder, etc.). Moreover it should be noted that certain electron microscopes may be equipped with a diffraction chamber and can therefore perform a double function (visual examination and production of a diffraction pattern).

*
* *

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories suitable for use solely or principally with microscopes, other than optical microscopes, or diffraction apparatus are also classified here; examples are the frame and its constituent chambers and the specimen stage. On the other hand, the heading **excludes** vacuum pumps (**heading 84.14**), electrical equipment (batteries, rectifiers, etc.) (**Chapter 85**), and electrical measuring instruments (voltmeters, milliammeters, etc.) (**heading 90.30**).

90.13 - Liquid crystal devices not constituting articles provided for more specifically in other headings; lasers, other than laser diodes; other optical appliances and instruments, not specified or included elsewhere in this Chapter.

9013.10 - Telescopic sights for fitting to arms; periscopes; telescopes designed to form parts of machines, appliances, instruments or apparatus of this Chapter or Section XVI

9013.20 - Lasers, other than laser diodes

9013.80 - Other devices, appliances and instruments

9013.90 - Parts and accessories

In accordance with Chapter Note 5, measuring or checking optical appliances, instruments and machines are **excluded** from this heading and fall in **heading 90.31**. Chapter Note 4, however, classifies certain refracting telescopes in this heading and not in heading 90.05. It should, moreover, be noted that optical instruments and appliances can fall not only in **headings 90.01 to 90.12** but also in other headings of this Chapter (in particular, **heading 90.15, 90.18 or 90.27**). This heading includes :

- (1) **Liquid crystal devices** consisting of a liquid crystal layer sandwiched between two sheets or plates of glass or plastics, whether or not fitted with electrical connections, presented in the piece or cut to special shapes and not constituting articles described more specifically in other headings of the Nomenclature.
- (2) **Lasers**. These produce or amplify electro-magnetic radiation in the wavelength range between 1 nanometre and 1 millimetre (ultra-violet, visible light and infra-red regions of the spectrum), by the process of controlled stimulated emission. When the lasing medium (e.g., crystals, gases, liquids, chemical products) is excited by the light from an electric source or by the reaction from another source of energy, the light beams which are produced inside the lasing medium are repeatedly reflected and amplified in such a way that a coherent light beam (visible or invisible) is emitted from one end which is partly transparent.

In addition to the lasing medium, the energy source (pumping system) and the resonant optical cavity (reflector system), i.e., the basic elements combined in the laser head (possibly with Fabry-Perot interferometers, interference filters and spectrometers), lasers generally also incorporate certain auxiliary components (e.g., a power supply unit, a cooling system, a control unit and, in the case of the gas laser, a gas supply system or, in the case of liquid lasers, a tank, fitted with a pump for the dye solutions). Some of these auxiliary components may be contained in the same housing as the laser head (compact laser) or may take the form of separate units, connected to the laser head by cables, etc. (laser system). In the latter case the units are classified in this heading **provided** they are presented together.

Lasers are classified in this heading not only if they are intended to be incorporated in machines or appliances but also if they can be used independently, as compact lasers or laser systems, for various purposes such as research, teaching or laboratory examinations, for example, laser pointers.

However, the heading **excludes** lasers which have been adapted to perform quite specific functions by adding ancillary equipment consisting of special devices (e.g., work-tables, work-holders, means of feeding and positioning workpieces, means of observing and checking the progress of the operation, etc.) and which, therefore, are identifiable as working machines, medical apparatus, control apparatus, measuring apparatus, etc. Machines and appliances incorporating lasers are also **excluded** from the heading. **Insofar** as their classification is not specified in the Nomenclature, they should be classified with the machines or appliances having a similar function. Examples include :

- (i) Machine-tools for working any materials by removal of material by laser (e.g., metal, glass, ceramics or plastics) (**heading 84.56**).
- (ii) Laser soldering, brazing or welding machines and apparatus, whether or not capable of cutting (**heading 85.15**).
- (iii) Instruments for levelling (aligning) pipes by means of a laser beam (**heading 90.15**).
- (iv) Laser apparatus specially used for medical purposes (e.g., in ophthalmological operations) (**heading 90.18**).

Subject to the provisions of Notes 1 and 2 to this Chapter, parts and accessories for lasers, for example, laser tubes, are also classified in this heading. However, this heading **does not include** electric flash lamps used for pumping, such as xenon lamps, iodine lamps and mercury vapour lamps (**heading 85.39**), laser diodes (**heading 85.41**) and laser crystals (e.g., rubies), laser mirrors and lenses (**heading 90.01** or **90.02**).

- (3) **Hand magnifying glasses and magnifiers** (e.g., pocket type or those for office use), and thread counters (these magnifiers may be fitted or combined with an illuminating lamp, they remain in this heading if the lamp enhances the use of the magnifier); binocular magnifying glasses (generally on supports) which, unlike stereoscopic microscopes of **heading 90.11**, are fitted with eyepieces but not with an objective.
- (4) “**Door-eyes**” for viewing through doors; also similar articles fitted with an optical system.
- (5) **Telescopic sights for weapons, refracting or reflecting, presented separately**; optical devices suitable for use with arms and mounted thereon or presented with the firearms on which they are designed to be mounted, are classified with the arm, see Note 1 (d) to **Chapter 93**.
- (6) **Telescopes of a kind designed to form parts of instruments of other headings of this Chapter** (e.g., telescopes forming parts of surveying instruments) or of machines of Section XVI.
- (7) **Fibrescopes for industrial use.** Fibrescopes for medical purposes (endoscopes) are **excluded** (**heading 90.18**).
- (8) **Stereoscopes**, including **hand-operated stereoscopes**, for three-dimensional viewing of coloured photographic diapositives, consisting of a case of plastics incorporating two fixed lenses and a lever-operated revolving mechanism (to change the pictures which are mounted in sets on each interchangeable revolving disc).
- (9) **Kaleidoscopes, other than toy kaleidoscopes** (**Chapter 95**).
- (10) **Magnifying periscopes** for submarines or tanks; and **non-magnifying periscopes** (e.g., for trenches).

(11) **Mounted glass mirrors, optically worked, which are unsuitable for fitting to instruments or apparatus** (for example, certain rear-view mirrors, chimney or drain inspection mirrors, and special mirrors for wind-tunnel observations).

Rear-view or other mirrors, **not** optically worked (including shaving mirrors, whether or not magnifying) are **excluded (heading 70.09 or 83.06)**.

(12) **Optical lightbeam signalling apparatus**, for the long-distance transmission of optical signals (for example, in morse code).

(13) **Slide viewers** fitted with a single magnifying lens and used for examining photographic slides.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

90.14 - Direction finding compasses; other navigational instruments and appliances.

9014.10 - Direction finding compasses

9014.20 - Instruments and appliances for aeronautical or space navigation (other than compasses)

9014.80 - Other instruments and appliances

9014.90 - Parts and accessories

(I) DIRECTION FINDING COMPASSES

This group covers all types of direction finding compasses, from the simple types used by hikers, cyclists, etc., to those specialised for use in mining, navigation, etc., (including magnetic compasses, gyroscopic compasses, gyromagnetic compasses, binnacle compasses, position finding compasses, etc.).

(II) OTHER NAVIGATIONAL INSTRUMENTS AND APPLIANCES

This group includes :

- (A) **Instruments for the determination of a ship's position**, such as sextants, octants, azimuths, etc.
- (B) **Other special marine or river navigational instruments**, for example :
 - (1) **Automatic pilots (Gyro pilots)**. These are complex units which control the ship's rudder in relation to the readings of a gyroscopic compass.
 - (2) **Course recording apparatus**. These give an accurate record of the course (and any changes of course) during a ship's journey.
 - (3) **Inclinometers**; for measuring rolling.
 - (4) **Logs**. These indicate the speed of a ship by measuring the apparent distance covered in a given time. Nowadays, these instruments are always automatic. One type operates by means of a **screw** or propeller (a screw is mounted in the ship's stream and is connected to a dial on board the ship). Another type is based on the **principle of differential pressure**, the pressure varying according to the speed of the stream (they generally comprise a Pitot tube); the distance and speed is read on a dial on board the ship.

The heading also covers logs incorporating a counter which records the number of times an electric circuit is broken (i.e., the number of revolutions of the log), thus showing the distance covered by the ship.

- (5) **Sounding leads** (hand leads and winch-operated deep-sea leads), which determine the depth of the water and the nature of the sea bed.
- (6) **Echo sounding instruments**. An audible echo returned by the sea bed is detected on board ship by a very sensitive microphone, and read on a galvanometer.
- (7) **Ultrasonic sounding or detecting equipment**, for example, asdic, sonar or the like, used for normal sounding operations, for mapping the sea bed, for detecting submarines, wrecks, shoals of fish, etc.

(C) **Special instruments for air navigation**, such as :

- (1) **Altimeters**. A type of barometer calibrated in height units and based on the fact that atmospheric pressure decreases with altitude.
- (2) **Air speed indicators**. These operate by differential pressure measurements of the aircraft's slipstream, and show the speed of the aircraft in relation to the surrounding air.
- (3) **Climbing or diving speed indicators**. These show the vertical speed of descent or ascent of the aircraft, by means of a differential pressure gauge.
- (4) **Artificial horizons or gyro-horizons and turning and banking indicators**. These are based on gyroscopic principles, the former indicating the angle of the aircraft by reference to the transversal or longitudinal axis, and the latter by reference to the vertical axis.
- (5) **Mach-meters**. These indicate the ratio between the air speed and the local speed of sound. The ratio is expressed as a "Mach number".
- (6) **Accelerometers**. These determine the maximum limit (not to be exceeded) of the inert forces produced by acceleration during high-speed evolutions.
- (7) **Automatic pilots**. This apparatus temporarily replaces the pilot by controlling the equilibrium and flight of the aircraft in accordance with a pre-established setting (altitude, course, etc.). It consists chiefly of direct-operated or servo-motor controls (usually hydraulic motors which replace the pilot's movements), and of automatic acting apparatus (high-speed gyroscopes) which co-ordinate instrument readings and the action of the servo-motors.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

*
* * *

This heading also **excludes** :

- (a) Radar apparatus, radio navigational aid apparatus, e.g., global positioning system (GPS) receivers, and radio remote control apparatus (**heading 85.26**).
- (b) Pantographs and eidographs, used for course plotting in navigation (**heading 90.17**).
- (c) Barometers and thermometers (including reversible thermometers for underwater research) (**heading 90.25**).
- (d) Pressure gauges, liquid level indicators and other instruments of **heading 90.26**.
- (e) Revolution counters (**heading 90.29**).
- (f) Ammeters, voltmeters and other apparatus for measuring or checking electrical quantities of **heading 90.30**.
- (g) Marine chronometers and time-keepers (**Chapter 91**).

90.15 - Surveying (including photogrammetrical surveying), hydrographic, oceanographic, hydrological, meteorological or geophysical instruments and appliances, excluding compasses; rangefinders.

9015.10 - Rangefinders

9015.20 - Theodolites and tachymeters (tacheometers)

9015.30 - Levels

9015.40 - Photogrammetrical surveying instruments and appliances

9015.80 - Other instruments and appliances

9015.90 - Parts and accessories

**(I) INSTRUMENTS AND APPLIANCES USED IN GEODESY,
TOPOGRAPHY, SURVEYING OR LEVELLING**

These are generally intended for use in the field, for example, in cartography (land or hydrographic maps); in the preparation of plans; for triangulation measurements; for calculating the area of a piece of land; in determining heights above or below some horizontal reference level; and for all similar measurements in constructional work (building roads, dams, bridges, etc.), in mining, in military operations, etc.

This group includes :

- (1) Optical or opto-electronic **theodolites** (vernier reading, microscope, suspended (wall-stand type), universal, mining, etc., types), optical or opto-electronic **tachymeters** (**tacheometers**) (theodolites incorporating a rangefinder), **transits**, **gyrotheodolites**, **compass-clinometers**, **sighting clinometers** for use in survey or artillery, etc.
- (2) **Optical levels** (spirit, autoset, telescopic, collimator, laser, etc.), generally used mounted on a tripod.
- (3) **Alidades** (whether or not with a telescope), **optical squares** and cross-staffs (whether or not with prisms) and **pantometers** (with or without sighting telescope), **clinometers** (with a collimator or sighting telescope), used to determine gradients and inclines, **mining dials**, graphometers, heliostats for trigonometrical survey, etc.
- (4) **Plane tables, land chains and other special measures for surveying** (including band-measures specialised thereto, winch-type measures for mine-shafts, etc.), pickets or ranging poles, whether or not graduated (of metal, wood, etc.), levelling staves (self-reading, telescopic, folding, etc.), electromagnetic distance measuring equipment (EDM) reflector prisms and poles.

This heading **does not cover** :

- (a) Global positioning system (GPS) receivers (**heading 85.26**).
- (b) Measuring instruments consisting of a steel band, waterproof tape, etc., and similar unspecified devices for taking linear measurements (**heading 90.17**).
- (c) Revolution counters, mileometers and the like (**heading 90.29**).
- (d) Levels (air bubble type, etc.) used in building or constructional work (e.g., by masons, carpenters or mechanics), and plumb-lines (**heading 90.31**).

(II) PHOTOGRAMMETRICAL INSTRUMENTS AND APPLIANCES

These are mainly used for plotting topographic, archaeologic, etc., maps, but they are also used for other purposes (e.g., study of tides, ground-swells, etc.). The maps, etc., are plotted from photographs or digital images taken from two different viewpoints a known distance apart, which must then be "restituted" (to obtain accurate information in respect of the shape, size and co-ordinates of objects in the image or photograph).

This apparatus consists essentially of :

- (1) **The "erecting" apparatus** consisting mainly of a projector (with a light source), a negative-carrier, an objective and a projection table. This apparatus enables the scale to be changed, and it can also photographically correct negatives of aerial photographs which, in practice, contain errors in perspective, etc., due to variations in the terrain.
- (2) **Restitution apparatus** (stereoplotters or photogoniometers) also called stereotopographs, stereoplanigraphs, "autographs", stereoplotters, stereocomparators, etc. These are complex apparatus used to plot the planigraphic details and contour lines constituting a map or plan, this operation generally being done continuously and without separate calculation.
- (3) **Co-ordinatographs** of the type used with restitution apparatus; these bear the map on which the pencil controlled by the stereotopograph or the stereoplanigraph traces its indications.
- (4) **Analytical stereomeasuring systems** which consist of an optomechanical apparatus, operated photogrammetrically, and a programmed calculator. These systems are used for visual or analytical interpretation of photographic or digital images.

But the heading **excludes** aerial survey photographic cameras (**heading 90.06**), and co-ordinatographs not designed for photogrammetric uses (**heading 90.17**).

(III) HYDROGRAPHIC INSTRUMENTS

Hydrography is the scientific description and plotting of water courses, depths, tide levels, etc. The majority of the instruments used for such purposes are, therefore, covered by the previous paragraphs.

(IV) OCEANOGRAPHIC OR HYDROLOGICAL INSTRUMENTS

- (1) **Special level recorders**, for recording fluctuations in the level of lakes or rivers; they consist essentially of a float and recorder.
- (2) **Bucket-wheel current meters and hydrometric paddle-wheels**, for measuring the speed of currents in rivers, canals, etc.
- (3) **Swell or tide recorders**.

Industrial instruments based on the same working principles as the instruments described in paragraphs (IV) (1) and (2) above (e.g., liquid level indicators, flow meters, etc.) are, however, **excluded** (**heading 90.26**).

(V) METEOROLOGICAL INSTRUMENTS

It should be noted that this group **does not cover** thermometers, barometers, hygrometers and psychrometers, nor combinations of such instruments (**heading 90.25**).

The group does, however, include the following :

- (1) **Wind direction indicators**, whether or not fitted with dials.
- (2) **Anemometers**, i.e., meteorological instruments for measuring wind speed. One type consists of a rotor carrying three cup-shaped blades mounted on a vertical axis, readings being obtained by a counter. The other most common type consists of a kind of weather vane fitted with a tube in which the wind pressure is measured by a differential pressure gauge graduated in speed units. The group also covers **anemometers** in which a generator produces a fluctuating voltage which is then indicated on a voltmeter calibrated in wind speed.

It should be noted that special types of anemometers, for measuring the speed of air currents in mines, tunnels, chimneys, furnaces or other air passages, consisting essentially of a special type of fan and a dial, are **excluded** (**heading 90.26**).

- (3) **Evaporation meters** (Piche, evaporation balance types, etc.).
- (4) **Sunshine recorders** (glass sphere, sensitised paper types, etc.).
- (5) **Nephoscopes**, for indicating the speed and direction of movement of clouds.
- (6) **Ceilometers**, for determining the height of the cloud ceiling above the earth by indicating the angular elevation of a spot of light formed where a strong beam of light meets the cloud so that the height may be computed automatically by triangulation.
- (7) **Visibility meters**, for measuring meteorological visibility or the capability of air to transmit light.
- (8) **Rain gauges and indicators**, for measuring rainfall in a particular place. The simplest type consists of a funnel of known diameter fixed to a receptacle to collect the rain which is then measured in a calibrated tube.
- (9) **Actinometers, solarimeters and pyrheliometers**, for measuring the intensity of solar rays or the total radiation received from the sky.

It should, however, be noted that the heading **excludes** simple or combined thermometers used for the same purpose (**heading 90.25**).

- (10) **Aerological sounding apparatus** (radio-sonde or radio-wind apparatus) for suspending from a balloon or parachute. Such apparatus consist of instruments (thermometer, barometer and hygrometer) for high altitude research work, combined with a wireless transmitter enabling the instrument readings to be automatically recorded on the ground. When separately presented, the balloons and parachutes are **excluded** (**Chapter 88**).
- (11) **Theodolites** for recording successive positions of sounding balloons.

(VI) GEOPHYSICAL INSTRUMENTS

Many geophysical instruments are **excluded**, for example, gas, sludge or soil analysis apparatus, photoelectric fluorometers and fluoroscopes (instruments using ultra-violet light to detect or identify numerous substances) (**heading 90.27**); electric or electronic measuring instruments (e.g., instruments for measuring resistivity, radioactivity counters, thermocouple instruments) (**heading 90.30**), etc.

The following remain in this heading :

- (1) **Seismometers and seismographs**, for recording the time, duration and intensity of movements of a point on the earth's crust, and seismometers and seismographs used both for recording the various phenomena occurring during earthquakes, and in prospecting for mineral oil. In these instruments the seismic waves set up by an earthquake, or by the firing of an explosive charge, are converted into electric impulses.
- (2) **Magnetic or gravimetric geophysical instruments used in prospecting for ores, oil, etc.** These highly sensitive instruments include magnetic balances, magnetometers, magnetic theodolites and gravimeters, torsion balances.
- (3) **Electronic magnetic gradiometers** (also known as "proton magnetometers") which measure the gradient of the earth's magnetic field.
- (4) **Circumferential acoustic scanning tools** which create a "picture" of a borehole by measuring the acoustic travel time of an ultrasonic signal emitted from a rotating transducer in the head of the tool.
- (5) **Apparatus for measuring the inclination of a borehole.**

(VII) RANGEFINDERS

This group covers all types of optical or opto-electronic rangefinders for determining the distance between the instrument and a given object. They are used in surveying, photography and cinematography, by the armed forces, etc.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), this heading also covers parts and accessories of the goods of this heading. Such parts and accessories include arrows for land chains.

On the other hand, monopods, bipods, tripods and similar articles, even though specially designed for instruments or appliances of this heading, are, **excluded** (**heading 96.20**).

90.16 - Balances of a sensitivity of 5 cg or better, with or without weights.

This heading covers balances of all types, including electronic balances, **provided their sensitivity is 5 cg or better**. Weights presented with such balances fall in this heading, but weights presented separately, even if made of precious metal, are **excluded (heading 84.23)**.

Many of the balances of this heading are designed for precision measurement and are made of non-corrosive metal or of light alloys, with knife-edges, bearings and planes of agate. To protect the balances from air currents and dust, they may be enclosed in a glass or plastics case or built in a cabinet consisting chiefly of glass or plastics; they are then manipulated by handles and other devices outside the cabinet. They may also be fitted with an optical device (e.g., magnifying lens), be artificially illuminated to assist in reading the scale, or be fitted with levelling devices (tripod, adjustable screws, spirit-level, etc.).

In certain **torsion balances**, the weight to be measured is counterbalanced by the torsion of a wire.

Certain **electronic balances** are used in a vacuum or under controlled pressure, to record the variations in weight of substances submitted to special treatment (heating, cooling, the action of a gas, vacuum treatment, exposure to light, etc.). Weight variations are measured by recording the current passing through a magnetic balancing coil.

The heading includes :

- (1) **Analytical balances** (e.g., microchemical balances, microbalances, aperiodic analytical balances) used mainly in quantitative chemical analysis.
- (2) **Assay balances**, used in the assaying of precious metals.
- (3) **Balances for precious stones**, graduated in carats.
- (4) **Chemists' balances, yarn balances, samples balances** (used to establish the weight of paper, textile fabrics, etc.).
- (5) **Hydrostatic (or specific gravity) balances**, for ascertaining the specific gravity of liquids or solids.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories (including mounted or unmounted agate knife-edges, bearings and planes), identifiable as being suitable for use solely or principally with the balances of this heading are also classified here (for example, beams, trays, cabinets, dials, swing dampers).

On the other hand, monopods, bipods, tripods and similar articles, even though specially designed for the apparatus of this heading, are **excluded (heading 96.20)**.

*
* * *

Balances of a sensitivity poorer than 5 cg are **excluded (heading 84.23)**.

90.17 - Drawing, marking-out or mathematical calculating instruments (for example, drafting machines, pantographs, protractors, drawing sets, slide rules, disc calculators); instruments for measuring length, for use in the hand (for example, measuring rods and tapes, micrometers, callipers), not specified or included elsewhere in this Chapter.

9017.10 - Drafting tables and machines, whether or not automatic

9017.20 - Other drawing, marking-out or mathematical calculating instruments

9017.30 - Micrometers, callipers and gauges

9017.80 - Other instruments

9017.90 - Parts and accessories

This heading includes drawing, marking-out or mathematical calculating instruments. It also includes instruments for measuring length, for use in the hand.

This heading **does not**, however, **include** :

- (a) Mitre boxes and tools used in the graphic arts (e.g., chisels, gouges, etching needles) (**Chapter 82**).
- (b) Graphic tablets and digitizers (**heading 84.71**).
- (c) Pattern generating apparatus designed to produce masks and reticles from photoresist coated substrates (such as optical, E-beam, focused ion beam, X-ray or laser beam apparatus) (**heading 84.86**).
- (d) Co-ordinatographs of a type used for photogrammetrical purposes (**heading 90.15**).

These include :

(A) Drawing instruments.

(1) **Pantographs and eidographs** for smaller, larger or same scale reproductions of maps, plans, drawings, parts to be machined, etc. The heading includes such instruments used for course plotting in navigation.

(2) **Drafting machines** generally using a system of parallelograms, with or without drawing boards or tables.

The heading also covers drafting machines incorporating automatic data processing machines or working in conjunction with such machines.

(3) **Drawing compasses**, dividers, reduction compasses, spring bows, mathematical drawing pens, dotting wheels, etc., whether in a case (e.g., drawing sets) or separately.

(4) **Set squares** (standard, hatching, wood or metal working), **adjustable squares**, **T squares** (standard or articulated), **drawing curves**, **rulers** (flat, square, hatching (parallel rules), standard, etc.).

(5) **Protractors**, from the ordinary protractors found in drawing sets to the complex protractors as used, for example, in engineering.

(6) **Stencils** of a kind clearly identifiable as being **specialised as drawing instruments**. Stencils not so specialised are classified according to their constituent material.

(B) Marking-out instruments.

(Marking-out consists in marking construction lines, etc., on the surface of a part to be machined, sawn, etc.).

(1) **Beam compasses** (marking, carpenters', etc.) with plain or divided laths.

(2) **Scribers and centre punches.**

(3) **Surface plates** used as a datum plane for marking-out or for checking plane surfaces, etc. **Straight-edges and squares** (of cast iron, stone, etc.) with a true plane surface.

(4) **V-blocks and X-blocks** for supporting cylindrical workpieces.

The heading **does not cover** engraving tools for working in the hand with self-contained motor (**heading 84.67**).

(C) Mathematical calculating instruments.

Slide rules, disc calculators, cylindrical calculators and other calculating instruments based on the slide rule or other mathematical calculating principle including, for instance, pocket-type adding and subtracting devices operated by the selection of numbers with a stylus according to a given procedure. This group also includes rules and discs for calculating photographic exposure times on adjustment by reference to the condition of the sky, time of day, aperture setting, type of subject and sensitivity of emulsion.

Calculating or accounting machines, however, are **excluded (heading 84.70)**.

(D) Instruments for measuring length, for use in the hand.

These instruments are capable of indicating the length, i.e., linear dimensions, of the object to be measured, for example a line drawn or imaginary (straight or curved) on the object. The instruments are therefore capable of measuring dimensions such as diameters, depths, thicknesses and heights which are indicated as a unit of length (e.g., millimetres). These instruments must also have characteristics (size, weight, etc.) which enable them to be held in the hand to carry out the measurement.

Instruments specially designed to be used permanently mounted on a stand or other support or connected to machines or other apparatus by means of flexible tubing, cables, etc., to carry out the measurement are **excluded (heading 90.31)**.

This group includes :

(1) **Micrometers**; instruments having a micrometric head, either of the screw- or screwless-type (the screwless-type incorporate a slide action and are usually electronic). They are used to measure, for example, outside or inside diameters, thicknesses, screw thread pitch. The measurement may be read on the screw itself, on a dial or on a digital display.

(2) **Callipers** (vernier, dial indicating or electronic), for measuring, e.g., diameters, depths, thicknesses.

(3) **Gauges**, having an adjustable measuring device.

Gauges without adjustable devices, used only for sizing parts or checking angles, forms, etc. (for example, plug gauges, ring gauges), are **excluded (heading 90.31)**.

(4) **Comparators (dial type)**, used to check the inside or outside tolerance of dimensions (e.g., reaming or rectification checks). They incorporate a measuring rod, amplifying dial and transmission system (rack, gear, lever, spring, pneumatic, hydraulic, etc.).

(5) **Measuring rods** (plain or divided, straight or folding) and **measuring tapes** (e.g., spring rules, riband-rules, drum wound bands), including standard rods, measuring sticks and the like.

The heading **excludes** measuring devices specially designed for surveying (land chains, levelling staves, ranging poles, etc.) and winch-type measures for mine shafts (**heading 90.15**).

(6) **Divided scales** (school rulers, etc.), including V-shaped rules for measuring the diameter of convex bodies and vertical measuring apparatus with movable crossheads.

(7) **Map measurers** (opisometers); small instruments with or without a dial, used for measuring distances on maps, plans, etc.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), the heading also covers parts and accessories identifiable as being suitable for use solely or principally with the machines, apparatus and instruments described above, e.g., micrometer extension anvils; stands for slip gauges; micrometer stands; hinges or joints for folding rules.

90.18 - Instruments and appliances used in medical, surgical, dental or veterinary sciences, including scintigraphic apparatus, other electro-medical apparatus and sight-testing instruments (+).

- Electro-diagnostic apparatus (including apparatus for functional exploratory examination or for checking physiological parameters) :

9018.11 - - Electro-cardiographs

9018.12 - - Ultrasonic scanning apparatus

9018.13 - - Magnetic resonance imaging apparatus

9018.14 - - Scintigraphic apparatus

9018.19 - - Other

9018.20 - Ultra-violet or infra-red ray apparatus

- Syringes, needles, catheters, cannulae and the like :

9018.31 - - Syringes, with or without needles

9018.32 - - Tubular metal needles and needles for sutures

9018.39 - - Other

- Other instruments and appliances, used in dental sciences :

9018.41 - - Dental drill engines, whether or not combined on a single base with other dental equipment

9018.49 - - Other

9018.50 - Other ophthalmic instruments and appliances

9018.90 - Other instruments and appliances

This heading covers a very wide range of instruments and appliances which, in the vast majority of cases, are used only in professional practice (e.g., by doctors, surgeons, dentists, veterinary surgeons, midwives), either to make a diagnosis, to prevent or treat an illness or to operate, etc. Instruments and appliances for anatomical or autopic work, dissection, etc., are also included, as are, under certain conditions, instruments and appliances for dental laboratories (see Part (II) below). The instruments of the heading may be made of any material (including precious metals).

The heading **does not cover** :

- (a) Sterile catgut and other sterile material for surgical sutures, sterile laminaria and sterile laminaria tents (**heading 30.06**).
- (b) Diagnostic or laboratory reagents of **heading 38.22**.
- (c) Hygienic or pharmaceutical articles of **heading 40.14**.
- (d) Laboratory, pharmaceutical or hygienic glassware of **heading 70.17**.
- (e) Sanitary ware of base metal (in particular, **headings 73.24, 74.18 and 76.15**).
- (f) Manicure or pedicure sets and instruments (**heading 82.14**).
- (g) Carriages for disabled persons (**heading 87.13**).
- (h) Spectacles, goggles and the like, corrective, protective or other (**heading 90.04**).

- (ij) Photographic cameras (**heading 90.06**) **unless** incorporated permanently in the instruments or appliances of this heading.
- (k) Microscopes, etc., of **heading 90.11** or **90.12**.
- (l) Disc calculators used for calculating lung function, body mass index, etc., of **heading 90.17**.
- (m) Mechano-therapy, oxygen therapy, ozone therapy, artificial respiration, aerosol therapy, massage apparatus, etc., of **heading 90.19**.
- (n) Orthopaedic appliances, artificial parts of the body and fracture appliances, including those for animals (**heading 90.21**).
- (o) X-ray apparatus, etc., (whether medical or not) of **heading 90.22**.
- (p) Clinical thermometers (**heading 90.25**).
- (q) Instruments and appliances used in laboratories to test blood, tissue fluids, urine, etc., whether or not such tests serve in diagnosis (generally **heading 90.27**).
- (r) Medical or surgical furniture, including that for veterinary use (operating tables, examination tables, hospital beds), dentists' chairs not incorporating dental appliances of this heading, etc. (**heading 94.02**).

On the other hand, this heading includes specialised measuring instruments used exclusively in professional practice, such as cephalometers, dividers for measuring cerebral lesions, obstetrical pelvimeters, etc.

It should also be noted that a number of the instruments used in medicine or surgery (human or veterinary) are, in effect, tools (e.g., hammers, mallets, saws, chisels, gouges, forceps, pliers, spatulae, etc.), or articles of cutlery (scissors, knives, shears, etc.). Such articles are classified in this heading **only** when they are clearly identifiable as being for medical or surgical use by reason of their special shape, the ease with which they are dismantled for sterilisation, their better quality manufacture, the nature of the constituent metals or by their get-up (frequently packed in cases or boxes containing a set of instruments for a particular treatment : childbirth, autopsies, gynaecology, eye or ear surgery, veterinary cases for parturition, etc.).

The instruments and appliances classified here may be equipped with optical devices; they may also make use of electricity, either as motive power or for transmission, or as a preventive, curative or diagnostic agent.

This heading also covers instruments and appliances operated by laser or other light or photon beam processes and ultrasonic instruments and appliances.

(I) INSTRUMENTS AND APPLIANCES FOR HUMAN MEDICINE OR SURGERY

This group includes :

- (A) **Instruments which may be used under the same names for several purposes**, for example :
 - (1) **Needles** (for sutures, ligatures, vaccination, blood tests, hypodermic needles, etc.).
 - (2) **Lancets** (for vaccination, blood-letting, etc.).
 - (3) **Trocars** (for puncturing) (gall-bladder, general purpose, etc., types).
 - (4) **Surgical knives and scalpels** of all kinds.

- (5) **Sounds** (prostatic, bladder, urethral, etc.).
- (6) **Specula** (nasal, mouth, laryngeal, rectal, vaginal, etc.).
- (7) **Mirrors and reflectors** (for examination of eye, larynx, ear, etc.).
- (8) **Scissors, shears, forceps, pliers, chisels, gouges, mallets, hammers, saws, scrapers, spatulae.**
- (9) **Cannulae, catheters, suction tubes**, etc.
- (10) **Cauterries** (thermo, galvano, micro, etc.).
- (11) **Tweezers; dressing, swab, sponge or needle holders (including radium needle holders).**
- (12) **Retractors** (lip, jaw, abdominal, tonsil, liver, etc.).
- (13) **Dilators** (laryngeal, urethral, oesophageal, uterine, etc.).
- (14) **Wire guides** used for the placement of catheters, needles, tissue dilators, endoscopes and atherectomy devices.
- (15) **Clips** (suture, etc.).
- (16) **Syringes** (glass, metal, glass and metal, plastics, etc.), of all kinds, e.g., injection, puncture, anaesthesia, irrigation, wound washing, suction (with or without pump), eye, ear, throat, uterine, gynaecological, etc.
- (17) **Surgical staplers** for inserting staples to close a wound.

(B) **Special diagnostic instruments and apparatus.**

These include :

- (1) **Stethoscopes.**
- (2) **Instruments to measure rate of breathing** (to determine basal metabolism).
- (3) **Sphygmomanometers, tensiometers and oscilloscopes** (to measure blood pressure).
- (4) **Spirometers** (to assess lung capacity).
- (5) **Cephalometers.**
- (6) **Pelvimeters.**

(C) **Ophthalmic instruments.** These fall into various categories :

- (1) **Surgical instruments** such as corneal trephines, keratomes.
- (2) **Diagnostic instruments** such as ophthalmoscopes; binocular loupes with head-bands and **binocular-type microscopes**, consisting of a microscope, an electric lamp with a slit, and a head-rest, the whole being mounted on an adjustable support, for the examination of the eyes; tonometers (for testing the intra-ocular tension); eye specula.

(3) **Orthoptic or sight-testing apparatus** including amblyoscopes, retinoscopes, skiascopes, strabometers, keratometers, keratoscopes, eye measurement meters designed to measure the distance between the pupils, trial-cases (of lenses) and trial-frames (for carrying the trial lenses), optometric scales, test charts. However, optometric scales and charts on paper, paperboard or plastics, used for colour perception tests, are excluded (**Chapter 49**).

This heading also covers electrically heated compresses for the eyes, and electro-magnets designed for removing metallic particles from the eyes.

- (D) **Ear instruments**, e.g., auriscopes. However, tuning forks, whether or not for medical use, are excluded (**heading 92.09**).
- (E) **Anaesthetic apparatus and instruments** (face masks, face-piece harness, intratracheal tubes, etc.).
- (F) **Instruments for nose, throat or tonsil treatment** : clamps (for straightening the nasal cartilage); transillumination apparatus (for sinuses and nasal fossae); tonsilotomes and guillotines; direct laryngoscopes; laryngeal brushes, etc.
- (G) **Pharyngeal, oesophageal, stomach or tracheotomy instruments** : oesophagoscopes, bronchoscopes, stomach pumps, intubation tubes, etc.
- (H) **Urinary canal or bladder instruments** : urethrotomes, lithotrity instruments, bladder-grit suction apparatus, instruments for prostatectomy.
- (IJ) **Artificial kidney (dialysis) apparatus**.
- (K) **Gynaecological or obstetrical instruments** : vaginal retractors; hysterectomy instruments; obstetrical stethoscopes; specialised optical instruments for examination of the genital organs; forceps; perforators; embryotomy instruments (for dissection of the foetus); cephalotribe and cranioclasts (instruments to crush the head of a child which has died in the uterus); instruments for taking internal measurements; etc.
- (L) **Portable pneumo-thorax apparatus, blood transfusion apparatus, artificial leeches**.

The heading also covers sterile hermetically sealed containers of plastics, from which air has been evacuated but containing a small quantity of anti-coagulant and fitted with an integral donor tube and a phlebotomy needle, used for the collection, storage and transfusion of human whole blood. However, special blood storage bottles of glass are excluded (**heading 70.10**).

- (M) **Chiropodists' electric grinders**.
- (N) **Acupuncture needles** - gold, silver, steel.
- (O) **Endoscopes** : gastroscopes, thoracoscopes, peritoneoscopes, bronchoscopic telescopes, cystoscopes, urethoscopes, resectoscopes, cardioscopes, colonoscopes, nephroscopes, laryngoscopes, etc. Many of these have an operating channel large enough to perform surgery via remotely controlled instruments. However, endoscopes for non-medical purposes (fibrescopes) are excluded (**heading 90.13**).
- (P) **Apparatus incorporating an automatic data processing machine** and designed solely for calculating the dose and distribution of therapeutic radiation.

- (Q) **Hyperbaric chambers** (also known as decompression chambers) which are specially equipped pressure vessels to administer oxygen at elevated atmospheric pressure levels. They are used for the treatment of conditions such as decompression sickness, air embolism, gas gangrene, carbon monoxide poisoning, refractory osteomyelitis, skin grafts and flaps, actinomycosis and exceptional blood loss anaemia.
- (R) **Lamps** which are specially designed for diagnostic, probing, irradiation, etc. purposes. Torches, such as those in the shape of a pen are **excluded (heading 85.13)** as are other lamps which are not clearly identifiable as being for medical or surgical use (**heading 94.05**).

(II) DENTAL INSTRUMENTS AND APPLIANCES

In addition to those common to this and the previous group (such as masks and other dental analgesic apparatus), the main instruments and appliances included in this category are :

- (1) **Surgeons' finger-guards** (whether or not articulated) **and gags; cheek or lip retractors, tongue depressors and clips.**
- (2) **Forceps** of all kinds, **elevators, tweezers** of all kinds (to remove exposed teeth, aligning pivot teeth, etc.), **cutters** (for dissecting, dressing, filling and gouging, etc.), **root forceps.**
- (3) **Instruments for endodontic treatment** (broaches, reamers, files, pluggers, spreaders, etc.).
- (4) **Bone scissors and files; gouges and mallets for resecting the jaw and the maxillary sinus; raspatories; scalpels; special knives and scissors; special dentists' tweezers; "excavators" and probes.**
- (5) **Special instruments for cleaning gums and sockets; scalers for treating dental tartar; scrapers and enamel chisels.**
- (6) **Miscellaneous probes; needles** (abscess, hypodermic, suture, cotton-wool, etc.); **cotton-wool holders and swab holders; insufflators; dental mirrors.**
- (7) **Gold-filling instruments** (pluggers, mallets, etc.); **filling instruments** (cement or resin spatulae, amalgam stoppers and mallets, amalgam-carriers, etc.); **impression compound trays.**
- (8) **Dental burrs, discs, drills and brushes**, specially designed for use with a dental drill engine or handpiece.

The heading also covers tools and instruments of a kind used in prosthetic dentistry either by the practitioner himself or by a dental technician, for example : knives; spatulae and other modelling tools; miscellaneous pliers and tweezers (for fixing clamps and crowns, cutting pivots, etc.); saws; shears; mallets; files; chisels; scrapers; burnishers; metal formers, for the manufacture, by beating, of metal dental crowns. The heading also covers dental casting machines, dental milling machines, and dental trimmers for trimming models of dentures. The heading **does not**, however, **include** tools or other articles of general use (furnaces, moulds, soldering tools, melting ladles, etc.); these are classified in their respective headings.

The following also fall in this heading :

- (i) **Dental drill engines** with swivel arm, whether on a separate base, for wall-mounting, or for fitting to the equipment described under (ii) below.

- (ii) **Complete dental equipment on its base** (stationary or mobile unit). The main usual features are a frame carrying a compressor, a transformer, a control panel and other electrical apparatus; the following are also often mounted on the unit : swivel arm drill, spittoon and mouth rinser, electric heater, hot air insufflator, spray, cautery instrument tray, diffused lighting, shadowless lamp, fan, diathermic apparatus, X-ray apparatus, etc.

Some types of this equipment are designed to operate by the use of abrasive materials (usually aluminium oxide) instead of with a drill; the abrasives are usually projected against the teeth by compressed gas (e.g., carbon dioxide).

- (iii) **Spittoon mouth rinsers** whether on a base, stand or on swivel arms. They are usually combined with warm water supply and warm water syringe.
- (iv) **Polymerisation devices** (light or heat), amalgamators, ultrasonic scalers, electrosurgery equipment, etc.
- (v) **Devices for dental treatment** which operate by the use of lasers.
- (vi) **Dentists' chairs incorporating dental equipment** or any other dental appliances classifiable in this heading.

The heading **does not**, however, **include** dentists' chairs not incorporating dental appliances of this heading; these dentists' chairs fall in **heading 94.02** whether or not fitted with equipment such as lighting fittings.

It should, however, be noted that the heading **excludes** certain items of dental equipment mentioned in paragraph (ii) above, when they are presented separately; these are classified in their own respective headings, for example, compressors (**heading 84.14**), X-ray, etc., apparatus (**heading 90.22**). **heading 90.22** also covers X-ray, etc., apparatus designed for a separate stand, or for wall-mounting in dental surgeries. Separately presented diathermy apparatus is, however, classified with the electro-medical apparatus of this heading (see Part (IV) below).

It should be noted that dental cements and other dental fillings fall in **heading 30.06**; the preparations known as "dental wax" or as "dental impression compounds", put up in sets, in packings for retail sale or in plates, horseshoe shapes, sticks or similar forms, and other preparations for use in dentistry, with a basis of plaster (of calcined gypsum or calcium sulphate), fall in **heading 34.07**.

(III) VETERINARY INSTRUMENTS AND APPLIANCES

This group includes a number of articles which, though designed for veterinary use, are similar to those of Part (I) or (II) above, for example :

- (A) **General purpose instruments** (e.g., needles, lancets, trocars, scalpels, specula, sounds, scissors, forceps, hammers, curettes, retractors, syringes).
- (B) **Special instruments and appliances**, such as, ophthalmoscopes, eye specula, laryngoscopes, stethoscopes, forceps, embryotomes.
- (C) **Dental instruments.**

The group also includes instruments and apparatus specialised for veterinary use, for example :

- (1) **Instruments and appliances for the udder**, e.g., teat dilators and puncturing sounds (to open the teats of cows); appliances for treating puerperal or milk fever in cows.
- (2) **Instruments and appliances for castration**: emasculators; castrating clamps and clamps (for producing atrophy of the male genital glands); castrating vices and forceps; ovariotomes, etc.
- (3) **Instruments and appliances for parturition**: specialised obstetrical cords, straps, head-collars, forceps and hooks, mechanical calving aids, etc.

- (4) **Miscellaneous instruments** : artificial inseminators; tail-dockers; horn-cutters; sprays for treatment of diseases of respiratory, digestive, urinary, genital, etc., organs in animals; special control apparatus, i.e., for preventing animals from moving during operations (mouth-gags, hobbles, etc.); special syringes for applying medicaments and syringes to be filled with an anaesthetic or a medicament (antiserum, vaccine, etc.) for remote projection at free-roaming animals, for example by means of a gun or pistol operated by compressed gas; appliances for administering pills; special snaffles for ingesting drenches; hooks for sand-crack (to close cracks in hooves); endoscopic instruments for determining the sex of chicks, etc.

The heading **excludes** trichinoscopes (optical instruments for examination of pork) (**heading 90.11**), orthopaedic appliances for animals (**heading 90.21**), operating tables for animals (**heading 94.02**, see corresponding Explanatory Note).

Tools of a type used equally by veterinary surgeons and blacksmiths are classified in **Chapter 82** (e.g., toeing files; nail or hoof clippers; paring knives; pliers; pincers; hammers, etc.); **Chapter 82** also covers cattle-branding tools (punches, irons for burning off hoof-rind, etc.) and shearing tools.

(IV) SCINTIGRAPHIC APPARATUS

These are apparatus which scan parts of the body and create images of an organ or a record of its functioning. It includes apparatus incorporating a scintillation counter the data from which is converted into analogue signals for the purpose of making medical diagnoses (e.g., gamma camera, scintillation scanner).

(V) OTHER ELECTRO-MEDICAL APPARATUS

This heading also covers electro-medical apparatus for preventive, curative or diagnostic purposes, **other than X-ray**, etc., apparatus of **heading 90.22**. This group includes :

- (1) **Electro-diagnostic apparatus**, which include :
- (i) **Electro-cardiographs** (apparatus which, by means of currents produced by contractions of the cardiac muscle, record heart movements as electrocardiograms).
 - (ii) **Phonocardiographs** (specially designed to register heart noises as phonocardiograms; they may also be used as electro-cardiographs).
 - (iii) **Cardioscopes** (used in conjunction with the two preceding instruments to enable simultaneous observation of cardiograms and phonocardiograms).
 - (iv) **Rheocardiographs** (electrical apparatus for measuring changes of electrical resistance due to the functioning of the heart).
 - (v) **Electroencephalographs** (for examination of the brain).
 - (vi) **Electrosphygmographs** (for registering arterial pressure and volume).
 - (vii) **Electrotonographs** (for registering variations in arterial, intravenous or intracardial pressure).
 - (viii) **Electroretinographs** (for measuring strain in the retina).

- (ix) **Audiometers and similar apparatus** (for hearing tests based on frequency variations).
 - (x) **Diagnostic apparatus incorporating or operating in conjunction with an automatic data processing machine** for processing and visualising clinical data, etc.
 - (xi) **Ultrasonic diagnostic equipment** used for the representation of organs, e.g., on a display tube, by means of ultrasonic waves.
 - (xii) **Nuclear Magnetic Resonance (NMR) apparatus** used to represent the characteristics of tissues and organs inside the human body, using the magnetic properties of body atoms, such as hydrogen atoms.
- (2) **Electrotherapy apparatus.** Apart from its use in diagnosis, this apparatus is employed to treat diseases such as neuritis, neuralgia, hemiplegia, phlebitis, endocrinal anaemia. Certain of these appliances can be combined with electro-surgical instruments referred to in paragraph (7) below.
- (3) **Iono-therapy apparatus** used to administer active medicaments (sodium or lithium salicylate, potassium iodide, histamine, etc.) through the skin by the aid of an electric current.
- (4) **Diathermy apparatus** to treat certain diseases which require heat (e.g., rheumatism, neuralgia, dental ailments). These operate by the use of high-frequency (shortwave, ultrasonic, ultra shortwave, etc.) currents, and employ electrodes in a variety of forms (e.g., plates, rings, tubes).
- (5) **Electric shock treatment apparatus** to treat mental or nervous diseases.
- (6) **Cardiac defibrillators** for defibrillating the heart by the application of electric current.
- (7) **Electro-surgical apparatus.** These utilise high-frequency electric currents, the needle, probe, etc., forming one of the electrodes. They can be employed to cut tissues (**electrocutting**) with a lancet (electric lancet), or to coagulate the blood (**electrocoagulation**). Certain combined instruments may, by the use of control pedals, be made to act interchangeably as electrocutters or electrocoagulators.
- (8) **Actinotherapy apparatus.** These employ radiations within, or more generally just outside, the visible spectrum (infra-red, ultra-violet) for treatment of certain diseases or for diagnostic purposes (special lighting to reveal skin diseases). This apparatus generally incorporates lamps, though infra-red ray apparatus may be fitted with heating resistances or heating panels with reflectors.
- (9) **Artificial incubators for babies.** Basically these consist of a transparent cubicle of plastics, electrical heating equipment, safety and warning devices, and oxygen and air filtering and regulating apparatus. In most cases they are mounted on a trolley and have built-in baby scales.

Cases containing electrodes or other devices for use with the apparatus described above are also included in this group.

This heading also **excludes** prenatal listening apparatus for non-medical use of **heading 85.18** (see the Explanatory Note to that heading).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

◦
◦ ◦

Subheading Explanatory Notes.

Subheading 9018.12

This subheading covers electro-diagnostic ultrasonic scanning apparatus. This apparatus operates by sending high-frequency sound waves into the human body through a transducer. The transducer is placed in contact with the body, and alternately emits short pulses of ultrasound and "listens" for their echoes. The echoes result from the sound waves being reflected by the organs within the body, and their characteristics are interpreted to yield information about the location, size, shape and texture of the tissues. Interpretation is generally carried out by an automatic data processing machine, with the output being presented as a video image of the tissues.

This method of body scanning is used for examining the foetuses of pregnant women. It is also well suited for the examination of the breasts, heart, liver and gall-bladder.

Subheading 9018.13

Magnetic Resonance Imaging (MRI) relies on the principle that the nuclei of hydrogen atoms will align when subjected to an intense magnetic field. If a radio frequency is then aimed at these atoms, the alignment of the nuclei will shift. When the radio waves are turned off, the nuclei realign themselves, transmitting in the process a small electric signal. As the human body is primarily composed of hydrogen atoms, an image of virtually any area of the body can be generated from the returning pulses. Since the hydrogen represents water content, the returning pulses can be used to make distinctions between tissues. This makes it possible to obtain an image of bone-marrow and tissue.

The electro-diagnostic magnetic resonance imaging apparatus of this subheading consists of a huge electro-magnet, a radio-frequency generator and an automatic data processing machine for evaluation. It must be installed in a room completely shielded from external radio-frequencies. To obtain the intense magnetic field required, the electro-magnets are supercooled by means of liquid helium.

Hydrogen was chosen as the basis for magnetic resonance imaging because of its abundance in the human body and its prominent magnetic characteristics. It is also possible to use other elements such as, for example, sodium or phosphorus.

Subheading 9018.14

The electro-diagnostic apparatus of this subheading is used to obtain an image of the distribution of gamma rays in the human body. This image is produced using suitable apparatus such as the scintigraphic scanner and, above all, the gamma camera.

These nuclear scanners require giving the patient an oral dose or injection of a radioactive compound (the tracer) which is quickly absorbed by the organ being studied. The body is then scanned with a gamma counter, which records the amount of radiation emitted by the tracer as it penetrates the target organ (for example, the brain), in order to determine where the radio-isotope is absorbed.

A video picture is produced by automatic data processing machine analysis of the radiation detected. This picture is a patchwork of light and dark areas or contrasting colours which show where in the organ the radio-isotope was taken up. Such scans provide information about both the structure and the function of the organ concerned.

An example of scintigraphic apparatus is the Positron Emission Tomography (PET) scanner. It combines the principles of nuclear medicine with the imaging techniques used in the Computed Tomography (CT) scanner (see the Subheading Explanatory Note to subheading 9022.12).

90.19 - Mechano-therapy appliances; massage apparatus; psychological aptitude-testing apparatus; ozone therapy, oxygen therapy, aerosol therapy, artificial respiration or other therapeutic respiration apparatus.

9019.10 - Mechano-therapy appliances; massage apparatus; psychological aptitude-testing apparatus

9019.20 - Ozone therapy, oxygen therapy, aerosol therapy, artificial respiration or other therapeutic respiration apparatus

(I) MECHANO-THERAPY APPLIANCES

These appliances are mainly used to treat diseases of the joints or muscles, by mechanical reproduction of various movements. It should be noted that such treatment is usually carried out under medical supervision; the apparatus of this heading should therefore be distinguished from the ordinary physical culture or medical exercising equipment designed for use in the home or in specially equipped premises (**heading 95.06**) (e.g., elastic cable extenders or exercisers; spring grips of various kinds; "rowing" machines for reproducing rowing movements; stationary one-wheeled cycles for training purposes or for developing leg muscles).

Since mechano-therapy refers only to treatment involving movement of the joint, etc., this heading **excludes** wholly stationary apparatus (e.g., steps, ladders, parallel bars) even if they are for use in the rehabilitation of the limbs; such articles are classified in their respective headings. For the purposes of this heading, however, apparatus may be regarded as mechanical even if it incorporates only comparatively simple mechanical devices such as springs, wheels, pulleys, etc.

Subject to the above conditions, the heading includes :

- (1) Apparatus for rotation exercises of the wrist.
- (2) Apparatus for rehabilitation of the fingers.
- (3) Apparatus for rotation exercises of the feet.

Most of these three types of appliances consist mainly of grips linked to levers, adjustable counterweights, devices for holding the limbs, the whole mounted on a base. They are hand-operated.

- (4) Apparatus for simultaneous flexion and extension of the knee and hip.
- (5) Apparatus for trunk exercises.
- (6) Apparatus for walking exercises, consisting of a frame, with supporting crutches and hand grips, resting on a series of wheels.
- (7) Apparatus for improving the circulation, strengthening heart muscles and rehabilitating the lower limbs, consisting of a kind of wheel-less cycle fixed on a frame, which can be pedalled when the patient is sitting up or lying down.
- (8) Universal-type apparatus, power-operated, which by the use of interchangeable accessories, can be employed for numerous mechano-therapeutic purposes (e.g., for treatment of diseases of the joints or muscles of the neck, shoulder, elbow, wrist, fingers, hip, knee, etc.).

(II) MASSAGE APPARATUS

Apparatus for massage of parts of the body (abdomen, feet, legs, back, arms, hands, face, etc.) usually operate by friction, vibration, etc. They may be hand- or power-operated, or may be of an electro-mechanical type with a motor built in to the working unit (vibratory-massaging appliances). The latter type in particular may include interchangeable attachments (usually of rubber) to allow various methods of application (brushes, sponges, flat or toothed discs, etc.).

This group includes simple rubber rollers or similar massaging devices. It also covers hydromassage appliances for all-over or partial massage of the body, using the action of water or a blend of water and air under pressure. Examples of these appliances include spa baths, presented complete with pumps, turbines or blowers, ducts, controls and all fittings; devices for massaging the breasts, using the action of water distributed by a series of small nozzles mounted inside a form fitted over the breast, and made to revolve by a stream of water introduced through a flexible tube.

The following are also regarded as massage apparatus within the meaning of this heading : mattresses designed to prevent or treat bedsores by constantly varying the places at which the weight of the patient's body rests and also providing a superficial massage effect on tissues liable to necrosis.

(III) PSYCHOLOGICAL APTITUDE-TESTING APPARATUS

This is used by doctors, etc., to test the speed of reflex actions, co-ordination of movements or other physical or psychological reactions. It is used in particular to test people whose occupations demand special aptitudes (airmen, drivers, etc.), or to test the educational or vocational aptitudes of children.

The heading covers various types of such apparatus (e.g., appliances for testing mechanical aptitudes or manual dexterity; revolving seats designed for variable speeds and abrupt stopping to test the reactions of aircraft pilots).

It should, however, be noted that the heading **excludes** apparatus of a kind normally used for medical diagnosis of sight, hearing, the heart, etc. (**heading 90.18**). Similarly, articles having the character of constructional or building sets and equally suitable for use as amusements and for aptitude testing are classified as games or toys (**Chapter 95**).

(IV) OZONE THERAPY APPARATUS

This apparatus provides for the treatment of diseases of the respiratory organs by using the therapeutic properties of ozone (chemical formula O₃), e.g., by inhaling.

(V) OXYGEN THERAPY, ARTIFICIAL RESPIRATION OR OTHER THERAPEUTIC RESPIRATION APPARATUS

These are used in cases of drowning, electrocution, acute poisoning (e.g., carbon monoxide), for weak newly-born babies, post-operative shock, infantile paralysis (poliomyelitis), acute asthma, insufficient lung development, etc.

These appliances include :

- (A) **Appliances used instead of manual methods of artificial respiration**, e.g., mechanical devices operating by bringing pressure to bear on the patient's chest, by a rocking movement, by forced inhalation, etc.
- (B) **Oxygen therapy appliances proper**. These operate either by inhalation of oxygen or of a mixture of oxygen and carbon dioxide through a mask, or by feeding oxygen into a respiratory chamber consisting of a tent of transparent plastics fitted to the patient's bed.
- (C) **Appliances known as "iron lungs" and the like**. These consist essentially of :
 - (1) A chamber, made of metal, wood or glass fibre, to accommodate the patient's body (the head remaining outside), or a smaller chamber of transparent plastics covering only the chest.
 - (2) An independent unit comprising an air suction system and an emergency blower which may be power- or hand-operated.
 - (3) A thick air-tight tube connecting the blower system to the chamber.

Certain oxygen therapy appliances described above (in particular oxygen tents) may also be used for administration of aerosols, the patient receiving simultaneously an inhalation of oxygen and a medicament dispersed as a micro-spray (see Part (VI) below).

The heading **does not include** hyperbaric or decompression chambers (**heading 90.18**).

(VI) AEROSOL THERAPY APPARATUS

This is used for the application of a therapeutic agent in the treatment of pulmonary, cutaneous, oto-rhino-laryngologic, gynaecologic diseases, etc., by the dispersion (nebulisation) in the form of a mist of various medicinal solutions (hormones, vitamins, antibiotics, broncho-dilating preparations, essential oils, etc.).

Some of these appliances are of the individual type (nebulisers) designed for connecting to cylinders of oxygen or compressed air, or for fitting to the oxygen tents described in Part (V) above. Others are of the aerosol generator type for doctors' consulting rooms or hospitals; these consist of a cabinet containing a motor-compressor unit, measuring instruments, the generator proper and various application devices (masks, nasal, buccal, gynaecological, etc., nozzles). The heading includes aerosol-type hand-sprays for spraying teeth or gums which operate by compressed gas contained in a screw-on cartridge; the action of the medicinal substance used cleans the mouth and treats diseases such as periodontitis.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here. Such parts and accessories include tents and tent fixing devices for oxygen therapy apparatus.

90.20 - Other breathing appliances and gas masks, excluding protective masks having neither mechanical parts nor replaceable filters.

(I) BREATHING APPLIANCES

The heading includes breathing appliances of a kind used by, for example, airmen, divers, mountaineers or firemen. These may be self-contained (where the breathing circuit is fed from a cylinder of oxygen or compressed air) or may be connected by a hose to compressors, compressed air supply pipes, storage cylinders or (in the case of certain short distance apparatus) the outside atmosphere.

This heading also includes divers' helmets which require to be fitted to divers' suits before they are air-tight, and **anti-radiation or anti-contamination protective suits**, incorporating breathing apparatus.

(II) GAS MASKS

These enable the wearer to breathe in atmospheres polluted by dust, poisonous vapours, smoke, etc., and are therefore used in certain industries, or in warfare (against poison gases).

In these appliances air for breathing comes directly from the outside and is passed through a filtering device which absorbs poison gases or retains dust. They therefore consist essentially of a mask, with an arrangement enabling the wearer to see, a metal frame with outlet and inlet valves, and a socket to which is fitted either a filter or a flexible tube connected to a filter system carried on the back or chest. A more simple type protects only the mouth and the nose; it consists of a sheath held in place by one or more elastic ribbons, and contains a filtering or absorbent material (asbestos wool, sponge rubber, cotton wadding, etc., which may be impregnated or not) easily replaced after use.

The following articles are **not** regarded as breathing appliances or gas masks of this heading :

- (a) Masks for protection against dust, odours, etc., not equipped with a replaceable filter, but consisting of several layers of bonded fibre fabric, whether or not treated with activated carbon or having a central layer of synthetic fibres, and masks of textile materials, used by surgeons, nurses, etc., operating upon or attending to a patient (**heading 63.07**).
- (b) Masks for protection against dust or particles of materials, consisting of a simple wire mesh sheath with no filtering device other than a sheet of gauze (**Section XV**).
- (c) Masks for administering anaesthetics (**heading 90.18**).
- (d) Divers' respiratory masks of a kind used without oxygen or compressed air bottles, and simple underwater breathing tubes (generally known as "snorkels") for swimmers or divers (**heading 95.06**).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

90.21 - Orthopaedic appliances, including crutches, surgical belts and trusses; splints and other fracture appliances; artificial parts of the body; hearing aids and other appliances which are worn or carried, or implanted in the body, to compensate for a defect or disability.

9021.10 - Orthopaedic or fracture appliances

- Artificial teeth and dental fittings :

9021.21 -- Artificial teeth

9021.29 -- Other

- Other artificial parts of the body :

9021.31 -- Artificial joints

9021.39 -- Other

9021.40 - Hearing aids, excluding parts and accessories

9021.50 - Pacemakers for stimulating heart muscles, excluding parts and accessories

9021.90 - Other

(I) ORTHOPAEDIC APPLIANCES

Orthopaedic appliances are defined in Note 6 to this Chapter. These are appliances for :

- Preventing or correcting bodily deformities; or
- Supporting or holding parts of the body following an illness, operation or injury.

They include :

- (1) Appliances for hip diseases (coxalgia, etc.).
- (2) Humerus splints (to enable use of an arm after resection), (extension splints).
- (3) Appliances for the jaw.
- (4) Traction, etc., appliances for the fingers.
- (5) Appliances for treating Pott's disease (straightening head and spine).
- (6) Orthopaedic footwear and special insoles designed to correct orthopaedic conditions, provided that they are either (1) made to measure or (2) mass-produced, presented singly and not in pairs and designed to fit either foot equally.
- (7) Dental appliances for correcting deformities of the teeth (braces, rings, etc.).

- (8) Orthopaedic foot appliances (talipes appliances, leg braces, with or without spring support for the foot, surgical boots, etc.).
- (9) Trusses (inguinal, crural, umbilical, etc., trusses) and rupture appliances.
- (10) Appliances for correcting scoliosis and curvature of the spine as well as all medical or surgical corsets and belts (including certain supporting belts) characterised by :
 - (a) Special pads, springs, etc., adjustable to fit the patient.
 - (b) The materials of which they are made (leather, metal, plastics, etc.); or
 - (c) The presence of reinforced parts, rigid pieces of fabric or bands of various widths.

The special design of these articles for a particular orthopaedic purpose distinguishes them from ordinary corsets and belts, whether or not the latter also serve to support or hold.

- (11) Orthopaedic suspenders (**other than** simple suspenders of knitted, netted or crocheted materials, etc.).

This group also includes crutches and crutch-sticks. (It should, however, be noted that ordinary walking-sticks, even if specially made for disabled persons, are **excluded (heading 66.02)**.)

This group further includes walking aids known as "walker-rollators", which provide support for the users as they push them. They generally consist of a tubular metal frame on three or four wheels (some or all of which may swivel), handles and hand-brakes. "Walker-rollators" can be adjustable in height and can be equipped with a seat between the handles and with a wire basket for carrying personal items. The seat allows the user to take short rest breaks whenever necessary.

The heading **does not include** :

- (a) Stockings for varicose veins (**heading 61.15**).
- (b) Simple protectors or devices designed to reduce pressure on certain parts of the foot, (**heading 39.26**, if made of plastics, or **heading 40.14**, if of cellular rubber fixed on gauze with adhesive plaster).
- (c) Supporting belts or other support articles of the kind referred to in Note 1 (b) to this Chapter, e.g., pre-natal or maternity belts (generally **heading 62.12** or **63.07**).
- (d) Mass-produced footwear the inner soles of which have been simply arched to alleviate flat-footedness (**Chapter 64**).

This group also covers **orthopaedic appliances for animals**, for example, hernia trusses or straps; leg or foot fixation apparatus; special straps and tubes to prevent animals from crib-biting, etc.; prolapsus bands (to retain an organ, rectum, uterus, etc.); horn supports, etc. But it **excludes** protective devices having the character of articles of ordinary saddlery and harness for animals (e.g., shin pads for horses) (**heading 42.01**).

(II) SPLINTS AND OTHER FRACTURE APPLIANCES

Fracture appliances are used either to immobilise injured parts of the body (for extension or protection), or for setting fractures. They are also used in the treatment of dislocations and other joint injuries.

Some of these articles are designed for fitting onto the patient (e.g., wire, zinc or wooden cradles for holding limbs, plaster bandage splints, fracture appliances for ribs, etc.); others are designed to be fixed to a bed, a table or another support (protective bed cradles, extension fracture apparatus made of tubing, to be used in the place of splints or cradles, etc.). However, when the latter appliances form an inseparable part of the bed, table or another support, they are **excluded** from this heading.

Subject to the provisions of Note 1 (f) to this Chapter, the heading also includes plates, nails, etc., which are inserted inside the human body by surgeons to hold together the two parts of a broken bone or for similar treatment of fractures.

(III) ARTIFICIAL LIMBS, EYES, TEETH AND OTHER ARTIFICIAL PARTS OF THE BODY

These wholly or partially replace defective parts of the body and usually resemble them in appearance. They include :

(A) Artificial ocular fittings :

- (1) **Artificial eyes.** These are usually made of plastics or glass to which small quantities of metallic oxides have been added in order to imitate the features and colouring of the various parts of the human eye (sclera, iris, pupil). They may be of single or of double shell types.
- (2) **Intra-ocular lenses.**

Artificial eyes for tailors' dummies, for furs, etc., are **excluded** (generally classified in **heading 39.26** or **70.18**); artificial eyes identifiable as parts of dolls or of toy animals fall in **heading 95.03** or in **heading 70.18**, if they are of glass.

(B) Artificial teeth and dental fittings, for example :

- (1) **Solid artificial teeth**, usually made of porcelain or plastics (acrylic polymers in particular). These may be "diatotic" teeth having a small number of holes into which the fixing material penetrates (generally molars), or may be fitted with two metallic pins for fixing (generally incisors and canines) or with a groove for sliding on to a metal ridge fixed to the dental plate (also usually incisors and canines).
- (2) **Hollow artificial teeth**, also made of porcelain or plastics and with the external shape of teeth (incisors, canines or molars).

According to the method of fixing, they are called "pivot teeth" (placed on a small metallic pin or pivot fitted into the prepared root), or "crowns" (fitted by means of artificial resin on to a previously shaped stump).

- (3) **Dentures**, whole or part, comprising a plate of vulcanised rubber, plastics or metal to which the false teeth are fitted.
- (4) **Other articles** such as, prefabricated **metal crowns** (gold, stainless steel, etc.) used for the protection of real teeth; **cast tin bars** ("heavy bars") for weighting and increasing the stability of dentures; **stainless steel bars** for reinforcing vulcanised rubber dental plates; various other dentists' accessories, clearly identifiable as such, for making metal crowns or dentures (sockets, rings, pivots, hooks, eyelets, etc.).

It should be noted that dental cements and other dental fillings fall in **heading 30.06**; the preparations known as " dental wax " or as " dental impression compounds ", put up in sets, in packings for retail sale or in plates, horseshoe shapes, sticks or similar forms, and other preparations for use in dentistry, with a basis of plaster (of calcined gypsum or calcium sulphate), fall in **heading 34.07**.

- (C) **Other artificial parts of the body**, e.g., arms, forearms, hands, legs, feet, noses, artificial joints (e.g., for hips, knees), and tubes of synthetic fabric for replacing blood vessels and heart-valves.

The heading **excludes** pieces of bone or skin for grafting, in sterile containers (**heading 30.01**) and bone reconstruction cements (**heading 30.06**).

(IV) HEARING AIDS

These are generally electrical appliances with a circuit containing one or more microphones (with or without amplifier), a receiver and a battery. The receiver may be worn internally or behind the ear, or it may be designed to be held in the hand against the ear.

This group is **restricted** to appliances for overcoming deafness; it therefore **excludes** articles such as headphones, amplifiers and the like used in conference rooms or by telephonists to improve the audibility of speech.

(V) OTHER APPLIANCES WHICH ARE WORN OR CARRIED, OR IMPLANTED IN THE BODY, TO COMPENSATE FOR A DEFECT OR DISABILITY

This group includes :

- (1) Speech-aids for persons having lost the use of their vocal cords as a result of an injury or a surgical operation. These consist essentially of an electronic impulse generator. When pressed against the neck, for example, they generate vibrations in the cavities of the throat which are modulated by the user to produce audible speech.
- (2) Pacemakers for stimulating defective heart muscles. These are roughly the size and weight of a pocket watch and are implanted beneath the skin of the patient's chest. They incorporate an electric battery and are connected by electrodes to the heart, which they provide with the impulses necessary for its functioning. Other types of pacemakers are used to stimulate other organs (for example, the lungs, the rectum or the bladder).
- (3) Electronic aids for the blind. These consist essentially of an ultrasonic transmitter-receiver powered by an electric battery. The frequency variations resulting from the time taken for the ultrasonic beam to travel out to an obstacle and be reflected back enable the user, through an appropriate device (e.g., an internal ear-piece), to detect the obstacle and judge its distance.
- (4) Appliances implanted in the body, used to support or replace the chemical function of certain organs (e.g., secretion of insulin).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

90.22 - Apparatus based on the use of X-rays or of alpha, beta or gamma radiations, whether or not for medical, surgical, dental or veterinary uses, including radiography or radiotherapy apparatus, X-ray tubes and other X-ray generators, high tension generators, control panels and desks, screens, examination or treatment tables, chairs and the like (+).

- Apparatus based on the use of X-rays, whether or not for medical, surgical, dental or veterinary uses, including radiography or radiotherapy apparatus :

9022.12 -- Computed tomography apparatus

9022.13 -- Other, for dental uses

9022.14 -- Other, for medical, surgical or veterinary uses

9022.19 -- For other uses

- Apparatus based on the use of alpha, beta or gamma radiations, whether or not for medical, surgical, dental or veterinary uses, including radiography or radiotherapy apparatus :

9022.21 -- For medical, surgical, dental or veterinary uses

9022.29 -- For other uses

9022.30 - X-ray tubes

9022.90 - Other, including parts and accessories

(I) APPARATUS BASED ON THE USE OF X-RAYS

The fundamental element of this apparatus is the unit containing the X-ray generating tube or tubes. This unit, which is usually suspended or mounted on a pedestal or other support with a directing or elevating mechanism, is fed with appropriate voltages from special equipment consisting of an assembly of transformers, rectifiers, etc. In most other respects, the structural characteristics of X-ray apparatus vary according to the use for which they are designed, for example :

(A) **X-ray apparatus used in diagnosis.** These depend on the facts that X-rays can penetrate bodies which are impervious to ordinary light and that their absorption increases with the density of the bodies traversed. They include :

(1) **Radioscopic (fluoroscopic) apparatus.** X-rays which have traversed the organ under examination are made to cast a shadow on a screen; the varying densities of the shadow image represent the state of the organ.

(2) **Radiographic apparatus.** After leaving the body under examination, the X-rays strike a photographic plate or film and are recorded thereon. The same apparatus may be used for radioscopy and radiography.

(3) **Apparatus consisting of X-ray apparatus combined with a specially designed camera.** These photograph the image of which is produced on an X-ray screen mounted in the camera itself. **Provided** the apparatus and specialised camera are presented at the same time, they are to be classified together in this heading even if they are separately packed for convenience of transport. Separately presented cameras, however, are classified in **heading 90.06**.

- (B) **Radiotherapy apparatus.** Both the penetrating power of X-rays and their destructive effect on certain living tissues are used in the treatment of many diseases, e.g., certain skin diseases and certain tumours. This treatment is known as "superficial" or "deep" according to the depth reached by the rays.
- (C) **X-ray apparatus for industrial use.** There are many industrial applications of X-rays. They are used, for example, in metallurgy to locate blisters or to check the uniformity of alloys; in engineering to check the accuracy of assemblies; in the electrical industry to check heavy cables or frosted glass lamps; in the rubber industry to check the reactions of the inner casings of tyres (e.g., stretching of canvases); in various industries for checking or measuring the thickness of materials. For all these various applications the apparatus generally resembles that used for diagnostic purposes described above, except that it may be equipped with adaptors and ancillary equipment for particular purposes.

The heading also covers :

- (1) Special apparatus (X-ray diffraction and X-ray spectrometry equipment) used for the examination of the crystalline structure as well as the chemical composition of materials; the X-rays are diffracted by crystals and then made to fall on a photographic film or an electronic counter.
- (2) Apparatus for radioscopic examination of bank notes or other documents.

(II) APPARATUS BASED ON THE USE OF ALPHA, BETA OR GAMMA RADIATIONS

Alpha, beta or gamma radiations emanate from a radioactive substance with the property of emitting radiations by spontaneous transformation of its atoms. This radioactive substance is placed in a container, normally of steel coated with lead (bomb), which has an aperture designed to let the radiations pass in one direction only. Gamma radiations can be used for much the same purpose as X-rays.

The following types may be distinguished, according to the radiations employed and the use for which they are designed :

- (1) **Therapy apparatus**, in which the radioactive source is a charge of radium, radio-cobalt or some other radioactive isotope.
- (2) **Apparatus for radiological examinations**, used mainly in industry for checking metal parts, etc., without damaging their structure.
- (3) **Apparatus** having a measuring instrument such as beta and gamma ray thickness gauges for measuring the thickness of materials (sheets, linings and the like), apparatus for monitoring the contents of packages containing any product (pharmaceutical products, foodstuffs, sporting gun cartridges, perfumes, etc.) or ionisation anemometers. In these apparatus, the required information is generally obtained by measuring the change in the amount of radiation applied to the factor under examination.
- (4) **Fire alarms** incorporating smoke detectors containing a radioactive substance.

The heading **does not cover** instruments and apparatus which are not designed to incorporate a radioactive source and which merely measure or detect radiation even when such instruments are calibrated in arbitrary terms (**heading 90.30**).

**(III) X-RAY TUBES AND OTHER X-RAY GENERATORS,
HIGH TENSION GENERATORS, CONTROL PANELS AND DESKS,
SCREENS, EXAMINATION OR TREATMENT TABLES,
CHAIRS AND THE LIKE**

This group includes :

- (A) **X-ray tubes.** These are devices in which electrical energy is transformed into X-rays.

The characteristics of such tubes vary according to the use for which they are designed. They consist essentially of a cathode from which the electrons are emitted, and a target (anti-cathode or anode) on which the electrons impinge, thus causing it to emit X-rays. In some cases, the tubes also have a number of intermediate electrodes for accelerating the stream of electrons. The electrodes are mounted in a tube or container, usually of glass, with the appropriate electrical contacts. The tube is often mounted in an electrically insulated metal container filled with oil. Sometimes the tube is gas filled, but more usually it is maintained at a high degree of vacuum.

The heading excludes glass envelopes for X-ray tubes (**heading 70.11**).

- (B) **Other X-ray producing apparatus**, e.g., apparatus incorporating a betatron which greatly accelerates the stream of electrons and so produces X-rays of a very high penetrating power. Betatrons and other electron accelerators not adapted for the production of X-rays nor incorporated in X-ray apparatus are **excluded** (**heading 85.43**).
- (C) **X-ray screens.** Radioscopic screens are fluorescent surfaces on which the radiations are received. The active surface usually consists of barium cyanoplivate, cadmium sulphide or cadmium tungstate. They are often also coated with a lead-glass facing. Some screens, known as intensifying screens, produce an image which consists of actinic light that adds to the density of the photographic image formed purely by the X-rays.
- (D) **X-ray high tension generators.** These incorporate a transformer and rectifying valves mounted inside an insulating screen; they also have detachable high tension contacts for making connections to the X-ray tube. It should be noted that this heading is **restricted** to generators which are specialised for use with X-ray apparatus.
- (E) **X-ray control panels and desks.** These incorporate devices for controlling the exposure time and voltage, and often also include a dosimeter forming an integral part of the apparatus. It should be noted that this heading is **restricted** to panels and desks which are specialised for use with X-ray apparatus.
- (F) **Examination or treatment tables, chairs and the like specialised for X-ray work**, whether designed to be incorporated in the X-ray apparatus or to form separate articles. **Provided** they are exclusively or primarily designed for use with X-ray apparatus, such tables, chairs, etc., remain classified in this heading even if presented separately; but tables, chairs, etc., not specialised for X-ray work are **excluded** (usually **heading 94.02**).

*
* * *

This heading also includes lightning arresters based on the principle of radioactivity.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories identifiable as being solely or principally for use with X-ray apparatus, etc., are also classified in this heading. Such parts and accessories include :

- (1) **Applicators**, usually lead-lined, for fitting to the X-ray tube port or radioactive " bomb "; they are sometimes called " localisers ".
- (2) **Electric incandescent centring devices**, used particularly in radiotherapy to check the area treated, by direct sighting on the skin. Like the previous accessories, these devices are usually mounted on the outlet port of the X-ray tube or of the " bomb ".
- (3) **Protective casings** of lead-glass or of other substances based on certain salts opaque to X-rays. These casings are placed around the X-ray tubes to protect operators against harmful radiations.
- (4) **Lead covered or lead-glass protective screens or shields** for placing between the operator and the X-ray tubes.

The heading **does not**, however, **cover** protective devices designed to be worn by the operator, such as overalls or gloves of lead-filled rubber (**heading 40.15**), or lead-glass goggles (**heading 90.04**).

*
* *

The heading also **excludes** :

- (a) Radium needles, and tubes, needles and the like containing other radioactive materials (**Chapter 28**).
- (b) Photographic plates and film (**Chapter 37**).
- (c) Kenotrons and other rectifying tubes or valves, used in power supply units for X-ray apparatus (**heading 85.40**).
- (d) Apparatus for examining radiophotographs (including image projectors) (**heading 90.08** or **90.10**), and apparatus for developing radiographic or radiophotographic photographs (**heading 90.10**).
- (e) Medical apparatus for application of ultra-violet or infra-red rays (actinotherapy) (**heading 90.18**).
- (f) Instruments for measuring or detecting alpha, beta, gamma or X-radiations; these fall in **heading 90.30**, unless incorporated in radiology apparatus.

○
○ ○

Subheading Explanatory Note.

Subheading 9022.12

This subheading includes so-called whole-body computed tomographs. These are radiodiagnosis systems for wholebody examination by electronic body-section radiography (tomography). The regions of the body are scanned by an X-ray beam in individual steps and layers and the varying attenuation of the X-rays in the body is measured by hundreds of detectors arranged annularly around the tunnel in which the patient lies on a table.

The system's own automatic data processing machine converts the data from the sensors into an image which is displayed on the system monitor. The tomographic images are usually photographed by a special camera incorporated in the system and if necessary they are stored electromagnetically.

90.23 - Instruments, apparatus and models, designed for demonstrational purposes (for example, in education or exhibitions), unsuitable for other uses.

This heading covers a wide range of instruments, apparatus and models designed for demonstrational purposes (e.g., in schools, lecture rooms, exhibitions) and unsuitable for other uses.

Subject to this proviso, the heading includes :

- (1) Special demonstrational machines or appliances such as the Wimshurst machine (for experiments with electricity), the Atwood machine (for demonstrating the law of gravity), Magdeburg hemispheres (for demonstrating the effects of atmospheric pressure), the's Gravesande ring (for demonstrating thermal expansion), Newton's disc (for demonstrating the colour composition of white light).
- (2) Models of human or animal anatomies (whether or not articulated or fitted with electric lighting); models of stereometric bodies, of crystals, etc. Models of this kind are usually made of plastics or of compositions based on plaster.
- (3) Training dummies, constituting an inflatable life-size model of the human body with artificial respiratory parts reproducing those of a human being; used for training in the "kiss-of-life" revival method.
- (4) Cross-sectional models of ships, locomotives, engines, etc., cut to show their internal operation or the functioning of an important part; panels showing, in relief, for example, the assembly of a radio (for radiotelegraphists' schools), or the oil circulation in an engine, etc., whether or not fitted with an electric lighting system.
- (5) Show-cases and exhibit panels, etc., displaying samples of raw materials (textile fibres, woods, etc.), or showing the various stages of manufacture or processing of a product (for instruction in technical schools).
- (6) Models, etc., for artillery training, used in training courses held indoors.
- (7) Prepared slides for microscopic study.
- (8) Models of towns, public monuments, houses, etc. (of plaster, paperboard, wood, etc.).
- (9) Small scale demonstrational models (of aircraft, ships, machines, etc.) generally of metal or wood (e.g., for advertising purposes, etc.). It should, however, be noted that models suitable solely for ornamental purposes are classified in their respective headings.
- (10) Relief maps (of provinces, towns, mountain ranges, etc.), relief plans of towns, and terrestrial or celestial globes in relief, whether or not printed.

(11) Military tank simulators which are used for the training (including advanced training) of tank drivers. These consist essentially of the following components :

- a driving cabin mounted on a movable platform,
- a viewing system consisting of a scale model of terrain and a television camera mounted on a travelling gantry,
- an instructor's console,
- a computer unit,
- a hydraulic power unit, and
- an electrical supply cabinet.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

*
* *

The heading also **excludes** :

- (a) Printed plans, diagrams, illustrations, etc., even if designed for use in teaching, advertising, etc. (**Chapter 49**).
- (b) Ground flying trainers, of **heading 88.05**.
- (c) Articles designed for both recreational and demonstrational purposes (e.g., certain model sets of mechanical parts; mechanical or electrical toy locomotives, boilers, cranes, aircraft, etc.) (**Chapter 95**).
- (d) Automata, etc., of **heading 96.18**.
- (e) Collectors' pieces of **heading 97.05**.
- (f) Antiques (e.g., relief plans and globes) of an age exceeding 100 years (**heading 97.06**).

90.24 - Machines and appliances for testing the hardness, strength, compressibility, elasticity or other mechanical properties of materials (for example, metals, wood, textiles, paper, plastics).

9024.10 - Machines and appliances for testing metals

9024.80 - Other machines and appliances

9024.90 - Parts and accessories

This heading covers a wide range of machines and appliances for testing the hardness, elasticity, tensile strength, compressibility or mechanical properties of various materials (e.g., metals, wood, concrete, textile yarns and fabrics, paper or paperboard, rubber, plastics, leather). It therefore **excludes** :

- (a) Instruments or appliances for examining the microscopic structure of materials (e.g., metallographic or other microscopes - **heading 90.11 or 90.12**), or for analysing materials, or measuring properties such as porosity, thermal expansion, etc. (**heading 90.27**).
- (b) Instruments or apparatus designed only for ordinary measurement or checking of width, thickness, etc. (e.g., of machined parts, wire, metal goods) (**heading 90.17 or 90.31**).
- (c) Instruments for detecting faults, fissures, cracks or other defects in materials (**heading 90.31**).

The machines and appliances of this heading are generally used in industrial or research laboratories for testing manufactured articles (usually carefully selected or standard specimens). They may also be used during manufacturing processes, in constructional work (in workshops, building sites, etc.) or to check goods on delivery in warehouses, etc.

They may range from large mechanically, electrically or hydraulically operated machines of considerable weight (several tons) to small portable or even pocket size instruments. Some "universal" types (e.g., for metal testing) can be used for hardness, tensile, bending, etc., tests by means of separate attachments. Although they usually operate on the "start-stop" principle, some are designed for automatic or semi-automatic operation, (e.g., for testing large output off an assembly line).

Test results may be ascertained either by direct reading (sometimes with the aid of a simple optical device such as a magnifying glass, or even a built-in microscope or profile projector), or by separate microscopic examination of the test-piece (e.g., observation of ball-test marks on metal). In addition, certain machines may have provision for recording the stresses, strains, etc., borne by the test-piece.

(I) MACHINES AND APPLIANCES FOR TESTING METALS

This group covers machines and appliances for :

- (A) **Tensile testing** on test-pieces, bars, wire, cables, springs, etc. Tensile tests are used to ascertain the elasticity, breaking stress and many other important properties of a metal. Tensile testing machines are of various types (e.g., vertical or horizontal, endless screw or hydraulic load types); basically, however, they each comprise jaws or clamps for holding the sample under test.

(B) **Hardness tests** on test-pieces, bars, machined parts, etc., the hardness of a metal being measured in terms of resistance of that metal to indentation. These tests include :

- (1) The **steel ball indentation test** (hardened steel or metallic carbide ball) or **Brinell test**. The indentation is produced by applying a continuous pressure (not by impact or by repeated blows) to the steel ball, by means of a lever, spring or piston; the diameter of the imprint is then measured with a microscope.
- (2) The **diamond pyramid indentation test**. This test may be made by the **Rockwell method** (in which the depth of the indentation is measured with a dial comparator), or by the **Vickers method** (microscope measurement of the area of the indentation). Other forms of these tests are also used (Monotron, Shore, Knoop, etc.), and there are also instruments for testing soft metals by means of a steel indenting tool (e.g., Rockwell method). The above three tests may be carried out by the same machine.
- (3) The **rebound test** carried out by the aid of **scleroscopes or sclerographs**. A small hammer (usually tipped with a diamond pyramid) is released from a pre-determined height on to the surface of the piece under test. The harder the metal, the higher will be the rebound of the hammer.
- (4) The **pendulum hardness test** in which the oscillations of a pendulum resting on the specimen are observed. The pendulum consists of an inverted U-shaped cast iron body fitted in the middle with a steel ball.

(C) **Bending tests.**

- (1) **Impact tests** carried out on bars (whether or not notched). The bar rests on two supports and is subjected to the repeated impacts of a ram until it breaks; its limiting resistance is thus determined.
 - (2) **Pressure tests** (mainly for bars), **bending tests** (springs).
- (D) **Ductility tests** mainly used to test sheet metal. An indenting tool, usually tipped with a steel ball, is gradually pressed into the sheet up to the point of perforation; the first contact is recorded, and the stress and deflection are then measured.
- (E) **Folding tests** (sheets, bars and wire), **compression tests** and **shearing tests** (mainly for cast iron).
- (F) **Fatigue tests**. Test-pieces are not only submitted to simple stresses, as described above, but are also subjected to compound and varying stresses. These tests are carried out by means of **rotating bending machines** (the specimens rotate at high speed), or **reversal torsional machines** (in which the torsional direction is alternately reversed), **electro-magnetic fatigue-testing machines**, etc.

(II) MACHINES AND APPLIANCES FOR TESTING TEXTILES

The main tests carried out by machines of this group include :

- (1) **Extensibility and resistance to rupture tests, elasticity or tensile strength under strain tests, and the like (and combinations of such tests)**. The material under test may be raw fibres or yarns, ropes or cables, ordinary fabrics, webbing, belts, etc.

These tests are made with the aid of **dynamometers** of various types, usually named after their operating principle (e.g., pendulum or balance-lever, dynamometers) or according to the material for which they are most frequently used (e.g., single yarn, twisted yarn or rope, glass fibre, hank or skein, fabric, dynamometers); these tests may also be made by the use of **extensometers**. Some dynamometers are equipped with a ball device for perforation tests on fabrics.

- (2) **Tests to detect changes in the dimensions of textile samples.** The expansion or shrinkage of a sample of fabric is measured after it has been stretched in the dry and in the wet states.
- (3) **Wear and tear tests.** These are carried out on textile goods liable to be exposed to friction (sheets, cloths, table linen, etc.) and sometimes also on the yarn itself.

These tests are carried out by means of **abrasion-testers**, **wear-testers**, etc. A strip of cloth stretched at a suitable tension is progressively worn away by a friction instrument (an abrasive disc, a rotating cylinder fitted with metal flanges, a steel milling wheel, etc.). Wear and tear resistance is measured by the number of revolutions required for the friction instrument to cause the fabric to break.

The heading **does not include** instruments used to inspect textile materials (e.g., yarn uniformity testers; strain-testers to determine the tension to which yarn is subjected on warping-frames, on spoolers, etc.; yarn torsion counters and torsographs to measure the torsion of yarns (**heading 90.31**)).

(III) MACHINES AND APPLIANCES FOR TESTING PAPER, PAPERBOARD, LINOLEUM, FLEXIBLE PLASTICS OR FLEXIBLE RUBBER

These tests are mainly concerned with tensile strength (measuring of extensibility, break-load, etc.) or resistance to perforation. They are effected by means of **dynamometers** similar in basic design to those used for textiles.

This group **includes** **bursting strength testers**, **fold testers**, **etc.** (e.g., for paper), **elasticity meters**, **reboundimeters**, **tensile testers**, **abrasion machines**, **plastimeters** (e.g., for rubber or plastics).

(IV) MACHINES AND APPLIANCES FOR TESTING OTHER MATERIALS

Most of these materials (e.g., wood, concrete, hard plastics) are subjected to tensile, bending, hardness, compression, shearing, abrasion, etc., tests, by means of machines and apparatus similar in principle to those used for metal testing (by ball-imprint, impact, etc.).

The heading also includes a large number of instruments, usually small in size, designed to determine the tensile strength, resistance to bending, compression, etc., of test-pieces moulded from foundry moulding sand. It also covers instruments designed for measuring the surface hardness of finished foundry moulds or mould cores.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

90.25 - Hydrometers and similar floating instruments, thermometers, pyrometers, barometers, hygrometers and psychrometers, recording or not, and any combination of these instruments.

- Thermometers and pyrometers, not combined with other instruments :

9025.11 -- Liquid-filled, for direct reading

9025.19 -- Other

9025.80 - Other instruments

9025.90 - Parts and accessories

(A) HYDROMETERS AND SIMILAR FLOATING INSTRUMENTS

These instruments are used for determining, generally by direct reading on a graduated stem, the specific gravity of solids or liquids, or some arbitrary value related to specific gravity (e.g., strength of spirituous liquors). The reading is sometimes converted by a table into other units.

The instruments are usually made of glass (though some may be of metal, e.g., nickel-silver, silver, etc.), and weighted at one end with mercury or fine lead shot. These weights are generally fixed, but instruments for ascertaining the density of liquids of different specific gravities are sometimes designed so that the weights can be varied or additional weights added. Some hydrometers (e.g., those used to determine the strength of the acid in accumulators) are enclosed in a glass syringe. Other types are combined with a thermometer.

Most of these instruments are known according to the use for which they are designed, for example, alcoholometers; saccharometers (used in brewing or in sugar manufacture); salinometers; lactodensimeters or lactometers; acidimeters (for determining the specific gravity of accumulator or other acid); urinometers; etc. Others are named after the inventor (e.g., Baumé, Brix, Balling, Bates, Gay-Lussac, Richter, Tralle, Sikes, Stoppani, etc.). Nicholson's hydrometer is used for solids.

The heading **does not cover** :

- (a) Instruments which determine specific gravity by other methods, for example, pyknometers (specific gravity bottles) (**heading 70.17**), specific gravity or hydrostatic balances (**heading 90.16**).
- (b) Certain analysis apparatus which are not floating instruments, for example, butyrometers (for determining the fatty content of butter), ureometers (for testing urea content); these are classified in **heading 70.17**.

(B) THERMOMETERS, THERMOGRAPHS AND PYROMETERS

This group includes :

- (1) **Glass thermometers, with a liquid-filled glass tube.** These include household thermometers (room, window thermometers, etc.), floating thermometers (bath thermometers, etc.), clinical thermometers, industrial thermometers (for boilers, furnaces, autoclaves, etc.), laboratory thermometers (used in calorimetry, etc.), special meteorological thermometers (e.g., for measuring solar or terrestrial radiations), thermometers used in hydrography (e.g., reversible thermometers used in taking deep-sea soundings). The heading also includes glass thermometers called minimum and maximum thermometers since they are designed to indicate the highest and lowest temperature they have recorded.

- (2) **Metallic thermometers** (in particular bi-metallic thermometers which make use of the different coefficients of expansion of two metal strips welded together). They are mainly used in meteorology, for air conditioning and for other scientific or industrial purposes; thermometers for use with motor vehicles, to indicate the temperature of the radiator water, are usually of this type.
- (3) **Expansion or pressure thermometers** with metallic systems. In these thermometers the expansible medium (liquids, vapours, gases) develops a pressure and actuates a Bourdon tube or similar pressure measuring device, which then operates a pointer over an indicator dial. Most of these thermometers are used for industrial purposes.
- (4) **Liquid crystal thermometers**. These contain liquid crystals which change their physical properties (e.g., colour) according to variations in temperature.
- (5) **Electrical thermometers and pyrometers**, such as :
 - (i) **Resistance thermometers and pyrometers** operating by changes in the electrical resistance of a metal (e.g., platinum) or of a semiconductor.
 - (ii) **Thermocouple thermometers and pyrometers** based on the principle that the heating of the junction of two different electric conductors generates an electro-motive force proportional to the temperature. The combinations of metals used are generally : platinum with rhodium-platinum; copper with copper-nickel; iron with copper-nickel; nickel-chromium with nickel-aluminium.
 - (iii) **Radiation (including optical) pyrometers**. These are of various types, e.g. :
 - (a) **Pyrometers** in which a concave mirror concentrates the radiations from an incandescent body, e.g., onto the hot junction of a thermocouple placed at the focal point of the mirror.
 - (b) **Disappearing filament pyrometers**. In these the temperature is measured by varying the brightness of a filament of an incandescent lamp, by means of a rheostat device, until it coincides with that of the image of the source to be controlled.

Electrical thermometers and pyrometers are sometimes combined with automatic regulating devices which control the operation of the furnace, oven, fermentation vats, etc. Such combinations are classified in **heading 90.32**.

- (6) **Optical, photometric cube type pyrometers**. A prism provides a field of view in which the centre section is illuminated by a standard incandescent lamp and the surrounding field is illuminated by light from the hot body. A circular glass disc, coated with an emulsion of varying density, is rotated so as to vary the intensity of light from the hot body. The number of degrees of rotation of the disc necessary to match the brightness in the inner and outer parts of the field is a measure of the temperature.
- (7) **Optical, disappearing filament type pyrometers**. The intensity of the image reflected from the furnace is equalised with that of the standard lamp by interposing a series of smoked glasses, or by the rotation of a graduated wedge of absorbing glass corresponding to given temperatures.
- (8) **Pyrometric telescopes based on rotatory polarisation**. These consist of two Nicol prisms between which is placed a calibrated quartz crystal; the temperature may be calculated from the angle through which one of the Nicol prisms must be turned to obtain a particular colouring.
- (9) **Pyrometers based on contraction of a solid substance** (clay, for instance). These consist of an oscillating lever, one arm of which moves before a dial, the other connecting with the rod which serves to estimate the temperature.

The heading also includes “**contact**” **thermometers** which indicate temperature but also incorporate an auxiliary device which can operate an electric signal light, alarm, relay or switch.

It further includes metallic or vapour pressure thermometers, sometimes called " pyrometers ", which enable maximum temperatures of up to 500 to 600 °C to be measured.

Thermographs also fall in this heading. They consist of a thermometer combined with an indicator registering the variations in temperature on a drum; they are operated by a mechanical or electric clock movement, or a synchronous motor.

The heading **excludes** " pyrosopes ", calliper-type instruments used for measuring the contraction of a clay, etc., test-piece taken from a ceramic furnace during firing to determine the course of the firing (**heading 90.17 or 90.31**).

(C) BAROMETERS AND BAROGRAPHHS

These are instruments for determining the atmospheric pressure; similar instruments (pressure gauges) for measuring the pressure of liquids or gases are **excluded** (**heading 90.26**).

There are two types of barometer in general use, the mercury barometer and the aneroid barometer.

The ordinary **mercury-barometer** consists of a mercury-filled glass tube sealed at the upper end. In one type the lower end stands in a cistern of mercury, while in another type the lower end of the tube is bent into a siphon, the atmospheric pressure then acting on the short open part of the tube. In both cases, the mercury column in the tube is balanced by the weight of the atmosphere, and its rise or fall (indicated on a scale or on a dial with a pointer) is a measure of the atmospheric pressure. Mercury barometers include the Fortin barometer (with adjustable cistern), the siphon barometer (with adjustable scale), the marine barometer (mounted in gimbals).

In the **aneroid barometer** the atmospheric pressure acts on one or more exhausted, corrugated metal capsules, or on a thin-walled, bent metal tube. The deformation of the capsules or of the tube is amplified and transmitted to a pointer indicating the atmospheric pressure on a scale or is converted into an electrical signal.

This heading also includes :

- (1) **Barometric altimeters** which indicate not only atmospheric pressure but also altitude; it should, however, be noted that the heading **excludes** altimeters (especially for air navigation) which indicate altitude only (**heading 90.14**).
- (2) **Sympiesometers**. In these the mercury is replaced by a liquid such as oil which compresses a gas contained in the tube.

Barographs are instruments for recording atmospheric pressure in a manner similar to that in which the thermographs record temperature (see Part (B) above).

(D) HYGROMETERS AND HYGROGRAPHHS

These are used to determine the moisture content of the air or other gases. The main types are :

- (1) **Chemical hygrometers**, based on absorption of moisture by chemical substances which are then weighed.
- (2) **Condensation or dewpoint hygrometers**, using the " dewpoint " method (i.e., the temperature at which water vapour begins to condense).
- (3) **Hair hygrometers**, based on the change in length of one or more hairs or strips of plastics, according to whether they are dry or humid. The hairs or strips of plastics are strung over a frame, weighted with a counterweight, and mounted on a pulley the axle of which is fitted with a needle moving across a dial. In some devices the movement is converted into an electrical signal.

- (4) **Hygrometers consisting of a torus-shaped glass tube** partly filled with mercury, and closed at one end by a diaphragm semi-pervious to the water vapour in the atmosphere. The pressure of the water vapour acts on the mercury and thus displaces the tube round a shaft connected to a needle on the dial. In some devices the displacement of the tube is converted into an electrical signal.
- (5) **Hygrometers with metallic strips** wound helicoidally and coated with a substance which reacts to humidity. The hygroscopic reaction varies the length of the metallic strips. This movement is transmitted to an axle fixed to the end of the metallic strips and fitted with a needle moving across a dial. In some devices the movement is converted into an electrical signal.
- (6) **Electrical hygrometers.** The operation of electrical hygrometers is normally based on the variation of conductivity of special absorbent salts (e.g., lithium chloride) or on the variation of the capacity of an electrical element in relation to humidity. (These instruments are sometimes graduated to show the dewpoint of the element to be measured.)

Fancy hygoscopes consisting essentially of more or less decorative objects (chalets, towers, etc.) with figurines coming in or going out, according to whether the weather is likely to be good or bad, are also classified here. On the other hand, papers impregnated with chemical substances, the colour of which varies according to the moisture content of the atmosphere are excluded (**heading 38.22**).

Hygographs, which also fall in this heading, are similar to hair hygrometers but record variations of relative humidity in a manner similar to that in which thermographs record temperature (see Part (B) above).

This heading **does not cover** instruments which determine the moisture content of solid matter (**heading 90.27**).

(E) PSYCHROMETERS

These are a special type of hygrometer. They determine the humidity content by reference to the difference in the temperatures indicated by (a) a dry thermometer which registers air temperature, and (b) a wet thermometer whose bulb is kept continually moist by a material impregnated with water which absorbs heat on evaporation.

Electrical psychrometers usually employ resistance thermometers or semiconductors in place of the non-electric thermometers of the normal psychrometer.

*
* * *

Hygrometers and psychrometers are employed for a wide variety of purposes, e.g., in meteorology (in observatories, in the home, etc.), in laboratories, in refrigerating plants, in artificial incubation, in air conditioning (especially in textile mills).

COMBINATIONS OF INSTRUMENTS

This heading also includes **combinations of the instruments referred to above** (e.g., combinations of hydrometers, thermometers, barometers, hygrometers, psychrometers), except when the addition of one or more other devices gives the combination the character of equipment or appliances covered by more specific headings (e.g., **heading 90.15** as meteorological instruments). In particular, the following remain classified in this heading :

- (1) **Thermo-hygographs** and **baro-thermo-hygographs; actinometers** (instruments consisting simply of two special thermometers combined).
- (2) **Pagoscopes**, i.e., instruments giving warning of frost, and therefore used especially in horticulture. These also consist essentially of a combination of two thermometers.

On the other hand, the heading **excludes** radio-sondes for atmospheric soundings (see Explanatory Note to **heading 90.15**).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), separately presented parts and accessories of apparatus or appliances of this heading remain classified here (e.g., dials, pointers, cases, graduated scales).

90.26 - Instruments and apparatus for measuring or checking the flow, level, pressure or other variables of liquids or gases (for example, flowmeters, level gauges, manometers, heat meters), excluding instruments and apparatus of heading 90.14, 90.15, 90.28 or 90.32.

9026.10 - For measuring or checking the flow or level of liquids

9026.20 - For measuring or checking pressure

9026.80 - Other instruments or apparatus

9026.90 - Parts and accessories

Apart from instruments or apparatus more specifically covered by other headings of the Nomenclature, such as :

- (a) Pressure-reducing valves and thermostatically controlled valves (**heading 84.81**);
- (b) Anemometers (wind gauges) and hydrological level gauges (**heading 90.15**);
- (c) Thermometers, pyrometers, barometers, hygrometers and psychrometers (**heading 90.25**);
- (d) Instruments and apparatus for physical or chemical analysis, etc. (**heading 90.27**),

this heading covers instruments and apparatus for measuring or checking the flow, level, pressure, kinetic energy or other process variables of liquids or gases.

The instruments and apparatus of this heading may be fitted with recording, signalling or optical scale-reading devices or transmitters with an electrical, pneumatic or hydraulic output.

Measuring or checking apparatus generally incorporates an element sensitive to variations in the quantity to be measured (e.g., Bourdon tube, diaphragm, bellows, semiconductors) moving a needle or a pointer. In some devices the variations are converted into electrical signals.

Measuring or checking instruments or apparatus of this heading combined with taps, valves, etc., are to be classified as indicated in the Explanatory Note to heading 84.81.

(I) APPARATUS FOR MEASURING OR CHECKING THE FLOW OR RATE OF FLOW OF LIQUIDS OR GASES

(A) **Flowmeters.** These indicate the rate of flow (in volume or weight per unit of time) and are used for measurement of flow both through open channels (rivers, waterways, etc.) and through closed conduits (piping, etc.).

Some flowmeters use the principle of the fluid meters of heading 90.28 (turbine-type, piston-type, etc.), but the majority are based on the principle of differential pressure. These include :

(1) **Differential pressure (fixed aperture) flowmeters.** These comprise essentially :

- (i) a primary device (e.g., Pitot or Venturi tube, simple diaphragm, orifice plates, shaped nozzle) to set up a differential pressure, and
- (ii) a differential pressure gauge (float, diaphragm, differential pressure, oscillating ring balance or flow transmitters, etc., type).

(2) **Variable area** (variable aperture) **flowmeters**. These usually consist of a graduated cone-shaped tube containing a heavy float which is carried along by the current until the flow of the liquid between the float and the wall reaches equilibrium. For high pressure liquids, use is made either of magnetic flowmeters (the position of an iron float in a non-magnetic tube being shown externally by a magnet), or of valve flowmeters (an iris diaphragm fitted inside the tube being connected in parallel with a small flowmeter).

(3) **Flowmeters** which operate by using magnetic fields, ultrasound or heat.

This heading excludes :

- (a) Hydrometric paddle-wheels for measuring the rate of flow in rivers, canals, etc., which fall in **heading 90.15** as hydrological instruments.
- (b) Apparatus which merely indicate the total amount of liquid delivered over a period, which are classified as supply meters in **heading 90.28**.

(B) **Anemometers** of the special types used for recording the rate of flow of air currents in mines, tunnels, chimneys, furnaces and conduits in general, and consisting essentially of a bladed fan and a calibrated dial. In some devices the measured values are converted into electrical signals.

(II) INSTRUMENTS AND APPARATUS FOR MEASURING OR CHECKING THE LEVEL OF LIQUIDS OR GASES

Level indicators for liquids and indicators for the content of gasometers.

Level indicators for liquids include :

- (1) **Float-type**. These may give a direct reading on a graduated column mounted on the float, or the effect may be transmitted to a dial needle by means of a cable and drum or be converted into an electrical signal.
- (2) **Pneumatic and hydrostatic type**. These are used to measure the level in pressure tanks, by means of a differential pressure gauge.
- (3) **Two-colour light type, for boilers**. These are based on the difference in the refractive indices of water and steam. They consist of a set of lamps, coloured screens, an optical system and a level which indicates in different colours the respective heights of the water and the steam.
- (4) **Electrical-type**, based, for example, on the variations of resistance, capacitance, ultrasound, etc.

This heading covers not only level indicators for closed reservoirs or tanks, but also those for open basins and canals (hydroelectric works, irrigation systems, etc.).

To ascertain the content of a gasometer, the level of the "bell" is measured, either directly or from a dial needle to which the bell is connected by means of a cable and drum.

Instruments for measuring or checking the level of solid materials are **excluded (heading 90.22 or 90.31, as the case may be)**.

(III) INSTRUMENTS AND APPARATUS FOR MEASURING OR CHECKING THE PRESSURE OF LIQUIDS OR GASES

Pressure gauges (e.g., manometers), apparatus for measuring the pressure of a liquid or gas. These differ from barometers in that the latter measure atmospheric pressure while pressure gauges indicate the pressure of a liquid or gas in a closed space. The main types of pressure gauges are as follows :

- (1) **Liquid-type pressure gauges** (mercury, water or other liquids, or two non-miscible liquids). The liquid is contained in a glass or metal tube; these gauges may be of the single column type, U-tube type, inclined tube or multtube type, or be in the form of an oscillating ring balance.

- (2) **Metallic pressure gauges.** Like aneroid barometers, these may have a single or multiple diaphragm, a capsule, Bourdon tube or spiral metal tube or some other pressure sensitive element which directly moves a pointer or varies an electrical signal.
- (3) **Piston-type pressure gauges.** In these, the pressure is applied either directly or via a diaphragm on to a piston which is weighted or held by a spring.
- (4) **Electrical pressure gauges** based on variations of an electrical phenomenon (e.g., resistance, capacitance) or using ultrasound.

Vacuum gauges for measuring very low pressures, including ionisation gauges using thermionic vacuum tubes (triodes). In these, positive ions produced by collision of the electrons with the molecules of the residual gas are attracted towards a negative plate. Thermionic vacuum tubes (triodes) presented separately are **excluded (heading 85.40)**.

The heading also covers the **maximum and minimum type pressure gauges**. **Differential pressure gauges**, used to measure differences in pressure, include the following types : two-liquid, float, oscillating ring balance, diaphragm, capsule, ball (without liquid), etc.

(IV) HEAT METERS

Heat meters measure the quantities of heat consumed in an installation (e.g., a hot water type heating system). They consist essentially either of a liquid supply meter, two thermometers placed respectively at the intake and outlet of the conduit, and a counting and totalising mechanism. This group also covers thermocouple heat meters.

Small heat meters of the types mounted on radiators in blocks of flats so that central heating costs can be fairly divided resemble thermometers and contain a liquid which evaporates under the effect of heat.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), separately presented parts and accessories of apparatus or appliances of this heading remain classified here. Examples include separate graphical recording devices (including those in which the indications supplied by several measuring or checking instruments are recorded), whether or not fitted with devices for signalling, pre-selection or control.

90.27 - Instruments and apparatus for physical or chemical analysis (for example, polarimeters, refractometers, spectrometers, gas or smoke analysis apparatus); instruments and apparatus for measuring or checking viscosity, porosity, expansion, surface tension or the like; instruments and apparatus for measuring or checking quantities of heat, sound or light (including exposure meters); microtomes.

9027.10 - Gas or smoke analysis apparatus

9027.20 - Chromatographs and electrophoresis instruments

9027.30 - Spectrometers, spectrophotometers and spectrographs using optical radiations (UV, visible, IR)

9027.50 - Other instruments and apparatus using optical radiations (UV, visible, IR)

9027.80 - Other instruments and apparatus

9027.90 - Microtomes; parts and accessories

This heading includes :

(1) **Polarimeters.** Instruments for measuring the angle through which the plane of polarisation of a ray of light is rotated in passing through an optically active substance. They consist essentially of a source of light, an optical device comprising polarising and analysing prisms, a tube holder in which the substance to be analysed is placed, an observation eyepiece and a measuring scale.

In addition to the essential optical elements of a conventional polarimeter, **electronic polarimeters** are also fitted with a photoelectric cell.

(2) **Half-shadow polarimeters** for analysing plane or elliptically polarised light.

(3) **Saccharimeters.** These are special polarimeters designed for determining the strength of sugar solutions.

(4) **Refractometers.** These are instruments for determining the refractive index of liquids or solids (one of the most important constants in determining the purity of substances). They consist essentially of a system of prisms, observing and reading eyepieces, and a device for controlling the temperature (since this greatly affects the refractive index). They are widely used, particularly in food industries (for testing oils, butter and other fatty substances, analysing jam, fruit juices, etc.), in the glass industry, in oil refineries and in biology (for measuring the protein content of blood plasma or discharges, etc.).

Most refractometers are mounted on a base or stand; others are of the hand type, while yet another type is intended for fixing on the side of manufacturing vats.

(5) **Spectrometers.** These instruments are used to measure the wave-lengths of emission and absorption spectra. They consist essentially of an adjustable slit collimator (through which the beam of light to be analysed passes), one or more adjustable prisms, a telescope and a prism table. Some spectrometers (particularly those used for infra-red or ultra-violet rays) are fitted with prisms or with diffraction gratings.

This group includes : **spectroscopes** for the observation of spectra; **spectrographs** for recording the spectrum on a photographic plate or film (**spectrograms**); **monochromators**, instruments for isolating a particular line in a line spectrum or for isolating certain parts of a continuous spectrum.

But the heading **excludes** spectroheliographs and spectrohelioscopes, used for solar observation (**heading 90.05**); spectrum projectors, for examining an enlarged spectrogram projected on to a screen (**heading 90.08**); micrometric microscopes and spectrocomparators incorporating microscopes (for comparative examination of spectrograms by optical observation) (**heading 90.11**) and spectrum analysers for measuring or checking electrical quantities (**heading 90.30**).

- (6) **Mass spectrographs** and similar apparatus for analysing the isotopic constitution, etc., of materials. But the heading **excludes** calutrons for isotopic separation (**heading 84.01**).
- (7) **Colorimeters.** The term “ colorimeter ” is applied to two distinct classes of instruments. One class is used to determine the colour of a substance (liquid or solid) by matching its colour against that produced by three primary colours (red, green and blue) mixed in variable but measurable proportions. The other class of colorimeters is used in chemical or biochemical analysis to determine the concentration of a substance present in a solution by a comparison of the colour of the substance (or of the colour of the substance after treatment with a reagent) with that of coloured standard plates or of a standard liquid. In one type of colorimeter of the latter class, the solution under test and a standard solution are contained in two glass tubes which are viewed by means of two prisms through an eyepiece. Certain of these instruments are based on the use of a photoelectric cell. In some instruments of this type a paper tape is used with a reagent changing its colour after reaction with a gas. These instruments use two photoelectric cells measuring the colour before and after reaction with the gas.

This group also covers other optical analysis apparatus such as **nephelometers** and **turbidimeters** (for determining the cloudiness of solutions), **absorptiometers**, **fluorimeters** (for determining fluorescence, widely used for analyses of vitamin, alkaloid contents, etc.), **blancometers** and **opacimeters** (specially used for measuring the degree of whiteness, opacity or brilliance of paper pulp, paper, etc.).

- (8) **Gas or smoke analysis apparatus.** These are used to analyse combustible gases or combustion by-products (burnt gases) in coke ovens, gas producers, blast furnaces, etc., in particular, for determining their content of carbon dioxide, carbon monoxide, oxygen, hydrogen, nitrogen or hydrocarbons. Electrical gas or smoke analysis apparatus are mainly for determining and measuring the content of the following gases : carbon dioxide, carbon monoxide and hydrogen, oxygen, hydrogen, sulphur dioxide, ammonia.

Some of these instruments or apparatus determine volumetrically the gases absorbed by appropriate chemical substances, or burnt. These include :

- (i) **Orsat's apparatus** consisting mainly of an aspirating bottle, one or more absorption bulbs and a measuring burette.
- (ii) **Combustion or explosion apparatus.** This is equipped, in addition, with a combustion or explosion pipette (platinum capillary tube, platinum or palladium wire tube, with induction sparking, etc.).

These various types of apparatus may also be used in combination.

Other models work on the basis of density, or by fractional condensation and distillation (cracking), or on the following principles :

- (i) Heat conductivity of a gas.
- (ii) Heating effect of combustible gases on an electrode, (e.g., carbon monoxide and hydrogen in flue gases).
- (iii) Selective absorption of ultra-violet, visible, infra-red or microwave radiations by the gas.

- (iv) Difference in the magnetic permeability of gases.
- (v) Chemiluminescent reactions of the gas with a suitable auxiliary gas component.
- (vi) Flame ionisation of hydrocarbons in a hydrogen flame.
- (vii) Difference in the conductivity of a suitable liquid reagent before and after reaction with the gas.
- (viii) Electrochemical reaction in cells with solid (especially zirconium oxide for oxygen analysis) or liquid electrolytes.

It should be noted that the heading includes gas or smoke analysis apparatus for use in industrial processes (i.e., directly connected to furnaces, gas generators, etc.). But apparatus consisting merely of laboratory glassware falls in **heading 70.17**.

- (9) **Electronic smoke detectors**, used in furnaces, ovens, etc., for example, in which a beam of light (or infra-red) rays is directed on to a photoelectric cell. According to the density of the smoke, the passage of this beam through the smoke causes variations in the current in the photoelectric cell circuit, thus operating a graduated indicator or a recording system and, in certain cases, a regulating valve. These apparatus may be fitted with an alarm device.

Electronic smoke detectors equipped solely with an alarm fall in **heading 85.31**.

- (10) **Fire damp detectors and other detectors** (e.g., for carbon dioxide). These include portable apparatus for gas detection in mines or tunnels, for detecting leaks in mains, etc.

- (11) **Apparatus for dust analysis in gases**. These operate by passing a given quantity of gas through a filter disc, and weighing the filter before and after the test. This category includes **Tyndallometers** used for measuring the amount of dust in the air and for testing dust masks, filters, etc. They consist of a dust chamber covered with black glass, a light source, a photometric head with a prismatic measuring device and a graduated circular scale for measuring the angles of rotation.

- (12) **Oxygen meters** for the determination of dissolved oxygen in liquids by use of a polarometric cell or by using the chemical reaction of thallium with dissolved oxygen (measurement of the change in electrolytic conductivity).

- (13) **Polarographic analysers** for the determination of the components of liquids, e.g., traces of dissolved metals in water, by measuring and evaluating the current/resistance relationship of electrodes immersed in the solution.

- (14) **Wet-chemical analysers** for the determination of inorganic or organic components of liquids, e.g., traces of metals, phosphates, nitrates, chlorides or integral parameters such as "Chemical Oxygen Demand" (COD) and "Total Organic Carbons" (TOC). The analyser consists of a sample preparation device, an analysing unit with, e.g., ion-sensitive electrodes, photometers or polarographs and, in automatic analysers, a control unit.

- (15) **Viscometers and the like**, used to determine viscosity (i.e., the internal friction of a liquid).

They may be based on :

- (i) The principle of the capillary tube, that is the measurement of the time required by the liquid to flow through the tube under constant pressure (e.g., Ostwald, Engler, etc., viscometers).

- (ii) The effect of friction between a solid and a liquid.
- or (iii) The time taken by a ball to fall through the liquid.
- (16) **Polariscopes (strain viewers).** These measure internal strains in glass (e.g., strains resulting from toughening, annealing, soldering, etc., which might cause the glass to break easily). They consist essentially of a chamber containing an electric lamp, a light diffusion device, a polariser and a polarising telescope. Stresses in the glass are shown as bright iridescent colours.
- (17) **Expansion meters.** These measure the expansion or contraction on change of temperature of steel, metal alloys, coke, etc. Most of these instruments are of the recording type (mechanical recording on a graph or photographic recording).
- (18) **Apparatus for the determination of porosity or permeability** (to water, air or other gases, etc.) known as **porosimeters or permeameters** (not to be confused with permeameters for measuring magnetic permeability of substances). They are used for paper, textile fibres, fabrics, plastics, leather, sand, etc.
- (19) **Instruments for measuring the surface or interfacial tension of liquids (e.g., torsion balances).** The surface or interfacial tension of liquids is usually determined by one of the three following factors : the weight of a drop falling from a given capillary tube (or the number of drops having a known volume) (drop-weight method); the height of free rise of a liquid in a capillary tube of known diameter (capillary rise method); or the force required to detach a ring from the surface of a liquid.
- (20) **Apparatus for measuring osmotic pressure (osmometers)**, i.e., the pressure which occurs when two miscible liquids are separated by a membrane which is partially but unequally permeable to the two liquids.
- (21) **Apparatus for testing mineral oils and their derivatives** (e.g., tar, bitumen, asphalt). These include apparatus for determining the flash point, setting point, flow point, drop point, etc., of mineral oils, melting point of paraffin wax, water content, dirt content, sulphur content, consistency of greases and tars, cloud point, cold point, etc.
- (22) **pH meters and rH (redoxpotential) meters.** pH meters are used to measure the factor expressing the acidity or alkalinity of a solution or mixture (pure water being the neutral standard). rH meters are used to measure the oxidising or reducing power of a solution. These instruments operate on a number of different principles; the most common type employs the electrometric system, in which electrodes are used to set up a potential difference which is proportional to the pH or rH of the solution. In addition to measuring, these instruments may also be used for automatic control.
- (23) **Electrophoresis instruments.** These are based on the change in concentration occurring when a direct current is passed through a solution. The electrically charged particles migrate at different speeds according to the nature of the product.
- These instruments usually incorporate a photometric device consisting of a photoelectric cell and a milliammeter graduated directly in units of optical density. They are used for analysing various solutions (proteins, amino-acids, etc.), for examining substances such as plasma, hormones, enzymes, viruses, etc., and for studying polymerisation phenomena.

- (24) **Chromatographs** (such as gas-, liquid-, ion- or thin-layer chromatographs) for the determination of gas or liquid components. The gas or liquid to be analysed is passed through columns or thin layers of absorbent material and then measured by means of a detector. The characteristics of the gases or liquids under analysis are indicated by the time taken for them to pass through the columns or thin layers of absorbent material, while the quantity of the different components to be analysed is indicated by the strength of the output signal from the detector.
- (25) **Electronic titration instruments** using measuring electrodes to titrate water, silver salts, halogens, etc.
- (26) **Analytical instruments** –sometimes called "moisture meters for solids" - **based on the dielectric constant, electrical conductivity, absorption of electromagnetic energy or infrared radiation of substances**.
- (27) **Conductivity meters** to determine the electrolytic conductivity or the concentration of salts, acids or bases dissolved in a liquid.
- (28) **Photoelectric cell densitometers and microdensitometers** used to measure the density of spectrographic photographs, and for analysing any phenomenon which is recorded on a photographic emulsion.
- (29) **Photometers**. Instruments for measuring the intensity of light. The light to be measured and the standard source of light are placed so that they illuminate a given surface with equal intensity. If instead of comparing two light intensities, comparison is made of their respective spectra, the instrument then used is known as a **spectrophotometer**.
- Photometers are widely used for various optical processes and analyses (for determining, for example, degree of concentration, degree of brilliance or transparency of solid substances; degree of exposure of photographic plates or films (densitometers); depth of colour of transparent or opaque solid substances or solutions).
- Certain photometers used in photography or cinematography are known as **exposure meters**, and are used for measuring exposure times or for determining lens apertures.
- (30) **Luxmeters** (used for determining the intensity, in " lux " units, of a source of light).
- (31) **Calorimeters**. These measure the amounts of heat absorbed or given off by a solid, a liquid or a gas. The main categories are :
- (A) **Ice calorimeters (Bunsen's)** based on variations in volume produced by melting ice. They consist of a test-tube surrounded by ice, dipped into a tank of water, and of a graduated tube containing mercury.
- (B) **Heating calorimeters (Berthelot)** based on the principle of the transfer of quantities of heat. They consist basically of a calorimetric jar filled with water inside a vat also containing water; they are equipped with stirrers and thermometers. Two current types of calorimeter are based on this same principle, i.e. :
- (i) **Calorimeters for the determination of the specific heat of gases or of liquid fuels.** In these appliances, water is circulated through a compartment where a quantity of gas or liquid is burnt. The difference in the temperature of the water at the time of entry and leaving is measured.
- (ii) **Bomb calorimeters.** These are used for determining the heats of combustion of materials. Basically they consist of a steel vessel (bomb), containing a known amount of the solid or fluid to be tested and also oxygen under pressure. By means of a suitable device the specimen is ignited in the oxygen and the amount of heat generated is determined by placing the bomb in a water calorimeter.

This heading also includes **calorimeters for industrial use**; these are mounted on generators producing gas with a given calorific power. However, if they are connected to regulating apparatus in order to maintain the mixed gases at the required level of calorific power, they are **excluded** (generally **heading 90.32**).

- (32) **Cryoscopes and ebullioscopes other than** those having the character of laboratory glassware (**heading 70.17**).

* * *

This heading also includes **microtomes**, instruments used in microscope work to cut very thin sections of a known thickness from substances to be examined. Microtomes may be of various types, e.g., hand type (a kind of straight razor), revolving type, sliding carriage type (horizontal or inclined plane).

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), the heading also covers parts and accessories identifiable as being solely or principally for use with the above-mentioned instruments and apparatus.

* * *

The heading also **excludes** :

- (a) Laboratory equipment of refractory materials (retorts, jars, crucibles, cups, baths and the like) (**heading 69.03**), and similar articles of other ceramic materials (**heading 69.09**).
- (b) Laboratory glassware (**heading 70.17**). (For further details, see below.)
- (c) Microscopes (**heading 90.11** or **90.12**).
- (d) Precision balances (**heading 90.16**).
- (e) X-ray, etc., apparatus (**heading 90.22**).
- (f) Demonstrational apparatus of **heading 90.23**.
- (g) Machines and appliances for carrying out tests on certain materials (**heading 90.24**).
- (h) Hydrometers, thermometers, hygrometers and similar instruments of **heading 90.25**, whether or not for use in laboratories.
- (ij) The apparatus of **heading 90.26**.

* * *

Classification of goods which are potentially within the scope both of this heading and of heading 70.17 (laboratory glassware).

In these cases, classification is governed by the following considerations :

- (1) If an article has the **essential character of glassware** (whether or not graduated or calibrated, and whether or not with subsidiary stoppers, connections, etc., of rubber, etc.), it is **not to be classified in this heading** even if it is normally known as a particular instrument or apparatus.
- (2) In general, instruments normally cease to have the essential character of glassware when they consist partly of glass but are **mainly** of other materials, or if they consist of glass parts **incorporated or permanently fixed** in frames, mounts, cases or the like.
- (3) The combination of glass parts with measuring **instruments** (e.g., pressure gauges, thermometers) may, in practice, provide grounds for considering such instruments as proper to this heading.

Accordingly, the following instruments in the form of simple calibrated glassware fall in **heading 70.17** :

Butyrometers, lactobutyrometers and similar instruments for testing dairy products; albuminometers and ureometers; eudiometers; volumenometers; nitrometers, Kipps or Kjeldahl apparatus and the like; calcimeters; cryoscopes and ebullioscopes for determining molecular weights, etc.

*
* *

This heading also **excludes** machines or apparatus (whether or not electric) of the type classified in **Section XVI**, whether or not, in view of their low output, small size and general structure, they are obviously intended for use in laboratories (e.g., for preparing or treating specimens). The heading therefore **excludes** ovens, autoclaves, drying or steaming ovens or cabinets; desiccators; crushers and mixers; centrifuges; stills, presses; filters and filter presses; stirrers; etc.

Similarly, heating apparatus (Bunsen burners, steam-heating baths, etc.), tools, laboratory furniture (e.g., laboratory benches, microscope benches, fume cupboards) and brushes are classified in their own appropriate headings (**Section XV, Chapter 94 or 96**).

90.28 - Gas, liquid or electricity supply or production meters, including calibrating meters therefor.

- 9028.10 - Gas meters
- 9028.20 - Liquid meters
- 9028.30 - Electricity meters
- 9028.90 - Parts and accessories

These meters are generally fitted with a device driven at a speed proportional to the rate of fluid flow or to the electrical quantity being measured. They are often fitted in a bypass or shunt off the main or connected to measuring transformers, so that only part of the flow passes through them, but are calibrated so as to indicate the total quantity passing through the service pipes or through the main.

Gas, liquid or electricity supply or production meters fall in this heading whether or not fitted with a clockwork recording device, or with a simple mechanical or electrical device for bringing controlling, signalling, etc., appliances into action.

(I) GAS OR LIQUID SUPPLY OR PRODUCTION METERS

These meters are used to measure in volumetric units the amount of fluid passing through a pipe. Flowmeters, which measure rate of flow are **excluded (heading 90.26)**.

This heading includes household supply meters, plant production or supply meters, and standard meters (for checking the accuracy of ordinary meters). In addition to simple meters, the heading also includes special meters such as maximum, prepayment, price-calculating, etc., meters.

Supply or production meters consist essentially of the measuring device (turbine, piston, diaphragm, etc.), the mechanism for regulating the admission of fluid (generally slide valves), the transmission (endless screw, camshaft, gears or other systems), and a recorder or an indicator (pointer or drum type) or both.

(A) Gas supply or production meters.

(1) Wet meters.

The measuring device generally consists of a drum or wheel partitioned into compartments; this revolves in a cylindrical casing rather more than half filled with a liquid (water, oil, etc.). The drum is rotated by the gas which on entering the meter, fills the submerged compartments and thus raises them above the level of the water. The revolutions of the drum are indicated on a counting mechanism.

Another type of meter (nutating bell meter), consists of a bell in which the gas passes in and out of a succession of chambers; the bell, which is centrally guided, is thus made to nutate around an inclined axis which engages a cranked arm attached to the driving spindle of the counting mechanism.

(2) Dry meters.

These are of several types. The measuring device may consist of pistons, diaphragms or of a fan wheel, driven by the pressure of the gas, and connected to a counter mechanism. The usual meter consists of a box divided in two compartments by a partition. Each compartment is itself divided by a central diaphragm; the gas passes successively in and out of these four compartments. The alternating motion of the diaphragm operates the counting mechanism.

- (B) **Liquid supply or production meters** (cold or hot water, mineral oil, alcohol, beer, wine, milk, etc.), but **not** including pumps for liquids (even if fitted with measuring devices) of heading 84.13.

These meters include :

(1) **Impeller or fan wheel meters.**

These are also called **inferential meters** since the volume of liquid is inferred from its speed. The measuring device consists of a fan wheel or impeller which revolves at a speed proportional to the flow of the liquid. These revolutions operate a counting mechanism.

(2) **Diaphragm meters.**

These are similar to the dry gas meters described above. A cast iron cylinder is divided into two compartments by a flexible diaphragm which extends or retracts when the compartments are alternately filled or emptied. This motion operates the counter mechanism.

(3) **Reciprocating piston meters.**

These meters may consist of one or more pistons which perform a reciprocating movement inside the cylinders. As in a steam engine, a system of slide valves alternately directs the liquid under measure to the top and bottom sides of the piston and opens or closes the plug cocks. The motion of the pistons is geared to the counter mechanism.

(4) **Disc-piston meters.**

In these meters the piston is replaced by a revolving disc which divides a spherical chamber into two equal compartments alternately filled and emptied. The resulting oscillating motion of the disc is geared to the counter mechanism.

(5) **Rotary piston meters.**

One type of these meters consists of a cylindrical working chamber fitted with a radial partition which projects partially across the chamber. The measuring device is a cylindrical piston, the wall of which is split, and which fits over the partition. The filling and emptying of the compartment imparts an oscillating (semi-rotary) motion to the cylinder and this motion is geared to the counter mechanism.

In another type of meter there is no partition in the working chamber, and a true rotary motion of an elliptical piston is obtained. In some cases, the meter consists of a nutating cone in a partitioned spherical chamber.

The meters referred to in items (2) to (5) above are known as *positive displacement* type.

(II) ELECTRICITY SUPPLY OR PRODUCTION METERS

These meters measure the amount of electricity consumed (in ampere-hours or multiples thereof) (quantity meters), or the amount of energy consumed (in watt-hours or multiples thereof) (energy meters). When the voltage is constant, quantity meters may be calibrated in watt-hours (or in multiples of watt-hours). Some meters are devised for use with direct current, others for alternating current.

The heading **excludes** apparatus such as voltmeters, ammeters, wattmeters, etc., which simply measure electrical quantities and are not designed for registering the total amount of electricity or energy consumed (**heading 90.30**).

This heading includes the following main types of electricity supply meters :

(A) **Motor meters.**

These meters consist essentially of one or more inductors, a revolving element (armature) whose speed of revolution is proportional to the amount of electricity or energy consumed, a counting mechanism and a pointer or drum indicator (or a combination of both).

Motor meters are usually fitted with an eddy current brake, a metal brake-disc in which eddy currents are generated as it revolves between the poles of one or more permanent magnets.

(B) **Static meters.**

These meters consist essentially of electronic static sub-assemblies, such as multipliers or quantifiers equipped with an indicating device. They produce an electrical current or resistance directly proportional to the amount of electrical energy consumed. The indicating device may be mechanical (fitted with a pointer or drum indicator) or electronic.

These include :

- (1) **Prepayment meters.**
- (2) **Multiple-rate meters** (calculating the electrical energy supplied at two or more different rates).
- (3) **Maximum meters** (indicating the maximum value of the average load during a given period).
- (4) **Peak meters** (indicating the consumption above a certain peak value).
- (5) **Excess meters** (similar to peak meters but also indicating the total energy used).
- (6) **Impulsing meters** (fitted with a pulse transmitter).
- (7) **Reactive meters.**
- (8) **Demonstration meters.**
- (9) **Direct current meters** (volt-hour (Vh) meters, ampere-hour (Ah) meters, watt-hour (Wh) meters).
- (10) **Meters with pulse input** for connection to impulsing meters, fitted with a consumption register and a totalling device or a maximum device (indicating or recording) or an excess device, etc.
- (11) **Standard meters** for checking and calibrating other meters.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), separately presented parts and accessories of meters of this heading remain classified here.

90.29 - Revolution counters, production counters, taximeters, mileometers, pedometers and the like; speed indicators and tachometers, other than those of heading 90.14 or 90.15; stroboscopes.

9029.10 - Revolution counters, production counters, taximeters, mileometers, pedometers and the like

9029.20 - Speed indicators and tachometers; stroboscopes

9029.90 - Parts and accessories

This heading includes :

- (A) Counters indicating a total number of units of any kind (revolutions, items, length, etc.), or an amount to be paid. But the heading **excludes** totalling devices of a kind falling in **heading 84.73**, the gas, liquid or electricity supply or production meters of **heading 90.28**, and opisometers or planimeters of **heading 90.17** or **90.31**.
- (B) Apparatus indicating a speed of revolution or a linear speed in relation to a time factor (tachometers and speed indicators), **other than** those of **heading 90.14** or **90.15**.
- (C) Stroboscopes of all kinds.

Such apparatus and instruments remain classified here whether or not they incorporate a clockwork recording device, and whether or not they are fitted with simple mechanical or electric devices for bringing a signalling apparatus, machine controls, brakes, etc., into action.

(A) COUNTING DEVICES

(1) Revolution counters.

These instruments count the number of revolutions of a mechanical part (e.g., machine shaft). They consist mainly of a driving spindle geared to pointer or drum indicators. They usually have a device for re-setting the counter to zero. The counters may be coupled to the revolving part either directly (in some cases the part drives the gearing itself) or by remote control. The driving spindle may be operated by a rotary, alternating or pulsating movement of the turning part (e.g., encoders).

It should, however, be noted that the heading **excludes** yarn grading winding reels, torsionometers and similar testing or checking apparatus incorporating revolution counters (**heading 90.31**).

(2) Production counters.

These are similar in construction to revolution counters. They are used, in particular, for measuring lengths (e.g., on spinning or twisting machines); for counting the movements of a machine (an automatic balance, a pump, the picks of a spinning machine, etc.); or for counting a number of articles (printed sheets delivered by a rotary press, articles carried by a conveyor belt, bank notes, etc.). In practice, the appliances used for these purposes are generally revolution counters which have been adapted to indicate the length or number of units in terms of the revolutions of the driving spindle.

Electronic production counters. The articles to be counted interrupt a beam falling on a photoelectric cell. A recording apparatus then computes the number of articles which have passed through the beam.

This group also covers multiple counters (e.g., those used to check the output of several operators working on the same machine).

This group also includes the electro-magnetic counters used in automatic telephone exchanges to count the number of telephone calls made by a subscriber; they usually incorporate an electro-magnet which moves the recording mechanism (cyclometer-type rollers, etc.) one position each time a pulse of electric current is passed through its winding.

(3) **Counters for indicating the working hours of machines, motors, etc., (time or hour meters).**

In practice, these are revolution counters calibrated in working hours.

(4) **Entry counters.**

These counters are operated by turnstiles or other appliances placed at the entrances of museums, parks, sports grounds, etc., where they record the number of visitors or spectators.

(5) **Billiards meters.**

These are mechanical counters (roller-type and the like), usually hand-operated, for recording the score.

The heading **excludes** meters which employ a clock movement to indicate the time in play or the amount payable based on that time (**heading 91.06**). Billiard markers, ball or slide type, fall in **heading 95.04**.

(6) **Instruments and apparatus for measuring short time intervals** by counting, and which, not having a movement of the watch or clock type (including synchronous movements), **do not** fall in Chapter 91. The heading also covers **electronic impulse counters (scalers)** (e.g., passenger counters on motor coaches, trains, etc.).

(7) **Taximeters.**

These usually have a clock movement. They indicate the fare payable in relation to time **and to the distance covered**.

(8) **Mileometers.**

These are revolution counters for vehicles, and are usually graduated in linear units (miles, kilometres, etc.). Most mileometers are combined with speed indicators.

(9) **Pedometers.**

These instruments have a watch type mechanism and are used for an approximate measurement of distances. They contain a pendulum which, at each step, advances the train of wheels by one unit. The distance covered is calculated from the number of steps taken and their length.

(10) **Hand-held counters.**

These counters usually read no more than four numbers in fixed categories. The user depresses a button in the category being counted to activate the display.

(B) SPEED INDICATORS AND TACHOMETERS

These instruments differ from the revolution counters and production counters of Part (A) above in that they indicate the number of revolutions, speed, output, etc., **per unit of time** (e.g., revolutions per minute, miles per hour, kilometres per hour, metres per minute). They are usually mounted on vehicles (cars, motorcycles, bicycles, locomotives, etc.) or machines (motors, turbines, paper-making machines, printing machinery, textile machinery, etc.).

The speed indicators and tachometers classified here normally function on one of the following principles :

(1) **Chronometric system.**

The measuring mechanism is combined with a clock or watch movement. Sometimes the time is measured by means of a separate chronograph; in this case, the two instruments are classified in their appropriate headings.

(2) **Centrifugal system.**

A vertical governor arm, held by a spring, rotates with the driving spindle. A pair of weights carried by the governor arm are thrown outwards by centrifugal force, so that the distance the governor arm is displaced is proportional to the speed. This displacement is transmitted to the instrument pointer.

(3) **Vibration system.**

This type is used for high speed machines such as steam turbines, pumps, compressors, electric motors, etc. The mechanical resonance of vibrations of the frame or bearings of the machine cause graduated reeds to oscillate at a rate corresponding to the number of revolutions of the machine.

(4) **Magnetic (induction) system.**

A system of permanent magnets rotating with the driving spindle generates eddy-currents in a disc of copper or aluminium placed in the magnetic field. This current is proportional to the rotating speed of the magnets. The disc is thus "dragged" or pulled round, but its rotation is retarded by a restraining spring. The disc is connected to a pointer indicating the speed.

(5) **Electrical systems.**

These are either fitted with a photoelectric cell or operated by an impulse generator mounted on the machine.

Speed indicators and tachometers of this heading may be fixed or portable, simple or multi-function (e.g., maximum or minimum), differential (in which case they give the difference between two speeds as a percentage), combined with an adding counter or a time meter or graphical recording device, etc. The heading also covers certain instruments which simultaneously record speed, mileage, time in motion and at a standstill, etc.

(C) STROBOSCOPES

Stroboscopes enable machines in operation to be observed as though they were moving slowly or were stationary; they can also be used to measure the speed of rotating or reciprocating movements. In the latter case, they are known more particularly as **stroboscopic tachometers**. Stroboscopes operate on the principle of producing apparent immobility or reduced speed in the mechanism to be observed, by means of successive glimpses (flashes) at fixed intervals. The mechanism under observation may be permanently illuminated for examination through an optical instrument (a disc with one or more radial slots or "windows") which interrupts the line of sight; or the mechanism may be placed in the dark and illuminated periodically for very short periods (flashes). The speed of the rotating or reciprocating mechanism under observation can be ascertained by adapting the speed of the disc or the frequency of the flashes until the impression of immobility is obtained.

Stroboscopes based on the principle of **permanent illumination** consist essentially of a clockwork driven with one or more windows, a speed regulator, an eyepiece and a graduated drum (usually graduated in revolutions per minute).

Stroboscopes functioning on the principle of **periodic illumination** differ appreciably according to the device producing the light flashes. The most simple types consist of an ordinary lamp, a motor with a speed regulator controlling the frequency of the flashes, and a graduated dial. The flashes may also be produced by a gas discharge lamp. These gas discharge stroboscopes are much more complex in structure and can be used for taking photographs or making films; they are sometimes mounted on castors or rollers. The flashes required for the observation of a rotating or reciprocating mechanism may be controlled by the mechanism itself. Synchronisation is achieved by means of a spring-type interrupter, a photoelectric cell, an electro-magnetic relay, etc.

Except when permanently incorporated in stroboscopes, the photographic or cinematographic cameras fall in their appropriate heading.

Stroboscopes are used, in particular, for observing or measuring the speed of motors, transmission gear, textile machinery (parts such as spindles, winders, cards, shuttles), paper-making machines, printing machinery or machine-tools. They are also used in medicine for examination of the vibration of the vocal chords.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), separately presented parts and accessories of apparatus or appliances of this heading remain classified here.

90.30 - Oscilloscopes, spectrum analysers and other instruments and apparatus for measuring or checking electrical quantities, excluding meters of heading 90.28; instruments and apparatus for measuring or detecting alpha, beta, gamma, X-ray, cosmic or other ionising radiations.

9030.10 - Instruments and apparatus for measuring or detecting ionising radiations

9030.20 - Oscilloscopes and oscillographs

- Other instruments and apparatus, for measuring or checking voltage, current, resistance or power :

9030.31 -- Multimeters without a recording device

9030.32 -- Multimeters with a recording device

9030.33 -- Other, without a recording device

9030.39 -- Other, with a recording device

9030.40 - Other instruments and apparatus, specially designed for telecommunications (for example, cross-talk meters, gain measuring instruments, distortion factor meters, psophometers)

- Other instruments and apparatus :

9030.82 -- For measuring or checking semiconductor wafers or devices

9030.84 -- Other, with a recording device

9030.89 -- Other

9030.90 - Parts and accessories

**(A) INSTRUMENTS AND APPARATUS FOR MEASURING
OR DETECTING ALPHA, BETA, GAMMA, X-RAY,
COSMIC OR OTHER IONISING RADIATIONS**

These instruments and apparatus are used in scientific research, for industrial purposes (metallurgy, petroleum prospecting, etc.), or for biological or medical purposes (in conjunction with radioactive tracers). They include :

- (1) **Detection instruments incorporating ionisation chambers.** A potential difference is set up between two electrodes contained in the ionisation chamber. The ions formed when a radiation enters the chamber are attracted to the electrodes, and the resulting changes in the potential difference may be amplified and measured.
- (2) **Geiger counters.** A large potential difference is maintained between the electrodes of the counter; the ions produced by an incoming radiation are greatly accelerated, and in turn ionise the gas contained in the tube. This sets up impulses which may be counted.

The ionisation chamber and Geiger counter apparatus of this heading normally consist of several units such as a chamber or counter, an amplifier, a voltage supply unit for the chamber or counter, and a counting circuit or indicating instrument. All these units are often incorporated in the same case. Sometimes all the units except the chamber or counter are in the same case, and apparatus of this type (which requires a chamber or counter before it is complete) remains classified in this heading (as an essentially complete instrument). When the individual units are presented separately they are classified in accordance with the provisions of the General Explanatory Note to this Chapter.

Certain ionisation chambers which are used to measure total quantities of radiation over an appreciable time (e.g., 24 hours) do not require any auxiliary amplifiers, etc., but incorporate a very light moving pointer which can be read under a microscope and then shows the total amount of radiation which has passed through the chamber. These chambers (which often resemble fountain pens) are complete measuring instruments in themselves and are classified in this heading.

The heading also covers **scintillation counters**. These consist of a device (photomultiplier) which is made up essentially of a photoelectric cell and an electron multiplier. They operate on the principle that radiation may be detected or measured by its effect in exciting the fluorescence of certain crystals (zinc sulphide, thallium activated sodium iodide, anthracene, plastics impregnated with tetraphenyl-butadiene, etc.). The crystals are placed between the source of radiation and one electrode of the counter.

This group also includes :

- (1) **Dosimeters and similar apparatus used in radiology** for measuring and checking the intensity and penetrating power of X-rays.
- (2) **Apparatus for measuring cosmic or similar radiations.**
- (3) “ **Thermopile** ” **neutron detectors and measuring or detecting instruments** incorporating neutron detector tubes (boron, boron trifluoride or hydrogen types, or using radioactive fissionable elements).
- (4) **Radiation measuring or detecting instruments** incorporating liquid or solid scintillators.

The heading **excludes** :

- (a) Apparatus incorporating a scintillation counter whose data are converted into analogue signals for the purpose of making medical diagnoses (e.g., gamma camera, scintillation scanner) (**heading 90.18**).
- (b) Measuring or checking apparatus designed to incorporate a radioactive source (in particular, artificial isotopes), for example, for measuring thickness of materials (sheets, linings or the like), for monitoring the contents of packages, for measuring low speed air currents (ionisation anemometers), etc. (**heading 90.22**).

(B) OSCILLOSCOPES, SPECTRUM ANALYSERS AND OTHER INSTRUMENTS AND APPARATUS FOR MEASURING OR CHECKING ELECTRICAL QUANTITIES

Oscilloscopes and oscillographs are used respectively for observing or recording rapid variations of an electrical quantity (voltage, current, etc.). The instruments may be divided into three main categories :

- (a) **Duddell oscillographs**, in which a coil, usually consisting of a loop of taut wire with mirrors attached, moves in the field of an electro-magnet. The periodic phenomenon under study can be observed directly on a sheet of frosted glass, or recorded on a photographic tape.
- (b) **Soft iron and graver type oscillographs**, with a coil acting on a strip of soft iron placed in a constant field. A lightweight rod, pointed at one end, is fixed to the strip and traces the phenomenon (e.g., by cutting a coated cellulose acetate tape).
- (c) **Cathode-ray oscilloscopes and oscillographs**; these operate by recording how a cathode-ray beam is deflected by electrostatic or electro-magnetic forces. These instruments, which may be in one or more parts, consist essentially of the cathode-ray tube, feeding devices and transformers, amplifiers, a sweeping or scanning system and other auxiliary devices and, sometimes, an electronic switch. Oscilloscopes with a memory, used to examine isolated rapid transient phenomena, are equipped with either a cathode-ray memory tube or a numeric memory associated with a cathode-ray tube. In the first type, the image of the signal is captured and maintained on the cathode-ray tube. In the second type, the signal is recorded in the memory and can be retrieved at will to be viewed on the screen.

*
* *

Spectrum analysers are instruments which identify the different frequency components of an electrical input signal. They are mainly used to analyse electrical quantities. They can also analyse ionising radiations, sound waves or other non-electrical quantities when used in conjunction with radiation detectors or other devices which can detect non-electrical quantities and convert them into electrical signals.

*
* *

The heading covers transient phenomena recorders which are apparatus designed to capture a signal and to record it with a view to transmitting it later, in an appropriate form, onto a display apparatus (television monitor, for example). "Logic analysers", which are apparatus used to examine electrical circuits consisting for the most part of semiconductor devices, are also classified here.

*
* *

Instruments and apparatus for measuring or checking electrical quantities may be indicating or recording types.

They may be subdivided, according to their mode of operation, into a number of groups, such as :

- (1) **Moving-coil instruments**, in which the current to be measured passes through a coil free to move in the magnetic field provided by a permanent magnet. The pointer is secured to the moving coil.
- (2) **Moving-iron instruments**, in which the pointer is deflected by a solenoid acting upon a piece of soft iron fixed to the pointer shaft.
- (3) **Electrodynamic instruments**, in which the current to be measured passes through fixed and moving coils, the moving coils operating in the magnetic field of the fixed coils. The pointer is secured to the moving coils.
- (4) **Induction instruments**, consisting of a pointer shaft on which is mounted a flat disc or cylinder which operates in the air gap of an electro-magnet having one or more coils.
- (5) **Thermocouple instruments**, in which the current to be measured is passed through a heater applied to the hot junction of a bi-metallic thermocouple whose electromotive force is then measured.
- (6) **Electrically operated instruments** based on semiconductor technology with a pointer or an opto-electronic display for analogue or digital readout.

Apart from the above-mentioned types of instruments or apparatus which generally effect direct measurements, the heading also includes those which supply the operator with certain data from which the quantity to be measured can be calculated (comparative method). This group includes, in particular, **measuring bridges** and **potentiometers**. These are usually mounted in boxes or cases containing one or more galvanometers, standard resistors, standard capacitors, standard inductors, standard cells, transformers, converters, switches, etc. Measuring bridges are often named after their inventor (Wheatstone, Thomson, Anderson, Maxwell, Sauty, Schering, Kohlrausch, Wien, etc.); others have names indicating the grouping system of the units of comparison (decade pattern bridges, double bridges, T-type bridges, etc.), or the special purpose of the bridge (impedance, resistance, capacitance or connection bridges, universal bridges, etc.).

The following are, however, **excluded (Chapter 85)** when presented separately : transformers, standard resistors, standard capacitors, standard inductors, standard cells, etc.; also earphones (headsets) (used instead of the visual null indicator in some types of measuring bridge).

*
* *

The main types of electrical measurements are :

- (I) **Measurement of electric currents**. This is carried out, in particular, by means of galvanometers or amperemeters (ammeters).
- (II) **Voltage measurement**, by voltmeters, potentiometers, electrometers, etc. The electrometers used for measuring very high voltages are electrostatic; they differ from the usual type of voltmeter in that they are fitted with spheres or plates held on insulating pillars.

- (III) **Measurement of resistance and conductivity**, by means of ohmmeters or measuring bridges, in particular.
- (IV) **Measurement of power** by means of wattmeters.
- (V) **Measurement of capacitance and inductance**, effected by means of measuring bridges, and expressed in farads or henrys.
- (VI) **Measurement of frequencies**, by means of frequency meters graduated in hertz (cycles per second).
- (VII) **Measurement of wavelengths or radio frequencies** by wavemeters, or slotted line or slotted waveguide instruments.
- (VIII) **Measurement of phase angles or power factors**, carried out with phase meters, calibrated in power factors ($\cos \phi$).
- (IX) **Measurement of the ratios of two electrical quantities** by ratiometers.
- (X) **Measurement of magnetic fields or magnetic fluxes**, effected with galvanometers or fluxmeters.
- (XI) **Measurement of the electrical or magnetic properties of materials**, carried out with hysteresis testers, permeameters or similar instruments.
- (XII) **Testing of synchronism**, by means of synchrosopes, instruments for indicating the phase relation and difference in frequency between two periodic phenomena. Such instruments can be recognised by the fact that their dials bear the indications "Fast" and "Slow" (with corresponding arrows).
- (XIII) **Measurement and recording of rapid variations of electrical quantities** by means of the oscilloscopes or oscillographs described above.

*
* *

Some electrical measuring instruments can be used for many purposes, for example, electrical or electronic instruments known as "universal testers" (e.g., multimeters) which serve for the rapid measurement of voltages (direct or alternating), currents (direct or alternating), resistances and capacitances.

The heading also includes a wide range of electrical or electronic instruments used in radio-communications or telecommunications. In addition to the voltmeters, potentiometers, measuring bridges, ammeters, wattmeters, phase meters and frequency meters already mentioned, this range includes :

- (i) **Impedance testers and bridges**, for determining the impedance in a circuit, and also for measuring capacitances or inductances.
- (ii) **Inductance bridges and similar instruments**, for measuring ring inductances on the Wheatstone bridge principle.

- (iii) **Nepermeters and decibel meters.** These are used for measuring the attenuation over long distance telephone circuits. Instruments and apparatus for measuring quantities of sound fall in **heading 90.27**.
- (iv) **Fading indicators.** Unlike nepermeters (which give measurements based on a compensatory system), these give a direct indication of the fading.
- (v) **Cross-talk meters**, used on telephone circuits for measuring various quantities.
- (vi) **Transmission level indicators.**
- (vii) **Noise level meters**, for use on high frequency lines.
- (viii) **Gain measuring instruments**, for measuring the gain through repeaters relaying long distance telephone circuits.
- (ix) **Instruments for measuring interference**, e.g., noise voltage in long distance telephone installations or interference from neighbouring high tension circuits.
- (x) **Psophometers**, instruments for calculating line-noise, i.e., the electromotive force of a source of current which would produce the same interference if substituted for the voltages induced in the telephone circuit.
- (xi) **Peak indicators**, for recording short voltage peaks such as occur in transmission systems (e.g., long distance telephone cables, radio transmission circuits, shortwave links).
- (xii) **Echo meters**, used in establishing line balance by direct readings of echo expressed in nepers or decibels.
- (xiii) **Distortion factor meters**, for measuring the harmonic distortion introduced into complex transmissions.

Some of the above instruments, in particular those used for electro-acoustic measurements, are calibrated in nepers or decibels.

This heading also covers other instruments and apparatus which perform operations of a kind described in the heading, including **valve testing or measuring instruments, in particular those for testing radio valves**. These valve testing or measuring instruments are sometimes designed so as to produce the characteristic curve of the valve on the screen of an oscilloscope.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), separately presented parts and accessories of instruments or appliances of this heading remain classified here. Examples of these are: **coincidence units**, electronic, for use with Geiger-Müller counters or proportional counters, **solid scintillators** in the form of crystals or of elements of plastics, mounted or metal-sheathed, designed solely for fitting to detection instruments, **neutron detector tubes** using boron, boron trifluoride, hydrogen or fissionable elements.

90.31 - Measuring or checking instruments, appliances and machines, not specified or included elsewhere in this Chapter; profile projectors (+).

9031.10 - Machines for balancing mechanical parts

9031.20 - Test benches

- Other optical instruments and appliances :

9031.41 -- For inspecting semiconductor wafers or devices or for inspecting photomasks or reticles used in manufacturing semiconductor devices

9031.49 -- Other

9031.80 - Other instruments, appliances and machines

9031.90 - Parts and accessories

In addition to **profile projectors**, this heading covers **measuring or checking instruments, appliances and machines, whether or not optical**. It should, however, be noted that this group **does not include** any instruments, apparatus, etc., falling in headings 90.01 to 90.12 or 90.15 to 90.30; in particular, the following are therefore **excluded** :

- (a) Astronomical instruments of **heading 90.05**.
- (b) Microscopes (**heading 90.11** or **90.12**).
- (c) Surveying, etc., instruments and appliances of **heading 90.15**.
- (d) Instruments for measuring length, for use in the hand (**heading 90.17**).
- (e) Medical, surgical, etc., instruments and appliances of **heading 90.18**.
- (f) Machines or appliances for testing the mechanical properties of materials (**heading 90.24**).
- (g) Flowmeters, etc., of **heading 90.26**.
- (h) Instruments and apparatus for measuring and checking electrical quantities and instruments and apparatus for measuring or detecting ionising radiations of **heading 90.30**.
- (ij) Automatic regulating or controlling instruments and apparatus (**heading 90.32**).

**(I) MEASURING OR CHECKING INSTRUMENTS,
APPLIANCES AND MACHINES
(A)**

These include :

- (1) **Machines for balancing mechanical parts (dynamic, static or with an electronic balancing device)** e.g., armatures, rotors, crank shafts, connecting rods, propeller shafts, wheels, flywheels.

In dynamic machines, the parts are rotated on two bearing blocks or between centres, the out-of-balance being measured mechanically (tracing of diagrams on a recording plate, spring balance principle, etc.).

Static balancing machines operate on the tilting principle, the out-of-balance being measured on scales or dials. They differ from dynamic machines in that the part to be balanced does not rotate.

Out-of-balances are compensated either by counterweights or removal of material.

On machines fitted with an electronic balancing device, the vibrations due to unbalance are detected by a special sensitive element and are then amplified.

This heading also covers balancing machines fitted with a machine-tool (drilling-machine, for example) and used exclusively for rectifying out-of-balances.

- (2) **Test benches** for engines and motors, electrical generators, pumps, speed indicators or tachometers, etc., consisting of a frame and a measuring or calibrating instrument.
- (3) **Laboratory appliances** of a kind used for testing fuels and in particular for measuring the octane index of petroleum or the cetane index of diesel engine oils. This apparatus usually consists of an internal combustion engine, a dynamo, an ignition generator, heating resistors, measuring instruments (thermometers, pressure gauges, voltmeters, ammeters, etc.).
- (4) **Apparatus for testing and regulating vehicle motors**, for checking all parts of the ignition system (coils, sparking plugs, condensers, batteries, etc.), for ascertaining the best carburettor setting (by analysing exhaust gases), or for measuring the compression in the cylinders.
- (5) **Planimeters**, for measuring plane areas (e.g., on plans, diagrams, skins or hides). A tracing point combined with a measuring device follows the outline of the area to be measured.

Integrators, harmonic analysers and other instruments are based on the planimetric principle and capable of measuring other factors (e.g., volume, moments of inertia).

- (6) **Head contour measurers**, used by hatters, which operate by perforating a sheet of paper.
- (7) Dial indicating **comparators**, micrometric devices, electronic, opto-electronic and pneumatic sensors, whether or not automatic, as well as all devices or instruments for measuring length, angles or other geometrical quantities using such sensors. The heading also includes recording comparators, and comparators fitted with a mechanical device which conveys mass produced parts to the comparator and eliminates defective parts.

However, this heading **does not include** the dial type comparators for use in the hand described in Item (4) of Part (D) of the Explanatory Note to heading 90.17 (see exclusion (d) above).

- (8) **Column-type gauges** for checking precision set squares, for checking heights or for other checks during manufacturing processes.
- (9) **Sine bars and adjustable table sine bars** for checking angles.
- (10) **Bubble levels**, used in numerous trades, including **micrometric adjustable levels** (bubble level with built-in micrometer), **block levels** (metal frame with two levels) used in engineering, and **liquid levels** based on the communicating vessels principle.

It should be noted that the heading **excludes** levels specialised for surveying purposes (**heading 90.15**).

- (11) **Clinometers** (pointer or graticule types, clinometer-rules, clinometer-protractors) to check a level as compared with a horizontal plane, or to measure surface inclination.

However, the instruments, also called clinometers, used in surveying to gauge the height of land, are excluded (heading 90.15).

- (12) **Plumb-lines.**

- (13) **Spherometers** to measure the curvature of spherical surfaces (lenses, mirrors, spectacle lenses, etc.). These consist essentially of a base with three pins (at the angles of an equilateral triangle), a divided rule and a micrometric screw with feeler. Other types (opticians' lens measurers) may be fitted with a dial to indicate the curvature directly.

- (14) **Checking standards.**

- (15) **Multidimensional measuring equipment**, including **Co-ordinate Measuring Machines** (CMMs) used to perform dimensional checks, either manually or mechanically, on various components or parts of machines.

- (16) **Opticians' centring machines** for determining and marking the axis and centre of a lens.

- (17) **Micrometric standard measuring machines**, based on the micrometer principle. These consist of a fixed tailstock (with a contact indicator) and an adjustable headstock with micrometer screw.

- (18) **Apparatus for measuring or detecting vibrations, expansion, shock or jarring**, used on machines, bridges, dams, etc.

- (19) **Apparatus for checking textile materials**, for example, **yarn grading winding reels (warp reels)**, for obtaining a determined length of yarn or slivers, (with or without tension regulator, counter and bell); **torsiometers and torsographs** for determining torsion of yarn; **tensiometers** for measuring tension of yarn on textile machines (warping, spool winding, spinning, etc.); **instruments for checking the regularity of yarn** by winding on a drum or board, usually comprising a device for checking the interval between windings.

- (20) **Surface-finish testing instruments** and machines for gauging the condition of surface.

In mechanical or pneumatic types the gauging is done by means of a hard contact point or air jets.

In electrical types a sapphire or diamond pick-up moves across the surface to be tested and converts any irregularities of that surface into an electric potential. The vertical movements of the pick-up are converted into the electric potential by means of a piezo-electric crystal or, indirectly, by being made to vary the value of a capacitor or inductor. The electric potential is then amplified and measured. Comparison of the measurement with the readings obtained by use of selected surface roughness standards (small metal plates supplied for that purpose) give a measure of the state of the surface being tested.

- (21) **Gear testing machines** using, for example, a lever amplifying system, for testing profile forms, pitch diameters, tooth spacing and rolling contact, etc. (on spur and bevel gears), lead, etc. (on helical and worm gears).

- (22) **Instruments for measuring the contracting of a clay, etc., test piece** taken from a ceramic furnace during firing to determine the course of the firing (pyroscopes). These instruments are often similar to callipers but are calibrated in arbitrary units.
- (23) **Instruments for measuring irregular surfaces** (such as skins and hides) by the photoelectric process. (The differences in the current from a photoelectric cell depend on how much of a uniformly lit glass sheet is covered by the opaque surface under measure.)
- (24) **Instruments for measuring the diameter of yarns** by the photoelectric process as described in Item (23) above.
- (25) **Instruments for continuous measurement and checking of the thickness** of metal sheets or strip in rolling mills, etc.
- (26) **Ultrasonic thickness measuring instruments** which enable thickness to be ascertained by observations made from one side of the material only.
- (27) **Instruments for detecting faults, fissures, cracks or other defects in materials** (bars, tubes, profiles, machined articles, such as screws, needles, etc.). These operate either by observing the cathode-ray screen diagram resulting from magnetic variations, or by direct reading of variations in magnetic permeability as indicated on a graduated scale or by the use of ultrasonic waves. The latter group includes **ultrasonic instruments for checking soldered or welded joints**, which operate on the principle that any lack of continuity in the medium through which the ultrasonic waves pass deflects the beam. Defects may be measured by either observing the attenuation of the beam or by echo methods. The observation may be made on a cathode-ray tube screen.
- (28) **Special instruments for checking watches or watch parts.** These include :
- Instruments for checking hairsprings.**
 - Amplitude meters** for checking the amplitude of the oscillations of the balance wheel. A light beam, which is interrupted by the movement of the balance wheel, is projected on to a photoelectric cell which thus gives a measure of the amplitude.
 - Oscillometers** for testing and checking complete watch movements. The watch movement is placed on a microphone, and each tick of the watch produces a potential which is amplified and applied to two electrodes. One of the electrodes is fitted with points which thus perforate a record on a paper strip.
 - Instruments for the final check of the watch.** These operate on the same principle as oscillometers (recording the ticking of the watch placed on a microphone) but may also be fitted with a cathode-ray oscilloscope.
- (29) **Special electrical instruments for measuring stress and strain.** They are based, for example, on the following principles :
- Variations in the resistance of a wire when subjected to stress (strain gauges). However, electrical resistors known as "strain gauges" fall in **heading 85.33**.

- (ii) Variations of capacity between specially constructed electrodes.
- (iii) Electric potentials produced by quartz or similar crystals when subjected to pressure.

This group also includes **dynamometers**, used to measure the compression or tractive force of hydraulic presses, rolling mills, material testing machines, etc., and also for load tests (aircraft). They usually consist of a metal body (cylinder, ring, etc.) to which stress is applied, and of a measuring apparatus, graduated in units of weight, which records any change in the shape of the metal body.

However, dynamometers for testing the properties of materials are **excluded** (**heading 90.24**).

- (30) **Load cells** which convert changes in applied force (including weight) into proportional changes in voltage. These changes in voltage are generally detected by instruments for measuring, controlling, weighing, etc., and are expressed in the desired units.
- (31) **Electronic chronographs and chronoscopes** for measuring the duration of an electric contact. These consist of a capacitor which is charged through a high resistance whilst the contact is closed; the measurement is made on a valve voltmeter calibrated in time units.

(B)

This heading also covers **optical** type measuring and checking appliances and instruments, such as :

- (1) **Optical or graduated scale comparators**, for checking the dimensions of a part being manufactured against a standard piece; the movement of the feeler is magnified by an optical device (revolving mirror principle).
- (2) **Comparator benches** for checking elongation, lengths, surfaces, etc. These incorporate table and frame, sliding carriage and two mounted micrometric microscopes.
- (3) **Measuring benches** for large parts, thread gauges, gear cutters, threaded shafts for lathes, cross members, etc. These incorporate frame and table, viewing microscope, two micrometric microscopes and projection apparatus.
- (4) **Interferometers**, for checking plane surfaces. These are based on the principle of light interference, and comprise a standard optical flat and lenses with micrometric cross wires for measuring the interference bands. But the heading **excludes** standard optical flats (**heading 90.01**), and interferometers for measuring refractive indices (**heading 90.27**).
- (5) **Optical surface testers**, for gauging the condition of surfaces by means of a combination of a prism and a lens.
- (6) **Apparatus equipped with rapid impulse differential feeler and optical viewer**, for photographically recording and measuring profiles and conditions of surfaces.
- (7) **Alignment telescopes**, for checking straightness of benches or machine slides and measuring metallic constructions. They are operated by collimation or auto-collimation and comprise a telescope and a collimator or mirror.

- (8) **Optical rules**, for measuring deviations from the plane; they incorporate a hollow rule with a prism and lens at each end, and an eyepiece micrometer incorporating a feeler.
- (9) **Micrometric reading apparatus** for checking movement of tables of machine-tools; they incorporate a micrometric device for reading off millimetre graduations on individual scales.
- (10) **Optical goniometers or angle gauges**, for checking sharpening angles of teeth or blades (front rake) during sharpening. They incorporate either an optical device with lens and mirrors and a dial for reading off the angle of incidence, or a shutter system forming a mirror and an adjustable eyepiece.
- (11) **Focimeters**, for taking measurements of spectacle lenses.

The apparatus and instruments mentioned above remain classified in this heading whether or not they are suitable for mounting on machines.

It should, however, be noted that **heading 84.66** covers fittings for adjusting the work or tools on machine-tools or water-jet cutting machines, including "optical" fittings (e.g., "optical" dividing heads and "optical" circular tables) incorporating optical devices to assist in reading scales, in carrying out adjustments, etc.

(II) PROFILE PROJECTORS

Profile projectors, used for checking the shape and dimensions of a wide variety of objects (pieces cut to shape, gears and pinions for small-sized mechanisms, screws, screw-taps, chasers, etc.), or for examining surfaces. In the majority of these projectors, light from a lamp is concentrated into a beam by a condenser before being directed on to the specimen, which is placed on a stage. The specimen is silhouetted in the beam which, after being reflected several times, is finally projected, by a set of prisms, on to a screen which is generally built in to the projector. Some of these projectors are fitted with an intermediate stage on which a standard part is placed.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), the heading also covers parts and accessories identifiable as being suitable for use solely or principally with the machines, apparatus and instruments described above, e.g., planimeter arms, stands and checking tables for dial comparators.

◦
◦ ◦

Subheading Explanatory Note.

Subheading 9031.49

This subheading covers not only instruments and appliances which provide a direct aid or enhancement to human vision, but also other instruments and apparatus which function through the use of optical elements or processes.

90.32 - Automatic regulating or controlling instruments and apparatus.

9032.10 - Thermostats

9032.20 - Manostats

- Other instruments and apparatus :

9032.81 -- Hydraulic or pneumatic

9032.89 -- Other

9032.90 - Parts and accessories

In accordance with Note 7 to this Chapter, this heading covers :

- (A) Instruments and apparatus for automatically controlling the flow, level, pressure or other variables of liquids or gases, or for automatically controlling temperature, whether or not their operation depends on an electrical phenomenon which varies according to the factor to be automatically controlled, which are designed to bring this factor to, and maintain it at, a desired value, stabilised against disturbances, by constantly or periodically measuring its actual value; and
- (B) Automatic regulators of electrical quantities, and instruments or apparatus for automatically controlling non-electrical quantities, the operation of which depends on an electrical phenomenon varying according to the factor to be controlled, which are designed to bring this factor to, and maintain it at, a desired value, stabilised against disturbances, by constantly or periodically measuring its actual value.

(I) INSTRUMENTS AND APPARATUS FOR AUTOMATICALLY CONTROLLING THE FLOW, LEVEL, PRESSURE OR OTHER VARIABLES OF LIQUIDS OR GASES, OR FOR AUTOMATICALLY CONTROLLING TEMPERATURE

Automatic control apparatus for liquids or gases and apparatus for automatically controlling temperature form part of complete automatic control systems and consist essentially of the following devices :

- (A) **A device for measuring** the variable to be controlled (pressure or level in a tank, temperature in a room, etc.); in some cases, a simple device which is sensitive to changes in the variable (metal or bi-metal rod, chamber or bellows containing an expanding liquid, float, etc.) may be used instead of a measuring device.
- (B) **A control device** which compares the measured value with the desired value and actuates the device described in (C) below accordingly.
- (C) **A starting, stopping or operating device.**

Apparatus for automatically controlling liquids or gases or temperature, within the meaning of Note 7 (a) to this Chapter, consists of these three devices forming a single entity or in accordance with Note 3 to this Chapter, a functional unit.

Some instruments and apparatus do not incorporate devices which compare the measured value with the desired value. They are directly activated by means of a switch, e.g., when the predetermined value is reached.

Instruments and apparatus for automatically controlling the flow, level, pressure and other variables of liquids or gases or for automatically controlling temperature are connected to an appliance which carries out the orders (pump, compressor, valve, furnace burner, etc.) which restores the variable (e.g., liquid measured in a tank or temperature measured in a room) to the prescribed value, or which, in the case of a safety system, for instance, stops the operation of the machine or apparatus controlled. This appliance, generally remote controlled by a mechanical, hydraulic, pneumatic or electric control, is to be classified in its own appropriate heading (pump or compressor : **heading 84.13** or **84.14**; valve : **heading 84.81**, etc.). If the automatic control apparatus is combined with the appliance which carries out the orders, the classification of the whole is to be determined under either Interpretative Rule 1 or Interpretative Rule 3 (b) (see Part (III) of the General Explanatory Note to Section XVI and the Explanatory Note to heading 84.81).

This group includes :

- (A) **Pressure controllers or regulators**, also called **manostats**. These consist essentially of a pressure sensitive device, a controlling device which compares (e.g., by means of an adjustable spring) the pressure to be controlled with the prescribed pressure, and an electric contact or a small valve operating a servo-circuit.

This apparatus may be used, for instance, to control a motor pump or compressor which supplies a pressure tank, or to operate pneumatic valve positioners, or with a valve to regulate the flow, pressure, etc., of liquids or gases.

These pressure regulators differ from the pressure reducing valves of **heading 84.81** (sometimes also called "pressure regulators").

- (B) **Level regulators or controllers** for the automatic control of a level.

In the **float-type level controller**, the float acts on a diaphragm or a magnetic or other device which operates an electric switch; this in turn switches on or off a pump, a valve, etc.

In the **electrode system** the liquid is connected to earth and forms part of the circuit. One pole of the transformer is also earthed. When the surface of the liquid comes into contact with the electrode, the circuit is closed and a relay comes into operation.

- (C) **Humidity regulators**, sometimes also called **humidistats**, are instruments for automatically controlling humidity in steaming cabinets, furnaces, workshops, warehouses, etc.

The operation depends on variations in the length of a bundle of hair or some other element sensitive to humidity and they generally operate a signalling device or control an apparatus which can modify the degree of humidity found (steam input valve, humidifier or de-humidifier, fan, etc.).

- (D) **Thermostats** are used for automatically controlling temperature. The main components of a thermostat are :

(1) An element sensitive to changes in temperature whose action may depend on :

- (a) The change in shape of a bi-metal strip (straight, U or spiral-shaped, etc.);
- (b) The vapour pressure of a liquid;
- (c) The expansion of a liquid or of a metal rod;
- (d) An electrical resistor or a thermocouple.

In bi-metal strip thermostats, the strip is fixed inside a plunger tube or in a case. In metal rod thermostats, the rod fits in a plunger tube. In vapour pressure or liquid types, the sensitive element may consist of a folded diaphragm enclosing a fluid, or of a system incorporating a diaphragm, a capillary tube and a bulb or elbow.

- (2) A drum, disc or other device for pre-setting the desired temperature.
- (3) A triggering or operating device which consists mainly, depending on the type of transmission used (mechanical, servo-fluid, electrical), of a lever assembly, springs, etc., a valve, or an electrical switch. This device operates a signal or an appliance (generally remote) such as a steam or hot water intake valve, boiler burner, air conditioning unit, fan, etc., which regulates the temperature.

Thermostats are used, in particular, for controlling temperature in houses or other buildings, in ovens, cookers, boilers, water heaters, cold storage installations, chimneys or flues, steaming apparatus or cabinets, and other industrial or laboratory equipment.

- (E) **Temperature regulators** for setting and maintaining pre-set temperatures on electrical heating appliances (cookers, grills, percolators, etc.) consist essentially of a bi-metal strip which, when deflected by the heat from a shunt resistor on the power circuit, operates a switch to make and break the power circuit, the "On" and "Off" periods (and consequently the temperature of the heating elements) being determined by the position of a manual control dial; the "Full" position renders the bi-metal assembly inoperative and thus, particularly in the initial stages of heating, permits continuous operation of the heating element.

This heading excludes :

- (a) "Thermostatic" or "thermostat" steamers, cabinets, etc., in which the temperature is kept constant by means of a thermostat, which are to be classified in their respective headings.
- (b) Thermostatically controlled valves (**heading 84.81**).

- (F) **Oven-draught regulators** are used, for example, in central heating or air conditioning plants, to control automatically the air intake by reference to the temperature, pressure, etc.

**(II) AUTOMATIC REGULATORS OF ELECTRICAL QUANTITIES, AND
INSTRUMENTS OR APPARATUS FOR AUTOMATICALLY CONTROLLING
NON-ELECTRICAL QUANTITIES THE OPERATION OF WHICH
DEPENDS ON AN ELECTRICAL PHENOMENON VARYING ACCORDING
TO THE FACTOR TO BE CONTROLLED**

The automatic regulators of this heading are intended for use in complete automatic control systems which are designed to bring a quantity, electrical or non-electrical, to, and maintain it at, a desired value, stabilised against any disturbances, by constantly or periodically measuring its actual value. They consist essentially of the following devices :

- (A) **A measuring device** (sensing device, converter, resistance probe, thermocouple, etc.) which determines the actual value of the variable to be controlled and converts it into a proportional electrical signal.

- (B) **An electrical control device** which compares the measured value with the desired value and gives a signal (generally in the form of a modulated current).
- (C) **A starting, stopping or operating device** (generally contacts, switches or circuit breakers, reversing switches or, sometimes, relay switches) which supplies current to an actuator in accordance with the signal received from the control device.

An automatic regulator within the meaning of Note 7 (b) to this Chapter consists of the devices described in (A), (B) and (C) above, whether assembled together as a single entity or in accordance with Note 3 to this Chapter, a functional unit.

If they do not conform to the definitions outlined above, these devices are to be classified as follows :

- (1) Electrical measuring devices generally fall in **heading 90.25, 90.26 or 90.30**.
- (2) Electrical control devices are to be classified in this heading as incomplete automatically controlling instruments or apparatus.
- (3) Starting, stopping or operating devices are generally to be classified in **heading 85.36** (switches, relays, etc.).

Automatic regulators are connected to an electrical, pneumatic or hydraulic actuator, which brings the controlled variable back to the desired value. This actuator may be the clamps which adjust the gap between the electrodes of an arc furnace, the motorised valve which controls the intake of water or steam in a boiler, a furnace, a pulping machine, etc.

The actuators are to be classified in their own appropriate headings (adjustable clamp : **heading 84.25**; motorised or solenoid valve : **heading 84.81**; electro-magnetic positioner : **heading 85.05**; etc.). If the automatic regulator is combined with the actuator, the classification of the whole is to be determined under either Interpretative Rule 1 or Interpretative Rule 3 (b) (see Part (III) of the General Explanatory Note to Section XVI and the Explanatory Note to heading 84.81).

Electronic regulators function on a strictly electrical principle, and not electro-mechanically. Their characteristic features are semiconductors (transistors) or integrated circuits.

These regulators are used not only for electrical quantities, such as voltage, amperage, frequency and power, but also for other quantities such as revolutions per minute, torque, traction force, level, pressure, flow or temperature.

This heading also **excludes** :

- (a) Cut-outs combined, in a single housing, with a voltage regulator or a current regulator, for use in conjunction with internal combustion piston engines (**heading 85.11**).
- (b) "Programmable controllers" of **heading 85.37**.

PARTS AND ACCESSORIES

Subject to the provisions of Notes 1 and 2 to this Chapter (see the General Explanatory Note), parts and accessories of apparatus or appliances of this heading remain classified here.

90.33 - Parts and accessories (not specified or included elsewhere in this Chapter) for machines, appliances, instruments or apparatus of Chapter 90.

This heading covers all parts and accessories for machines, appliances, instruments or apparatus of this Chapter, **other than** :

- (1) Those mentioned in Chapter Note 1, e.g. :
 - (a) Optical elements of glass, not optically worked (**Chapter 70**).
 - (b) Articles of a kind used in machines, appliances, instruments or apparatus, of vulcanised rubber other than hard rubber (e.g., rubber gaskets, washers and the like) (**heading 40.16**), of leather or of composition leather (e.g., leather diaphragms for gas meters) (**heading 42.05**) or of textile material (**heading 59.11**).
 - (c) Parts of general use, as defined in Note 2 to Section XV, of base metal (**Section XV**) or similar goods of plastics (**Chapter 39**).
 - (2) Those covered by Chapter Note 2 (a), which constitute in **themselves** machines, appliances, instruments or apparatus of any particular heading of **Chapter 90** or of **Chapter 84, 85 or 91** (**other than** the residual headings 84.87, 85.48 or 90.33). It therefore follows that separately presented articles of this type must be classified in their respective headings. Examples of such goods include :
 - (a) Vacuum pumps (**heading 84.14**), taps or valves (**heading 84.81**), gears (**heading 84.83**).
 - (b) Electrical motors (**heading 85.01**), transformers (**heading 85.04**), permanent magnets and electro-magnets (**heading 85.05**), primary cells (**heading 85.06**), audio-frequency electric amplifiers (**heading 85.18**), capacitors of **heading 85.32**, resistors (**heading 85.33**), relays (**heading 85.36**), tubes or valves (**heading 85.40**), photocells of **heading 85.41**, high or intermediate frequency amplifiers (**heading 85.43**).
 - (c) Optical elements of **heading 90.01** or **90.02**.
 - (d) Photographic cameras (**heading 90.06**), thermometers and hygrometers (**heading 90.25**).
 - (e) Clock or watch movements (**heading 91.08** or **91.09**).
 - (3) Those identifiable as suitable for use solely or principally with a particular kind of machine, appliance, instrument or apparatus, or with a number of machines, appliances, instruments or apparatus of the same heading of this Chapter; these are classifiable, by application of Chapter Note 2 (b), in the same heading as the relevant machines, appliances, instruments or apparatus.
-

Chapter 91

Clocks and watches and parts thereof

Notes.

- 1.- This Chapter does not cover :
 - (a) Clock or watch glasses or weights (classified according to their constituent material);
 - (b) Watch chains (heading 71.13 or 71.17, as the case may be);
 - (c) Parts of general use defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39) or of precious metal or metal clad with precious metal (generally heading 71.15); clock or watch springs are, however, to be classified as clock or watch parts (heading 91.14);
 - (d) Bearing balls (heading 73.26 or 84.82, as the case may be);
 - (e) Articles of heading 84.12 constructed to work without an escapement;
 - (f) Ball bearings (heading 84.82); or
 - (g) Articles of Chapter 85, not yet assembled together or with other components into watch or clock movements or into articles suitable for use solely or principally as parts of such movements (Chapter 85).
- 2.- Heading 91.01 covers only watches with case wholly of precious metal or of metal clad with precious metal, or of the same materials combined with natural or cultured pearls, or precious or semi-precious stones (natural, synthetic or reconstructed) of headings 71.01 to 71.04. Watches with case of base metal inlaid with precious metal fall in heading 91.02.
- 3.- For the purposes of this Chapter, the expression "watch movements" means devices regulated by a balance-wheel and hairspring, quartz crystal or any other system capable of determining intervals of time, with a display or a system to which a mechanical display can be incorporated. Such watch movements shall not exceed 12 mm in thickness and 50 mm in width, length or diameter.
- 4.- Except as provided in Note 1, movements and other parts suitable for use both in clocks or watches and in other articles (for example, precision instruments) are to be classified in this Chapter.

GENERAL

This Chapter covers certain apparatus designed mainly for measuring time or for effecting some operation in relation to time. It includes timepieces suitable for carrying on the person (watches and stop-watches), other timepieces (ordinary clocks, clocks with watch movements, alarm clocks, marine chronometers, clocks for motor vehicles, etc.), and also time recording apparatus, time interval measuring instruments and time switches; in general, it also covers parts of these articles.

The articles of this Chapter may be of any material (including precious metals) and they may be decorated or trimmed with natural or cultured pearls, or natural, synthetic or reconstructed precious or semi-precious stones (see the Explanatory Notes to headings 91.11 and 91.12).

The classification of clocks and watches combined with some other object (an article of furniture, a lamp, inkstand, paperweight, writing-pad, tobacco jar, cigarette or cigar lighter, handbag, powder compact, cigarette case, propelling-pencil, walking-stick, etc.) is governed by the Rules for the Interpretation of the Nomenclature. The mere inclusion of internal lighting does not remove clocks or watches from this Chapter.

In addition to the exclusions specified in the Explanatory Note to each heading, this Chapter **excludes**, *inter alia* :

- (a) Sundials and hour-glasses (classified according to their constituent material).
- (b) Musical automatons (mechanical singing birds and the like) and musical boxes without time dials (**heading 92.08**).
- (c) Toy clocks and watches and Christmas tree accessories in the form of clocks or watches, such as those without clock or watch movements (**heading 95.03** or **95.05**).
- (d) Automata and other animated displays of a kind used for shop window dressing (**heading 96.18**).
- (e) Works of art, collectors' pieces, and antiques (**Chapter 97**).

A clock or watch is composed of two main parts : the **movement** and the **container** for the movement (case, cabinet, etc.).

Mechanical watch or clock movements consist of the following parts :

- (1) The **body or frame** usually consists of the plate and the bridges. The plate, to which the bridges are fixed by screws and pins, is the basic support of the movement. Some bodies or frames incorporate, apart from the bridges and the plate proper, one or more additional plates (called, for example, dial plate, lower plate cover) intended to hold in place certain parts of the movement (motion work, alarm mechanism, etc.).
- (2) The **device which drives the movement**, usually consisting of weights or springs; the source of energy may also be electricity, or changes in temperature or atmospheric pressure.
- (3) The **train**, i.e., the succession of toothed wheels which connects the driving device to the escapement and enables time to be measured.
- (4) The **motion work**, i.e., the series of parts which links the motion of the minute hand to that of the hour hand. In movements with a dial plate, the motion work is generally located between the dial plate and the plate.
- (5) The **escapement**; this provides the pendulum or balance and hairspring with the necessary energy and ensures that the motion of the train is controlled.

The most usual types of escapement are the anchor or lever, the pin-pallet, the cylinder and the detent.

- (6) The **regulating device**; this regulates the motion produced by the driving mechanism. It consists of a pendulum, a balance-wheel and hairspring combination, a tuning fork, a piezo-electric quartz crystal or any other system capable of determining intervals of time.
- (7) The **winding and hand setting mechanism** (operated by a push piece, a draw piece, or a rocking bar, etc.).

The assembled movement, together with the dial and hands, is fitted in the container or case.

The balance-wheel, the escapement parts and the train parts are finely pivoted. In the cheaper types of clocks and watches, they are pivoted directly in the metal of the plate and bridges, but in better instruments the bearings are jewelled to resist wear.

Clocks and watches may be equipped with a striking work, an alarm mechanism or a set of chimes. Each of these devices requires a special movement.

Mechanical clocks and watches may be wound by hand, by electricity or automatically.

*
* *

The apparatus of this Chapter may be electrical (including electronic), e.g. :

- (A) **Clocks using a dry battery or an accumulator with a low running reserve** (of the order of a few minutes). These clocks have a conventional balance-wheel and hairspring combination or a pendulum, the spring being periodically rewound by an electro-magnet.
- (B) **Clocks connected to the mains, with a high running reserve** (several hours). These are also equipped with a normal balance-wheel and hairspring combination or pendulum, the spring or weight being rewound periodically by an electric motor (synchronous, induction, etc.).
- (C) **Pendulum clocks driven from a dry battery, an accumulator or the mains**; the pendulum is kept swinging by means of an electro-magnetic device.
- (D) **Clocks and watches powered by a dry battery or an accumulator**, with a **regulating device** (tuning fork, piezo-electric quartz crystal, etc.) which is kept oscillating by an **electronic circuit**.
- (E) **Synchronous motor clocks**. These are connected to a controlled frequency current and therefore consist solely of the motor and the train, without a controlling device.

Electric clock systems are dealt with more specifically in the Explanatory Note to heading 91.05.

Some electric clocks are equipped with devices for setting them to the correct time by remote control.

*
* *

For the purposes of Note 3 to this Chapter, which defines watch movements, the following methods of measurement apply :

(a) **Measurement of thickness**

The thickness of a movement is the distance from the outer plane of the dial support (or the visible surface of the display if the latter is incorporated in the movement) to the furthest opposite outer plane, without taking account of any screws, nuts or other fixed parts projecting beyond that plane.

(b) **Measurement of width, length or diameter**

As appropriate, the width, length or diameter (which are determined by their axis of symmetry) is to be measured without taking the winding spindle or crown into consideration.

91.01 - Wrist-watches, pocket-watches and other watches, including stop-watches, with case of precious metal or of metal clad with precious metal.

- Wrist-watches, electrically operated, whether or not incorporating a stop-watch facility :

9101.11 -- With mechanical display only

9101.19 -- Other

- Other wrist-watches, whether or not incorporating a stop-watch facility :

9101.21 -- With automatic winding

9101.29 -- Other

- Other :

9101.91 -- Electrically operated

9101.99 -- Other

The Explanatory Note to heading 91.02 applies, *mutatis mutandis*, to this heading.

In accordance with Note 2 to this Chapter, watches of this heading must have cases wholly of precious metal or of metal clad with precious metal. They may be set with gem stones or with natural or cultured pearls and may be fitted with a cover or have a bracelet of precious metal (gem set or not).

In accordance with Note 7 to Chapter 71, the expression "metal clad with precious metal" means material made with a base of metal upon one or more surfaces of which there is affixed, by soldering, brazing, welding, hot-rolling or similar mechanical means, a covering of precious metal.

However, watches with case of precious metal or of metal clad with precious metal, having a steel back, fall in **heading 91.02**, as do watches with case of base metal inlaid with precious metal.

91.02 - Wrist-watches, pocket-watches and other watches, including stop-watches, other than those of heading 91.01.

- Wrist-watches, electrically operated, whether or not incorporating a stop-watch facility :

9102.11 -- With mechanical display only

9102.12 -- With opto-electronic display only

9102.19 -- Other

- Other wrist-watches, whether or not incorporating a stop-watch facility :

9102.21 -- With automatic winding

9102.29 -- Other

- Other :

9102.91 -- Electrically operated

9102.99 -- Other

This heading covers mechanical and electrical (mostly electronic) timekeeping instruments with case and movement, of a kind intended to be worn or carried and designed to function in all positions, which indicate the time or measure intervals of time, regardless of the thickness of the movement. These include wrist-watches, pocket-watches, fob-watches, watches for carrying in handbags, watches mounted in brooches, rings, etc.

However, timepieces incorporating a stand, however simple, should not be regarded as watches.

The heading covers not only watches with simple movements but also those with complex systems (i.e., incorporating extra elements in addition to those for simply indicating hours, minutes and seconds), for example, chronograph watches, alarm watches, repeaters and striking watches, automatic watches, calendar watches and watches indicating the working reserve.

The heading includes fancy or special-feature watches, such as watertight, shock-proof or antimagnetic watches; eight-day watches; self-winding watches; watches with luminous dials and hands; watches with centre-seconds hands or special dials; handless watches; sports watches (e.g., watches for skin divers, with built-in depth indicator); Braille watches.

Chronometer watches are high precision watches which have been tested in different positions and at variable temperatures. This group also includes **deck watches, but not marine chronometers and the like (heading 91.05)**.

Chronograph watches not only show the time of day but can also be used to measure comparatively short periods of time. Those with hands have two special hands in addition to the usual three hands (for hours, minutes and seconds), i.e., a centre-seconds hand, which makes one complete revolution per minute and can be started, stopped and brought back to zero by means of a pendant or knob, and a hand which records how many minutes the centre-seconds hand has been in operation. Certain chronograph watches have a further seconds hand.

The heading also covers **stop-watches**. Those with hands differ from the chronograph watches described above in that they do not have the usual hour, minute and seconds hands, but only the centre-seconds hand (with or without a further seconds hand) and the minute recording hand. However, electronic stop watches frequently have a subsidiary facility to indicate the time of day.

Chronograph watches and stop-watches may mark fifths, tenths, hundredths and thousandths of a second. They are sometimes equipped with special devices so that the speed of a runner, a motor vehicle, sound, etc., the pulse rate, the output of a machine, etc., can be determined without calculation. Certain of these may also have devices for recording the time.

Wrist-straps presented with their watches (whether or not attached) are classified in this heading.

The heading **excludes** the following when separately presented : watch cases and parts of watch cases (**heading 91.11**), watch movements (**heading 91.08** or **91.10**), watch straps, watch bands and watch bracelets (**heading 91.13**) and parts of movements (generally **heading 91.10** or **91.14**).

The heading further **excludes** :

- (a) Pedometers (**heading 90.29**).
- (b) Clocks with watch movements (**heading 91.03**).
- (c) Instrument panel clocks and clocks of a similar type, for vehicles, aircraft, spacecraft or vessels (**heading 91.04**).

91.03 - Clocks with watch movements, excluding clocks of heading 91.04.

9103.10 - Electrically operated

9103.90 - Other

This heading covers clocks (including alarm clocks but **excluding** clocks of **heading 91.04**) **provided** they are equipped with watch movements, and are essentially constructed for indicating the time of day. Under Chapter Note 3, the expression "watch movements" in this heading means devices regulated by a balance-wheel and hairspring, quartz crystal or any other system capable of determining intervals of time, with a display or a system to which a mechanical display can be incorporated. Such watch movements shall not exceed 12 mm in thickness and 50 mm in width, length or diameter.

It should however be noted that the heading **excludes** :

- (a) Instrument panel clocks and clocks of a similar type, for vehicles, aircraft, spacecraft or vessels; these are classified in **heading 91.04** regardless of the type or thickness of the movement.
- (b) Clocks (including alarm clocks) which do not satisfy the conditions specified in the first paragraph, for example, pendulum clocks, clocks with any other regulating system capable of determining intervals of time and exceeding 12 mm in thickness or exceeding 50 mm in width, length or diameter and clocks with movements without a regulating system (e.g., driven by synchronous motor). These fall in **heading 91.05**.

Alarm clocks are equipped with a striking mechanism (usually with the clock case acting as gong) which is set off at a given time of day fixed in advance by means of a special hand. The striking mechanism is sometimes replaced by a musical device.

Provided they have watch movements, the heading covers, *inter alia* :

- (i) Household or office clocks (including alarm clocks) on feet, on stands, etc.
- (ii) Travelling clocks with cases.
- (iii) Calendar clocks.
- (iv) Eight-day clocks.
- (v) Clocks which strike the hours.
- (vi) Clocks with luminous dials and hands.

The heading **excludes** the following when separately presented : movements (**heading 91.08** or **91.10**), clock cases (**heading 91.12**) and parts of movements (generally **heading 91.10** or **91.14**).

91.04 - Instrument panel clocks and clocks of a similar type for vehicles, aircraft, spacecraft or vessels.

This heading covers all clocks, complete with case and movement, specially constructed for mounting in the instrument panels, steering wheels, rear-view mirrors, etc., of vehicles (motor vehicles, motor bicycles, etc.), aircraft, spacecraft or vessels, regardless of the type and thickness of the movement. They are usually electric (mostly electronic) clocks, self-winding clocks, or mechanical eight-day clocks.

The heading also covers **vehicle chronographs**, which, in addition to the usual hands, have a chronograph hand, a minute recording hand and a running-time recorder.

The heading **excludes** the following when presented separately : movements (**headings 91.08 to 91.10**), clock cases (**heading 91.12**) and parts of movements (generally **heading 91.10** or **91.14**).

91.05 - Other clocks.

- Alarm clocks :

9105.11 -- Electrically operated

9105.19 -- Other

- Wall clocks :

9105.21 -- Electrically operated

9105.29 -- Other

- Other :

9105.91 -- Electrically operated

9105.99 -- Other

This heading covers timekeepers, **not** classified elsewhere in the Chapter, essentially constructed for indicating the time of day; they must, therefore, have **movements other than watch movements**. Clocks and alarm clocks with watch movements (as defined by Chapter Note 3) are **excluded (heading 91.03)**.

The clocks classified here may be weight, spring, electrically or electronically operated; they are generally regulated by a pendulum, a balance-wheel and hairspring, a tuning fork or a piezo-electric quartz crystal. They are often equipped with a striking mechanism (hours, half-hours, or quarters) acting on a bell or gong, or a multi-gong chiming mechanism.

Subject to the above conditions, the heading includes :

Public clocks; clocks for shops, the home, etc.; period clocks; special regional forms of fancy clocks (Neuchâtel clocks, Paris clocks, cuckoo-clocks, Westminster chiming clocks, etc.); "marionette" clocks; coin-operated clocks; astronomical or observatory clocks; self-winding clocks (wound, for example, by variations of temperature or atmospheric pressure); alarm clocks; centre-seconds clocks; electronic clocks; piezo-electric quartz crystal clocks.

The heading also includes **clocks for electric clock systems** as used in towns, factories, telephone exchanges, stations, airports, banks, hotels, schools, hospitals, etc. These systems consist of a precision-regulated master clock and the secondary clocks which it drives by remote control. The **master clock** has usually a mechanical or electrical movement and a contact device for transmitting the driving impulses to the secondary clocks. The **secondary clocks**, indicating the hours and minutes, receive their driving impulses at the end of each minute or half-minute. They have an electro-magnet with a rotating or oscillating armature which actuates the train and the motion work; each impulse from the master clock advances the minute hand by one minute or half-minute. The train may also be driven by an electrically wound spring or directly by an electric motor. Seconds-indicating secondary clocks are provided with centre-seconds hands in addition to the hour and minute hands. In this case, the master clock must have a special device emitting impulses each second, besides the minutes contact. It should, however, be noted that the heading **excludes** secondary clocks with only minute and seconds hands or with seconds hands alone (for regulating watches, etc.); these fall in **heading 91.06**.

Secondary clocks may be used indoors or outdoors, may have two or more dials, and may be designed for placing on a flat surface such as a table.

Master clocks sometimes control other electric appliances, such as time-registers, watchmen's tell-tales, switching appliances, recorders, signals (bells, sirens, lamps), beacons or ground-lights.

The heading also includes groups of mains-driven synchronous clocks, and pneumatic installations operated by compressed air, used for relaying and synchronising time.

The heading also covers **marine or similar chronometers**, i.e., high precision stationary timepieces, mainly designed for keeping time on ships though some are also used for scientific purposes. These instruments are generally larger than chronometer watches and are fitted in boxes; they may or may not be mounted in gimbals. They usually run either two or eight days at one winding, and generally have a detent escapement, a fusee, a device for converting the force of the mainspring into constant pressure, and a working reserve indicator.

The heading **excludes** the following when presented separately : clock cases (**heading 91.12**), movements (**heading 91.09 or 91.10**) and parts of movements (generally **heading 91.10 or 91.14**).

The heading further **excludes** :

- (a) Deck watches (**heading 91.01 or 91.02**).
- (b) Instrument panel clocks and clocks of a similar type, for vehicles, aircraft, spacecraft or vessels (**heading 91.04**).

91.06 - Time of day recording apparatus and apparatus for measuring, recording or otherwise indicating intervals of time, with clock or watch movement or with synchronous motor (for example, time-registers, time-recorders).

9106.10 - Time-registers; time-recorders

9106.90 - Other

Provided they are operated by a movement of the watch or clock type (including secondary or synchronous motor clock movements) or by a synchronous motor with or without reduction gear, this heading covers :

(i) A wide range of apparatus for recording the time of day at which some action or operation is effected;

and (ii) Apparatus, **not** elsewhere specified, for measuring, recording or otherwise indicating intervals of time.

Such apparatus may have dials indicating hours, minutes or seconds. However, certain instruments of this heading, such as time-registers, watchmen's tell-tales and pigeon-timers, are sometimes constructed without dials.

The heading includes :

- (1) **Time-registers** for recording the arrival and departure of employees in factories, workshops, etc. These consist of a case containing a clock, a date marker actuated by the clock movement, a hammer and an inking ribbon. The employee inserts his card in the machine and operates the hammer either mechanically or electrically, thus stamping the card with the exact date, hour and minute. The number of hours he has been present can then be calculated from the card. Mechanical eight-day clocks and electric clocks are most commonly used. They may be independent, connected to a master clock or themselves serve as master clocks. In the last case, they sometimes set off a striking mechanism or a siren (see the Explanatory Note to heading 91.05).
- (2) **Time-recorders** similar to the time-registers described in (1) above but marking also the month, the year, a serial number or other indications; some of these instruments are also equipped with a device for totalling up working hours (e.g., per day or per week). These instruments are also used for stamping mail or accounting documents, dating costing slips, etc.
- (3) **Watchmen's tell-tales**, usually portable. These have a clock movement actuating a paper dial or a dating appliance. By means of a special key, the watchman records his periodical visits (hour, minute, number of post) at the control points by perforating or stamping the revolving dial, or by printing with an inking tape on a paper strip.
- (4) **Pigeon-timers** for recording the arrival of homing pigeons at the end of a race. These are portable cases containing a clock, a drum for the rings and a device which marks the day, hour, minute and second of arrival either by printing on a tape, or by perforating a disc or paper band.
- (5) **Master frequency control instruments** used with systems of synchronous motor clocks, time switches, etc. These instruments have a dial indicating the standard time, the time of the synchronous motor clock and the time difference between the two. They consist essentially of a mechanism for indicating the time differences, a secondary clock movement, controlled by a master clock and indicating the standard time, a synchronous motor clock movement and various contact, signalling or regulating devices.

- (6) **Timers** for measuring the duration of short-lived phenomena limited by opening and closing electric contacts. These timers are used for checking electricity supply meters, for measuring the speed of human reactions, etc. Their principal parts are a synchronous motor, an electro-magnetic coupling and a meter with a dial indicating seconds and hundredths of seconds; the whole is contained in a case. When the instrument is in operation, the synchronous motor runs continuously and is coupled to the meter for the duration of the phenomenon.

Electric or electronic timers without a movement of the clock type or a synchronous motor are excluded (heading 90.31).

- (7) **Table or stadium timers for sporting events**, indicating time of arrival or playing time in minutes and seconds.

Stadium clocks with clock dials are, however, excluded (heading 91.05).

- (8) **Stop-clocks and other timers used for measuring the duration of some processes**. These have a seconds dial, a dial for totalling minutes, and a lever for starting and stopping.

- (9) **Timers for registering the duration of telephone conversations**; these operate like stop-clocks and may have a striking mechanism.

- (10) **Time-recorders for sporting events**, with synchronous motor movement, usually controlled by a quartz crystal oscillator. These can record time correctly to one hundredth of a second, and also the order of arrival or departure; they may operate either photographically, or by printing on or perforating a paper tape moving at constant speed.

Items of auxiliary sporting timekeeping apparatus (stands and holders for timers, starting gates, photoelectric cell devices, acoustical, electric or radio telegraphic transmission instruments, etc.) are classified in their own appropriate headings.

- (11) **Process timers** for short periods of time. These ring a bell after a given number of minutes (usually up to 60); they are equipped with an alarm movement and a dial normally bearing the figures 0-10, 0-30 or 0-60. They are used in all fields where the duration of a process must be controlled.

However, time switches, which differ from process timers in that instead of actuating a striking system at a given time, they "make" or "break" an electric circuit, are excluded (heading 91.07).

- (12) **Secondary clocks** (operated by a master clock) with only minute and seconds hands or with seconds hands alone (for regulating watches, etc.).

- (13) **Billiards meters** which employ a clock movement to indicate the time in play or the amount payable based on that time.

- (14) **Time clocks for chess-players**, consisting of two clock or watch movements with dials indicating time in hours and minutes, and two buttons or levers by which the movements can be started and stopped.

The heading excludes the following when presented separately : cases for the apparatus described above (classified either in heading 91.12 or in their respective headings, see the Explanatory Note to heading 91.12), watch or clock movements (headings 91.08 to 91.10), and parts of such movements (generally heading 91.10 or 91.14).

The heading also excludes :

- (a) Instruments and apparatus of **Chapter 90**, whether or not having a movement of the watch or clock type, but not equipped with a time dial, such as recording tide gauges and seismographs (heading 90.15), barographs and thermographs (heading 90.25), manometers (heading 90.26), gas, liquid or electricity supply or production meters (heading 90.28), revolution counters, production counters, speed indicators, tachometers, taximeters, pedometers and instruments and apparatus for measuring short time intervals by counting (heading 90.29), opisometers (heading 90.31).
- (b) Chronometer watches, chronograph watches and stop-watches (heading 91.01 or 91.02).
- (c) Metronomes (heading 92.09).

91.07 - Time switches with clock or watch movement or with synchronous motor.

This heading covers devices which do **not** have the character of clocks of heading 91.05, but are mainly designed to make or break electric circuits automatically at given times, usually at times determined according to a previously established daily or weekly programme. To be included in this heading these devices **must have** a movement of the watch or clock type (including secondary or synchronous motor clock movements) or a synchronous motor with or without reduction gear.

Time switches are used for the control of lighting circuits (for public places, shop windows, staircases, illuminated signs, etc.), heating circuits (water heaters, etc.), cooling installations, pumps, two-rate electricity supply meters, etc. They consist essentially of a mechanical or electric movement of the watch or clock type or a synchronous motor, usually a dial with or without hands, a time-regulating device (levers and pins), together with systems of driving relays, switches and commutators. The whole is enclosed in a case with terminals. The dial is usually marked in hours and sometimes also in days and months; levers or pins around its periphery actuate the contact devices at the desired times.

Time switches may be set in action by thermostats, pressure regulators, water level regulators, etc.

The heading also includes **switches for making and breaking the circuit supplying electrical apparatus** (television receivers, irons, washing machines, billiard table lights, etc.), switching on when coins are inserted and switching off through the action of a synchronous motor, the interval being determined by the number of coins inserted.

The heading **excludes** the following when presented separately : cases for the devices described above (classified either in **heading 91.12** or in their respective headings, see the Explanatory Note to heading 91.12), watch or clock movements (**headings 91.08 to 91.10**) and parts of such movements (generally **heading 91.10** or **91.14**).

91.08 - Watch movements, complete and assembled.

- Electrically operated :

- 9108.11 -- With mechanical display only or with a device to which a mechanical display can be incorporated
- 9108.12 -- With opto-electronic display only
- 9108.19 -- Other
- 9108.20 - With automatic winding
- 9108.90 - Other

This heading applies to assembled watch movements without cases, that is to say, complete and ready for use. These movements may be of five principal types :

- (1) mechanical movements;
- (2) electronic movements of the balance-spring type;
- (3) electronic movements with a flexural resonator (tuning fork);
- (4) quartz movements with an analogue time display (hands);
- (5) quartz movements with an electronic digital time display (light-emitting diodes (LED) or liquid crystal display (LCD)).

Mechanical or electronic movements with an analogue time display may be presented without dial or hands. In electronic (*solid state*) movements with a digital time display, the display cell forms an integral part of the movement; without it the movement cannot function and hence cannot be regarded as complete and assembled within the meaning of this heading.

Under Chapter Note 3, the expression "watch movements" in this heading means devices regulated by a balance-wheel and hairspring, quartz crystal or any other system capable of determining intervals of time, with a display or a system to which a mechanical display can be incorporated. Such watch movements shall not exceed 12 mm in thickness and 50 mm in width, length or diameter. These movements are therefore mainly intended for the watches and clocks of headings 91.01 to 91.03, but they remain classified here even if for incorporation in other articles of this Chapter or even in instruments or apparatus of other Chapters (measuring or precision instruments, pedometers, explosive devices, etc.).

The heading **excludes** movements not conforming to the above conditions (**heading 91.09 or 91.10**), and spring-operated motors of **heading 84.12**.

The movements of this heading may be unpolished, polished, nickel-plated, rhodium-plated, silvered, gilded, varnished, etc.

Battery or accumulator powered watch movements are classified in this heading, whether or not the battery or accumulator is present.

91.09 - Clock movements, complete and assembled.

9109.10 - Electrically operated

9109.90 - Other

This heading covers all assembled movements of the clock type, that is to say, complete and ready for use; those having an analogue time display device (hands) may be with or without dial or hands.

The movements of this heading are mainly intended for the goods of headings 91.04 to 91.07, but they remain classified here even if meant for incorporation in instruments or apparatus of other Chapters (measuring or precision instruments, meters, explosive devices, etc.).

The heading **excludes** :

- (a) Spring-operated or weight-operated motors, etc., not fitted, nor adapted to be fitted, with escapements, of **heading 84.12** (e.g., those for operating musical boxes).
- (b) Watch movements as defined in Chapter Note 3 (see the Explanatory Note to **heading 91.08**).

The heading therefore covers, *inter alia*, movements regulated by a balance-wheel and hairspring or by any other regulating system capable of determining intervals of time, and exceeding 12 mm in thickness or 50 mm in width, length or diameter; pendulum movements; electrical clock movements, with or without regulators (secondary clock movements, synchronous clock movements, etc.).

To be classified here, synchronous and secondary clock movements **must** incorporate, in addition to the synchronous motor or the electro-magnet, a clock train, i.e., a train containing parts such as the first, second, third and fourth wheel, the minute wheel and hour wheel. Separately presented electro-magnets and synchronous motors are classified in their own appropriate headings, whether or not they are equipped with reduction gears regulating the speed of the shaft.

These clock movements may be unpolished, polished, nickel-plated, rhodium-plated, silvered, gilded, varnished, etc.

91.10 - Complete watch or clock movements, unassembled or partly assembled (movement sets); incomplete watch or clock movements, assembled; rough watch or clock movements.

- Of watches :

9110.11 -- Complete movements, unassembled or partly assembled (movement sets)

9110.12 -- Incomplete movements, assembled

9110.19 -- Rough movements

9110.90 - Other

Movement set (chablon) means a **complete set** of the components of a watch or clock movement, unassembled or partly assembled (marketed in this form). In the case of mechanical display movements, the dial and hands may or may not be included.

Incomplete mechanical watch or clock movement means a movement which is mounted but lacks certain parts other than the dial, hands or winding spindle (e.g., the escapement or the barrel bridge).

Incomplete fully electronic watch or clock movement means a movement which is mounted but lacks certain parts other than the battery (e.g., the display, part of the electronic circuit or components thereof).

Incomplete electronic watch or clock movement with mechanical display means a movement which is mounted but lacks certain parts other than the dial, hands, setting spindle or battery (e.g., the electronic circuit or components thereof, the motor).

Rough watch or clock movement means the unassembled parts of a watch or clock movement consisting of the plate (and any additional plates), bridges, train, motion work, winding and setting mechanism, and additional mechanisms such as automatic winding device, calendar mechanisms, chronograph, alarm, etc., but without escapement, balance-wheel and hairspring or other regulating device, mainspring, dial or hands. These may be presented with or without a barrel.

91.11 - Watch cases and parts thereof.

9111.10 - Cases of precious metal or of metal clad with precious metal

9111.20 - Cases of base metal, whether or not gold- or silver-plated

9111.80 - Other cases

9111.90 - Parts

This heading covers :

(A) **Cases for the watches of heading 91.01 or 91.02** (pocket-watches, wrist-watches, chronograph watches, etc.), with or without glasses, presented without movements.

(B) **Parts of these cases**, including :

- (1) **The case body**, i.e., the framework of the case. It may have **hinges** for the bottom, and in pocket-watches the case bodies have also hinges for the dome and the bezel.
- (2) **The pendant**, welded to the case body, with the **watch bow** (for pocket-watches) and the **bushings**.
- (3) **The dome**, the inner cover protecting the movement (does not exist in ordinary watches).
- (4) **The bezel**, the part which holds the glass. The edge for holding the glass in place is more especially referred to as the **groove**.
- (5) **The bottom**, which closes the watch on the opposite side from the glass. Ordinary watches have only one, while hunters have a second similar piece (the **cover**) which protects the glass.

Cases for wrist-watches have no pendant or watch bow proper, but have **lugs** for attaching the wrist-straps. These lugs consist of several parts, including the **bar** which may be fixed or spring-operated. Some ladies' wrist-watches have no lugs but are provided with **claws** for attaching a cord.

Wrist-watch cases often consist of only two parts, the case body and the bottom being combined. Sometimes, the bottom and the bezel each bear one part of the dome, or the bezel and the case body are in one piece. In more highly finished types, the movement is first enclosed in a **protective dome**.

Watch cases and parts thereof may be of any material. They are mainly made of base metal (steel, nickel, etc., polished, chromium-plated, silvered or gilded), or of precious metal, or of metal clad with precious metal, or sometimes of plastics, ivory, agate, mother-of-pearl or tortoise-shell. They may be ornamented (engine-turned, engraved, chased, trimmed with natural or cultured pearls, natural, synthetic or reconstructed precious or semi-precious stones, etc.).

The heading **excludes** :

- (a) Simple protective covers for watches, nor watch glasses; these are classified in their own appropriate headings.
- (b) Parts of general use as defined in Note 2 to Section XV (which include springs for watch cases), of base metal (**Section XV**) and similar goods of plastics (**Chapter 39**).
- (c) Clock cases and cases of a similar type for other goods of this Chapter, and parts thereof (**heading 91.12**).

91.12 - Clock cases and cases of a similar type for other goods of this Chapter, and parts thereof.

9112.20 - Cases

9112.90 - Parts

This heading covers clock cases, and, **provided** they are of a type similar to clock cases, cases for other goods of this Chapter; **subject** to this reserve, the heading therefore includes cases for alarm clocks, marine chronometers, motor vehicle clocks, time-registers, time-recorders or time-stamps, time interval meters (minute timers, seconds timers, etc.) or for other clocks of this Chapter. Such cases remain in the heading whether with or without glasses, and whether or not finished. But the heading **excludes** cases of a type not similar to normal clock cases but rather of the type used for scientific apparatus, electricity supply meters, etc. (cases for timers, time-recorders or time switches are sometimes of this kind); such cases are classified in their own appropriate headings.

The cases classified here are made in widely different forms; they are usually of metal (including precious metal), wood, plastics, leather, tortoise-shell, mother of pearl, marble, alabaster, ceramic materials, onyx, agate or ivory. They may be ornamented, trimmed with natural or cultured pearls or natural, synthetic or reconstructed precious or semi-precious stones, or combined with motifs, sculptures, statuettes, figures of animals, etc.

The heading also includes parts of clock cases, such as bezels, frames, pedestals, stands and feet.

The heading **excludes** :

- (a) Protective covers, usually of glass, presented separately (**heading 70.20**).
- (b) Parts of general use as defined in Note 2 to Section XV (which include springs for clock cases), of base metal (**Section XV**) and similar goods of plastics which are classified in **Chapter 39**.
- (c) Watch cases (**heading 91.11**).

91.13 - Watch straps, watch bands and watch bracelets, and parts thereof.

9113.10 - Of precious metal or of metal clad with precious metal

9113.20 - Of base metal, whether or not gold- or silver-plated

9113.90 - Other

This heading covers all kinds of watch straps, watch bands and watch bracelets, i.e., all devices for fastening watches to the wrist.

Watch straps, watch bands and watch bracelets may be of any material, for example, base metal, precious metal, leather, plastics or textile material. They may also be clearly decorative in character without this affecting their classification.

The heading also includes parts of watch straps, watch bands and watch bracelets, identifiable as such, of any material.

The heading **excludes** :

- (a) Other attaching devices (neck chains, pendant bands, watch chains, rings, brooches, etc.) which are classifiable in their appropriate headings.
- (b) Buckles and buckle-clasps of precious metal or of metal clad with precious metal (**heading 71.15**) or of base metal (**heading 83.08**).
- (c) Watch straps, watch bands and watch bracelets presented with their watches but not attached thereto (**heading 91.01** or **91.02**).

91.14 - Other clock or watch parts.

9114.10 - Springs, including hair-springs

9114.30 - Dials

9114.40 - Plates and bridges

9114.90 - Other

This heading covers all clock or watch parts **other than** :

(a) Parts excluded by Chapter Note 1 :

- (1) Weights, clock or watch glasses, watch chains, ball bearings and bearing balls (e.g., for self-winding watches).
- (2) Parts of general use as defined in Note 2 to Section XV, e.g., screws (bridge, crown, dial, ratchet, click, end-stone cap or index disc, yoke, setting lever, etc.), taper pins, clock chains, figures for dials, of base metal (**Section XV**) or similar goods of plastics (**Chapter 39**) or of precious metal or of metal clad with precious metal (generally **heading 71.15**).

These parts are classified in their own appropriate headings. However, clock and watch springs (mainsprings, hairsprings, etc.) remain in this heading.

(b) Parts specifically included in other headings of this Chapter (e.g., the complete and assembled movements of **heading 91.08** or **91.09**, the movement sets, incomplete watch or clock movements, assembled or rough watch or clock movements of **heading 91.10**, the cases of **heading 91.11** or **91.12** and the watch straps, watch bands and watch bracelets of **heading 91.13**).

Except as provided in paragraph (a) or (b) above, parts suitable for use both in clocks or watches and in other articles, for example, in toys, meters or measuring or precision instruments (springs, trains, jewels, hands, etc.) fall in this heading (see Chapter Note 4). However, the heading **does not cover** parts which are not clearly clock or watch parts (e.g., printing or totalling devices for time-registers, and certain other parts used in articles of heading 91.06 or 91.07).

The heading includes identifiable blanks of clock or watch parts, but it **excludes** metal pieces not yet recognisable as clock or watch parts (e.g., plates, bridges, etc., direct from the lathe or roughly cut to shape, without drilling, hollowing, etc.). These are classified according to their constituent material.

The clock or watch parts of this heading may be unpolished, polished, nickel-plated, rhodium-plated, silvered, gilded, varnished, etc., or jewelled.

Subject to the above provisions, the principal clock or watch parts classified here are :

(A) PARTS OF WATCH MOVEMENTS (regardless of complexity of system)

These include :

- (1) **Frame** : plate (and any additional plates), bridges (of the barrel, centre wheel, third wheel, fourth wheel, balance-wheel (cock), escapement, setting wheel, etc.).
- (2) **Driving mechanism** : mainspring, barrel, barrel cover, barrel arbor and ratchet, click, click spring.

- (3) **Train** : centre wheel and pinion, third wheel and pinion, fourth wheel and pinion.
- (4) **Motion work** : cannon pinion, minute wheel pinion and minute wheel, hour wheel.
- (5) **Escapement** (anchor or lever, pin pallet, cylinder, detent, etc.) : escape wheel and pinions, lever, pallet staff, rollers, pallet stones, impulse pin, cylinder.
- (6) **Regulating device** : balance, balance staff, hairspring (flat, Bréguet, cylindrical), tuning-fork, stud, collet, regulator, index stud, end-stone cap or index disc, regulator spring, lower cap jewel end-piece, including special parts for shock-proof devices.
- (7) **Winding and setting mechanism** : crown, winding stem and pinion, clutch wheel, setting wheels, crown ratchet wheel, crown wheel core, yoke (rocking bar), setting lever, setting lever spring and yoke springs.
- (8) **Parts of electronic movements** : circuits for watches comprising, for example, an insulating base carrying printed connections and other discrete components formed otherwise than by printing (for example, coils, capacitors, resistors, diodes and transistors), possibly together with an integrated circuit.
- (9) **Platform escapements** consist of the plate, bridges, escapement, balance-wheel and hairspring, and the regulator of a clock or watch movement, with or without train. They remain classified here whether assembled with the escapement regulated, or unassembled.

Assembled platform escapements may be intended for incorporation in a whole range of appliances using clock or watch movements (time-registers, time switches, etc.), and sometimes also in small clocks or alarm clocks.

(B) PARTS OF CLOCK OR ALARM CLOCK MOVEMENTS

Many of the parts of these movements are similar in principle to parts of watch movements but are larger.

Parts peculiar to clock movements include weight drums, pendulums, including compensated pendulums (mercury, invar stem, etc.), crutches, verges, verge wheels, recoil escapements, dead-beat (or Graham) escapements, etc., independent winding keys. Parts of alarm clock movements include fixed winding keys and knobs for setting.

(C) STRIKING WORK PARTS

- (1) **Striking work of alarm clocks** : stop or detent, notched collar, release wheel, escape wheel, index staff, pallet, striking hammer, etc.
- (2) **Clock striking work** (locking plate type, rack type, etc.) : drum or barrel and barrel wheel, locking plate, great wheel, pin wheel, third wheel, warning wheel, fly, detents, levers or fly springs, repeater rack, snail, hammer, lifting piece, arbor, fly wheel, gathering pallet, rack, ball, gong, chimes.

(D) JEWELS

This category includes **only** worked stones (jewels), i.e., those which have been turned, cut, polished, drilled, hollowed, etc., or mounted (in a setting or a screw). Unworked or roughly sawn jewels are **excluded** (**Chapter 71**). Watchmakers' jewels are usually extremely small, their diameter and thickness rarely exceeding 2 mm and 0.5 mm, respectively.

The principal stones used in clock- or watch-making are natural or synthetic rubies, sapphires and garnets, and occasionally diamonds. In cheap articles, glass is sometimes used, or the jewels are replaced by metal caps.

Clock or watch jewels bear the names of parts which they support, e.g., centre wheel jewels, third wheel jewels, fourth wheel jewels, escape wheel jewels, pallet staff jewels and balance-wheel jewels. The bearing of a cylindrical pivot consists of a drilled jewel or of a drilled jewel and a solid jewel (end-stone). There are also bearings consisting of conical cavity jewels.

In addition to round jewels used as bearings, clocks and watches with a lever escapement usually also contain three special jewels : two pallet stones (bevelled jewels attached to each end of the pallet) and an impulse pin (a jewel, usually of semi-round or triangular section, intended for the roller).

The jewelling process may be carried out by hand setting, by using a mounted jewel, or, more usually, by pressing.

(E) DIALS

Dials generally bear divisions or figures indicating the hours, minutes and seconds. They may be flat or curved. They are usually of silvered, gilded, painted, oxidised or otherwise coated brass, of enamelled copper, of gold or silver, or sometimes of paper, glass, plastics or pottery. The figures and inscriptions are produced by various methods (transfer, painting, stamping, etc.). Dials may have luminous figures or symbols.

Dials are fixed to the plate (or to an additional plate, called " dial plate ") by screws, pins or an outer ring of metal.

(F) HANDS

These indicate hours, minutes and seconds. The heading also covers special hands for chronograph watches and hands for alarm clocks, etc. Watch or clock hands may be flat or curved, and may be made of steel, brass or copper, generally polished, oxidised, nickel-plated, chromium-plated, silvered, gilded or lacquered; they are sometimes of gold and even of bone. Luminous hands have " windows " filled with a compound based on radioactive salts (radio-thorium, meso-thorium, etc.). There are innumerable types of hands, designed to suit the type of dial.

Chapter 92

Musical instruments; parts and accessories of such articles

Notes.

1.- This Chapter does not cover :

- (a) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
- (b) Microphones, amplifiers, loud-speakers, head-phones, switches, stroboscopes or other accessory instruments, apparatus or equipment of Chapter 85 or 90, for use with but not incorporated in or housed in the same cabinet as instruments of this Chapter;
- (c) Toy instruments or apparatus (heading 95.03);
- (d) Brushes for cleaning musical instruments (heading 96.03), or monopods, bipods, tripods and similar articles (heading 96.20); or
- (e) Collectors' pieces or antiques (heading 97.05 or 97.06).

2.- Bows and sticks and similar devices used in playing the musical instruments of heading 92.02 or 92.06 presented with such instruments in numbers normal thereto and clearly intended for use therewith, are to be classified in the same heading as the relative instruments.

Cards, discs and rolls of heading 92.09 presented with an instrument are to be treated as separate articles and not as forming a part of such instrument.

GENERAL

This Chapter covers :

- (A) Musical instruments (headings 92.01 to 92.08).
- (B) Parts and accessories of these instruments (heading 92.09).

Some musical instruments (pianos, guitars, etc.) may have an electrical sound pick-up and amplifying device; they nevertheless remain classified in their respective headings in this Chapter, **provided** that, without the electrical equipment, they can still be used like the similar conventional-type instruments. The electrical equipment itself, **unless** forming an integral part of the instrument or housed in the same cabinet as the instrument, is however in all cases **excluded (heading 85.18)**.

Electrical or electronic instruments (other than the automatic pianos of heading 92.01) which are not suitable for playing without the electrical or electronic equipment fall in heading 92.07 (see the corresponding Explanatory Note). The latter heading therefore covers, for example, electrostatic, electronic or similar guitars, organs, pianos, accordions, carillons.

The instruments and apparatus of this Chapter may be of any material, including precious metal or metal clad with precious metal, and may incorporate precious or semi-precious stones (natural, synthetic or reconstructed).

In accordance with Note 2 to this Chapter, bows and plectra used in playing the string musical instruments of heading 92.02, and sticks (including soft-headed sticks) and mallets for percussion musical instruments of heading 92.06, when presented with those instruments in numbers normal thereto and clearly intended for use therewith, are to be classified with the relative instruments and **not** in heading 92.09. However, cards, discs and rolls of heading 92.09 presented with an instrument are to be treated as separate articles and not as forming a part of such instrument.

In addition to the exclusions specifically mentioned in the Explanatory Notes below, this Chapter also **excludes** :

- (a) Electronic musical modules (**heading 85.43**).
- (b) Musical instruments which can be clearly recognised as toys because of the character of the material used, their rougher finish, the lack of musical qualities or by any other characteristics (**Chapter 95**). Examples include certain mouth organs, violins, accordions, trumpets, drums, musical boxes.
- (c) Collectors' pieces (**heading 97.05**) (e.g., instruments having an historical or ethnographical interest), or antiques of an age exceeding 100 years (**heading 97.06**).

92.01 - Pianos, including automatic pianos; harpsichords and other keyboard stringed instruments (+).

9201.10 - Upright pianos

9201.20 - Grand pianos

9201.90 - Other

This heading covers :

- (1) **Pianos**, with a keyboard and strings struck by hammers, whether or not fitted with an electrical sound pick-up and amplifying device, i.e. :
 - (a) **Upright pianos**, which have a sound-board on which the strings are mounted vertically, and when overstrung, with the bass strings crossing the remainder;
 - (b) **Grand pianos** (concert and baby grands), which have strings mounted horizontally in an elongated casing.

This group includes **automatic pianos**, whether or not incorporating a keyboard, which are played, e.g., by means of perforated rolls of paper or paperboard; they may be mechanically, pneumatically or electrically operated.

However, " electronic pianos " and electronic musical instruments which may be fitted to pianos in order to produce the sound effects of other instruments while the piano is being played fall in **heading 92.07** (see the General Explanatory Note to this Chapter).

- (2) **Harpsichords and other keyboard stringed instruments such as spinets and clavichords.**

◦◦◦

Subheading Explanatory Note.

Subheadings 9201.10 and 9201.20

These subheadings also include **automatic pianos**.

92.02 - Other string musical instruments (for example, guitars, violins, harps).

9202.10 - Played with a bow

9202.90 - Other

This heading covers :

(A) Instruments played with a bow

The chief examples of such instruments are **violins**, **viols** and **violas** (the latter being slightly larger than ordinary violins), **violoncellos** and **bass-viols** and **double basses**.

(B) Other string musical instruments

This group includes :

(1) **Plucked string instruments**, in which sound vibrations are obtained by momentarily displacing the string out of alignment, either with the fingers or with a small pointed piece (plectrum) of wood, ivory, tortoise-shell, plastics, etc. Examples include :

- (a) **Mandolines** (Neapolitan mandolines with a deeply cambered back, flat mandolines, mandolas, etc.).
- (b) **Guitars.**
- (c) **German lutes** (a kind of mandoline).
- (d) **Banjos** (a long-necked instrument having a circular flat-backed body with a flat belly formed by a drumskin).
- (e) **Ukuleles** (small guitars with a thick neck).
- (f) **Zithers (or cithers)**. These have a flat sound-box of approximately trapezoidal shape, and a large number of strings usually of metal.
- (g) **Balalaikas.**
- (h) **Harps**. These are stringed instruments plucked with the fingers; they have a triangular frame and strings of graduated lengths.

(2) **Other instruments**, such as :

- (a) **Aeolian harps**. These are used in gardens, etc. They consist of a number of strings mounted on a sounding box; when placed in a current of wind they produce natural harmonics.
- (b) **Czimbalo**s. These have a frame on which steel strings are mounted. They are played by striking with soft-headed hammers, and are used in gipsy orchestras.

In some instruments, particularly guitars, the sound may be electronically amplified without excluding them from this heading; however, electronic instruments such as guitars without sound-boxes fall in **heading 92.07** (see the General Explanatory Note to this Chapter).

[92.03]

[92.04]

92.05 - Wind musical instruments (for example, keyboard pipe organs, accordions, clarinets, trumpets, bagpipes), other than fairground organs and mechanical street organs.

9205.10 - Brass-wind instruments

9205.90 - Other

This heading covers wind musical instruments **not** specified in **heading 92.08** (fairground organs, mechanical street organs, sound signalling instruments, etc.) though these could, in certain respects, also be considered wind instruments.

The heading includes :

(A) Brass-wind instruments.

The term “brass-wind” refers to the tone quality of instruments used in a particular section of an orchestra, rather than to the constituent material of the instruments. This group includes instruments, generally of metal (brass, nickel-silver, silver, etc.) in the form of a tapered tube terminating in a bell; they may be coiled to various degrees. They are fitted with a hollowed-out mouthpiece, sounded with the lips and usually valve operated. They include cornets, trumpets (simple trumpets, orchestral trumpets, etc.), bugles, saxhorns, baritone and bass bugles, bombardons (bass-tuba), bass sousaphones, trombones (valve or sliding type), orchestral horns (e.g., French horns) and non-valved horns used in orchestras (e.g., hunting horns).

(B) Other wind musical instruments.

This group covers :

- (1) **Keyboard pipe organs** (church-organ type). These are wind instruments in which the movement of the keys is transmitted to the pipes electrically, electro-pneumatically or mechanically.

The heading also covers the console and the organ case (i.e., the woodwork in which the organ is contained and which is usually of decorative design) when presented with the organ. If presented separately, they are **excluded (heading 92.09)**.

This heading **does not include** orchestrions, street organs and similar pipe instruments, not fitted with a keyboard but operated either automatically or by a handle (**heading 92.08**). Electronic organs are classified in **heading 92.07**.

- (2) **Harmoniums and similar keyboard instruments with free metal reeds, but without pipes.**

- (3) **Accordions and similar instruments, concertinas, bandoneons and foot-blown accordions.**

The heading excludes electronic accordions (see the Explanatory Note to **heading 92.07**, and the General Explanatory Note to this Chapter).

- (4) **Mouth organs (harmonicas).**

- (5) **So-called “wood-wind” instruments.** These instruments consist essentially of a tube (of wood or reed, metal, plastics, ebonite, glass) with holes generally fitted with keys and rings. They are usually sounded with reeds. This group includes flutes, recorders, fifes, flageolets, oboes, clarinets, cors anglais, bassoons, saxophones and sarrusophones.

The group also covers ocarinas (small egg-shaped instruments made of metal or clay, giving a flute-like sound), and sliding whistles (of metal or ebonite).

- (6) **Other wind instruments** (e.g., bagpipes, Breton pipes or the musette, consisting of a wind-chest or bag made of skin or from a bladder, and three to five pipes - one pipe being the chanter and the others the drones).

92.06 - Percussion musical instruments (for example, drums, xylophones, cymbals, castanets, maracas).

Percussion musical instruments are struck with an object of a similar kind, or with a stick or similar device, or with the bare hand. These instruments are also known collectively as “the drums”.

The main instruments in this heading are :

(A) **Those with a stretched skin**, e.g. :

- (1) **Tabors and tambourins**.
- (2) **Drums (shallow side drums, bass or big drums, etc.)**. These consist of a wooden or metal cylinder with parchment or vellum stretched over each end (double-headed drums). They are sounded by striking with one or two plain or leather-headed sticks.
- (3) **Timpani and kettle-drums**. These consist of parchment stretched over hollow copper hemispheres (varying considerably in size and usually resting on the ground). They are tuned to a definite note and are sounded with sticks.
- (4) **Tambourines with jingles**. These consist of a hoop covered with skin and are fitted with jingles or copper tongues which are sounded by shaking the instrument in different ways, or by striking it with the palm of the hand, the fingertips, etc.
- (5) **Tom-toms**.

(B) **Other percussion instruments** such as :

- (1) **Cymbals**. These are circular plates generally sounded by striking one against the other or by rubbing them together; in some cases, one single cymbal may be sounded by striking with a soft-headed stick.
- (2) **Gongs** (e.g., Chinese gongs), which are metal plates usually struck with a heavy stick tipped with a skin or felt wad.
- (3) **Triangles**, which are steel rods bent into the form of equilateral triangles; they are sounded with an iron rod.
- (4) **Jingles johnnies** (Chinese pavilions, Turkish crescents), which are fitted with jingles and small bells which sound on shaking the staff on which the instrument is mounted.
- (5) **Castenets**, which are small wooden, bone or ivory concave or shell-shaped instruments; they are either fixed to the fingers or mounted on a handle, and are sounded by striking one against the other.
- (6) **Xylophones** consisting of a series of small wooden slats of graduated lengths, mounted on two supports and played by striking with sticks.
- (7) **Metallophones**, which are similar to xylophones but have narrow metal plates (steel or duralumin) instead of wooden slats; (both xylophones and metallophones are often fitted with metal resonance tongues or tubes beneath the table). The heading also includes **similar instruments with glass plates**.

- (8) **Celestas** and the like, used in the percussion instruments group as a substitute for conventional chimes. These have the outward appearance of a small piano with pedal and dampers. Sound is produced by striking special thick steel plates with mechanical hammers operated by a keyboard.
- (9) **Bells, sets of bells, chimes and tubular bells** (a series of tubes suspended in a frame and struck either with a bare hand or with a hammer).
- (10) **Maracas** and similar instruments consisting of hollow bells or tubes sounded by shaking.
- (11) “**Claves**” consisting of a pair of hard wooden sticks.
- (12) **Flexatones** consisting of a metal plate mounted on a handle, and two wooden balls placed on either side of the plate. On shaking the instrument, the balls hit the plate causing it to vibrate, while the tone is controlled by bending the plate with the thumb.

Some of the instruments mentioned above are occasionally combined so that a single performer may play several at the same time. In dance-bands, for instance, the soft-headed stick used to sound the big drum is pedal-operated and, in addition, the drum is fitted with cymbals, gongs, wood-blocks (types of wooden resonance boxes either equipped with bells or forming a xylophone), etc.

Carillons for public buildings, suitable for producing music, are also classified here.

However, electronic percussion musical instruments are classified in **heading 92.07**.

The heading also **excludes** :

- (a) Door or table bells and gongs, door chimes, etc., which are not musical instruments (**heading 83.06** or **85.31**).
- (b) Chimes and other striking mechanisms for clocks (**heading 91.14**).

92.07 - Musical instruments, the sound of which is produced, or must be amplified, electrically (for example, organs, guitars, accordions).

9207.10 - Keyboard instruments, other than accordions

9207.90 - Other

This heading covers musical instruments in which the sound is generated or amplified **electrically** (including **electronically**) (i.e., those which cannot be played for normal hearing without their electrical or electronic components, even though the vibrating devices with which they are fitted may produce faint sounds). In this respect, they differ from certain other instruments (e.g., pianos, accordions, guitars) which, while they may be equipped with an electrical sound pick-up and amplifying device, are nevertheless independent instruments suitable for playing without such devices, in the same way as similar conventional-type instruments. Electrically operated automatic pianos are **excluded (heading 92.01)**.

The instruments of this heading are usually based on the use of :

(A) Electro-magnetic generators.

In one of the systems based on this principle, the generator has a drive shaft connected by a flexible coupling to a synchronous motor which drives it at constant speed. Different sized gear wheels are placed in pairs along the shaft, each wheel driving toothed wheels known as "tone" wheels. When the instrument is connected to the mains, the synchronous motor turns the tone wheels at speeds which vary according to the diameter of the gear wheels. A permanent magnet carrying a coil at one end is fitted near each tone wheel and parallel to it. When the wheels rotate, the teeth placed at regular intervals around their edges under the pole of the associated magnets; this causes variations in the fields which in turn set up weak current changes in the coils. These currents, which are of predetermined frequencies, are electrically amplified and transmitted to loudspeakers.

This principle is used in particular for the "organ" type of instrument.

In another system, a harmonium-type "free-reed" moves across a pole of a permanent magnet, its vibrations producing variations in the magnetic field set up in a coil wound around the magnet. The resulting current is electrically amplified and transmitted to a loudspeaker.

(B) Electrostatic generators, of which there are several types :

(1) **Stretched wire generators.** In these the vibrations produced when a wire carrying an electric current is struck by a hammer, give rise to variations in capacitance between the wire and metal parts (studs) adjacent to it. The variations in capacitance correspond exactly to the vibrations of the string, so that they provide faithful reproduction when amplified.

(2) **Vibrating reed generators,** in which the current is carried by reeds instead of strings.

(3) **Variable-condenser generators,** in which the condensers (capacitors) are rotated at constant speed by a motor.

(C) Oscillating electronic valve (or tube) generators, including gas discharge tube oscillators.

- (D) **Photoelectric generators**, in which a light ray passing through a perforated disc is thrown on a cell. By carefully calculating the number of apertures in the discscreen, a corresponding number of current variations is obtained and these, amplified, produce the desired sound.

Some of these instruments are called electro-magnetic, electrostatic, electronic, radio-electric, photoelectric pianos, organs, accordions, carillons, etc., but are nearly always known by their registered trade names. They enable faithful sound reproduction of most musical instruments to be obtained by simply changing registers. Such instruments may be described as "monophone" when they only give a succession of separate notes, or "polyphone" when they produce several notes at once (e.g., "organs").

Some may be played separately; others may be adapted to an ordinary piano, the instrument being played with the right hand while the piano accompaniment is played with the left hand. Such instruments are classified here, whether or not presented with the piano.

Although they may generally be essential for the normal operation of the instruments of this heading, electrical or electronic apparatus (in particular the amplifier and loudspeaker) are **excluded** and fall in their respective headings (**Chapter 85**) whenever they are not built into the unit itself. When, however, they are incorporated in or housed in the same cabinet as the instrument they are classified with the instrument, even though they may be packed separately for convenience of transport.

This heading **does not cover** conventional type clocks (with dials showing the hours) which are used with certain electronic chimes to strike automatically the hours, half-hours, etc. (**Chapter 91**).

92.08 - Musical boxes, fairground organs, mechanical street organs, mechanical singing birds, musical saws and other musical instruments not falling within any other heading of this Chapter; decoy calls of all kinds; whistles, call horns and other mouth-blown sound signalling instruments.

9208.10 - Musical boxes

9208.90 - Other

**(A) MUSICAL INSTRUMENTS NOT FALLING IN ANY OTHER
HEADING OF THIS CHAPTER**

These include :

- (1) **Musical boxes.** These consist of small mechanical movements playing tunes automatically, incorporated into boxes or various other containers. The main component is a cylinder set with pins (according to the notes of the tune to be played); on rotating, the pins contact metal tongues arranged like the teeth of a comb, causing them to vibrate and produce the notes. The components are mounted on a plate and the cylinder is rotated either by a spring-operated (clockwork) motor which is wound with a key or directly by a handle. In some types, the cylinder may be replaced by a sheet-metal disc made on the hill and dale principle.

Articles which incorporate a musical mechanism but which are essentially utilitarian or ornamental in function (for example, clocks, miniature wooden furniture, glass vases containing artificial flowers, ceramic figurines) **are not** regarded as musical boxes within the meaning of this heading. These articles are classified in the same headings as the corresponding articles not incorporating a musical mechanism.

Also, articles such as wrist watches, cups and greeting cards containing electronic musical modules **are not** regarded as goods of this heading. Such articles are classified in the same headings as the corresponding articles not incorporating such modules.

- (2) **Fairground organs**, e.g., orchestrions and similar instruments. Some fairgrounds organs are large instruments fitted with two dummy keyboards, one of which plays on metal strings by means of piano key-action, while the other controls organ pipes; in addition, there are catgut strings played by mechanical bows. These instruments may incorporate drums, cymbals, accordions, etc., thereby giving orchestra-like effects. They are mainly used in amusement parks or fairgrounds, etc. They may be hand or power operated, and are played from perforated rolls or cards.
- (3) **Mechanical street organs.** These consist of a case containing a barrel (or cylinder) set with copper pins which, when turned by a handle, operate valves on wood or metal pipes.
- (4) **Mechanical singing birds.** These are small automatons usually enclosed in a cage. A spring-operated (clockwork) motor in the base of the cage actuates a set of pistons and bellows thereby producing a modulated note and causing the head and body of the imitation bird to move.
- (5) **Musical saws.** These have a special steel blade which is caused to vibrate either with a bow or a felt-headed hammer.
- (6) **Other fancy instruments** such as rattles and mouth-operated sirens.

Cards, discs and rolls, whether or not presented with instruments of this heading (see Note 2 to this Chapter), are always classified in **heading 92.09**.

(B) DECOY CALLS OF ALL KINDS AND MOUTH-BLOWN SOUND SIGNALLING INSTRUMENTS

- (1) **Decoy calls and effects, etc.**, are small mouth-blown or hand-operated instruments which imitate bird or animal calls in order to attract game.
- (2) **Mouth-blown sound signalling instruments** such as :
 - (i) **Horns and call horns**, made of horn, bone, metal, etc.
 - (ii) **Whistles (mouth-blown)** of metal, wood, etc., for giving signals, etc.

The heading also **excludes** :

- (a) Door bells, table bells, bicycle bells, etc. (**heading 83.06** or **85.31**).
- (b) Bulb-operated horns and warning horns (e.g., for vehicles), ships' sirens, portable or fixed hand-operated roof sirens; these are classified according to the constituent material, or in **Section XVI** or **XVII**, as the case may be.
- (c) Electrically operated sound signalling equipment or apparatus (**heading 85.12** or **85.31**, as the case may be).

92.09 - Parts (for example, mechanisms for musical boxes) and accessories (for example, cards, discs and rolls for mechanical instruments) of musical instruments; metronomes, tuning forks and pitch pipes of all kinds.

9209.30 - Musical instrument strings

- Other :

9209.91 -- Parts and accessories for pianos

9209.92 -- Parts and accessories for the musical instruments of heading 92.02

9209.94 -- Parts and accessories for the musical instruments of heading 92.07

9209.99 -- Other

This heading covers :

(A) Metronomes, tuning forks and pitch pipes.

This group covers metronomes, tuning forks and pitch pipes whether intended for musical or other uses.

Metronomes are small mechanical devices used to indicate the exact tempo in which a piece of music is to be played; they are generally contained in a pyramid shaped box and may be fitted with a bell. The main part is a beating rod pivoted at its lower end; the movement of the rod may be accelerated or retarded according to a scale located behind the bar.

The group also includes metronomes used for industrial purposes; these are fitted with electrical contacts.

Tuning forks are usually small U-shaped metal bars which, when vibrated, emit one given note; the group also covers large concert-hall tuning forks consisting of a metal tongue mounted on a sounding box and struck with a hammer.

Pitch pipes (tuning pipes) are mouth-blown and consist of one or more reeds or pipes; these generally emit several notes (4 or 6).

The group also includes tuning forks used in medicine (in particular for hearing tests, in which case they are preset to emit a wide range of vibrations and are often put up in cases containing several instruments), for stroboscopic observations. Some are fitted with electrical devices for maintaining the vibrations.

(B) Mechanisms for musical boxes.

See the Explanatory Note to heading 92.08.

(C) Musical instrument strings.

This group covers **strings for true string instruments** (pianos, harps, violins, violoncellos, mandolines, etc.). These are usually made of :

- (1) Catgut (generally from the intestines of sheep). Catgut strings are made up of a certain number of strands according to the thickness required; each strand consists either of a ribbon of gut cut lengthwise or a complete gut.

- (2) Silk. Silk strings, usually made up of 140 strands of silk, have the external appearance of catgut strings. They are coated with a thin layer of gum arabic and polished with white wax.
- (3) Monofilament of man-made fibre materials (usually nylon).
- (4) Wire of steel (usually stainless), aluminium, silver, copper, etc. Metal strings are either single-strand, or made up of a metal core covered with metal wire (wound round the core). Strings of this kind are known as " metal-wound ".
- (5) Gut, silk or nylon covered with metal wire (aluminium or other base metal, whether or not silver-plated, silver, etc.). The metal wire is wound round the core and strings of this kind are known as gut, silk- or nylon-wound.

Musical instrument strings are recognisable by their finish. (Steel strings are made of polished metal and their diameter is carefully calibrated. Gut strings are completely uniform and the diameter is constant; some gut strings are white and translucent, others, however, such as strings for harps, are occasionally dyed red or blue, etc.) Strings may also be recognisable by the way in which they are put up (small paper bags, envelopes and the like, often printed with instructions for use). In addition, some strings (particularly metal strings) have loops or small metal balls enabling them to be fitted to the instrument concerned.

The heading **does not cover** wire, gut and monofilament of synthetic textile materials (whether or not cut to length), not identifiable as musical instrument strings (**classified in their own appropriate headings**).

(D) Other parts and accessories.

This group covers parts and accessories of musical instruments (other than those referred to in (B) and (C) above, but **not** loudspeakers and audio-frequency amplifiers (**heading 85.18**) **nor**, generally speaking, electrical apparatus (motors, photoelectric cells, etc.), not fitted with parts or accessories of musical instruments.

This group includes :

(1) Parts of pianos, organs, harmoniums or similar instruments, such as :

Complete keyboards (i.e., a complete set of keys mounted on a frame); piano mechanisms (i.e., key-actions with associated hammers including sound-dampers); cases for pianos or harmoniums; sound-boards; wooden or cast-iron frames; pedal mechanisms and pedals; wrest pins; metal tongues (or reeds) for harmoniums; separate keys for keyboards; hammers, dampers, shafts and forks for hammers, etc.; organ pipes, wind-chests, bellows and other component parts (including cases) of organs.

Keys, stops, bellows and keyboards for accordions are also classified here.

However, the heading **excludes** the small strips of ivory, bone or plastics, simply cut to rectangular shape but requiring polishing, rounding of corners or further working before use as coverings for keys of musical instruments; these strips are classified in their own appropriate headings (**heading 96.01** or **Chapter 39**).

(2) Parts and accessories of instruments falling in heading 92.02 (string musical instruments), such as :

Bodies of mandolines, guitars or similar instruments; guitar or mandoline " mechanisms " (i.e., the pegs and worm and tooth wheels located at the scroll-end of the neck so that the strings can be properly tensioned); parts of violins, violoncellos or the like, e.g., backs, bellies, necks (whether or not in the rough), fingerboards, nuts, bridges, tailpieces (on which the strings are mounted) and buttons therefor, ribs (between belly and back), pegs (kind of keys fitted to the scroll for varying the tension of the strings), string adjusters, etc., standards for violoncellos and double basses (for resting the instruments on the ground); bows and parts of bows (sticks, heels, tension screws, etc.) including horsehair in bundles for bows; plectra, mutes, chin-rests.

(3) Parts and accessories for the instruments of heading 92.07, such as :

Chests (for electronic pianos, organs and carillons), pedal mechanisms and pedals, keyboards, tone wheels (for organs, in particular).

See the Explanatory Note to heading 92.07 regarding electronic parts and accessories.

(4) Parts and accessories for so-called " wood-wind " instruments of heading 92.05, such as :

Turned component parts of wood for so-called " wood-wind " instruments (clarinets, flutes and the like); metal bodies of instruments; slides; extensions; mouthpieces of various types and mouthpiece covers; reeds; valves, valve control buttons; keys, rings, ferrules, bells, mutes; key pads (for flutes, clarinets, etc.).

(5) Parts and accessories for percussion instruments, such as :

Sticks, whether or not soft-headed; mallets of various types; drum brushes; pedals used in dance-bands; cymbal brackets; drum-barrels and braces, etc.; slats or plates, tables and supporting frames for xylophones or similar instruments; skins for drums or the like, cut to circular or approximately circular shape and clearly identifiable; strings (usually of true hemp, jute or sisal) intended for stretching the skins of certain instruments such as drums; and the catgut or metal strings (snares) which cross the snare-heads of side-drums, when identifiable as such.

*
* *

The heading also covers :

- (1) **Music holders for fixing to instruments. Stands (other than monopods, bipods, tripods and similar articles, of heading 96.20) for holding an instrument** (e.g. sidedrums or saxophones).
- (2) **Mechanical devices for playing a musical instrument.** These are auxiliary devices enabling keyboard instruments to be played mechanically with cards, discs or rolls; they may be operated by handles, pedals or by bellows, or may be mechanically or electrically driven. They may be fitted inside or outside the instrument (pianos or harmoniums usually).

- (3) **Cards, discs and rolls**, for automatic musical instruments; these articles are classified here whether or not presented together with the instruments for which they are intended (see Note 2 to this Chapter).

*
* *

The heading also **excludes** :

- (a) Articles of general use as defined in Note 2 to Section XV, such as hinges, handles, fittings (e.g., for pianos), of base metal (**Section XV**), and similar goods of plastics (**Chapter 39**).
 - (b) Tuning tools (**heading 82.05**).
 - (c) Spring-operated (clockwork) motors, not fitted with other parts, for musical boxes or mechanical singing birds (**heading 84.12**).
 - (d) Watch or clock movements not fitted with parts or accessories of musical instruments (**headings 91.08 to 91.10**).
 - (e) Piano stools (**heading 94.01**), music-stands or desks constructed for placing on the floor or ground (**heading 94.03**) and candle brackets for pianos (**heading 94.05**).
 - (f) Rosin for bow-strings, in moulded shapes (**heading 96.02**).
 - (g) Cleaning brushes for flutes, oboes, etc. (**heading 96.03**).
-

Section XIX

ARMS AND AMMUNITION; PARTS AND ACCESSORIES THEREOF

Chapter 93

Arms and ammunition; Parts and accessories thereof

Notes.

- 1.- This Chapter does not cover :
 - (a) Goods of Chapter 36 (for example, percussion caps, detonators, signalling flares);
 - (b) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
 - (c) Armoured fighting vehicles (heading 87.10);
 - (d) Telescopic sights and other optical devices suitable for use with arms, unless mounted on a firearm or presented with the firearm on which they are designed to be mounted (Chapter 90);
 - (e) Bows, arrows, fencing foils or toys (Chapter 95); or
 - (f) Collectors' pieces or antiques (heading 97.05 or 97.06).
- 2.- In heading 93.06, the reference to " parts thereof " does not include radio or radar apparatus of heading 85.26.

GENERAL

This Chapter covers :

- (1) Arms of all descriptions designed for ground, sea or air warfare, for use by military armed forces or by the police or other organised services (customs, frontier guards, etc.).
- (2) Arms for use by private persons for defence, hunting, target shooting (e.g., in miniature ranges, shooting galleries or fairground stands), etc.
- (3) Other devices which operate by the firing of an explosive charge (e.g., line-throwing guns and Very pistols).
- (4) Ammunition and missiles (**other than** articles of **Chapter 36**).

Subject to a few **exceptions** (see the Explanatory Notes to headings 93.05 and 93.06), the Chapter also includes parts and accessories of arms and parts of ammunition.

Telescopic sights and other optical devices suitable for use with arms and mounted thereon, or presented with the firearms on which they are designed to be mounted, are classified with the arm. Otherwise presented, such optical devices are **excluded** (**Chapter 90**).

Vehicles are **excluded** from this Chapter even if they are designed solely for military use, and whether or not they are fitted with weapons. The Chapter therefore **excludes**, for example, armoured railway vehicles (**Chapter 86**), tanks and armoured cars (**heading 87.10**), military aircraft (**heading 88.01** or **88.02**), and warships (**heading 89.06**). However, separately presented arms for these vehicles, etc. (guns, machine-guns, etc.), fall in this Chapter (see the Explanatory Note to heading 93.01 with regard to certain arms mounted on railway or road vehicles).

The following are also **excluded** from this Chapter :

- (a) Steel helmets and other military headgear (**Chapter 65**).
- (b) Personal protective armour, e.g., cuirasses, coats of mail, bullet-proof jackets, etc. (classified according to their constituent materials).
- (c) Cross-bows, bows and arrows for archery, and arms having the character of toys (**Chapter 95**).
- (d) Collectors' pieces and antiques (**heading 97.05 or 97.06**).

The arms and parts thereof of this Chapter may contain precious metal, metal clad with precious metal, natural or cultured pearls, precious and semi-precious stones (natural, synthetic or reconstructed), tortoise-shell, mother-of-pearl, ivory and similar materials.

93.01 - Military weapons, other than revolvers, pistols and the arms of heading 93.07.

9301.10 - Artillery weapons (for example, guns, howitzers and mortars)

9301.20 - Rocket launchers; flame-throwers; grenade launchers; torpedo tubes and similar projectors

9301.90 - Other

This heading covers all military weapons **other than** the revolvers and pistols of **heading 93.02** and the arms of **heading 93.07**. The heading includes separately presented weapons and firearms designed to form part of the armament of vessels, armoured trains, aircraft, tanks or armoured cars.

The heading includes :

- (1) **Artillery weapons and infantry support weapons**, i.e., all types of cannon and ordnance (fixed or on wheels, tracks, etc.), such as field, medium, heavy and super-heavy artillery, long-range guns, anti-aircraft guns, anti-tank guns, howitzers and mortars.

Long-range guns mounted on railway wagons also fall in this heading (and not in Chapter 86). Mobile and self-propelled guns, which should be distinguished from tanks and other armoured fighting vehicles of **heading 87.10**, are also classified here.

- (2) **Arms** capable of continuous and very rapid fire; some are suitable for handling by one man.

This group includes machine-guns, sub-machine-guns (machine-pistols) and other continuous-fire weapons.

- (3) **Military firearms such as rifles and carbines.**

- (4) **Other specialised military projectors**, for example, military rocket projectors and launchers, **other than** those of **heading 93.03**; apparatus for the discharge of depth-charges; torpedo tubes; flame-throwers (apparatus for projecting an ignited volatile liquid at an enemy) **other than** flame guns specialised for destroying weeds (**heading 84.24**).

93.02 - Revolvers and pistols, other than those of heading 93.03 or 93.04.

This heading covers revolvers and pistols, whatever the calibre, which are capable of discharging any missile (**other than** signal flares) by firing an explosive charge, and which are designed to be held in and fired from the hand.

Revolvers are single barrelled firearms incorporating a revolving cylinder.

Pistols have one or more barrels. They may also have interchangeable barrels. Semi-automatic pistols have a magazine which can be loaded with several rounds of ammunition, but the trigger must be operated for each round fired.

The heading also covers miniature pistols and revolvers; it also includes such weapons made in the form of other objects, for example, pencils, pocket knives or cigarette cases, **provided** they are, in fact, firearms.

The heading **excludes** continuous fire weapons (i.e., those which use pistol ammunition and which, once pressure has been applied to the trigger, continue to fire until either the magazine is exhausted or pressure is released from the trigger); these are classified in **heading 93.01** as sub-machine-guns (machine-pistols). They may be capable of being fired from the hand, but usually have extended stocks.

The heading also **excludes** :

- (a) Captive-bolt type humane killers, Very pistols for the discharge of signal flares, pistols or revolvers for the firing of blank cartridges (with solid or blocked barrels, or with tapered cylinders) for race-starting, theatrical property pistols, "black powder" muzzle-loading pistols neither designed for nor capable of firing a cartridge (**heading 93.03**).
- (b) Spring, air or gas pistols (**heading 93.04**).

93.03 - Other firearms and similar devices which operate by the firing of an explosive charge (for example, sporting shotguns and rifles, muzzle-loading firearms, Very pistols and other devices designed to project only signal flares, pistols and revolvers for firing blank ammunition, captive-bolt humane killers, line-throwing guns).

9303.10 - Muzzle-loading firearms

9303.20 - Other sporting, hunting or target-shooting shotguns, including combination shotgun-rifles

9303.30 - Other sporting, hunting or target-shooting rifles

9303.90 - Other

This heading includes all firearms **not covered by headings 93.01 and 93.02**; it includes some devices which are not weapons but which operate by the firing of an explosive charge.

The heading includes :

- (1) **Sporting, hunting and target shooting guns, rifles and carbines** of all calibres, smooth-bored or rifled. Sporting and hunting guns frequently have more than one barrel and sometimes have one smooth-bore barrel and one rifled barrel and may have interchangeable barrels (smooth-bore and rifled). They often have decorative chasing on metal parts and carved butts. Target shooting guns usually have only one barrel.

These guns may fire only one round at a time and be required to be reloaded manually after each shot, or they may be fitted with a magazine and capable of repetition firing, or they may have a mechanism for rapid semi-automatic fire.

Sporting guns made to resemble walking-sticks are included in this group.

- (2) **Duck cannon (punt-guns)**, specially designed for shooting waterfowl. They are usually mounted on a stand or support designed to be fixed to a boat.
- (3) **Muzzle-loading (" black powder ") firearms** neither designed for nor capable of firing a cartridge.
- (4) **Very pistols and other devices designed to project only signal flares.**
- (5) **Dummy, imitation or safety pistols and revolvers** capable of firing only blank cartridges. They may have solid or blocked barrels with a vent for the escape of gases. Certain revolvers may have the chambers in the cylinder tapered, while some starters' or stage property pistols have no barrel. When used for starting races, these pistols may be fitted with electrical devices which actuate chronometer equipment.
- (6) **Captive-bolt humane killers.** These resemble pistols for firing blank cartridges. The explosion drives forward a bolt sliding within the barrel in order to kill or stun the animal. The bolt does not leave the pistol but is drawn back for further use.

The heading **excludes** bullet-type pistols (usually of large calibre), occasionally used for slaughtering animals (**heading 93.02**).

- (7) **Line-throwing guns**, used mainly on board ship or at lifeboat stations for life-saving and establishing communication.
- (8) **Harpoon guns**, used for propelling a harpoon attached to a line to catch fish, marine mammals, turtles, etc.
- (9) **Warning guns, mortars and similar apparatus**, firing blank ammunition, used to raise an alarm (e.g., at lifeboat stations), to celebrate an event or to give warning of the presence of poachers, etc.
- (10) “**Hail cannon**”, a kind of cannon consisting of a truncated sheet-iron cone, for firing at hail clouds to cause rain.

The heading **excludes** riveting tools, wall-plugging tools, etc., operated by means of an explosive charge (**heading 82.05**).

93.04 - Other arms (for example, spring, air or gas guns and pistols, truncheons), excluding those of heading 93.07.

The heading covers arms **other than** firearms of **headings 93.01 to 93.03** and arms of **heading 93.07**.

It includes the following :

- (1) **Truncheons, life-preservers, weighted canes and the like** for police, etc., and **loaded walking-sticks**.
- (2) **Knuckledusters**, i.e., pieces of metal shaped to fit a clenched fist and with which blows are delivered.
- (3) **Catapults** designed for shooting at birds or pests. They may be in the form of a walking-stick.

Toy catapults are **excluded (heading 95.03)**.

- (4) **Air guns, rifles and pistols.** These resemble normal rifles, pistols, etc., but they have provision for compressing a column of air which is released into the barrel of the weapon when the trigger is pulled, thus ejecting the ammunition.
Guns, rifles and pistols operating on the same principle, but with gases other than air, are also included.
- (5) **Similar weapons operated by the release of a heavy spring mechanism.**
- (6) **Guns and pistols**, operated by compressed carbon dioxide gas, for remote projection of an automatic syringe, containing an anaesthetic or a medicament (antiserum, vaccine, etc.) at free-roaming animals.
- (7) **Aerosol spray cans containing tear gas.**

93.05 - Parts and accessories of articles of headings 93.01 to 93.04.

9305.10 - Of revolvers or pistols

9305.20 - Of shotguns or rifles of heading 93.03

- Other :

9305.91 -- Of military weapons of heading 93.01

9305.99 -- Other

The parts and accessories of this heading include :

- (1) **Parts for military weapons**, e.g., liners (tubes for barrels), recoil mechanisms and breeches for guns of all kinds; turrets, carriages, tripods and other special mountings for guns, machine-guns, sub-machine-guns, etc., whether or not with aiming and loading mechanisms.
- (2) **Metal castings, stampings and forgings, for military small arms, sporting and target shooting guns, etc., revolvers and pistols**, e.g., barrels, breeches, locks, trigger guards, tumblers, levers, percussion hammers, cocking pieces, triggers, sears, extractors, ejectors, frames (of pistols), plates, butt plates, safety catches, cylinders (for revolvers), front and back sights, magazines.
- (3) **Protective covers and protective cases**, for butts, sights, barrels or breeches.
- (4) **Morris tubes, etc.** (small bore tubes for insertion in heavier calibre guns and rifles for practice on miniature ranges).
- (5) **Butt stocks and other wooden parts** for guns, rifles or carbines and **butts and plates** (of wood, metal, ebonite, etc.) for revolvers and pistols.
- (6) **Slings, band, piling or stacking and butt swivels and swivel bands** for guns, rifles or carbines.
- (7) **Silencers** (sound moderators).
- (8) **Removable recoil absorbers** for sporting or target shooting guns.

The heading **excludes** :

- (a) Parts of general use as defined in Note 2 to Section XV (e.g., screws, rivets and springs), of base metal (**Section XV**), and similar goods of plastics (**Chapter 39**).
- (b) Gun cases (**heading 42.02**).
- (c) Gun cameras for aircraft (**heading 90.07**).
- (d) Telescopic sights and similar sights for arms (**heading 90.13**).
- (e) Accessories more specifically covered by other headings of the Nomenclature, such as pull-throughs, cleaning rods and other cleaning tools for arms (**headings 82.05, 96.03**, etc.).

93.06 - Bombs, grenades, torpedoes, mines, missiles and similar munitions of war and parts thereof; cartridges and other ammunition and projectiles and parts thereof, including shot and cartridge wads.

- Shotgun cartridges and parts thereof; air gun pellets :

9306.21 -- Cartridges

9306.29 -- Other

9306.30 - Other cartridges and parts thereof

9306.90 - Other

This heading includes :

(A) **Ammunition**, e.g. :

- (1) Shells (explosive, shrapnel, armour piercing, star, flare, tracer, incendiary, smoke, etc.), and all other types of ammunition for guns and mortars.
- (2) Cartridges of all types : blank (including blank cartridges for riveting tools or for starting compression ignition internal combustion piston engines), bulleted, tracer, incendiary, armour piercing, ball and shot cartridges for sporting guns, etc.
- (3) Slugs, pellets (hollow, spherical, waisted, etc.) and darts for air, gas or spring guns, carbines or pistols, **other than** those for toys of **heading 95.03**.

(B) **Ballistic missiles** whose payload returns to the earth's surface after reaching its apogee and which impart to the payload a terminal velocity not exceeding 7,000 m/s .

(C) **Munitions of a type which contain their own means of propulsion after launching**, for example, torpedoes, flying bombs (missiles resembling aircraft), guided air missiles and rocket type ammunition.

(D) **Other munitions of war**, for example, land and sea mines, depth charges, hand and rifle grenades, aerial bombs.

(E) **Harpoons**, whether or not with explosive heads, for harpoon guns, etc.

(F) **Parts of ammunition and munitions of war**, for example :

- (1) Grenade, mine, bomb, shell and torpedo bodies.
- (2) Cartridge cases and other parts of cartridges, for example, bases (of brass), inner cups and inner bases and linings (of metal or paperboard) and wads (of felt, paper or cork, etc.).
- (3) Bullets and lead shot, prepared for ammunition.
- (4) Fuses (point and base detonating), whether time, percussion or proximity (electronically operated), for shells, torpedoes, etc.; parts of fuses, including protective caps.
- (5) Mechanical parts for certain munitions, such as special propellers and gyroscopes for torpedoes.

- (6) War-heads and buoyancy chambers for torpedoes.
- (7) Strikers, safety pins, levers and other parts of grenades.
- (8) Fins for bombs.

The heading **excludes** :

- (a) Propellant powders and prepared explosives, even if put up in forms ready for incorporation in munitions (**headings 36.01 and 36.02**); safety fuses, detonating fuses, percussion and detonating caps, igniters and electric detonators, including primers for shells (**heading 36.03**).
- (b) Signalling flares and rain rockets (**heading 36.04**).
- (c) Charges for fire-extinguishers, and charged fire-extinguishing grenades (**heading 38.13**).
- (d) Motors of **heading 84.11 or 84.12**, for rockets, torpedoes and similar missiles.
- (e) Radio or radar apparatus of **heading 85.26** (see Note 2 to this Chapter).
- (f) Watch or clock movements and parts thereof, for munitions or for parts of munitions (e.g., for fuses) (**headings 91.08 to 91.10 and 91.14**).

93.07 - Swords, cutlasses, bayonets, lances and similar arms and parts thereof and scabbards and sheaths thereof.

This heading covers weapons such as swords (including sword-sticks), cutlasses, bayonets, lances, spears, pikes, halberds, kukris commando knives, dirks, stilettos and daggers. Their blades usually consist of high quality steel, and in some cases a more or less elaborate shield or handguard is included.

The weapons remain classified in this heading even if used only for ceremonial or decorative purposes, or as theatrical properties.

Most of the weapons have a fixed blade, but some daggers and stilettos may have a movable blade normally housed within the handle. The blade may be opened and locked in position by hand or by a spring mechanism.

This heading also includes parts, for example, sword blades (including blanks therefor, even if only forged), hilts, guards and handles, and scabbards and sheaths for swords, bayonets, daggers, etc.

The heading **does not cover** :

- (a) Belts and similar accoutrements, designed to support swords, bayonets, etc., of leather (**heading 42.03**) or of textile materials (**heading 62.17**); sword-knots (generally **heading 42.05** or **63.07**).
 - (b) Hunting, camping and other knives, being cutlery (**heading 82.11**) or sheaths for such knives (generally **heading 42.02**).
 - (c) Scabbards and sheaths of precious metal or of metal clad with precious metal (**heading 71.15**).
 - (d) Fencing foils (**heading 95.06**).
-

Section XX

MISCELLANEOUS MANUFACTURED ARTICLES

Chapter 94

Furniture; bedding, mattresses, mattress supports, cushions and similar stuffed furnishings; lamps and lighting fittings, not elsewhere specified or included; illuminated signs, illuminated name-plates and the like; prefabricated buildings

Notes.

1.- This Chapter does not cover :

- (a) Pneumatic or water mattresses, pillows or cushions, of Chapter 39, 40 or 63;
- (b) Mirrors designed for placing on the floor or ground (for example, cheval-glasses (swing-mirrors)) of heading 70.09;
- (c) Articles of Chapter 71;
- (d) Parts of general use as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39), or safes of heading 83.03;
- (e) Furniture specially designed as parts of refrigerating or freezing equipment of heading 84.18; furniture specially designed for sewing machines (heading 84.52);
- (f) Lamps or lighting fittings of Chapter 85;
- (g) Furniture specially designed as parts of apparatus of heading 85.18 (heading 85.18), of heading 85.19 or 85.21 (heading 85.22) or of headings 85.25 to 85.28 (heading 85.29);
- (h) Articles of heading 87.14;
- (ij) Dentists' chairs incorporating dental appliances of heading 90.18 or dentists' spittoons (heading 90.18);
- (k) Articles of Chapter 91 (for example, clocks and clock cases);
- (l) Toy furniture or toy lamps or lighting fittings (heading 95.03), billiard tables or other furniture specially constructed for games (heading 95.04), furniture for conjuring tricks or decorations (other than electric garlands) such as Chinese lanterns (heading 95.05); or
- (m) Monopods, bipods, tripods and similar articles (heading 96.20).

2.- The articles (other than parts) referred to in headings 94.01 to 94.03 are to be classified in those headings only if they are designed for placing on the floor or ground.

The following are, however, to be classified in the above-mentioned headings even if they are designed to be hung, to be fixed to the wall or to stand one on the other :

- (a) Cupboards, bookcases, other shelved furniture (including single shelves presented with supports for fixing them to the wall) and unit furniture;
 - (b) Seats and beds.
- 3.- (A) In headings 94.01 to 94.03 references to parts of goods do not include references to sheets or slabs (whether or not cut to shape but not combined with other parts) of glass (including mirrors), marble or other stone or of any other material referred to in Chapter 68 or 69.
- (B) Goods described in heading 94.04, presented separately, are not to be classified in heading 94.01, 94.02 or 94.03 as parts of goods.
- 4.- For the purposes of heading 94.06, the expression "prefabricated buildings" means buildings which are finished in the factory or put up as elements, presented together, to be assembled on site, such as housing or worksite accommodation, offices, schools, shops, sheds, garages or similar buildings.

GENERAL

This Chapter covers, **subject** to the exclusions listed in the Explanatory Notes to this Chapter :

- (1) All furniture and parts thereof (headings 94.01 to 94.03).
- (2) Mattress supports, mattresses and other articles of bedding or similar furnishing, sprung, stuffed or internally fitted with any material, or of cellular rubber or plastics, whether or not covered (heading 94.04).
- (3) Lamps and lighting fittings and parts thereof, not elsewhere specified or included, of any material (**excluding** those of materials described in Note 1 to Chapter 71), and illuminated signs, illuminated name-plates and the like, having a permanently fixed light source, and parts thereof not elsewhere specified or included (heading 94.05).
- (4) Prefabricated buildings (heading 94.06).

For the purposes of this Chapter, the term "furniture" means :

(A) Any "movable" articles (**not included** under other more specific headings of the Nomenclature), which have the essential characteristic that they are constructed for placing on the floor or ground, and which are used, mainly with a utilitarian purpose, to equip private dwellings, hotels, theatres, cinemas, offices, churches, schools, cafés, restaurants, laboratories, hospitals, dentists' surgeries, etc., or ships, aircraft, railway coaches, motor vehicles, caravan-trailers or similar means of transport. (It should be noted that, for the purposes of this Chapter, articles are considered to be "movable" furniture even if they are designed for bolting, etc., to the floor, e.g., chairs for use on ships). Similar articles (seats, chairs, etc.) for use in gardens, squares, promenades, etc., are also included in this category.

(B) The following :

- (i) Cupboards, bookcases, other shelved furniture (including single shelves presented with supports for fixing them to the wall) and unit furniture, designed to be hung, to be fixed to the wall or to stand one on the other or side by side, for holding various objects or articles (books, crockery, kitchen utensils, glassware, linen, medicaments, toilet articles, radio or television receivers, ornaments, etc.) and separately presented elements of unit furniture.

- (ii) Seats or beds designed to be hung or to be fixed to the wall.

Except for the goods referred to in subparagraph (B) above, the term "furniture" **does not apply** to articles used as furniture but designed for placing on other furniture or shelves or for hanging on walls or from the ceiling.

It therefore follows that this Chapter **does not cover** other wall fixtures such as coat, hat and similar racks, key racks, clothes-brush hangers and newspaper racks, nor furnishings such as radiator screens. Similarly, the Chapter **excludes** the following types of goods **not** designed for placing on the floor : small articles of cabinet-work and small furnishing goods of wood (**heading 44.20**), and office equipment (e.g., sorting boxes, paper trays) of plastics or of base metal (**heading 39.26 or 83.04**).

However, equipment (cupboards, radiator screens, etc.) built-in or designed to be built-in, presented at the same time as the prefabricated buildings of heading 94.06 and forming an integral part thereof, remain classified in that heading.

Headings 94.01 to 94.03 cover articles of furniture **of any material** (wood, osier, bamboo, cane, plastics, base metals, glass, leather, stone, ceramics, etc.). Such furniture remains in these headings whether or not stuffed or covered, with worked or unworked surfaces, carved, inlaid, decoratively painted, fitted with mirrors or other glass fitments, or on castors, etc.

It should, however, be noted that furniture is **excluded** if it incorporates more than minor components (e.g., monograms, bands, ferrules, etc.) of precious metal or of metal clad with precious metal (**Chapter 71**).

Articles of furniture presented **disassembled** or **unassembled** are to be treated as assembled articles of furniture, **provided** the parts are presented together. This applies whether or not the furniture incorporates sheets, fittings or other parts of glass, marble or other materials (e.g., a wooden table with a glass top, a wooden wardrobe with a mirror, a sideboard with a marble top).

PARTS

This Chapter only covers parts, whether or not in the rough, of the goods of headings 94.01 to 94.03 and 94.05, when identifiable by their shape or other specific features as parts designed solely or principally for an article of those headings. They are classified in this Chapter when not more specifically covered elsewhere.

Parts of prefabricated buildings of heading 94.06, presented separately, are in all cases classified in their own appropriate headings.

In addition to the exclusions referred to in the individual Explanatory Notes below, this Chapter also **excludes**:

- (a) Beadings and mouldings, of **heading 44.09**.
- (b) Grooved strips of particle board, covered with plastics or other materials, intended to be cut and then folded along these cuts into a "U" shape so as to form parts of furniture (e.g., partitions of a drawer) (**heading 44.10**).
- (c) Sheets of glass (including mirrors), marble or other stone or of any other material referred to in **Chapter 68** or **69**, whether or not cut to shape, unless they are combined with other parts which clearly identify them as parts of furniture (e.g., a mirror-door for a wardrobe).
- (d) Springs, locks and other parts of general use as defined in Note 2 to Section XV, of base metal (Section XV), and similar goods of plastics (**Chapter 39**).
- (e) Toy furniture and toy lamps or lighting fittings (**heading 95.03**).
- (f) Collectors' pieces and antiques (**Chapter 97**).

94.01 - Seats (other than those of heading 94.02), whether or not convertible into beds, and parts thereof (+).

- 9401.10 - Seats of a kind used for aircraft
- 9401.20 - Seats of a kind used for motor vehicles
- 9401.30 - Swivel seats with variable height adjustment
- 9401.40 - Seats other than garden seats or camping equipment, convertible into beds
 - Seats of cane, osier, bamboo or similar materials :
- 9401.52 -- Of bamboo
- 9401.53 -- Of rattan
- 9401.59 -- Other
 - Other seats, with wooden frames :
- 9401.61 -- Upholstered
- 9401.69 -- Other
 - Other seats, with metal frames :
- 9401.71 -- Upholstered
- 9401.79 -- Other
- 9401.80 - Other seats
- 9401.90 - Parts

Subject to the exclusions mentioned below, this heading covers all seats (including those for vehicles, provided that they comply with the conditions prescribed in Note 2 to this Chapter), for example :

Lounge chairs, arm-chairs, folding chairs, deck chairs, infants' high chairs and children's seats designed to be hung on the back of other seats (including vehicle seats), grandfather chairs, benches, couches (including those with electrical heating), settees, sofas, ottomans and the like, stools (such as piano stools, draughtsmen's stools, typists' stools, and dual purpose stool-steps), seats which incorporate a sound system and are suitable for use with video game consoles and machines, television or satellite receivers, as well as with DVD, music CD, MP3 or video cassette players.

Seats of this heading may incorporate complementary non-seat components, for example, toy components, a vibration function, music or sound players, as well as lighting features.

Armchairs, couches, settees, etc., remain in this heading even if they are convertible into beds.

The heading **does not**, however, **include** :

- (a) Steps (usually **headings 44.21 and 73.26**).
- (b) Seat-sticks (**heading 66.02**).

- (c) Articles of **heading 87.14** (e.g., saddles).
- (d) Adjustable-speed revolving chairs for reflex-testing (**heading 90.19**).
- (e) Chairs and seats of **heading 94.02**.
- (f) Stools and foot-stools (whether or not rocking) designed to rest the feet, baby walkers, and linen and similar chests having a subsidiary use as seats (**heading 94.03**).

PARTS

The heading also covers identifiable parts of chairs or other seats, such as backs, bottoms and arm-rests (whether or not upholstered with straw or cane, stuffed or sprung), and spiral springs assembled for seat upholstery.

Separately presented cushions and mattresses, sprung, stuffed or internally fitted with any material or of cellular rubber or plastics whether or not covered, are **excluded (heading 94.04)** even if they are clearly specialised as parts of upholstered seats (e.g., settees, couches, sofas). When these articles are combined with other parts of seats, however, they remain classified in this heading. They also remain in this heading when presented with the seats of which they form part.

◦◦◦

Subheading Explanatory Notes.

Subheadings 9401.61 and 9401.71

“Upholstered seats” are those having a soft layer of, for example, wadding, tow, animal hair, cellular plastics or rubber, shaped (whether or not fixed) to the seat and covered with a material such as woven fabric, leather or sheeting of plastics. Also classified as upholstered seats are seats the upholstering materials of which are not covered or have only a white fabric cover which is itself intended to be covered (known as upholstered seats “in muslin”), seats which are presented with detachable seat or back cushions and which could not be used without such cushions, and seats with helical springs (for upholstery). On the other hand, the presence of horizontally-acting tension springs, designed to attach to the frame a steel wire lattice, taut woven fabric, etc., is not sufficient to cause the seats to be classified as upholstered. Similarly, seats covered directly with materials such as woven fabric, leather, sheeting of plastics, without the interposition of upholstering materials or springs, and seats to which a single woven fabric backed with a thin layer of cellular plastics has been applied, are not regarded as upholstered seats.

Subheading 9401.80

This subheading also covers safety seats suitable for use for the carriage of infants and toddlers in motor vehicles or other means of transport. They are removable and are attached to the vehicle’s seats by means of the seat belt and a tether strap.

94.02 - Medical, surgical, dental or veterinary furniture (for example, operating tables, examination tables, hospital beds with mechanical fittings, dentists' chairs); barbers' chairs and similar chairs, having rotating as well as both reclining and elevating movements; parts of the foregoing articles.

9402.10 - Dentists', barbers' or similar chairs and parts thereof

9402.90 - Other

(A) MEDICAL, SURGICAL, DENTAL OR VETERINARY FURNITURE

This group includes :

- (1) Operating tables for general or specialised surgery, designed to enable the patient to be placed in the position required for different operations by adjusting, inclining, rotating or raising the table.
- (2) Special orthopaedic tables for complex operations (e.g., on the hips, shoulders, spinal column).
- (3) Vivisection and similar tables for animals, frequently equipped with restraining apparatus.
- (4) Tables, table-beds and the like for clinical examinations, medical treatment, massage, etc.; beds and seats, e.g., for obstetrical, gynaecological, urological, cystoscopical, etc., examinations or operations, or for use in ear, nose, throat or eye treatment.

It should, however, be noted that the heading **excludes** tables and seats specialised for X-ray work, etc. (**heading 90.22**).

- (5) Special seats for doctors and surgeons.
- (6) Confinement beds (sometimes called birthing beds), usually consisting of a lower part with a basin which slides under the upper part.
- (7) Mechanical beds for raising injured or sick persons without shaking, or for giving them hygienic attention without moving them.
- (8) Beds with hinged mattress-supports specially designed for therapeutic treatment of pulmonary tuberculosis or other diseases.
- (9) Beds combined with splints or other dislocation or fracture appliances and the like.

However, when such equipment is of a type designed to be simply attached to, but not fixed to the bed, it falls in **heading 90.21**; beds without the mechanism fall in **heading 94.03**.

- (10) Stretchers and trolley-stretchers for moving patients inside hospitals, clinics, etc.

Carriages used to carry disabled persons in the street are **excluded** (**Chapter 87**).

- (11) Small tables, table-cupboards and the like, whether or not on wheels (trolleys), of a type specially designed for instruments or bandages, medical or surgical supplies or anaesthetic equipment; instrument sterilising trolleys; special disinfection wash-basins, self-opening sterile dressing boxes (generally on wheels) and waste bins for soiled dressings (whether or not on wheels); bottle-holders, irrigator or douche carriers and the like, whether or not on pivoting castors; special instrument or dressing cabinets and cases.
- (12) Dentists' chairs (including anaesthetising chair-beds) not incorporating dental appliances of heading 90.18, with mechanisms (usually telescopic) for raising as well as tilting and sometimes turning on a centre column, whether or not fitted with equipment such as lighting fittings.

Dentists' spittoon mouth rinsers, whether or not on a base or stand, and dentists' chairs incorporating dental appliances of heading 90.18, are **excluded (heading 90.18)**.

It should be noted that this group is restricted to furniture of a type specially designed for medical, surgical, dental or veterinary use; furniture for general use not having such characteristics is therefore **excluded**.

(B) BARBERS' CHAIRS AND SIMILAR CHAIRS, HAVING ROTATING AS WELL AS BOTH RECLINING AND ELEVATING MOVEMENTS

This group includes barbers' chairs and similar chairs, having rotating as well as both reclining and elevating movements.

It should, however, be noted that the heading excludes piano stools, mechanical type rocking-chairs, swivel chairs, etc. (**heading 94.01**).

(C) PARTS

Parts of the foregoing articles are classified in this heading **provided** they are recognisable as such parts.

These parts include :

- (1) Articles of a kind specially designed for fixing to operating tables to immobilise patients (such as shoulder, leg or thigh grips, leg supports, immobilising head-rests, arm or thorax supports and the like).
- (2) Certain clearly identifiable parts of dentists' chairs (e.g., head-rests, back pieces, foot-rests, arm-rests, elbow-rests, etc.).

94.03 - Other furniture and parts thereof.

- 9403.10 - Metal furniture of a kind used in offices
- 9403.20 - Other metal furniture
- 9403.30 - Wooden furniture of a kind used in offices
- 9403.40 - Wooden furniture of a kind used in the kitchen
- 9403.50 - Wooden furniture of a kind used in the bedroom
- 9403.60 - Other wooden furniture
- 9403.70 - Furniture of plastics
 - Furniture of other materials, including cane, osier, bamboo or similar materials :
- 9403.82 -- Of bamboo
- 9403.83 -- Of rattan
- 9403.89 -- Other
- 9403.90 - Parts

This heading covers furniture and parts thereof, **not covered** by the previous headings. It includes furniture for general use (e.g., cupboards, show-cases, tables, telephone stands, writing-desks, escritoires, book-cases, and other shelved furniture (including single shelves presented with supports for fixing them to the wall), etc.), and also furniture for special uses.

The heading includes furnitures for :

- (1) **Private dwellings, hotels, etc.**, such as : cabinets, linen chests, bread chests, log chests; chests of drawers, tallboys; pedestals, plant stands; dressing-tables; pedestal tables; wardrobes, linen presses; hall stands, umbrella stands; side-boards, dressers, cupboards; food-safes; bedside tables; beds (including wardrobe beds, camp-beds, folding beds, cots, etc.); needlework tables; stools and foot-stools (whether or not rocking) designed to rest the feet, fire screens; draught-screens; pedestal ashtrays; music cabinets, music stands or desks; play-pens; serving trolleys (whether or not fitted with a hot plate).
- (2) **Offices**, such as : clothes lockers, filing cabinets, filing trolleys, card index files, etc.
- (3) **Schools**, such as : school-desks, lecturers' desks, easels (for blackboards, etc.).
- (4) **Churches**, such as : altars, confessional boxes, pulpits, communion benches, lecterns, etc.
- (5) **Shops, stores, workshops, etc.**, such as : counters; dress racks; shelving units; compartment or drawer cupboards; cupboards for tools, etc.; special furniture (with cases or drawers) for printing-works.
- (6) **Laboratories or technical offices**, such as : microscope tables; laboratory benches (whether or not with glass cases, gas nozzles and tap fittings, etc.); fume-cupboards; unequipped drawing tables.

The heading **does not include** :

- (a) Travelling chests, trunks and the like, not having the character of furniture (**heading 42.02**).
- (b) Ladders and steps, trestles, carpenters' benches and the like not having the character of furniture; these are classified according to their constituent material (**headings 44.21, 73.26**, etc.).

- (c) Builders' fittings (e.g., frames, doors and shelves) for cupboards, etc. to be built into walls (**heading 44.18** if of wood).
- (d) Waste-paper baskets (of plastics, **heading 39.26**; of basket or wickerwork, **heading 46.02**; of base metal, **headings 73.26, 74.19**, etc.).
- (e) Hammocks (generally **heading 56.08** or **63.06**).
- (f) Mirrors designed for standing on the ground, such as cheval-glasses, swing-mirrors for shoe-shops, tailors, etc. (**heading 70.09**).
- (g) Armoured or reinforced safes (**heading 83.03**). On the other hand, containers specially designed to resist fire, impact and crushing and whose walls in particular do not offer any serious resistance to attempts at breaking them open by drilling or cutting are classified in this heading.
- (h) Refrigerators, ice cream machines, etc. (i.e., cabinets, etc., having the character of furniture but also equipped either with a refrigerating unit or with an evaporator of a refrigerating unit, or designed to receive such equipment) (**heading 84.18**) (see Note (1) (e) to this Chapter). **However**, ice-boxes, ice-chests and the like, and also insulated cabinets not equipped or designed to contain an active refrigerating element but insulated simply by glass fibre, cork, wool, etc., **remain classified in this heading**.
- (ij) Furniture specially designed for containing or providing a stand for sewing machines, whether or not it has a subsidiary use as furniture when the machine is not in use; protective covers, drawers, extensions and other component parts of such furniture (**heading 84.52**).
- (k) Furniture specially designed as part of apparatus of heading 85.18 (**heading 85.18**), of heading 85.19 or 85.21 (**heading 85.22**) or of headings 85.25 to 85.28 (**heading 85.29**).
- (l) Drawing tables fitted with instruments such as pantographs, (**heading 90.17**).
- (m) Dentists' spittoons (**heading 90.18**).
- (n) Mattress supports (**heading 94.04**).
- (o) Standard lamps and other lamps and lighting fittings (**heading 94.05**).
- (p) Billiard tables, or other furniture specially constructed for games, of **heading 95.04**, and tables for conjuring tricks, of **heading 95.05**.

94.04 - Mattress supports; articles of bedding and similar furnishing (for example, mattresses, quilts, eiderdowns, cushions, pouffes and pillows) fitted with springs or stuffed or internally fitted with any material or of cellular rubber or plastics, whether or not covered.

9404.10 - Mattress supports

- Mattresses :

9404.21 -- Of cellular rubber or plastics, whether or not covered

9404.29 -- Of other materials

9404.30 - Sleeping bags

9404.90 - Other

This heading covers :

(A) **Mattress supports**, i.e., the sprung part of a bed, normally consisting of a wooden or metal frame fitted with springs or steel wire mesh (spring or wire supports), or of a wooden frame with internal springs and stuffing covered with fabric (mattress bases).

But the heading **excludes** spiral springs assembled together for chairs or other seats (**heading 94.01**) and woven iron or steel wire mesh, unmounted (**heading 73.14**).

(B) **Articles of bedding and similar furnishing** which are sprung or stuffed or internally fitted with any material (cotton, wool, horsehair, down, synthetic fibres, etc.), or are of cellular rubber or plastics (whether or not covered with woven fabric, plastics, etc.). For example :

(1) Mattresses, including mattresses with a metal frame.

(2) Quilts and bedspreads (including counterpanes, and also quilts for baby-carriages), eiderdowns and duvets (whether of down or any other filling), mattress-protectors (a kind of thin mattress placed between the mattress itself and the mattress support), bolsters, pillows, cushions, pouffes, etc.

(3) Sleeping bags.

These articles remain classified in this heading whether or not they incorporate electric heating elements.

This heading also **excludes** :

(a) Water-mattresses (generally **heading 39.26** or **40.16**).

(b) Pneumatic mattresses or pillows (**heading 39.26, 40.16 or 63.06**) or pneumatic cushions (**heading 39.26, 40.14, 40.16, 63.06 or 63.07**).

(c) Leather covers for pouffes (**heading 42.05**).

(d) Blankets (**heading 63.01**).

(e) Pillow-cases, eiderdown or duvet covers (**heading 63.02**).

(f) Cushion covers (**heading 63.04**).

See the Explanatory Note to heading 94.01 concerning cushions or mattresses having the character of parts of seats.

94.05 - Lamps and lighting fittings including searchlights and spotlights and parts thereof, not elsewhere specified or included; illuminated signs, illuminated name-plates and the like, having a permanently fixed light source, and parts thereof not elsewhere specified or included.

9405.10 - Chandeliers and other electric ceiling or wall lighting fittings, excluding those of a kind used for lighting public open spaces or thoroughfares

9405.20 - Electric table, desk, bedside or floor-standing lamps

9405.30 - Lighting sets of a kind used for Christmas trees

9405.40 - Other electric lamps and lighting fittings

9405.50 - Non-electrical lamps and lighting fittings

9405.60 - Illuminated signs, illuminated name-plates and the like

- Parts :

9405.91 - - Of glass

9405.92 - - Of plastics

9405.99 - - Other

(I) LAMPS AND LIGHTING FITTINGS, NOT ELSEWHERE SPECIFIED OR INCLUDED

Lamps and lighting fittings of this group can be constituted of any material (**excluding** those materials described in Note 1 to Chapter 71) and use any source of light (candles, oil, petrol, paraffin (or kerosene), gas, acetylene, electricity, etc.). Electrical lamps and lighting fittings of this heading may be equipped with lamp-holders, switches, flex and plugs, transformers, etc., or, as in the case of fluorescent strip fixtures, a starter or a ballast.

This heading covers in particular :

- (1) **Lamps and lighting fittings normally used for the illumination of rooms**, e.g. : hanging lamps; bowl lamps; ceiling lamps; chandeliers; wall lamps; standard lamps; table lamps; bedside lamps; desk lamps; night lamps; water-tight lamps.
- (2) **Lamps for exterior lighting**, e.g. : street lamps; porch and gate lamps; special illumination lamps for public buildings, monuments, parks.
- (3) **Specialised lamps**, e.g. : darkroom lamps; machine lamps (presented separately); photographic studio lamps; inspection lamps (**other than** those of **heading 85.12**); non-flashing beacons for aerodromes; shop window lamps; electric garlands (including those fitted with fancy lamps for carnival or entertainment purposes or for decorating Christmas trees).
- (4) **Lamps and lighting fittings for the vehicles of Chapter 86, for aircraft or for ships or boats**, e.g. : headlamps for trains; locomotive and railway rolling stock lanterns; headlamps for aircraft; ships' or boats' lanterns. It should be noted, however, that sealed beam lamp units are classified in **heading 85.39**.

(5) **Portable lamps (other than those of heading 85.13)**, e.g., : hurricane lamps; stable lamps; hand lanterns; miners' lamps; quarrymen's lamps.

(6) **Candelabra, candlesticks, candle brackets, e.g., for pianos.**

This group also includes **searchlights and spotlights**. These throw a concentrated beam of light (which can usually be regulated) over a distance onto a given point or surface, by means of a reflector and lenses, or with a reflector only. The reflectors are usually of silvered glass, or of polished, silvered or chromium-plated metal. The lenses are usually plano-convex or stepped (Fresnel lenses).

Searchlights are used, e.g., for anti-aircraft operations, and spotlights, e.g., for stage sets and in photographic or film studios.

(II) ILLUMINATED SIGNS, ILLUMINATED NAME-PLATES AND THE LIKE

This group covers advertising lamps, signs, illuminated name-plates (including road signs) and like articles such as advertising plates and address plates, of any material, provided that they have a permanently fixed light source.

*
* *

PARTS

The heading also covers identifiable **parts** of lamps and lighting fittings, illuminated signs, illuminated name-plates and the like, not more specifically covered elsewhere, e.g., :

- (1) Suspension assemblies (rigid or chain type) for lighting pendants.
- (2) Globe holders.
- (3) Bases, handles and cases for hand lamps.
- (4) Burners for lamps; mantle holders.
- (5) Lantern frames.
- (6) Reflectors.
- (7) Lamp glasses or chimneys (bottle-necked, etc.).
- (8) Small cylinders of thick glass for miner's safety lamps.
- (9) Diffusers (including alabaster diffusers).
- (10) Bowls, cups, shades (including skeleton wire frames for making lampshades), globes and similar articles.
- (11) Chandelier trimmings, such as balls, pear-shaped drops, flower-shaped pieces, pendants, small plates and the like, identifiable by their size or their fixing or fastening devices.

Non-electrical parts of articles of this heading, combined with electrical parts, remain classified here. Separately presented electrical fittings (e.g., switches, lamp holders, flex, plugs, transformers, starters, ballasts) are **excluded** (**Chapter 85**).

This heading also **excludes** :

- (a) Candles (**heading 34.06**).
- (b) Resin torches (**heading 36.06**).
- (c) Signs, name-plates and the like, not illuminated or illuminated by a light source not permanently fixed, (**heading 39.26**, **Chapter 70**, **heading 83.10**, etc.).
- (d) Printed globes, with internal lighting fittings, of **heading 49.05**.
- (e) Wicks for lamps, of woven, plaited or knitted textile materials (**heading 59.08**).
- (f) Glass beads and fancy glass smallwares (e.g., fringes) made of threaded glass beads or bugles and intended for trimming lampshades (**heading 70.18**).
- (g) Electrical lighting and signalling equipment for cycles and motor vehicles (**heading 85.12**).
- (h) Electric filament lamps, discharge lamps (including tubes in various complex forms such as scrolls, letters, figures, stars, etc.) and arc lamps (**heading 85.39**).
- (ij) Photographic flashlight apparatus (including electrically ignited photographic flashbulbs) (**heading 90.06**).
- (k) Optical light-beam signalling apparatus (**heading 90.13**).
- (l) Medical diagnostic, probing, irradiation, etc., lamps (**heading 90.18**).
- (m) Decorations, such as Chinese lanterns (**heading 95.05**).

94.06 - Prefabricated buildings (+).

9406.10 - Of wood

9406.90 - Other

This heading covers prefabricated buildings, also known as “industrialised buildings”, of all materials.

These buildings, which can be designed for a variety of uses, such as housing, worksite accommodation, offices, schools, shops, sheds, garages and greenhouses, are generally presented in the form of:

- complete buildings, fully assembled, ready for use;
- complete buildings, unassembled;
- incomplete buildings, whether or not assembled, having the essential character of prefabricated buildings.

In the case of buildings presented unassembled, the necessary elements may be presented partially assembled (for example, walls, trusses) or cut to size (beams, joists, in particular) or, in some cases, in indeterminate or random lengths for cutting on the site (sills, insulation, etc.).

The buildings of this heading may or may not be equipped. However, only built-in equipment normally supplied is to be classified with the buildings. This includes electrical fittings (wiring, sockets, switches, circuit-breakers, bells, etc.), heating and air conditioning equipment (boilers, radiators, air conditioners, etc.), sanitary equipment (baths, showers, water heaters, etc.), kitchen equipment (sinks, hoods, cookers, etc.) and items of furniture which are built in or designed to be built in (cupboards, etc.).

Material for the assembly or finishing of prefabricated buildings (e.g., nails, glues, plaster, mortar, electric wire and cables, tubes and pipes, paints, wallpaper, carpeting) is to be classified with the buildings, **provided** it is presented therewith in appropriate quantities.

Presented separately, parts of buildings and equipment, whether or not identifiable as intended for these buildings, are **excluded** from the heading and are in all cases classified in their own appropriate headings.

“o

◦ ◦

Subheading Explanatory Note.

Subheading 9406.10

For the purposes of classification in this subheading, the expression “of wood” refers to prefabricated buildings with wooden structure, exterior walls, floor (if floor present), and other characteristic constructive elements consisting predominantly of wood.

Chapter 95

Toys, games and sports requisites; parts and accessories thereof

Notes.

- 1.- This Chapter does not cover :
- (a) Candles (heading 34.06);
 - (b) Fireworks or other pyrotechnic articles of heading 36.04;
 - (c) Yarns, monofilament, cords or gut or the like for fishing, cut to length but not made up into fishing lines, of Chapter 39, heading 42.06 or Section XI;
 - (d) Sports bags or other containers of heading 42.02, 43.03 or 43.04;
 - (e) Sports Fancy dress of textiles, of Chapter 61 or 62; sports clothing and special articles of apparel of textiles, of Chapter 61 or 62, whether or not incorporating incidentally protective components such as pads or padding in the elbow, knee or groin areas (for example, fencing clothing or soccer goalkeeper jerseys);
 - (f) Textile flags or bunting, or sails for boats, sailboards or land craft, of Chapter 63;
 - (g) Sports footwear (other than skating boots with ice or roller skates attached) of Chapter 64, or sports headgear of Chapter 65;
 - (h) Walking-sticks, whips, riding-crops or the like (heading 66.02), or parts thereof (heading 66.03);
 - (ij) Unmounted glass eyes for dolls or other toys, of heading 70.18;
 - (k) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
 - (l) Bells, gongs or the like of heading 83.06;
 - (m) Pumps for liquids (heading 84.13), filtering or purifying machinery and apparatus for liquids or gases (heading 84.21), electric motors (heading 85.01), electric transformers (heading 85.04), discs, tapes, solid-state non-volatile storage devices, "smart cards" and other media for the recording of sound or of other phenomena, whether or not recorded (heading 85.23), radio remote control apparatus (heading 85.26) or cordless infrared remote control devices (heading 85.43);
 - (n) Sports vehicles (other than bobsleighs, toboggans and the like) of Section XVII;
 - (o) Children's bicycles (heading 87.12);
 - (p) Sports craft such as canoes and skiffs (Chapter 89), or their means of propulsion (Chapter 44 for such articles made of wood);
 - (q) Spectacles, goggles or the like, for sports or outdoor games (heading 90.04);
 - (r) Decoy calls or whistles (heading 92.08);
 - (s) Arms or other articles of Chapter 93;
 - (t) Electric garlands of all kinds (heading 94.05);
 - (u) Monopods, bipods, tripods and similar articles (heading 96.20);
 - (v) Racket strings, tents or other camping goods, or gloves, mittens and mitts (classified according to their constituent material); or
 - (w) Tableware, kitchenware, toilet articles, carpets and other textile floor coverings, apparel, bed linen, table linen, toilet linen, kitchen linen and similar articles having a utilitarian function (classified according to their constituent material).

- 2.- This Chapter includes articles in which natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal constitute only minor constituents.
- 3.- Subject to Note 1 above, parts and accessories which are suitable for use solely or principally with articles of this Chapter are to be classified with those articles.
- 4.- Subject to the provisions of Note 1 above, heading 95.03 applies, *inter alia*, to articles of this heading combined with one or more items, which cannot be considered as sets under the terms of General Interpretative Rule 3 (b), and which, if presented separately, would be classified in other headings, provided the articles are put up together for retail sale and the combinations have the essential character of toys.
- 5.- Heading 95.03 does not cover articles which, on account of their design, shape or constituent material, are identifiable as intended exclusively for animals, for example, "pet toys" (classification in their own appropriate heading).

Subheading Note.

1.- Subheading 9504.50 covers :

- (a) Video game consoles from which the image is reproduced on a television receiver, a monitor or other external screen or surface; or
- (b) Video game machines having a self-contained video screen, whether or not portable.

This subheading does not cover video game consoles or machines operated by coins, banknotes, bank cards, tokens or by any other means of payment (subheading 9504.30).

GENERAL

This Chapter covers toys of all kinds whether designed for the amusement of children or adults. It also includes equipment for indoor or outdoor games, appliances and apparatus for sports, gymnastics or athletics, certain requisites for fishing, hunting or shooting, and roundabouts and other fairground amusements.

Each of the headings of this Chapter also covers identifiable parts and accessories of articles of this Chapter which are suitable for use solely or principally therewith, and **provided** they are **not** articles excluded by Note 1 to this Chapter.

The articles of this Chapter may, in general, be made of any material **except** natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal. They may, however, incorporate **minor constituents** made of these materials.

Apart from the articles excluded in the following Explanatory Notes, this Chapter also **excludes** :

- (a) Fireworks or other pyrotechnic articles of **heading 36.04**.
- (b) Rubber tyres and other articles of **heading 40.11, 40.12 or 40.13**.
- (c) Tents and camping goods (generally **heading 63.06**).
- (d) Pumps for liquids (**heading 84.13**), filtering or purifying machinery and apparatus for liquids or gases (**heading 84.21**), electric motors (**heading 85.01**), electric transformers (**heading 85.04**), discs, tapes, solid-state non-volatile storage devices, "smart cards" and other media for the recording of sound or of other phenomena, whether or not recorded (**heading 85.23**), radio remote control apparatus (**heading 85.26**) or cordless infrared remote control devices (**heading 85.43**).
- (e) Arms and other articles of **Chapter 93**.

[95.01]

[95.02]

95.03 - Tricycles, scooters, pedal cars and similar wheeled toys; dolls' carriages; dolls; other toys; reduced-size ("scale") models and similar recreational models, working or not; puzzles of all kinds.

This heading covers :

(A) Wheeled toys.

These articles are usually designed for propulsion either by means of pedals, hand levers or other simple devices which transmit power to the wheels through a chain or rod, or, as in the case of certain scooters, by direct pressure of a person's foot against the ground. Other types of wheeled toys may be simply drawn or pushed by another person or driven by a motor.

These toys include :

- (1) Children's tricycles and the like, but **excluding** bicycles of **heading 87.12**.
- (2) Two- or three-wheeled scooters designed to be ridden by children, as well as youngsters and adults, with an adjustable or non-adjustable steering column and small solid or inflatable wheels. They are sometimes equipped with a bicycle-type handle-bar, a hand brake or a foot brake on the rear wheel.
- (3) Pedal- or hand-propelled wheeled toys in the form of animals.
- (4) Pedal cars, frequently in the form of miniature sports cars, jeeps, lorries, etc.
- (5) Wheeled toys, propelled by hand levers.
- (6) Other wheeled toys (with no mechanical transmission system) which are designed to be drawn or pushed, and are large enough for children to ride.
- (7) Children's cars powered by a motor.

(B) Dolls' carriages (e.g., strollers), including folding types.

This group covers doll's carriages, whether or not folding, fitted with two or more wheels, such as push-chairs, perambulators, strollers, etc. It also covers bedding for carriages, similar to that used for doll's beds.

(C) Dolls.

This group includes not only dolls designed for the amusement of children, but also dolls intended for decorative purposes (e.g., boudoir dolls, mascot dolls), or for use in Punch and Judy or marionette shows, or those of a caricature type.

Dolls are usually made of rubber, plastics, textile materials, wax, ceramics, wood, paperboard, papier maché or combinations of these materials. They may be jointed and contain mechanisms which permit limb, head or eye movements as well as reproductions of the human voice, etc. They may also be dressed.

Parts and accessories of dolls of this heading include : heads, bodies, limbs, eyes (**other than** those unmounted of glass, of **heading 70.18**), moving mechanisms for eyes, voice-producing or other mechanisms, wigs, dolls' clothing, shoes and hats.

(D) Other toys.

This group covers toys intended essentially for the amusement of persons (children or adults). However, toys which, on account of their design, shape or constituent material, are identifiable as intended exclusively for animals, e.g., pets, do not fall in this heading, but are classified in their own appropriate heading. This group includes :

All toys **not included** in **(A) to (C)**. Many of the toys are mechanically or electrically operated.

These include :

- (i) Toys representing animals or non-human creatures even if possessing predominantly human physical characteristics (e.g., angels, robots, devils, monsters), including those for use in marionette shows.
- (ii) Toy pistols and guns.
- (iii) Constructional toys (construction sets, building blocks, etc.).
- (iv) Toy vehicles (**other than** those of **group A**), trains (whether or not electric), aircraft, boats, etc., and their accessories (e.g., railway tracks, signals).
- (v) Toys designed to be ridden by children but not mounted on wheels, e.g., rocking horses.
- (vi) Non-electric toy motors, toy steam engines, etc.
- (vii) Toy balloons and toy kites.
- (viii) Tin soldiers and the like, and toy armaments.
- (ix) Toy sports equipment, whether or not in sets (e.g., golf sets, tennis sets, archery sets, billiard sets; baseball bats, cricket bats, hockey sticks).
- (x) Toy tools and implements; children's wheelbarrows.
- (xi) Toy cinematographs, magic lanterns, etc.; toy spectacles.
- (xii) Toy musical instruments (pianos, trumpets, drums, gramophones, mouth organs, accordions, xylophones, musical boxes, etc.).
- (xiii) Dolls' houses and furniture, including bedding.
- (xiv) Dolls' tea and coffee sets; toy shops and the like, farmyard sets, etc.
- (xv) Toy counting frames (abaci).
- (xvi) Toy sewing machines.
- (xvii) Toy clocks and watches.
- (xviii) Educational toys (e.g., toy chemistry, printing, sewing and knitting sets).
- (xix) Hoops, skipping ropes, diabolo spools and sticks, spinning and humming tops, balls (**other than** those of **heading 95.04 or 95.06**).

- (xx) Books or sheets consisting essentially of pictures, toys or models, for cutting out and assembly; also books containing "stand-up" or movable figures **provided** they have the essential character of toys (see the Explanatory Note to heading 49.03).
- (xxi) Toy marbles (e.g., veined glass marbles put up in any form, or glass balls of any kind put up in packets for the amusement of children).
- (xxii) Toy money boxes; babies' rattles, jack-in-the-boxes; toy theatres with or without figures, etc.
- (xxiii) Play tents for use by children indoors or outdoors.

Certain of the above articles (toy arms, tools, gardening sets, tin soldiers, etc.) are often put up in sets.

Certain toys (e.g., electric irons, sewing machines, musical instruments, etc.) may be capable of a limited "use"; but they are generally distinguishable by their size and limited capacity from real sewing machines, etc.

(E) Reduced-size ("scale") models and similar recreational models.

This includes models of a kind mainly used for recreational purposes, for example, working or scale models of boats, aircraft, trains, vehicles, etc., and kits of materials and parts for making such models, other **than** sets having the character of competitive games of **heading 95.04** (e.g., sets comprising slot-racing motor cars with their track layout).

This group also includes life-size or enlarged reproductions of articles **provided** they are for recreational purposes

(F) Puzzles of all kinds.

Collections of articles, the individual items of which if presented separately would be classified in other headings in the Nomenclature, are classified in this heading when they are put up in a form clearly indicating their use as toys (e.g., instructional toys such as chemistry, sewing, etc., sets).

Also, as provided by Note 4 to this Chapter, subject to Note 1 to this Chapter, this heading includes articles of the heading combined with one or more items which would be classified in other headings if presented separately, provided that :

- (a) the combined items are put up together for retail sale, but the combination cannot be considered as a set under the terms of General Interpretative Rule 3 (b); and
- (b) the combination has the essential character of toys. Such combinations generally consist of an article of this heading and one or more items of minor importance (e.g., small promotional articles or small amounts of confectionery).

PARTS AND ACCESSORIES

This heading also covers identifiable parts and accessories of the articles of this heading, which are suitable for use solely or principally therewith and **provided** they are **not** articles excluded by Note 1 to this Chapter. Such parts and accessories include :

- (1) Musical box movements which, by their form, constituent material and simple design, could not be used in musical boxes of **heading 92.08**.
- (2) Miniature internal combustion piston engines and other engines (**other than** electric motors of **heading 85.01**) for example, for model aircraft, ships, which are characterised, *inter alia*, by small cylinder capacity and power rating, low weight and small size.

This heading also **excludes** :

- (a) Paints put up for children's use (**heading 32.13**).
- (b) Modelling pastes put up for children's amusement (**heading 34.07**).
- (c) Children's picture, drawing or colouring books of **heading 49.03**.
- (d) Transfers (**heading 49.08**).
- (e) Bells (including bells for tricycles or for other wheeled toys), gongs or the like, of **heading 83.06**.
- (f) Musical boxes which have a doll figure attached (**heading 92.08**).
- (g) Card games (**heading 95.04**).
- (h) Paper hats, "blow-outs", masks, false noses and the like (**heading 95.05**).
- (ij) Crayons and pastels for children's use, of **heading 96.09**.
- (k) Slates and blackboards, of **heading 96.10**.
- (l) Lay figures and automata of a kind used for shop window dressing (**heading 96.18**).
- (m) jump balls with one or more handles designed for physical exercises.

95.04 - Video game consoles and machines, articles for funfair, table or parlour games, including pintables, billiards, special tables for casino games and automatic bowling alley equipment (+).

9504.20 - Articles and accessories for billiards of all kinds

9504.30 - Other games, operated by coins, banknotes, bank cards, tokens or by any other means of payment, other than automatic bowling alley equipment

9504.40 - Playing cards

9504.50 - Video game consoles and machines, other than those of subheading 9504.30

9504.90 - Other

This heading includes :

- (1) Billiard tables of various types (with or without legs), and accessories therefor (e.g., billiard cues, cue rests, balls, billiard chalks, ball or slide type markers). But the heading **excludes** mechanical counters (roller-type and the like) (**heading 90.29**), meters which employ a clock movement to indicate the time in play or the amount payable based on that time (**heading 91.06**), and billiard-cue racks (classified in **heading 94.03** or according to their constituent material).
- (2) Video game consoles and machines as defined in Subheading Note 1 to this Chapter.

Video game consoles and machines whose objective characteristics and principal function are such that they are intended for entertainment purposes (game-playing) remain classified in this heading, whether or not they fulfil the conditions of Note 5 (A) to Chapter 84 regarding automatic data processing machines.

The heading also includes parts and accessories of video game consoles and machines (for example cases, game cartridges, game controllers, steering wheels), provided they fulfil the conditions of Note 3 to this Chapter.

However, the heading **excludes** :

- (a) Optional peripherals (keyboards, mouses, disk storage units, etc.) which fulfil the conditions of Note 5 (C) to Chapter 84 (**Section XVI**).
- (b) Optical discs recorded with game software and used solely with a game machine of this heading (**heading 85.23**).
- (3) Tables of the furniture type specially constructed for games (e.g., tables with a draught-board top).
- (4) Special tables for casino or parlour games (e.g., for roulette or for miniature horse races); croupiers' rakes, etc.
- (5) Table football or similar games.

- (6) Machines, operated by coins, banknotes, bank cards, tokens or by other means of payment, of the kind used in amusement arcades, cafés, funfairs, etc., for games of skill or chance (e.g., machines for revolver practice, printables of various types).
- (7) Automatic bowling alley equipment, whether or not equipped with motors and electro-mechanical features.

For the purpose of this heading the expression "automatic bowling alley equipment" applies not only to equipment where the pins are arranged in triangular form but also to other types (e.g., those in which the pins are arranged in a square).

- (8) Skittles and indoor croquet requisites.
- (9) Sets comprising slot-racing motor cars with their track layouts, having the character of competitive games.
- (10) Dartboards and darts.
- (11) Card games of all kinds (bridge, tarot, "lexicon", etc.).
- (12) Boards and pieces (chessmen, draughtsmen, etc.) for games of chess, draughts, dominoes, mah-jong, halma, ludo, snakes and ladders, etc.
- (13) Certain other accessories common to a number of games of this heading, for example, dice, dice boxes, counters, suit indicators, specially designed playing cloths (e.g., for roulette).

The heading also **excludes**:

- (a) Lottery tickets, "scratch cards", raffle tickets and tombola tickets (generally **heading 49.11**).
- (b) Card tables of **Chapter 94**.
- (c) Seats which incorporate a sound system and are suitable for use with video game consoles and machines, television or satellite receivers, as well as with DVD, music CD, MP3 or video cassette players (**heading 94.01**).
- (d) Puzzles (**heading 95.03**).

Subheading Explanatory Note.

Subheading 9504.50.

This subheading does not cover video game consoles or machines operated by coins, banknotes, bank cards, tokens or by any other means of payment; these are to be classified in subheading **9504.30**.

95.05 - Festive, carnival or other entertainment articles, including conjuring tricks and novelty jokes.

9505.10 - Articles for Christmas festivities

9505.90 - Other

This heading covers :

(A) **Festive, carnival or other entertainment articles**, which in view of their intended use are generally made of non-durable material. They include :

- (1) Festive decorations used to decorate rooms, tables, etc. (such as garlands, lanterns, etc.); decorative articles for Christmas trees (tinsel, coloured balls, animals and other figures, etc); cake decorations which are traditionally associated with a particular festival (e.g., animals, flags).
- (2) Articles traditionally used at Christmas festivities, e.g., artificial Christmas trees, nativity scenes, nativity figures and animals, angels, Christmas crackers, Christmas stockings, imitation yule logs, Father Christmases.
- (3) Articles of fancy dress, e.g., masks, false ears and noses, wigs, false beards and moustaches (**not being** articles of postiche - **heading 67.04**), and paper hats. However, the heading **excludes** fancy dress of textile materials, of **Chapter 61** or **62**.
- (4) Throw-balls of paper or cotton-wool, paper streamers (carnival tape), cardboard trumpets, "blow-outs", confetti, carnival umbrellas, etc.

The heading **excludes** statuettes, statues and the like of a kind used for decorating places of worship.

The heading also **excludes** articles that contain a festive design, decoration, emblem or motif and have a utilitarian function, e.g., tableware, kitchenware, toilet articles, carpets and other textile floor coverings, apparel, bed linen, table linen, toilet linen, kitchen linen.

(B) **Conjuring tricks and novelty jokes**, e.g., packs of cards, tables, screens and containers, specially designed for the performance of conjuring tricks; novelty jokes such as sneezing powder, surprise sweets, water-jet button-holes and "Japanese flowers".

This heading also **excludes** :

- (a) Natural Christmas trees (**Chapter 6**).
- (b) Candles (**heading 34.06**).
- (c) Packagings of plastics or of paper, used during festivals (classified according to constituent material, for example, **Chapter 39** or **48**).
- (d) Christmas tree stands (classified according to constituent material).
- (e) Textile flags or bunting of **heading 63.07**.
- (f) Electric garlands of all kinds (**heading 94.05**).

95.06 - Articles and equipment for general physical exercise, gymnastics, athletics, other sports (including table- tennis) or outdoor games, not specified or included elsewhere in this Chapter; swimming pools and paddling pools.

- Snow-skis and other snow-ski equipment :

9506.11 -- Skis

9506.12 -- Ski-fastenings (ski-bindings)

9506.19 -- Other

- Water-skis, surf-boards, sailboards and other water-sport equipment :

9506.21 -- Sailboards

9506.29 -- Other

- Golf clubs and other golf equipment :

9506.31 -- Clubs, complete

9506.32 -- Balls

9506.39 -- Other

9506.40 - Articles and equipment for table-tennis

- Tennis, badminton or similar rackets, whether or not strung :

9506.51 -- Lawn-tennis rackets, whether or not strung

9506.59 -- Other

- Balls, other than golf balls and table-tennis balls :

9506.61 -- Lawn-tennis balls

9506.62 -- Inflatable

9506.69 -- Other

9506.70 - Ice skates and roller skates, including skating boots with skates attached

- Other :

9506.91 -- Articles and equipment for general physical exercise, gymnastics or athletics

9506.99 -- Other

This heading covers :

(A) Articles and equipment for general physical exercise, gymnastics or athletics, e.g. :

Trapeze bars and rings; horizontal and parallel bars; balance beams, vaulting horses; pommel horses; spring boards; climbing ropes and ladders; wall bars; Indian clubs; dumb-bells and bar-bells; medicine balls; jump balls with one or more handles designed for physical exercises; rowing, cycling and other exercising apparatus; chest expanders; hand grips; starting blocks; hurdles; jumping stands and standards; vaulting poles; landing pit pads; javelins, discs, throwing hammers and putting shots; punch balls (speed bags) and punch bags (punching bags); boxing or wrestling rings; assault course climbing walls.

(B) Requisites for other sports and outdoor games (other than toys presented in sets, or separately, of heading 95.03), e.g. :

- (1) Snow-skis and other snow-ski equipment, (e.g., ski-fastenings (ski-bindings), ski brakes, ski poles).
- (2) Water-skis, surf-boards, sailboards and other water-sport equipment, such as diving stages (platforms), chutes, divers' flippers and respiratory masks of a kind used without oxygen or compressed air bottles, and simple underwater breathing tubes (generally known as "snorkels") for swimmers or divers.
- (3) Golf clubs and other golf equipment, such as golf balls, golf tees.
- (4) Articles and equipment for table-tennis (ping-pong), such as tables (with or without legs), bats (paddles), balls and nets.
- (5) Tennis, badminton or similar rackets (e.g., squash rackets), whether or not strung.
- (6) Balls, other than golf balls and table-tennis balls, such as tennis balls, footballs, rugby balls and similar balls (including bladders and covers for such balls); water polo, basketball and similar valve type balls; cricket balls.
- (7) Ice skates and roller skates, including skating boots with skates attached.
- (8) Sticks and bats for hockey, cricket, lacrosse, etc.; chistera (jai alai scoops); pucks for ice hockey; curling stones.
- (9) Nets for various games (tennis, badminton, volleyball, football, basketball, etc.).
- (10) Fencing equipment : fencing foils, sabres and rapiers and their parts (e.g., blades, guards, hilts and buttons or stops), etc.
- (11) Archery equipment, such as bows, arrows and targets.
- (12) Equipment of a kind used in children's playgrounds (e.g., swings, slides, see-saws and giant strides).
- (13) Protective equipment for sports or games, e.g., fencing masks and breast plates, elbow and knee pads, cricket pads, shin-guards, ice hockey pants with built-in guards and pads.
- (14) Other articles and equipment, such as requisites for deck tennis, quoits or bowls; skate boards; racket presses; mallets for polo or croquet; boomerangs; ice axes; clay

pigeons and clay pigeon projectors; bobsleighs (bobsleds), luges and similar non-motorised vehicles for sliding on snow or ice.

(C) **Swimming pools and paddling pools.**

The heading **excludes** :

- (a) Strings for lawn tennis and other rackets (**Chapter 39, heading 42.06** or **Section XI**).
- (b) Sports bags and other containers of **heading 42.02, 43.03** or **43.04**.
- (c) Sports gloves, mittens and mitts (generally **heading 42.03**).
- (d) Enclosure nets, and net carrying-bags for footballs, tennis balls, etc. (generally **heading 56.08**).
- (e) Sports clothing of textiles, of **Chapter 61** or **62**, whether or not incorporating incidentally protective components such as pads or padding in the elbow, knee or groin areas (e.g., fencing clothing or soccer goalkeeper jerseys).
- (f) Sails for boats, sailboards or landcraft, of **heading 63.06**.
- (g) Sports footwear (**other than** ice or roller skating boots with skates attached) of **Chapter 64** and sports headgear of **Chapter 65**.
- (h) Walking-sticks, whips, riding-crops and the like (**heading 66.02**), and parts thereof (**heading 66.03**).
- (ij) Sports craft (such as marine jets, canoes and skiffs) and sports vehicles (**other than** bobsleighs (bobsleds), toboggans and the like), of **Section XVII**.
- (k) Frogmen's and other goggles (**heading 90.04**).
- (l) Electro-medical apparatus and other instruments and appliances of **heading 90.18**.
- (m) Mechano-therapy appliances (**heading 90.19**).
- (n) Breathing appliances of a kind used with oxygen or compressed air bottles (**heading 90.20**).
- (o) Articles for sports purposes of **Chapter 91**.
- (p) Bowling requisites of all kinds (including automatic bowling alley equipment) and other equipment for parlour, table or funfair games (**heading 95.04**).

95.07 - Fishing rods, fish-hooks and other line fishing tackle; fish landing nets, butterfly nets and similar nets; decoy "birds" (other than those of heading 92.08 or 97.05) and similar hunting or shooting requisites.

9507.10 - Fishing rods

9507.20 - Fish-hooks, whether or not snelled

9507.30 - Fishing reels

9507.90 - Other

This heading covers :

- (1) **Fish-hooks** of all kinds (e.g., with single or multiple barbs) and sizes. These are usually made of steel but they may be bronzed, tinned, silvered or gilded.
- (2) **Fish landing nets, butterfly nets and similar nets.** These usually consist of pocket-like nets of textile yarn or cord, mounted on a wire support and fixed to a handle.
- (3) **Line fishing rods and tackle.** Fishing rods may be of various sizes, and may be made of various materials (bamboo, wood, metal, glass fibre, plastics, etc.). They may consist of a single piece or be jointed. Fishing tackle comprises such items as reels and reel mountings; artificial bait (e.g., imitation fish, flies, insects or worms) and hooks mounted with such bait; spinning bait; mounted lines and casts; fishing floats (cork, glass, quill, etc.) including luminous floats; line winding frames; automatic striking devices; mounted fishing rings (**other than** mounted rings of precious or semi-precious stone); sinkers, and fishing rod bells when mounted or attached to external clamps, clips or other devices.
- (4) **Certain hunting or shooting requisites** such as decoy " birds " (but **not including** decoy calls of all kinds (**heading 92.08**) or stuffed birds of **heading 97.05**) and lark mirrors.

This heading also **excludes** :

- (a) Feathers for making artificial flies (**heading 05.05** or **67.01**).
- (b) Yarns, monofilaments, cords, and real or imitation gut, cut to length but not made up into fishing lines (**Chapter 39, heading 42.06** or **Section XI**).
- (c) Sports bags and other containers (e.g., fishing rod cases and game bags) of **heading 42.02, 43.03** or **43.04**.
- (d) Unmounted rings (classified in their own appropriate headings).
- (e) Traps, snares, etc. (classified according to constituent materials).
- (f) Bells, non-electric, of base metal, for fishing tackle, not mounted or attached to external clamps, clips, or other devices (**heading 83.06**).
- (g) Clay pigeons (**heading 95.06**).

95.08 - Roundabouts, swings, shooting galleries and other fairground amusements; travelling circuses and travelling menageries; travelling theatres.

9508.10 - Travelling circuses and travelling menageries

9508.90 - Other

Fairground amusements, travelling circuses, travelling menageries and travelling theatres fall in this heading **provided** they comprise all the essential units required for their normal operation. The heading also includes items of auxiliary equipment **provided** they are presented with, and as components of, these various amusements, notwithstanding that when presented separately such items (e.g., tents, animals, musical instruments, power plants, motors, lighting fittings, seats, and arms and ammunition) would fall in other headings of the Nomenclature.

Subject to the provisions of Note 1 to this Chapter, articles which are identifiable as designed solely or principally for use as parts and accessories of such amusements (e.g., boats for swings and water-chutes), remain classified here when presented separately.

Fairground amusements falling in this heading include :

- (1) Roundabouts of all kinds.
- (2) "Dodge'em" car installations.
- (3) Water-chutes.
- (4) Scenic railways and slides.
- (5) Swinging boats.
- (6) Shooting galleries and coconut shies.
- (7) Mazes.
- (8) Freak shows.
- (9) Lotteries (e.g., wheels of fortune).

The heading **excludes** :

- (a) Travelling stalls for the sale of goods (confectionery and other products, etc.), for advertising or for educational or similar exhibitions.
 - (b) Tractors and other transport vehicles, including trailers, **other than** those specially designed for and forming part of fairground amusements (e.g., ring-stand trailers).
 - (c) Amusement machines operated by coins, banknotes (paper currency), discs or other similar articles. (**heading 95.04**).
 - (d) Goods for distribution as prizes.
-

Chapter 96

Miscellaneous manufactured articles

Notes.

1.- This Chapter does not cover :

- (a) Pencils for cosmetic or toilet uses (Chapter 33);
- (b) Articles of Chapter 66 (for example, parts of umbrellas or walking-sticks);
- (c) Imitation jewellery (heading 71.17);
- (d) Parts of general use, as defined in Note 2 to Section XV, of base metal (Section XV), or similar goods of plastics (Chapter 39);
- (e) Cutlery or other articles of Chapter 82 with handles or other parts of carving or moulding materials; heading 96.01 or 96.02 applies, however, to separately presented handles or other parts of such articles;
- (f) Articles of Chapter 90 (for example, spectacle frames (heading 90.03), mathematical drawing pens (heading 90.17), brushes of a kind specialised for use in dentistry or for medical, surgical or veterinary purposes (heading 90.18));
- (g) Articles of Chapter 91 (for example, clock or watch cases);
- (h) Musical instruments or parts or accessories thereof (Chapter 92);
- (ij) Articles of Chapter 93 (arms and parts thereof);
- (k) Articles of Chapter 94 (for example, furniture, lamps and lighting fittings);
- (l) Articles of Chapter 95 (toys, games, sports requisites); or
- (m) Works of art, collectors' pieces or antiques (Chapter 97).

2.- In heading 96.02 the expression " vegetable or mineral carving material " means :

- (a) Hard seeds, pips, hulls and nuts and similar vegetable materials of a kind used for carving (for example, corozo and dom);
- (b) Amber, meerschaum, agglomerated amber and agglomerated meerschaum, jet and mineral substitutes for jet.

3.- In heading 96.03 the expression " prepared knots and tufts for broom or brush making " applies only to unmounted knots and tufts of animal hair, vegetable fibre or other material, which are ready for incorporation without division in brooms or brushes, or which require only such further minor processes as trimming to shape at the top, to render them ready for such incorporation.

4.- Articles of this Chapter, other than those of headings 96.01 to 96.06 or 96.15, remain classified in the Chapter whether or not composed wholly or partly of precious metal or metal clad with precious metal, of natural or cultured pearls, or precious or semi-precious stones (natural, synthetic or reconstructed). However, headings 96.01 to 96.06 and 96.15 include articles in which natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal constitute only minor constituents.

GENERAL

This Chapter covers carving and moulding materials and articles of these materials, certain brooms, brushes and sieves, certain articles of haberdashery, certain articles of writing and office equipment, certain requisites for smokers, certain toilet articles, certain sanitary absorbent products (sanitary towels (pads) and tampons, napkins and napkin liners for babies and similar articles, of any material) and various other articles **not more specifically covered** by other headings in the Nomenclature.

The articles described in **headings 96.07 to 96.14 and 96.16 to 96.18** may be made wholly or partly of natural or cultured pearls, of precious or semi-precious stones (natural, synthetic or reconstructed), or of precious metal or metal clad with precious metal. However, the articles described in **headings 96.01 to 96.06 and 96.15** may incorporate those materials as **minor constituents** only.

96.01 - Worked ivory, bone, tortoise-shell, horn, antlers, coral, mother-of-pearl and other animal carving material, and articles of these materials (including articles obtained by moulding).

9601.10 - Worked ivory and articles of ivory

9601.90 - Other

This heading relates to worked animal materials (**other than** those referred to in **heading 96.02**). These materials are mainly worked by carving or cutting. Most of them may also be moulded.

For the purposes of this heading, the expression "worked" refers to materials which have undergone processes extending beyond the simple preparations permitted in the heading for the raw material in question (see the Explanatory Notes to headings 05.05 to 05.08). The heading therefore covers pieces of ivory, bone, tortoise-shell, horn, antlers, coral, mother-of-pearl, etc., in the form of sheets, plates, rods, etc., cut to shape (including square or rectangular) or polished or otherwise worked by grinding, drilling, milling, turning, etc. However, pieces which are identifiable as parts of articles are **excluded** from this heading if such parts are covered by another heading of the Nomenclature. Thus, piano-key plates and plates for insertion in butts of firearms fall in **headings 92.09** and **93.05** respectively. However, worked materials not identifiable as parts of articles remain classified in this heading (e.g., simple discs, plates or strips for inlaying, etc., or for subsequent use in the manufacture of piano-keys).

Provided they are worked or in the form of articles, the heading includes the following :

- (I) Ivory. Throughout the Nomenclature, elephant, hippopotamus, walrus, narwhal and wild boar tusks, rhinoceros horns and the teeth of all animals are regarded as ivory (see Note 3 to Chapter 5).
- (II) Bone, the hard solid parts of the bodies of many animals, worked almost solely by cutting.
- (III) Tortoise-shell, obtained almost exclusively from turtles. Tortoise-shell, which is yellowish, brownish or black in colour, is very malleable and becomes highly ductile when heated; when cooled it retains the shape given to it.
- (IV) Horn and antlers, obtained from the foreheads of ruminants. (Horn-cores are not used as carving or moulding materials but almost exclusively in the manufacture of gelatin.)
- (V) Natural coral (i.e., the calcareous skeletons of marine polyps) and agglomerated coral.
- (VI) Mother-of-pearl, the lustrous, iridescent nacreous lining of certain shells; its surface appears to be undulated although, in fact, it is perfectly smooth.
- (VII) Hooves, nails, claws and beaks.
- (VIII) Bone and similar materials obtained from marine mammals.
- (IX) Quills of feathers.

(X) Shells of crustaceans and molluscs.

The heading covers :

(A) Worked animal carving materials.

The carving materials mentioned in the heading are classified here **provided** they have undergone processes extending **beyond** cleaning or scraping, simple sawing to remove useless parts, cutting (sometimes followed by rough planing) and, in some cases, bleaching, flattening, trimming or splitting.

Thus, tortoise-shell is **excluded** if it has not undergone processes extending beyond the straightening and surface-levelling of scales (this last operation is exceptional since unworked tortoise-shell is almost always presented in sheets of uneven thickness and with curved surfaces) (see the Explanatory Note to **heading 05.07**, Part (B)). The heading similarly **excludes** coral from which only the outer crust has been removed (**heading 05.08**).

Also included are moulded products, of any shape, made from tortoise-shell scales, plates or claws, or from reconstituted materials obtained from powder or waste of any of the carving materials of the heading.

One of the properties of tortoise-shell is that it can be joined together by heating without the use of any special binder; advantage is taken of this property to obtain comparatively thick plates by uniting thin scales in layers, and to make articles. A characteristic of horn is that it becomes soft when heated and can then be flattened or reduced to a pasty consistency; it can, therefore, be worked by moulding in the same manner as tortoise-shell.

Polished or unpolished discs not having the character of button blanks (see the Explanatory Note to **heading 96.06**) and Jerusalem pearls, (i.e., irregular mother-of-pearl beads, simply pierced, but **not** polished, graded or further worked) remain classified in this heading even if temporarily strung.

(B) Articles of animal carving materials of the heading.

This group includes :

- (1) Cigar or cigarette cases, snuff-boxes, powder-boxes, buckles, clasps, lipstick cases.
- (2) Handles or mountings for brushes, presented separately.
- (3) Boxes of various kinds, cachou boxes, protective covers for watches.
- (5) Paper-knives, letter-openers, book-markers.
- (6) Frames for pictures, paintings, etc.
- (7) Book-covers.
- (8) Articles of religious use.
- (9) Crochet hooks and knitting needles.

- (10) Small ornamental articles (e.g., trinkets, carved articles **other than** those of **heading 97.03**).
- (11) Shoe horns.
- (12) Tableware such as knife-rests, small spoons and serviette rings.
- (13) Ornamental mounted horns and antlers (trophies, etc.).
- (14) Cameos and intaglios **other than** those constituting articles of jewellery.

The heading also includes articles made from special shells, and articles (e.g., tooth-picks and special tips for cigars) made from quills of feathers. However, the heading **excludes** quills simply cut to length and not further worked (**heading 05.05**) and quills prepared for use as fishing floats (**heading 95.07**).

Articles overlaid or inlaid with animal carving materials are classified in this heading, **provided** the overlaying or inlaying forms the main characteristic of the finished article. This may be so in the case of wooden boxes, caskets, etc., overlaid or inlaid with, e.g., ivory, bone, tortoise-shell or horn.

This heading also **excludes** :

- (a) Articles of **Chapter 66** (e.g., parts of umbrellas, sunshades, walking-sticks, etc., for example, handles, stems and tips).
- (b) Framed glass mirrors (**heading 70.09**).
- (c) Articles of animal carving materials, composed partly of precious metal or metal clad with precious metal, or of natural or cultured pearls, or precious or semi-precious stones (natural, synthetic or reconstructed) (**Chapter 71**). **Nevertheless** such articles **remain** classified in this heading when the natural or cultured pearls, precious or semi-precious stones (natural synthetic or reconstructed), precious metal or metal clad with precious metal constitute only minor constituents (e.g., monograms, initials, ferrules, rims, etc.).
- (d) Articles of imitation jewellery (**heading 71.17**).
- (e) Cutlery or other articles of **Chapter 82** with handles or other parts of carving or moulding materials; **however**, such handles and other parts, when presented separately, **remain** classified in this heading.
- (f) Articles of **Chapter 90** (e.g., binoculars; also frames and mountings, and parts of frames and mountings, for spectacles, pince-nez, lorgnettes, goggles and the like).
- (g) Articles of **Chapter 91** (e.g., watch and clock cases). Protective covers for watches **remain**, however, classified in this heading.
- (h) Articles of **Chapter 92**, e.g., musical instruments and parts thereof (hunting horns, piano or accordion keys, pegs, bridges, etc.).
- (ij) Articles of **Chapter 93** (e.g., parts of arms).
- (k) Articles of **Chapter 94** (e.g., furniture, lamp and lighting fittings).
- (l) Articles of **Chapter 95** (toys, games, sports requisites).
- (m) Articles of **headings 96.03** (e.g., brooms and brushes) and **96.04**. Brush handles or mountings, when presented separately **remain**, however, classified in this heading.

- (n) Articles of **headings 96.05, 96.06, 96.08, 96.11 or 96.13 to 96.16** (e.g., buttons and button blanks; fountain pens, pen-holders, etc.; smoking pipes, and pipe bowls, stems and other parts of pipes; cigar and cigarette holders and parts thereof; combs).
- (o) Articles of **Chapter 97** (e.g., original sculptures and statuary; collectors' pieces of zoological interest).

96.02 - Worked vegetable or mineral carving material and articles of these materials; moulded or carved articles of wax, of stearin, of natural gums or natural resins or of modelling pastes, and other moulded or carved articles, not elsewhere specified or included; worked, unhardened gelatin (except gelatin of heading 35.03) and articles of unhardened gelatin.

For the definition of the term “worked”, the second paragraph of the Explanatory Note to heading 96.01 applies, *mutatis mutandis*, to this heading (see also the Explanatory Notes to headings 14.04, 15.21, 25.30, 27.14, 34.04, 34.07, 35.03, for example).

(I) WORKED VEGETABLE OR MINERAL CARVING MATERIAL AND ARTICLES OF THESE MATERIALS

(A) Worked vegetable carving materials.

This group covers worked vegetable carving materials of the kind mentioned in Note 2 (a) to this Chapter. These include corozo (also known as “vegetable ivory”), the nuts of the dom palm and similar nuts of other palms (Tahiti, Palmyra, etc.), coconut shell, seeds of the *Canna indica* variety of reed (Indian shot), seeds of the *Abrus precatorius* (or bead tree), date stones, olive stones, the seeds of the piassava palm and locust beans.

It also covers articles produced by moulding powders of vegetable carving materials.

(B) Worked mineral carving materials.

This group covers mineral carving materials of the kind mentioned in Note 2 (b) to this Chapter.

The heading **does not cover** the following products which fall in **heading 25.30** :

- (i) Rough blocks or lumps of meerschaum or amber;
- (ii) Agglomerated meerschaum and agglomerated amber obtained from waste of natural meerschaum and amber scrap by agglomerating or moulding, in the form of plates, rods, sticks and similar shapes, not worked after moulding.

(C) Articles of vegetable or mineral carving materials.

Subject to the exclusions set out below, this group includes articles of vegetable or mineral carving materials, such as :

- (i) Small ornaments (e.g., statuettes).
- (ii) Small articles such as boxes and caskets.
- (iii) Discs, whether or not polished (**other than** button blanks, see the Explanatory Note to **heading 96.06**).

**(II) MOULDED OR CARVED ARTICLES OF WAX, OF STEARIN,
OF NATURAL GUMS OR NATURAL RESINS OR OF MODELLING PASTES,
AND OTHER MOULDED OR CARVED ARTICLES, NOT ELSEWHERE
SPECIFIED OR INCLUDED; WORKED, UNHARDEDENED GELATIN AND
ARTICLES OF UNHARDEDENED GELATIN**

This group includes, on the one hand, moulded and carved **articles** of various materials, **provided** those articles are **not specified or included** in other headings of the Nomenclature (e.g., articles of plastics - **Chapter 39**, or of ebonite - **Chapter 40**). It also covers worked **unhardened gelatin and articles thereof (other than goods of heading 35.03 or Chapter 49)**.

For the purposes of these materials, the expression “ **moulded articles** ” means articles which have been moulded to a shape appropriate to their intended use. On the other hand, materials moulded in the shape of blocks, cubes, plates, bars, sticks, etc., whether or not **impressed** during moulding, are **not included**.

Subject to the exclusions mentioned below, this group includes :

- (1) Moulded or carved articles of wax :
 - (i) Artificial honeycombs.
 - (ii) Moulding shapes for electroplating.
 - (iii) Imitation flowers, foliage or fruit, moulded in one piece, or assembled **otherwise** than by the processes (e.g., binding, glueing or similar methods) which make the goods classifiable in **heading 67.02**.
 - (iv) Busts, heads, figures or statuettes (**other than** articles of a kind used as tailors' dummies - see the Explanatory Note to **heading 96.18**, and original sculptures and statuary - see **heading 97.03**).
 - (v) Wax pearls.
 - (vi) T-shaped tubes made from a preparation based on wax, and used in certain surgical operations.
 - (vii) Imitation sweets, bars of chocolate and other imitation articles made of wax for window dressing.
 - (viii) Earplugs of wax on a cotton wool support.
 - (ix) Strips of wax enclosed in textile material used to fill in the gaps in wooden foundry shapes.
- (2) Moulded or carved articles of paraffin wax (especially containers for hydrofluoric acid).
- (3) Moulded or carved articles of stearin.
- (4) Moulded or carved articles of rosin (e.g., rosin for violin bows).
- (5) Moulded or carved articles of copal (usually imitations of articles of amber).
- (6) Moulded or carved articles of modelling wax (e.g., flowers or plants moulded in one piece, figures, statuettes and similar ornaments).

- (7) Moulded or carved articles made with a basis of flour or starch, agglomerated with gum and lacquered (imitation flowers or fruit, moulded in one piece, statuettes, etc.).
- (8) Sheets of unhardened gelatin cut to shape **other than square or rectangular**. Sheets cut to rectangular (including square) shape, whether or not surface worked, fall in **heading 35.03** or in **Chapter 49** (e.g., postcards) (see the Explanatory Note to heading 35.03). Articles of unhardened gelatin include, for example :
 - (i) Small discs for sticking billiard cue tips.
 - (ii) Capsules for pharmaceutical products and for mechanical lighter fuel.

*
* * *

Articles overlaid or inlaid with vegetable or mineral carving materials or with moulding materials are classified in this heading, **provided** the overlaying or inlaying forms the main characteristic of the finished article. This may be so in the case of wooden boxes, caskets, etc., overlaid or inlaid with materials described in this heading.

*
* * *

The provisions of the Explanatory Note to heading 96.01 as regards the products **excluded** from that heading are also applicable to this heading.

The heading also **excludes** :

- (a) Sealing wax, including bottle-sealing wax (**heading 32.14** or **34.04**).
- (b) Candles, tapers and the like of paraffin or other waxes, stearin, etc. (**heading 34.06**).
- (c) Modelling pastes, including those put up for children's amusement, and preparations known as "dental wax" or as "dental impression compounds", put up in sets, in packings for retail sale or in plates, horseshoe shapes, sticks or similar forms (**heading 34.07**).
- (d) Copying pastes with a basis of gelatin (**heading 38.24**).
- (e) Moulded articles of peat (**heading 68.15**).
- (f) Demonstrational models (**heading 90.23**).

96.03 - Brooms, brushes (including brushes constituting parts of machines, appliances or vehicles), hand-operated mechanical floor sweepers, not motorised, mops and feather dusters; prepared knots and tufts for broom or brush making; paint pads and rollers; squeegees (other than roller squeegees).

9603.10 - Brooms and brushes, consisting of twigs or other vegetable materials bound together, with or without handles

- Tooth brushes, shaving brushes, hair brushes, nail brushes, eyelash brushes and other toilet brushes for use on the person, including such brushes constituting parts of appliances :

9603.21 -- Tooth brushes, including dental-plate brushes

9603.29 -- Other

9603.30 - Artists' brushes, writing brushes and similar brushes for the application of cosmetics

9603.40 - Paint, distemper, varnish or similar brushes (other than brushes of subheading 9603.30); paint pads and rollers

9603.50 - Other brushes constituting parts of machines, appliances or vehicles

9603.90 - Other

**(A) BROOMS AND BRUSHES, CONSISTING OF TWIGS
OR OTHER VEGETABLE MATERIALS BOUND TOGETHER,
WITH OR WITHOUT HANDLES**

These are rather roughly made articles, with or without handles, used mainly for sweeping the ground (streets, yards, stables, etc.) or floors (e.g., vehicle floors). They usually consist either of a single bundle of vegetable material (twigs, straw, etc.) roughly bound together, or of one or more bundles of thick straw or reeds forming a core on which thinner and longer straw is fixed with textile threads; these textile threads may at the same time form decorative motifs. For use, these articles are generally mounted on a handle.

This group also includes fly-whisks, made in the same way but of lighter materials.

These brooms and brushes are generally made from birch, hazel, holly, heather or broom twigs, sorghum, millet, camelina, etc., straw (or panicles), or fibres of aloe, coco (coir), palm (piassava, in particular), etc., or buckwheat stalks.

(B) OTHER BROOMS AND BRUSHES

This group comprises a variety of articles, differing considerably both in materials and shape, used for toilet purposes, for household cleaning, for applying paints, adhesive or liquid products, and for certain industrial operations (cleaning, polishing, etc.).

In general, the brooms and brushes of this group consist either of small tufts or knots of flexible or springy fibres or filaments mounted in a broom or brush stock or back, or, as in the case of paint brushes, of a bunch of hairs or fibres strongly secured to the end of a short stock or handle with or without the aid of a metal ferrule or other retaining device.

The group also includes brooms and brushes of rubber or plastics moulded in one piece.

A very wide range of raw materials is used in the manufacture of the above articles. The materials used for the tufts, etc., may be :

- (A) Of animal origin : bristles of pig or wild boar; hair of horses, oxen, goats, badgers, martens, skunks, squirrels, polecats, etc.; fibres of horn; shafts of feathers.
- (B) Of vegetable origin : couch-grass roots, istle (or Tampico), coco (coir) or piassava fibres, esparto grass, sorghum panicles or split bamboo.
- (C) Of man-made filaments (e.g., nylon or viscose rayon).
- (D) Of wire (steel, brass, bronze, etc.), or of various other materials, e.g., cotton or wool yarn or twine, glass fibres.

The materials used for mountings include : wood, plastics, bone, horn, ivory, tortoise-shell, ebonite, certain metals (steel, aluminium, brass, etc.). In some brushes (e.g., circular brushes for machines, or brushes for special sweepers) leather, paperboard, felt or woven fabrics are also used. Quills of feathers are used as mountings for certain paint brushes.

Brushes in which natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal constitute only **minor constituents** (e.g., monograms or rims) are also included in this group.

The heading **excludes** brushes containing natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal otherwise than as minor constituents (**Chapter 71**).

This group includes :

- (1) Tooth brushes, including dental-plate brushes.
- (2) Shaving brushes.
- (3) Brushes for toilet use (e.g., brushes for the hair, beard, moustache or eyelashes; nail brushes; brushes for hair dyeing, etc.); hairdressers' neck brushes.
- (4) Brushes of rubber or plastics, moulded in one piece, for toilet use (washing hands, etc.), for cleaning lavatory pans, etc.
- (5) Clothes, hat or shoe brushes; comb-cleaning brushes.

- (6) Brushes for household use (e.g., scrubbing brushes, dish-washing brushes, sink-cleaning brushes, lavatory brushes, furniture brushes, radiator brushes, crumb brushes).
- (7) Brooms and brushes for sweeping roads, floors, etc.
- (8) Special car cleaning brushes of textile materials, whether or not impregnated with cleaning products.
- (9) Brushes for grooming animals (horses, dogs, etc.).
- (10) Brushes for oiling weapons, bicycles, etc.
- (11) Brushes for gramophone records, including those for mounting on the sound-arm to clean the record automatically.
- (12) Brushes for cleaning printing type or type-bars of typewriters.
- (13) Brushes for cleaning sparking plugs, files, parts to be welded, etc.
- (14) Brushes for removing moss or old bark from trees or bushes.
- (15) Brushes for stencilling, whether or not with ink reservoir and ink-flow control.
- (16) Paint and other brushes (round or flat) for plasterers, house painters, decorators, cabinet-makers, artists, etc. For example, brushes for washing off old paint-work, distempering brushes, paper-hanging brushes, varnishing brushes, etc.; brushes for oil or water colours, wash-tinting brushes; brushes for painting ceramics, gilding brushes, etc.; small brushes for office use.

This group also includes :

- (I) Brushes mounted on wire (usually strands of wire twisted together), for example, flue brushes; brushes for bottle-washing or for cleaning cylindrical lamp glasses; brushes for cleaning tubes and piping, etc.; cleaners for smoking pipes; cleaning brushes for rifles, revolvers or pistols; funnel and tube brushes for musical instruments, etc.
- (II) Brushes constituting machinery parts, for example, for road-sweepers; for spinning or weaving machines; for grinding, polishing or other machine-tools; for milling or paper-making machines; for watch-makers' or jewellers' lathes; for machines used in the leather, fur or shoe-making industries.
- (III) Brushes for electrical household appliances (e.g., floor polishers or waxers, vacuum cleaners).

This heading **excludes** :

- (a) Brush mountings or handles (classified according to the constituent material).
- (b) Textile polishing discs or pads (**heading 59.11**).
- (c) Card clothing (**heading 84.48**).
- (d) Diskettes for cleaning disk drives in ADP machines, etc. (**heading 84.73**).

- (e) Brushes of a kind specialised for use in dentistry or for medical, surgical or veterinary purposes (e.g., laryngeal brushes, and brushes for mounting on dental drills) (**heading 90.18**).
- (f) Brushes having the character of toys (**heading 95.03**).
- (g) Powder-puffs and pads for the application of cosmetics or toilet preparations (**heading 96.16**).

(C) HAND-OPERATED MECHANICAL FLOOR SWEEPERS, NOT MOTORISED

These are simple articles, usually consisting of a wheeled housing containing one or more cylindrical brushes operated by the movement of the wheels, propelled manually by means of a handle and used in particular for cleaning carpets.

The heading **excludes** motorised sweepers (**heading 84.79**).

(D) MOPS AND FEATHER DUSTERS

Mops consist of a bundle of textile cords or vegetable fibres mounted on a handle. Certain other mops consist of a mop-head pad made of textile or other material fitted or attached to a frame or other base connected to the handle. They include dust mops, spray mops and sponge mops used in dry or wet applications for cleaning up stains or liquid spills, cleaning floors, washing dishes, etc.

Feather dusters consist of a bundle of feathers mounted on a handle and are used for dusting furniture, shelves, shop windows, etc. In other types of feather dusters the “feathers” have been replaced by lambs’ wool, textile materials, etc., fixed to or wrapped around a handle.

This heading **excludes** cleaning cloth made of textile materials designed for use as hand cloths or for attachment to the mop-head frame or other base, when presented separately (**Section XI**).

(E) PREPARED KNOTS AND TUFTS

In accordance with Note 3 to this Chapter, this group is restricted to unmounted knots or tufts of animal hair, vegetable fibre, man-made filaments, etc., which are ready for incorporation without division in brooms or brushes, or which require only such further minor processes as trimming to shape at the top, to render them ready for such incorporation.

The heading therefore **excludes**, *inter alia*, bundles (or similar trade presentations) of animal hair, vegetable fibres or other materials which have not been prepared for broom or brush making. The heading also **excludes** assemblies of hair or fibres which have been prepared for broom or brush making, but which still require to be divided into smaller tufts before mounting into broom or brush heads, etc.

The prepared knots and tufts included in this group are mainly used for shaving brushes, paint brushes and painting or drawing brushes.

To bind them into a compact bundle, the fibre tufts (or knots) are usually dipped, up to about one quarter of their length, into a varnish or some other coating material; sometimes sawdust is also added for greater strength. Knots or tufts mounted in collars (usually of metal) are **excluded** (**group (B) above**).

Prepared tufts or knots which have to undergo other finishing processes after being mounted on a handle (rounding their ends, grinding of the fibre ends to give them required softness, etc.) remain in this group.

(F) PAINT PADS AND ROLLERS; SQUEEGEES (OTHER THAN ROLLER SQUEEGEES)

Paint rollers consist of a roller covered with lambskin or other material mounted on a handle.

Paint pads consist of a flat surface, for example, of woven fabric attached to a hard back, usually of plastics; they may have handles.

Squeegees are generally made of strips of plastics, rubber or felt mounted between two blades of wood, metal, etc., or mounted on a block of wood, metal, etc., and used as a broom on wet surfaces.

However, the group **excludes** roller squeegees, consisting of one or more rollers mounted on a handle and used in photography (**heading 90.10**).

96.04 - Hand sieves and hand riddles.

The expression "hand sieves and hand riddles" applies to articles made of strong gauze or other mesh material (of various mesh sizes) mounted in a rectangular or circular frame (generally of wood or metal), and used for separating **solid** substances according to particle size.

The materials most commonly used for the mesh are horsehair, man-made monofilaments, silk yarns, spun gut, wire (steel, iron, brass wire, etc.).

The heading includes :

Hand sieves and hand riddles for cinders, sand, seeds, garden mould, etc.; bolting cloth sieves (e.g., for flour); household sieves (e.g., for flour); sieves used in laboratories (to test fineness of cement, moulding sands, fertilisers, wood flour, etc.), including those which can be connected together to form a series; precision sieves for sorting precious or semi-precious stones (e.g., diamonds).

The heading **excludes** :

- (a) Sieves and riddles in the nature of fixed articles (e.g., screens resting on the ground for sifting earth or gravel - generally **heading 73.26**).
- (b) Simple strainers (e.g., for cheese) consisting of a container with a perforated sheet-metal bottom; funnels fitted with a filtering device; milk strainers; strainers for filtering paints, whitewash, fungicidal solutions, etc. (generally **Chapter 73**).
- (c) Sieves and riddles designed to be mounted on machines or appliances (e.g., for the milling industry, in agriculture, for screening stones, ores, etc.), such articles being classified as parts of machinery, etc., in accordance with Note 2 to Section XVI, generally in the same heading as the machine for which they are solely or principally designed (e.g., **heading 84.37** or **84.74**).

96.05 - Travel sets for personal toilet, sewing or shoe or clothes cleaning.

The heading covers certain travel sets consisting of articles individually falling in different headings of the Nomenclature or consisting of different articles of the same heading.

The heading includes :

- (1) **Toilet sets**, presented in a case of leather, fabric, plastics etc., containing, e.g., moulded plastic boxes, brushes, a comb, scissors, tweezers, a nail file, a mirror, a razor holder and manicure instruments.
- (2) **Sewing kits**, presented in a case of leather, fabric, plastics etc., containing, e.g., scissors, a measuring tape, a needle threader, sewing needles and sewing thread, safety pins, a thimble, buttons and press-studs.
- (3) **Shoe-cleaning kits**, presented in a case of leather, fabric, plastics, cardboard covered with plastics, etc., containing e.g., brushes, a tin or tube of polish and a fabric cleaning cloth.

The heading **excludes** manicure sets (**heading 82.14**).

This heading also **excludes** sets distributed by airlines to passengers (during their flight or at their destination if their baggage is not available), consisting of fabric bags containing articles of the type listed in Items (1) to (3) above, cosmetics, perfumery or toilet articles, handkerchiefs of cellulose wadding, but also made up textile articles such as pyjamas, T-shirts, trousers, shorts, etc. The articles of these sets are classifiable according to their **own appropriate heading**.

96.06 - Buttons, press-fasteners, snap-fasteners and press-studs, button moulds and other parts of these articles; button blanks.

9606.10 - Press-fasteners, snap-fasteners and press-studs and parts therefor

- Buttons :

9606.21 -- Of plastics, not covered with textile material

9606.22 -- Of base metal, not covered with textile material

9606.29 -- Other

9606.30 - Button moulds and other parts of buttons; button blanks

This heading covers buttons, studs, and similar articles used for fastening or decorating articles of apparel, household linen, etc. These articles may be made of various materials and they may contain natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), precious metal or metal clad with precious metal **provided** these latter materials are present as **minor components only**. Otherwise they fall in **Chapter 71**.

The principal materials used for making buttons, studs, etc., are base metals, wood, corozo, dom, bone, horn, plastics, ceramics, glass, ebonite, compressed paperboard, leather, composition leather, ivory, tortoise-shell or mother-of-pearl. They may also consist of combinations of these materials and may be textile covered.

The heading includes :

(A) **Pierced and shank buttons.** These may be of various sizes and shapes according to the purpose for which they are to be used (underwear, outer garments, footwear, etc.).

Spherical buttons may be distinguished from beads by the fact that the hole for the thread is not pierced centrally.

In some shank buttons, the shank is in the form of a spring-type hinge which enables the button to be secured to a garment without sewing. Other types (e.g., " bachelor buttons ") are affixed to garments by a snap mechanism.

(B) **Press-fasteners, snap-fasteners and press-studs.** These consist of two or more parts, and operate by means of a snap mechanism. Such fasteners and studs may be designed for sewing on garments, etc., or they may be attached by " riveting " (e.g., press-studs for gloves).

Press-fasteners and the like remain classified in this heading when the separate parts are supplied already mounted on strips of narrow tape.

The heading also covers :

(1) **Button moulds.** These articles are the interior part or " body " of certain types of buttons, and are designed to be covered with textile material, paper, leather, etc. They are classified here **only when clearly recognisable** as designed for button manufacture. These moulds may be of wood, orris root, etc., but the most usual type consists of two metal parts, one of which is covered with textile, etc., while the other fits into the first and holds the textile in place.

- (2) **Other parts of buttons, etc., identifiable as such** (e.g., shanks, bases, heads).
- (3) **Button blanks.** These include :
 - (i) **Moulded blanks** as obtained from the mould and not yet usable as buttons. They normally require to be trimmed, pierced and polished, but are readily distinguishable as being intended for manufacture into buttons.
 - (ii) **Stamped metal blanks** consisting of two parts (top and base) designed to fit one into the other.
 - (iii) **Blanks of mother-of-pearl, corozo, wood, etc., worked** (e.g., rounded or hollowed out on one or both sides or otherwise shaped, with rimmed edges, polished or pierced) so that they are **clearly identifiable** as intended for making buttons. On the other hand, a disc merely sawn, cut or polished, but not further worked, is **not** regarded as a button blank and is to be classified according to the constituent material.

The heading **excludes** cuff-links (**heading 71.13 or 71.17**).

96.07 - Slide fasteners and parts thereof.

- Slide fasteners :

9607.11 -- Fitted with chain scoops of base metal

9607.19 -- Other

9607.20 - Parts

This heading covers :

- (1) **Slide fasteners** of any size and for any purpose (for clothing, footwear, travel goods, etc.).

Most slide fasteners consist of two narrow strips of textile material one edge of each strip being fitted with scoops (of metal, plastics, etc.), which can be made to interlock by means of a slider or runner. Another type of slide fastener consists of two strips of plastics, each with a specially shaped edge designed to interlock one with the other under the action of a slider.

- (2) **Parts of slide fasteners**, e.g., chain scoops, sliders or runners, end pieces, and narrow strips of any length mounted with chain scoops.

96.08 - Ball point pens; felt tipped and other porous-tipped pens and markers; fountain pens, stylograph pens and other pens; duplicating stylos; propelling or sliding pencils; pen-holders, pencil-holders and similar holders; parts (including caps and clips) of the foregoing articles, other than those of heading 96.09.

9608.10 - Ball point pens

9608.20 - Felt tipped and other porous-tipped pens and markers

9608.30 - Fountain pens, stylograph pens and other pens

9608.40 - Propelling or sliding pencils

9608.50 - Sets of articles from two or more of the foregoing subheadings

9608.60 - Refills for ball point pens, comprising the ball point and ink-reservoir

- Other :

9608.91 -- Pen nibs and nib points

9608.99 -- Other

This heading covers :

- (1) **Ball point pens.** These generally consist of a body enclosing a tube of ink terminated by a ball.
- (2) **Felt tipped and other porous-tipped pens and markers**, including those of the fountain pen type.
- (3) **Fountain pens, stylograph pens and other pens** (pump, cartridge, plunger, vacuum, etc.), whether or not fitted with pen nibs or points.
- (4) **Duplicating stylos.**
- (5) **Propelling pencils or sliding pencils**, single or multilead type; including the spare leads normally contained therein.
- (6) **Pen-holders**, whether or not in one piece, and with or without nibs or caps.
- (7) **Pencil-holders and similar holders** (e.g., holders for crayons, drawing charcoals).

PARTS

The heading also covers identifiable parts not more specifically included elsewhere in the Nomenclature. For example :

Pen nibs of any design including unfinished nibs roughly cut to shape; clips; refills for ball point pens, comprising the ball point and the ink reservoir; holders for the ball points or felts of marking stylographs; ink-flow regulators; barrels for pens or pencils of this heading; filling or propelling mechanisms; ink sacs of rubber or other materials; point protectors; interchangeable renew nib units comprising nib, feed and collar; nib points (or pen points) which are small balls made from platinum alloys or from certain tungsten alloys used for pointing the tips of pen nibs to prevent premature wear.

The heading **does not cover** :

- (a) Ink cartridges for fountain pens (**heading 32.15**).
- (b) Steel balls for ball point pens and pencils (**heading 73.26 or 84.82**).
- (c) Mathematical drawing pens (**heading 90.17**).
- (d) Pencil leads (**heading 96.09**).

96.09 - Pencils (other than pencils of heading 96.08), crayons, pencil leads, pastels, drawing charcoals, writing or drawing chalks and tailors' chalks.

9609.10 - Pencils and crayons, with leads encased in a rigid sheath

9609.20 - Pencil leads, black or coloured

9609.90 - Other

The articles of this heading are of two types :

- (A) Those without any covering or simply covered with a protective band of paper (e.g., chalks, drawing charcoals, pencil leads, certain crayons, pastels, and slate pencils).
- (B) Pencils and crayons, with leads encased in wood or plastics or in some cases in a sheath composed of layers of paper.

The composition of pencil leads, chalks, pastels and crayons, etc., varies according to their intended use.

The heading includes :

- (1) **Slate pencils** of natural or agglomerated slate.
- (2) **Natural chalks in the form of sticks** (obtained by sawing or cutting).
- (3) **Prepared chalks**, usually made with a basis of calcium sulphate or of calcium sulphate and calcium carbonate, sometimes mixed with colouring matter.
- (4) **Drawing charcoals**, obtained usually by calcining spindle-tree wood.
- (5) **Crayons and pastels**, usually made of a mixture of chalk or clay, colouring matter, shellac or wax, spirit and turpentine.
- (6) **Pencils and crayons**, with leads encased in a rigid sheath.
- (7) **Pencil leads** (e.g., black leads, composed of a mixture of graphite and clay; coloured leads, consisting of metallic oxides or other mineral pigments combined with clay, chalk or wax; indelible or copying leads, composed of clay tinted with a dye, such as aniline or fuchsine).
- (8) **Litho-crayons**, with a basis of lamp black, wax, soap and tallow.
- (9) **" Ceramic " crayons**, with a basis of vitrifiable colours, fats, cocoa butter, wax, etc.

The heading includes pencils incorporating erasers or other fittings.

It also covers **tailors' chalks** (which are composed of steatite).

The heading **does not cover** :

- (a) Chalk in the crude state (**heading 25.09**).
- (b) Medicinal pencils (e.g., anti-migraine) (**heading 30.04**).
- (c) Pencils for cosmetic or toilet uses (e.g., eyebrow pencils, styptic pencils) (**heading 33.04 or 33.07**).
- (d) Billiard chalks (**heading 95.04**).

96.10 - Slates and boards, with writing or drawing surfaces, whether or not framed.

This heading covers slates and boards, clearly designed to be used for writing or drawing with slate pencils, chalks, felt or fibre tipped markers (e.g., school children's slates, blackboards and certain notice boards).

These articles, framed or not, may be of slate, including agglomerated slate, or may consist of any material (wood, paperboard, textile material, asbestos cement, etc.) covered on one or both sides with a preparation of powdered slate or any other coating suitable for writing on, or sheeting of plastics.

Boards or slates may bear permanent markings (lines, squares, lists of commodities, etc.) and may incorporate counting frames.

This heading **does not cover** writing or drawing slates which are not ready for use (**heading 25.14** or **68.03**).

96.11 - Date, sealing or numbering stamps, and the like (including devices for printing or embossing labels), designed for operating in the hand; hand-operated composing sticks, and hand printing sets incorporating such composing sticks.

This heading covers date, sealing and similar stamps and composing sticks, **provided** they are of a type designed to be used independently in the hand. (Date, sealing and similar stamps incorporating a base for fixing on a table, desk, etc., or designed for operating on a stand are **excluded** - see the Explanatory Note to **heading 84.72**.)

These articles include :

- (1) **Seals for use with sealing wax**, with or without design and whether or not provided with handles.
- (2) **Stamps of all kinds**, with or without the printing band or self-inking device; for example, date stamps, multiformula stamps, docketing and ticketing stamps, numbering stamps (self-changing or not), roller stamps, pocket stamps (usually consisting of a stamp and ink-pad in a protective case).
- (3) **Composing or setting sticks for receiving interchangeable characters**. Some sticks may bear a permanent text or design (e.g., post office composing or setting sticks in which only the date is changed).
- (4) **Small hand printing sets (not being toys)** consisting of a box containing a hand-operated composing or setting stick, interchangeable characters, tweezers and an ink-pad.
- (5) **Hand-operated devices for stamping tickets** with a date or other characters, even if incorporating a punch.

The heading **does not cover** :

- (a) Plumbing and sealing pliers, and animal marking pliers (**heading 82.03**).
- (b) Branding irons and marking punches (**heading 82.05**).
- (c) Unmounted letters, figures or other characters of a kind used in printing machines (**heading 84.42**). Other types of unmounted characters are classified according to the constituent material.
- (d) Hand-operated stamps incorporating a base plate for dry relief printing (**heading 84.72**).
- (e) Apparatus with clock movements for stamping a record of the time, e.g., of the receipt of a letter (**heading 91.06**).

96.12 - Typewriter or similar ribbons, inked or otherwise prepared for giving impressions, whether or not on spools or in cartridges; ink-pads, whether or not inked, with or without boxes.

9612.10 - Ribbons

9612.20 - Ink-pads

This heading covers :

- (1) **Ribbons**, whether or not on spools or in cartridges, for typewriters, calculating machines, or for any other machines incorporating a device for printing by means of such ribbons (automatic balances, tabulating machines, teleprinters, etc.).

The heading also includes inked, etc., ribbons, usually having metal fixing fittings, used in barographs, thermographs, etc., to print and record the movement of the recording machine needle.

These ribbons are usually of woven textiles, but sometimes they are made of plastics or paper. To fall in the heading, they **must have been inked or otherwise prepared to give impressions** (e.g., impregnation of textile ribbons, or coating of plastics strip or paper with colouring matter, ink, etc.).

The heading **does not cover** :

- (a) Rolls of carbon or other copying paper strip, not suitable for use as typewriter, etc., ribbons, but designed to produce duplicate copies in accounting machines, cash registers, etc. This strip, which is usually much wider than typewriter ribbons (generally more than 3 cm in width), falls in **Chapter 48**.
- (b) Ribbons not prepared by inking, impregnation, coating, etc., to give an impression; these are classified in **Chapter 39, Section XI**, etc., according to the constituent material.
- (c) Empty spools (classified according to their constituent material).
- (2) **Ink-pads, whether or not inked, for date stamps, etc.** They are generally composed of felt, woven fabric or other absorbent material on a wooden, metallic or plastic support which is often in the form of a box.

Hand-operated ink-rollers are **excluded** from this heading and are classified according to their constituent material.

96.13 - Cigarette lighters and other lighters, whether or not mechanical or electrical, and parts thereof other than flints and wicks.

9613.10 - Pocket lighters, gas fuelled, non-refillable

9613.20 - Pocket lighters, gas fuelled, refillable

9613.80 - Other lighters

9613.90 - Parts

This heading includes :

(1) Mechanical lighters.

These produce sparks, usually by means of a wheel with a milled-edge which is revolved in contact with a "flint" (generally of ferro-cerium alloy).

(2) Electrical lighters.

Current from the mains or a battery produces a spark, or in certain types, a glowing heat in an electric resistor.

(3) Chemical lighters.

In these a catalyst (usually sponge platinum) is made to glow by catalytic action in the presence of a gas.

(4) Non-mechanical lighters.

One type consists of a container incorporating a fuel reservoir, and a small removable metal rod (the striker) fitted with a steel tip. The striking of the steel tip on a "flint" fixed on the outside of the container produces a spark which ignites an inflammable material near the tip of the striker.

The lighters classified in this heading may be of the pocket or table types, or may be designed for fixing on the wall, fitting to gas stoves, etc. The heading also includes lighters for motor cars or other vehicles.

Lighters combined with other objects (e.g., cigarette cases, powder cases, watches generally with digital faces, electronic calculators) are classified in accordance with the General Interpretative Rules.

The heading also includes identifiable parts of lighters (e.g., outer casings, milled-edged wheels, empty or full fuel reservoirs).

The heading **does not cover** igniters of **heading 36.03**, flints (**heading 36.06**), wicks (**heading 59.08** or **70.19**) or fuel in containers (ampoules, bottles, cans, etc.) of a kind used for filling or refilling cigarette or similar lighters (generally **heading 36.06**).

96.14 - Smoking pipes (including pipe bowls) and cigar or cigarette holders, and parts thereof.

This heading covers :

- (1) **Smoking pipes** of all kinds (including calumets, chibouks or Turkish pipes, hookahs, etc.).
- (2) **Pipe bowls.**
- (3) **Cigar and cigarette holders.**
- (4) **Blocks of wood or briar root** roughly shaped for the manufacture of pipes.

The materials most commonly used in the manufacture of these articles (or of stems, mouthpieces or other parts) are terra-cotta and other ceramics, wood (box, cherry, etc.), briar root, amber, meerschaum, copal, ivory, mother-of-pearl, ebonite, steatite and clay.

The heading also includes the following parts : stems and mouthpieces for pipes; pipe-lids; absorbent pipe bowls; liners; inner parts (including filter cartridges), etc.

The heading **does not apply** to accessories (e.g., pipe-scrapers and pipe-cleaners); these fall in their own appropriate headings.

96.15 - Combs, hair-slides and the like; hair pins, curling pins, curling grips, hair-curlers and the like, other than those of heading 85.16, and parts thereof.

- Combs, hair-slides and the like :

9615.11 - - Of hard rubber or plastics

9615.19 - - Other

9615.90 - Other

This heading covers :

- (1) **Toilet combs of all kinds**, including combs for animals.
- (2) **Dress combs of all kinds**, whether for personal adornment or for keeping the hair in place.
- (3) **Hair-slides and the like** for holding the hair in place or for ornamental purposes.

These articles are usually made of plastics, ivory, bone, horn, tortoise-shell, metal, etc.

(4) **Hairpins.**

- (5) **Curling pins, curling grips, hair-curlers and the like, other than those of heading 85.16**, whether or not having coverings or fittings of textile, rubber or other materials.

These articles are usually made of base metal or plastics.

They fall in **Chapter 71** if containing precious metal or metal clad with precious metal, natural or cultured pearls, precious or semi-precious stones (natural, synthetic or reconstructed), **other than** as minor constituents.

This heading **excludes** textile headbands (**Section XI**).

96.16 - Scent sprays and similar toilet sprays, and mounts and heads therefor; powder-puffs and pads for the application of cosmetics or toilet preparations.

9616.10 - Scent sprays and similar toilet sprays, and mounts and heads therefor

9616.20 - Powder-puffs and pads for the application of cosmetics or toilet preparations

This heading covers :

- (1) **Scent, brilliantine and similar toilet sprays**, whether of the table or pocket type, and whether for personal or professional use. They consist of a reservoir, generally in the form of a bottle (of glass, plastics, metal or other material), to which is fixed the mount; this mount incorporates the head (with its spray-forming mechanism) and a pneumatic pressure bulb (sometimes enclosed in a textile net) or a piston device.
- (2) **Mounts for toilet sprays.**
- (3) **Head-pieces for toilet sprays.**
- (4) **Powder-puffs and pads** for applying any kind of cosmetic or toilet preparation (face-powder, rouge, talcum-powder, etc.). They may be made of any material (swan's or eider-down, skin, animal hair, pile fabrics, foam rubber, etc.), and they remain in this heading whether or not they have handles or trimmings of ivory, tortoise-shell, bone, plastics, base metal, precious metal or metal clad with precious metal.

The heading **does not apply to** :

- (a) Reservoirs (bottles, flasks, etc.) for scent sprays, presented separately (classified according to constituent material).
- (b) Rubber bulbs (**heading 40.14**).
- (c) Dispersing or spraying appliances of **heading 84.24**.
- (d) Scent spraying machines of **heading 84.76**.

96.17 - Vacuum flasks and other vacuum vessels, complete with cases; parts thereof other than glass inners.

This heading covers :

- (1) **Vacuum flasks and other similar vacuum vessels, provided they are complete.** This group includes vacuum jars, jugs, carafes, etc., designed to keep liquids, food or other products at fairly constant temperature, for reasonable periods of time. These articles usually consist of a double-walled receptacle (the inner), generally of glass, with a vacuum created between the walls, and a protective outer casing of metal, plastics or other material, sometimes covered with paper, leather, leathercloth, etc. The space between the vacuum container and the outer casing may be packed with insulating material (glass fibre, cork or felt). The heading also includes double-walled stainless steel vacuum insulated thermal flasks without a protective outer case, which perform temperature retention. In the case of vacuum flasks the lid can often be used as a cup.
- (2) **Outer cases, lids and cups** of metal, plastics, etc., for vacuum flasks or other vacuum vessels.

The heading **does not cover** separate glass inners (**heading 70.20**).

96.18 - Tailors' dummies and other lay figures; automata and other animated displays used for shop window dressing.

This heading covers :

(1) **Tailors' and dressmakers' dummies.**

These are models of the human body used to obtain the correct fitting of clothing during making-up; generally, they represent only the trunk of the human form. They are usually moulded from papier maché, plaster, plastics, etc., but some are made from certain plaiting materials such as cane, reeds or willow. The moulded forms are usually covered with textile material, and are generally mounted on a stand so that the height of the model from the ground can be varied.

(2) **Other lay figures and similar articles.**

These are representations of the human body or parts of the human body (e.g., head, trunk, legs, arms or hands), used to display articles of clothing, headgear, stockings, gloves, etc. These figures, etc., are made from the materials mentioned at (1) above. In the case of those representing the complete human form, the limbs are usually articulated so that the forms may be made to assume various positions. These figures are also used as models by artists and sculptors, and by medical students for practising methods of applying bandages, splints, etc.

This category **does not include** silhouette or profile shapes of figures which, though sometimes used for displaying goods, are more frequently used as direction signs. These articles are usually made of wood, paperboard or metal and are classified according to their constituent material.

(3) **Automata and other animated displays used for shop window dressing.**

These range from animated representations of humans or animals to numerous other automatically operating appliances of a kind used for displaying merchandise or for publicity purposes. They may be of any material, and are generally electrically or mechanically operated. Though frequently objects of curiosity in themselves, these articles are mainly intended to serve as novel methods of attracting attention to displays of goods or to particular articles exhibited in shop windows. They may be designed in various forms according to the nature of the merchandise or service to be advertised; they serve not only as an attractive means of presentation, but also in certain cases to illustrate by suitable movements the quality, method of operation, etc., of the articles displayed.

This heading **does not include** :

- (a) Apparatus or models, designed solely for demonstrational purposes, of **heading 90.23**.
- (b) Dolls and toys (**Chapter 95**).

96.19 - Sanitary towels (pads) and tampons, napkins and napkin liners for babies and similar articles, of any material.

This heading covers sanitary towels (pads) and tampons, napkins (diapers) and napkin liners for babies and similar articles, including absorbent hygienic nursing pads, napkins (diapers) for adults with incontinence and pantyliners, of any material.

In general, the articles of this heading are disposable. Many of these articles are composed of (a) an inner layer (e.g., of nonwovens) designed to wick fluid from the wearer's skin and thereby prevent chafing; (b) an absorbent core for collecting and storing fluid until the product can be disposed of; and (c) an outer layer (e.g., of plastics) to prevent leakage of fluid from the absorbent core. The articles of this heading are usually shaped so that they may fit snugly to the human body. This heading also includes similar traditional articles made up solely of textile materials, which are usually re-usable following laundering.

This heading **does not cover** products such as disposable surgical drapes and absorbent pads for hospital beds, operating tables and wheelchairs or non-absorbent nursing pads or other non-absorbent articles (in general, classified according to their constituent material).

96.20 - Monopods, bipods, tripods and similar articles.

This heading covers monopods, bipods, tripods and similar articles, which are used as support for cameras, video cameras, precision instruments, etc., to reduce random movements. They may be extendable and are usually portable and may be equipped with a quick release device or head for easy mounting and release of the apparatus or instrument they support. These articles can be made of any material, e.g., wood, aluminium, carbon or a combination thereof.

A monopod is a one-legged support, sometimes called a “unipod”. A bipod is a two-legged support for providing stability along two axes of motion. A tripod is a three-legged stand, which provides significant stability for the device it supports.

For the purpose of this heading, the expression “similar articles” refers to devices with four or more legs, which have the same function as monopods, bipods and tripods in reducing random movements. Selfie pods, also known as “selfie sticks”, designed to be held in the hand, rather than to stand on the ground, to take self-portraits (“selfies”) by positioning a smartphone, a photographic camera, a digital camera or a video camera recorder in an adjustable holder at the end of the stick, are also included in the heading, whether or not they are equipped with wired or wireless remote control for picture taking.

The heading **does not cover** :

- (a) Stands for microphones (**heading 85.18**).
- (b) Stands for holding an instrument (e.g., side-drums or saxophones) (**heading 92.09**).
- (c) Monopods, bipods, tripods and similar articles specially designed to be used with articles of **Chapter 93**.

* * *

Section XXI

WORKS OF ART, COLLECTORS' PIECES AND ANTIQUES

Chapter 97

Works of art, collectors' pieces and antiques

Notes.

- 1.- This Chapter does not cover :
 - (a) Unused postage or revenue stamps, postal stationery (stamped paper) or the like, of heading 49.07;
 - (b) Theatrical scenery, studio back-cloths or the like, of painted canvas (heading 59.07) except if they may be classified in heading 97.06; or
 - (c) Pearls, natural or cultured, or precious or semi-precious stones (headings 71.01 to 71.03).
- 2.- For the purposes of heading 97.02, the expression "original engravings, prints and lithographs" means impressions produced directly, in black and white or in colour, of one or of several plates wholly executed by hand by the artist, irrespective of the process or of the material employed by him, but not including any mechanical or photomechanical process.
- 3.- Heading 97.03 does not apply to mass-produced reproductions or works of conventional craftsmanship of a commercial character, even if these articles are designed or created by artists.
- 4.- (A) Subject to Notes 1 to 3 above, articles of this Chapter are to be classified in this Chapter and not in any other Chapter of the Nomenclature.
(B) Heading 97.06 does not apply to articles of the preceding headings of this Chapter.
- 5.- Frames around paintings, drawings, pastels, collages or similar decorative plaques, engravings, prints or lithographs are to be classified with those articles, provided they are of a kind and of a value normal to those articles. Frames which are not of a kind or of a value normal to the articles referred to in this Note are to be classified separately.

GENERAL

This Chapter covers :

- (A) Certain works of art : paintings, drawings and pastels, executed entirely by hand, and collages and similar decorative plaques (heading 97.01); original engravings, prints and lithographs (heading 97.02); original sculptures and statuary (heading 97.03).
- (B) Postage or revenue and similar stamps, stamp-postmarks, first-day covers, postal stationery (stamped paper) and the like, used or unused, **other than those of heading 49.07** (heading 97.04).
- (C) Collections and collectors' pieces of zoological, botanical, mineralogical, anatomical, historical, archaeological, palaeontological, ethnographic or numismatic interest (heading 97.05).
- (D) Antiques of an age exceeding 100 years (heading 97.06).

It should, however, be noted that such articles are classified in **other Chapters** of the Nomenclature if they do not comply with the conditions arising from the terms of the Notes or headings of this Chapter.

Articles of a kind described in headings 97.01 to 97.05 remain classified in those headings even if they are of an age exceeding 100 years.

97.01 - Paintings, drawings and pastels, executed entirely by hand, other than drawings of heading 49.06 and other than hand-painted or hand-decorated manufactured articles; collages and similar decorative plaques.

9701.10 - Paintings, drawings and pastels

9701.90 - Other

(A) PAINTINGS, DRAWINGS AND PASTELS, EXECUTED ENTIRELY BY HAND, OTHER THAN DRAWINGS OF HEADING 49.06 AND OTHER THAN HAND-PAINTED OR HAND-DECORATED MANUFACTURED ARTICLES

This group covers paintings, drawings and pastels (whether ancient or modern), **executed entirely by hand**. These works may take the form of oil paintings, wax paintings, tempera paintings, acrylic paintings, water-colours, gouache paintings, pastels, miniatures, illuminated manuscripts, pencil drawings (including Conté drawings), charcoal or pen drawings, etc., executed on any material.

As these works must be executed **entirely** by hand, articles obtained **wholly or partly** by any other process are **excluded**, for example, paintings, whether or not on canvas, obtained by photomechanical processes; paintings executed by hand on an outline or on a drawing obtained by ordinary engraving or printing processes; so-called "authentic copies" of paintings, obtained by means of a number of masks or stencils, even if these copies are certified authentic by the artist.

However, copies of paintings remain in this group irrespective of their artistic value, if they are executed entirely by hand.

This group also **excludes** :

- (a) Plans and drawings, for industrial, architectural or engineering purposes, being originals drawn by hand (**heading 49.06**).
- (b) Designs or drawings for fashion models, jewellery, wallpaper, fabrics, furniture, etc., being originals drawn by hand (**heading 49.06**).
- (c) Theatrical scenery, studio back-cloths or the like, of painted canvas (**heading 59.07 or 97.06**).
- (d) Hand-decorated manufactured articles such as wall coverings consisting of hand-painted woven fabrics, holiday souvenirs, boxes and caskets, ceramic wares (plates, dishes, vases, etc.), these are classified under their own appropriate headings.

(B) COLLAGES AND SIMILAR DECORATIVE PLAQUES

This group covers collages and similar decorative plaques, consisting of bits and pieces of various animal, vegetable or other materials, assembled so as to form a picture or decorative design or motif and glued or otherwise mounted on a backing, e.g., of wood, paper or textile material. The backing may be plain or it may be hand-painted or imprinted with decorative or pictorial elements which form part of the overall design. Collages range in quality from articles cheaply produced in quantity for sale as souvenirs up to products which require a high degree of craftsmanship and which may be genuine works of art.

For the purpose of this group, the term "similar decorative plaques" **does not include** articles consisting of a **single piece of material**, even if mounted or glued on a backing, which are more specifically covered by other headings of the Nomenclature such as "ornaments" of plastics, of wood, of base metal, etc. Such articles are classified in their appropriate headings (**headings 44.20, 83.06**, etc.).

* * *

Frames around paintings, drawings, pastels, collages or similar decorative plaques are to be classified with those articles in this heading, **only** if they are of a kind and of a value normal to those articles; in other cases the frames are to be classified separately in their appropriate headings as articles of wood, metal, etc. (see Note 5 to this Chapter).

97.02 - Original engravings, prints and lithographs.

This heading covers **original** engravings, prints and lithographs (whether ancient or modern), i.e., impressions produced directly, in black and white or in colour, from one or several plates wholly executed by hand by the artist, irrespective of the process or of the material employed by him, but **excluding** any mechanical or photomechanical process (see Note 2 to this Chapter).

Provided, they satisfy the other conditions of the preceding paragraph, the heading includes, as original works, lithographs executed by the transfer technique (in which the lithographic artist first makes his drawing on a special paper and then transfers the design to the stone).

The impressions as defined above are produced from engraved plates which may have been executed by various processes, e.g., line-engraving, dry-point, aquatint (acid process) or stipple-engraving.

Original impressions remain in this heading even if they have been retouched.

It is often difficult to distinguish the original article from the copy, fake or reproduction, but the relatively small number of impressions and the quality of the paper may be useful guides in determining originals; on the other hand, evidence of the use of half-tone screens (in photogravure and heliogravure) and, very often, the absence of the mark left on the paper by the plate, may indicate a copy or a reproduction.

Frames around engravings, prints or lithographs are to be classified with those articles in this heading, **only** if they are of a kind and of a value normal to those articles; in other cases the frames are to be classified separately in their appropriate headings as articles of wood, metal, etc. (see Note 5 to this Chapter).

It should be noted that the heading **excludes** the plates (in copper, zinc, stone, wood or any other material) from which engravings, etc., are made (**heading 84.42**).

97.03 - Original sculptures and statuary, in any material.

This heading covers original sculptures and statuary, ancient or modern. They may be in any material (stone, reconstituted stone, terra-cotta, wood, ivory, metal, wax, etc.), in the round, in relief or in intaglio (statues, busts, figurines, groups, representations of animals, etc., including reliefs for architectural purposes).

These works may be produced by various processes including the following : in one of these the artist carves the work directly from hard materials; in another the artist models soft materials into figures; these are then cast in bronze or in plaster, or are fired or otherwise hardened, or they may be reproduced by the artist in marble or in other hard materials.

In the latter process, the artist usually proceeds on the following lines :

He begins by roughing out his idea as a model, also known as a maquette, (usually on a reduced scale) in clay or other plastic material; with this as a basis, he then models a "clay form". This "clay form" is seldom sold, but is usually destroyed after it has served for moulding a very limited number of copies decided in advance by the artist, or it is placed in a museum for study purposes. These reproductions include, firstly, the "plaster model" produced directly from the "clay form". This "plaster model" is used either as a model for the execution of the work in stone or wood, or for preparing moulds for casting in metal or wax.

The same sculpture may therefore be reproduced as two or three "copies" in marble, wood, wax, bronze, etc., and a few in terra-cotta or in plaster. Not only the preliminary model, but also the "clay form", the "plaster model" and these "copies" constitute original works of the artist; the copies are in fact never quite identical as the artist has intervened at each stage with additional modelling, corrections to casts, and for the patina imparted to each article. Only rarely does the total number of replicas exceed twelve.

The heading therefore covers not only the original models made by the sculptor but also copies and reproductions of those models made by the second process described above, whether these are made by the sculptor himself or by another artist.

The heading **excludes** the following articles, even if they are designed or created by artists :

- (a) Ornamental sculptures of a commercial character.
- (b) Articles of personal adornment and other works of conventional craftsmanship of a commercial character (ornaments, religious effigies, etc.).
- (c) Mass-produced reproductions in plaster, staff, cement, papier maché, etc.

With the exception of articles of adornment classifiable in **heading 71.16 or 71.17**, all these articles are classified according to their constituent material (**heading 44.20** for wood, **heading 68.02** or **68.15** for stone, **heading 69.13** for ceramics, **heading 83.06** for base metal, etc.).

97.04 - Postage or revenue stamps, stamp-postmarks, first-day covers, postal stationery (stamped paper), and the like, used or unused, other than those of heading 49.07.

This heading covers the following products used or unused, **other than** those of **heading 49.07** :

- (A) **Postage stamps of all kinds**, i.e., the stamps of the kind normally used for affixing to correspondence or postal packages; "postage due" stamps, etc.
- (B) **Revenue stamps of all kinds**, i.e., receipt stamps, registration stamps, circulation permit stamps, consular stamps, stamped revenue bands, etc.
- (C) **Stamp-postmarks**, i.e., letters bearing a postmark, but no postage stamps, used before the introduction of postage stamps.
- (D) **Postage stamps stuck on envelopes or cards**, including "*first-day covers*", which are envelopes, usually marked "first-day", bearing a postage stamp (or a set of postage stamps) postmarked with its date of issue, and "*maximum cards*". The latter are cards bearing a postage stamp and a reproduction of the stamp's design. The postage stamp is cancelled with an ordinary or special date-stamp showing the place associated with the design and the date of issue.
- (E) **Postal stationery (stamped paper)**, i.e., franked envelopes, letter-cards, postcards, newspaper wrappers, etc.

The articles of this heading may be presented in bulk (separate stamps, date-stamped corners, complete sheets), or in collections. Albums containing collections of such articles are treated as forming part of the collections **provided** they are of a value normal to the collection.

The heading **excludes** :

- (a) Maximum cards and first-day covers (whether or not illustrated) not bearing postage stamps (**heading 48.17 or Chapter 49**).
- (b) Unused postage or revenue stamps, postal stationery (stamped paper) or the like, of current or new issue in the country in which they have, or will have, a recognised face value (**heading 49.07**).
- (c) Vouchers in the form of "savings stamps" issued by private or commercial bodies to customers, and stamps sometimes issued by retailers to their customers as a rebate on purchases (**heading 49.11**).

97.05 - Collections and collectors' pieces of zoological, botanical, mineralogical, anatomical, historical, archaeological, palaeontological, ethnographic or numismatic interest.

These articles are very often of little intrinsic value but derive their interest from their rarity, their grouping or their presentation. The heading includes :

(A) **Collections and collectors' pieces of zoological, botanical, mineralogical or anatomical interest**, such as :

- (1) Dead animals of any species, preserved dry or in liquid; stuffed animals for collections.
- (2) Blown or sucked eggs; insects in boxes, frames, etc. (**other than** mounted articles constituting imitation jewellery or trinkets); empty shells, **other than** those of a kind suitable for industrial use.
- (3) Seeds or plants, dried or preserved in liquid; herbariums.
- (4) Specimens of minerals (**not being** precious or semi-precious stones falling in **Chapter 71**); specimens of petrification.
- (5) Osteological specimens (skeletons, skulls, bones).
- (6) Anatomical and pathological specimens.

(B) **Collections and collectors' pieces of historical, ethnographic, palaeontological or archaeological interest**, for example :

- (1) Articles being the material remains of human activity suitable for the study of the activities of earlier generations, such as : mummies, sarcophagi, weapons, objects of worship, articles of apparel, articles which have belonged to famous persons.
- (2) Articles having a bearing on the study of the activities, manners, customs and characteristics of contemporary primitive peoples, for example, tools, weapons or objects of worship.
- (3) Geological specimens for the study of fossils (extinct organisms which have left their remains or imprints in geological strata), whether animal or vegetable.

(C) **Collections and collectors' pieces of numismatic interest.**

These are coins, banknotes which are no longer legal tender, other than those of heading 49.07, and medals presented as collections or as separate pieces; in the latter case, each consignment usually contains only a few examples of any one coin or medal, and these are classified here **only if** clearly intended for a collection.

The heading **excludes** coins and medals not regarded as collectors' pieces nor forming a collection of numismatic interest (e.g., large consignments of any one coin or medal); these generally fall in **Chapter 71**, but any such "coins" and "medals" so battered or bent that they are fit only for remelting, etc. are *prima facie* classifiable in the **headings for scrap and waste metal**.

Coins which are legal tender in the country of issue fall in **heading 71.18** even if they are put up for general sale in presentation cases.

Coins or medals mounted as jewellery are **excluded (Chapter 71 or heading 97.06)**.

Banknotes which are no longer legal tender, and which are not regarded as collectors' pieces nor as forming a collection, are classified in **heading 49.07**.

*
* *

Goods produced as a commercial undertaking to commemorate, celebrate, illustrate or depict an event or any other matter, whether or not production is limited in quantity or circulation, **do not fall** in this heading as collections or collectors' pieces of historical or numismatic interest unless the goods themselves have subsequently attained that interest by reason of their age or rarity.

97.06 - Antiques of an age exceeding one hundred years.

This heading covers all antiques of an age exceeding one hundred years, **provided** they are not included in **headings 97.01 to 97.05**. The interest of these articles derives from their age and, as a general consequence, their resulting rarity.

Subject to these conditions, the heading includes :

- (1) Antique furniture, frames and panelling.
- (2) Products of the printing industry : incunabula and other books, music, maps, engravings (**other than those of heading 97.02**).
- (3) Vases and other ceramic articles.
- (4) Textile articles : carpets, tapestries, embroidery, lace and other fabrics.
- (5) Jewellery.
- (6) Articles of goldsmiths' or silversmiths' wares (ewers, cups, candelabra, plate, etc.).
- (7) Leaded or stained glass windows.
- (8) Chandeliers and lamps.
- (9) Ironmongers' and locksmiths' wares.
- (10) Small ornaments for glass cabinets (boxes, sweetmeat boxes, snuff boxes, tobacco graters, caskets, fans, etc.).
- (11) Musical instruments.
- (12) Clocks and watches.
- (13) Glyptographers' wares (cameos, carved stones) and sigillographers' wares (seals, etc.).

Provided they retain their original character, the heading includes antique articles which have been repaired or restored. For example, the heading includes : antique furniture incorporating parts of modern manufacture (e.g., reinforcements and repairs); antique tapestries, leather or fabrics, mounted on modern wood.

The heading **does not cover**, irrespective of their age, pearls, natural or cultured, or precious or semi-precious stones of headings **71.01 to 71.03**.
